in the category \mathcal{C}_{site} . This makes sense as by our definition of morphisms of sites, the required fibre products in \mathcal{C}_m exist since u_φ transforms coverings into coverings. The same reasoning implies the claim (details omitted). Thus we see that the collection of coverings is stable under base change. The other axioms of a site are immediate. \square

Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. This means that for every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a cocontinuous functor denoted $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$.

Lemma 64.3.2. *Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. With notation as above, assume the functors $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ have property P of Sites, Remark 7.19.5. Then we can construct a site \mathcal{C}_{site} as follows.*

- (1) *An object of \mathcal{C}_{site} is an object U of \mathcal{C}_n for some n ,*
- (2) *a morphism $(\varphi, f) : U \rightarrow V$ of \mathcal{C}_{site} is given by a map $\varphi : [m] \rightarrow [n]$ with $U \in \text{Ob}(\mathcal{C}_n)$, $V \in \text{Ob}(\mathcal{C}_m)$ and a morphism $f : u_\varphi(U) \rightarrow V$ of \mathcal{C}_m , and*

- (3) a covering $\{(id, f_i) : U_i \rightarrow U\}$ in \mathcal{C}_{site} is given by an n and a covering $\{f_i : U_i \rightarrow U\}$ of \mathcal{C}_n .

Proof. Composition of $(\varphi, f) : U \rightarrow V$ with $(\psi, g) : V \rightarrow W$ is given by $(\varphi \circ \psi, g \circ u_\psi(f))$. This uses that $u_\psi \circ u_\varphi = u_{\varphi \circ \psi}$.

Let $\{(id, f_i) : U_i \rightarrow U\}$ be a covering as in (3) and let $(\varphi, g) : W \rightarrow U$ be a morphism with $W \in \text{Ob}(\mathcal{C}_m)$. We claim that

$$W \times_{(\varphi, g), U, (id, f_i)} U_i = W \times_{g, U, f_i} U_i$$

in the category \mathcal{C}_{site} where the right hand side is the object of \mathcal{C}_m defined in Sites, Remark 7.19.5 which exists by property P . Compatibility of this type of fibre product with compositions of functors implies the claim (details omitted). Since the family $\{W \times_{g, U, f_i} U_i \rightarrow W\}$ is a covering of \mathcal{C}_m by property P we see that the collection of coverings is stable under base change. The other axioms of a site are immediate. \square

Situation 64.3.3. Here we have one of the following two cases

- (A) \mathcal{C} is a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. For every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a morphism of sites $f_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ given by a continuous functor $u_\varphi : \mathcal{C}_m \rightarrow \mathcal{C}_n$.
- (B) \mathcal{C} is a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors having property P of Sites, Remark 7.19.5. For every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a cocontinuous functor $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ which induces a morphism of topoi $f_\varphi : \text{Sh}(\mathcal{C}_n) \rightarrow \text{Sh}(\mathcal{C}_m)$.

As usual we will denote f_φ^{-1} and $f_{\varphi,*}$ the pullback and pushforward. We let \mathcal{C}_{site} denote the site defined in Lemma 64.3.1 (case A) or Lemma 64.3.2 (case B).

Let \mathcal{C} be as in Situation 64.3.3. Let \mathcal{F} be a sheaf on \mathcal{C}_{site} . It is clear from the definition of coverings, that the restriction of \mathcal{F} to the objects of \mathcal{C}_n defines a sheaf \mathcal{F}_n on the site \mathcal{C}_n . For every $\varphi : [m] \rightarrow [n]$ the restriction maps of \mathcal{F} along the morphisms $(\varphi, f) : U \rightarrow V$ with $U \in \text{Ob}(\mathcal{C}_n)$ and $V \in \text{Ob}(\mathcal{C}_m)$ define an element $\mathcal{F}(\varphi)$ of

$$\text{Mor}_{\text{Sh}(\mathcal{C}_m)}(\mathcal{F}_m, f_{\varphi,*}\mathcal{F}_n) = \text{Mor}_{\text{Sh}(\mathcal{C}_n)}(f_\varphi^{-1}\mathcal{F}_m, \mathcal{F}_n)$$

Moreover, given $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ we have

$$f_\varphi^{-1}\mathcal{F}(\psi) \circ \mathcal{F}(\varphi) = \mathcal{F}(\varphi \circ \psi)$$

Clearly, the converse is true as well: if we have a system $(\{\mathcal{F}_n\}_{n \geq 0}, \{\mathcal{F}(\varphi)\}_{\varphi \in \text{Arrows}(\Delta)})$ as above, satisfying the displayed equalities, then we obtain a sheaf on \mathcal{C}_{site} .

Lemma 64.3.4. *In Situation 64.3.3 there is an equivalence of categories between*

- (1) $\text{Sh}(\mathcal{C}_{site})$, and
- (2) category of systems $(\mathcal{F}_n, \mathcal{F}(\varphi))$ described above.

In particular, the topos $\text{Sh}(\mathcal{C}_{site})$ only depends on the topoi $\text{Sh}(\mathcal{C}_n)$ and the morphisms of topoi f_φ .

Proof. See discussion above. \square

Lemma 64.3.5. *In Situation 64.3.3 the functor $\mathcal{C}_n \rightarrow \mathcal{C}_{site}$, $U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g : \text{Sh}(\mathcal{C}_n) \rightarrow \text{Sh}(\mathcal{C}_{site})$ satisfies*

- (1) g^{-1} associates to the sheaf \mathcal{F} on \mathcal{C}_{site} the sheaf \mathcal{F}_n on \mathcal{C}_n ,
- (2) g^{-1} has a left adjoint $g_!^{Sh}$ which commutes with finite connected limits, and
- (3) $g^{-1} : Ab(\mathcal{C}_{site}) \rightarrow Ab(\mathcal{C}_n)$ has a left adjoint $g_! : Ab(\mathcal{C}_n) \rightarrow Ab(\mathcal{C}_{site})$ which is exact.

Proof. It is clear that functor $\mathcal{C}_n \rightarrow \mathcal{C}_{site}$ is continuous and cocontinuous. Hence part (1) and the existence of $g_!^{Sh}$ and $g_!$ follows from Sites, Lemmas 7.20.1 and 7.20.5 and Modules on Sites, Lemmas 18.16.2 and 18.16.4.

Next, we come to the exactness properties of $g_!^{Sh}$ and $g_!$. Perhaps the most straightforward way to prove this is to give a formula for these functors. If \mathcal{G} is a sheaf on \mathcal{C}_n , then we claim $\mathcal{H} = g_!^{Sh}\mathcal{G}$ is the sheaf on \mathcal{C}_{site} whose degree m part is the sheaf

$$\mathcal{H}_m = \coprod_{\varphi: [n] \rightarrow [m]} f_\varphi^{-1}\mathcal{G}$$

Given a map $\psi : [m] \rightarrow [m']$ the map $\mathcal{H}(\psi) : f_\psi^{-1}\mathcal{H}_m \rightarrow \mathcal{H}_{m'}$ is given on components by the identifications

$$f_\psi^{-1}f_\varphi^{-1}\mathcal{G} \rightarrow f_{\psi \circ \varphi}^{-1}\mathcal{G}$$

Observe that given a map $a : \mathcal{H} \rightarrow \mathcal{F}$ of sheaves on \mathcal{C}_{site} we obtain a map $\mathcal{G} \rightarrow \mathcal{F}_n$ corresponding to the restriction of a_n to the component \mathcal{G} in \mathcal{H}_n . Conversely, given $b : \mathcal{G} \rightarrow \mathcal{F}_n$ we can define $a : \mathcal{H} \rightarrow \mathcal{F}$ by letting a_m be the map which on components

$$f_\varphi^{-1}\mathcal{G} \rightarrow \mathcal{F}_m$$

uses the maps adjoint to $\mathcal{F}(\varphi) \circ f_\varphi^{-1}b$. We omit the arguments showing these two constructions give mutually inverse maps

$$\text{Mor}_{Sh(\mathcal{C}_n)}(\mathcal{G}, \mathcal{F}_n) = \text{Mor}_{Sh(\mathcal{C}_{site})}(\mathcal{H}, \mathcal{F})$$

thus verifying the claim above. If \mathcal{G} is an abelian sheaf on \mathcal{C}_n , then $g_!\mathcal{G}$ is the abelian sheaf on \mathcal{C}_{site} whose degree m part is the sheaf

$$\bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^{-1}\mathcal{G}$$

with transition maps defined exactly as above. By definition of the site \mathcal{C}_{site} we see that these functors have the desired exactness properties and we conclude. \square

Lemma 64.3.6. *In Situation 64.3.3. If \mathcal{I} is an injective abelian sheaf on \mathcal{C}_{site} , then \mathcal{I}_n is an injective abelian sheaf on \mathcal{C}_n .*

Proof. This follows from Homology, Lemma 12.25.1 and Lemma 64.3.5. \square

Let \mathcal{C} be as in Situation 64.3.3. In statement of the following lemmas we will let $g_n : \mathcal{C}_n \rightarrow \mathcal{C}_{site}$ be the functor of Lemma 64.3.5. If $\varphi : [m] \rightarrow [n]$ is a morphism of Δ , then the diagram of topoi

$$\begin{array}{ccc} Sh(\mathcal{C}_n) & \xrightarrow{\quad f_\varphi \quad} & Sh(\mathcal{C}_m) \\ & \searrow g_n \quad \swarrow g_m & \\ & Sh(\mathcal{C}_{site}) & \end{array}$$

is not commutative, but there is a 2-morphism $g_n \rightarrow g_m \circ f_\varphi$ coming from the maps $\mathcal{F}(\varphi) : f_\varphi^{-1}\mathcal{F}_m \rightarrow \mathcal{F}_n$. See Sites, Section 7.35.

Lemma 64.3.7. *In Situation 64.3.3 and with notation as above there is a complex*

$$\dots \rightarrow g_2! \mathbf{Z} \rightarrow g_1! \mathbf{Z} \rightarrow g_0! \mathbf{Z}$$

of abelian sheaves on \mathcal{C}_{site} which forms a resolution of the constant sheaf with value \mathbf{Z} on \mathcal{C}_{site} .

Proof. We will use the description of the functors $g_n!$ in the proof of Lemma 64.3.5 without further mention. As maps of the complex we take $\sum (-1)^i d_i^n$ where $d_i^n : g_n! \mathbf{Z} \rightarrow g_{n-1}! \mathbf{Z}$ is the adjoint to the map $\mathbf{Z} \rightarrow \bigoplus_{[n-1] \rightarrow [n]} \mathbf{Z} = g_n^{-1} g_{n-1}! \mathbf{Z}$ corresponding to the factor labeled with $\delta_i^n : [n-1] \rightarrow [n]$. Then g_m^{-1} applied to the complex gives the complex

$$\dots \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([2],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([1],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([0],[m])} \mathbf{Z}$$

on \mathcal{C}_m . In other words, this is the complex associated to the free abelian sheaf on the simplicial set $\Delta[m]$, see *Simplicial*, Example 14.11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see *Simplicial*, Example 14.25.7, and since “taking free abelian sheaf on” is a functor, we see that the complex above is homotopy equivalent to the free abelian sheaf on $\Delta[0]$ (*Simplicial*, Remark 14.25.4 and Lemma 14.26.2). This complex is acyclic in positive degrees and equal to \mathbf{Z} in degree 0. \square

Lemma 64.3.8. *In Situation 64.3.3. Let \mathcal{F} be an abelian sheaf on \mathcal{C}_{site} . There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = H^q(\mathcal{C}_p, \mathcal{F}_p)$$

converging to $H^{p+q}(\mathcal{C}_{site}, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} .

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Consider the double complex with terms

$$A^{p,q} = \Gamma(\mathcal{C}_p, \mathcal{I}_p^q)$$

and first differential given by the alternating sum along the maps d_i^{p+1} -maps $\mathcal{I}_p^q \rightarrow \mathcal{I}_{p+1}^q$, see Lemma 64.3.4. Note that

$$A^{p,q} = \Gamma(\mathcal{C}_p, \mathcal{I}_p^q) = \text{Mor}_{\text{Ab}(\mathcal{C}_{site})}(g_p! \mathbf{Z}, \mathcal{I}^q)$$

Hence it follows from Lemma 64.3.7 that the rows of the double complex are exact in positive degrees and evaluate to $\Gamma(\mathcal{C}_{site}, \mathcal{I}^q)$ in degree 0. On the other hand, since restriction is exact (Lemma 64.3.5) the map

$$\mathcal{F}_p \rightarrow \mathcal{I}_p^\bullet$$

is a resolution. The sheaves \mathcal{I}_p^q are injective abelian sheaves on \mathcal{C}_p (Lemma 64.3.6). Hence the cohomology of the columns computes the groups $H^q(\mathcal{C}_p, \mathcal{F}_p)$. We conclude by applying Homology, Lemmas 12.22.6 and 12.22.7. \square

64.4. Simplicial semi-representable objects

Let \mathcal{C} be a site. Recall that $\text{SR}(\mathcal{C})$ denotes the category of semi-representable objects of \mathcal{C} . See *Hypercovers*, Definition 24.2.1. For an object $K = \{U_i\}_{i \in I}$ of $\text{SR}(\mathcal{C})$ we will use the notation

$$\mathcal{C}/K = \coprod_{i \in I} \mathcal{C}/U_i$$

and we will call it the *localization of \mathcal{C} at K* . There is a natural structure of a site on this category, with coverings inherited from the localizations \mathcal{C}/U_i (and whence

from \mathcal{C}). If $f : K \rightarrow L$ is a morphism of $\text{SR}(\mathcal{C})$, then we obtain a cocontinuous functor

$$f : \mathcal{C}/K \longrightarrow \mathcal{C}/L$$

by applying the construction of Sites, Lemma 7.24.7 to the components. More precisely, if $f = (\alpha, f_i)$ where $K = \{U_i\}_{i \in I}$, $L = \{V_j\}_{j \in J}$, $\alpha : I \rightarrow J$, and $f_i : U_i \rightarrow V_{\alpha(i)}$ then f maps the component \mathcal{C}/U_i into the component $\mathcal{C}/V_{\alpha(i)}$ via the construction of the aforementioned lemma.

Let K be a simplicial object of $\text{SR}(\mathcal{C})$. By the construction above we obtain a simplicial object $n \mapsto \mathcal{C}/K_n$ in the category whose objects are sites and whose morphisms are cocontinuous functors of sites. Since these localization functors satisfy the assumption of Lemma 64.3.2 by Sites, Remark 7.24.10 we obtain a site $(\mathcal{C}/K)_{\text{site}}$.

We can describe this site explicitly as follows. Say $K_n = \{U_{n,i}\}_{i \in I_n}$ and that for $\varphi : [m] \rightarrow [n]$ the morphism $K(\varphi) : K_n \rightarrow K_m$ is given by $a(\varphi) : I_n \rightarrow I_m$ and $f_{\varphi,i} : U_{n,i} \rightarrow U_{m,a(\varphi)(i)}$ for $i \in I_n$. Then we have

- (1) an object of \mathcal{C}/K corresponds to an object $(U/U_{n,i})$ of $\mathcal{C}/U_{n,i}$ for some n and some $i \in I_n$,
- (2) a morphism between U and V is a pair (φ, f) where $\varphi : [m] \rightarrow [n]$ with $U/U_{n,i}$ and $V/U_{m,a(\varphi)(i)}$ and $f : U \rightarrow V$ is a morphism of \mathcal{C} such that

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \searrow f & \downarrow \\ U_{n,i} & \xrightarrow{f_{\varphi,i}} & U_{m,a(\varphi)(i)} \end{array}$$

is commutative, and

- (3) a covering $\{(\text{id}, f_j) : U_j \rightarrow U\}$ is given by an n and $i \in I_n$ and objects $U/U_{n,i}$, $U_j/U_{n,i}$ such that $\{f_j : U_j \rightarrow U\}$ is a covering of \mathcal{C} .

Lemma 64.4.1. *Let \mathcal{C} be a site. Let K be a simplicial object of $\text{SR}(\mathcal{C})$. If \mathcal{C} has fibre products, then \mathcal{C}/K can also be viewed as a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. The construction of Lemma 64.3.1 then produces the same site as the construction above.*

Proof. Given a morphism of objects $U \rightarrow V$ of \mathcal{C} the localization morphism $j : \mathcal{C}/U \rightarrow \mathcal{C}/U$ is a left adjoint to the base change functor $\mathcal{C}/V \rightarrow \mathcal{C}/U$. The base change functor is continuous and induces the same morphism of topoi as j . See Sites, Lemma 7.26.3. Argueing as above we can use this to define a morphism of sites $\mathcal{C}/A \rightarrow \mathcal{C}/B$ given any morphism $A \rightarrow B$ of $\text{SR}(\mathcal{C})$. Applying this to the morphisms of the simplicial object K we obtain simplicial object $(\mathcal{C}/K)'$ in the category of sites with morphisms of sites. Let $(\mathcal{C}/K)'_{\text{site}}$ be the site constructed in Lemma 64.3.1. Since the base change functors are adjoint to the localization functors, we find that $(\mathcal{C}/K)'_{\text{site}}$ is the same as the category $(\mathcal{C}/K)_{\text{site}}$. Equality of the sets of coverings is immediate from the definitions. \square

Let \mathcal{C} be a site. Let $L = \{V_i\}$ be an object of $\text{SR}(\mathcal{C})$. There is a continuous and cocontinuous localization functor $j : \mathcal{C}/K \rightarrow \mathcal{C}$ which is the product of the localization functors $\mathcal{C}/V_i \rightarrow \mathcal{C}$. We obtain functors j^{-1} , j_* , $j_!^{Sh}$, and $j_!$ exactly as in Sites, Section 7.24 and Modules on Sites, Section 18.19. Given a simplicial object K of $\text{SR}(\mathcal{C})$ we obtain a family of localization functors $j_n : \mathcal{C}/K_n \rightarrow \mathcal{C}$.

Lemma 64.4.2. *Let \mathcal{C} be a site. Let K be a simplicial object of $SR(\mathcal{C})$. The forgetful functor $(\mathcal{C}/K)_{site} \rightarrow \mathcal{C}$ is continuous and cocontinuous and induces a morphism of topoi*

$$g : Sh((\mathcal{C}/K)_{site}) \longrightarrow Sh(\mathcal{C})$$

as well as functors $g_!^{Sh}$ and $g_!$ left adjoint to g^{-1} on sheaves of sets and abelian groups with the following properties:

- (1) the functor g^{-1} associates to a sheaf \mathcal{F} on \mathcal{C} the sheaf on $(\mathcal{C}/K)_{site}$ which in degree n is equal to $j_n^{-1}\mathcal{F}$,
- (2) the functor g_* associates to a sheaf \mathcal{G} on $(\mathcal{C}/K)_{site}$ the equalizer of the two maps $j_{0,*}\mathcal{G}_0 \rightarrow j_{1,*}\mathcal{G}_1$,

Proof. The functor is continuous and cocontinuous by our choice of coverings and our description of (certain) fibre products in $(\mathcal{C}/K)_{site}$ in the proof of Lemma 64.3.2. Details omitted. Thus we obtain a morphism of topoi and functors $g_!^{Sh}$ and $g_!$, see Sites, Section 7.20 and Modules on Sites, Section 18.16. The description of g^{-1} is immediate from the definition as the composition $\mathcal{C}/K_n \rightarrow \mathcal{C}/K \rightarrow \mathcal{C}$ is the localization morphism j_n .

Proof of (2). Let \mathcal{F} be a sheaf on \mathcal{C} and let \mathcal{G} be a sheaf on $(\mathcal{C}/K)_{site}$. A map $a : g^{-1}\mathcal{F} \rightarrow \mathcal{G}$ corresponds to a system of maps $a_n : j_n^{-1}\mathcal{F} \rightarrow \mathcal{G}_n$ on \mathcal{C}/K_n by Lemma 64.3.4. Taking $n = 0$ we get a map $j_0^{-1}\mathcal{F} \rightarrow \mathcal{G}_0$ which is adjoint to a map $a_0 : \mathcal{F} \rightarrow j_{0,*}\mathcal{G}_0$. Since a_0 is compatible with a_1 via the two maps $j_{0,*}\mathcal{G}_0 \rightarrow j_{1,*}\mathcal{G}_1$ we see that a_0 maps into the equalizer. Conversely, given a map $a_0 : \mathcal{F} \rightarrow j_{0,*}\mathcal{G}_0$ into the equalizer we can pick, for any n , one of the maps $j_{0,*}\mathcal{G}_0 \rightarrow j_{n,*}\mathcal{G}_n$ and compose to get a well defined map $a_n : \mathcal{F} \rightarrow j_{n,*}\mathcal{G}_n$. These fit together to define a map of sheaves $g^{-1}\mathcal{F} \rightarrow \mathcal{G}$. \square

Lemma 64.4.3. *Let \mathcal{C} be a site with equalizers and fibre products. Let \mathcal{G} be a presheaf of sets on \mathcal{C} . Let K be a hypercovering of \mathcal{G} , see Hypercoverings, Definition 24.5.1. Then we have a canonical isomorphism*

$$R\Gamma(\mathcal{G}, E) = R\Gamma((\mathcal{C}/K)_{site}, g^{-1}E)$$

for $E \in D^+(\mathcal{C})$. If K is a hypercovering, then $R\Gamma(E) = R\Gamma((\mathcal{C}/K)_{site}, g^{-1}E)$.

Proof. First, let \mathcal{I} be an injective abelian sheaf on \mathcal{C} . Then the spectral sequence of Lemma 64.3.8 for the sheaf $g^{-1}\mathcal{I}$ degenerates as $(g^{-1}\mathcal{I})_p$ is the restriction of \mathcal{I} to \mathcal{C}/K_p which is injective by Cohomology on Sites, Lemma 21.8.1 (extended in the obvious manner to localization at semi-representable objects of \mathcal{C}). Thus we see that the complex

$$\mathcal{I}(K_0) \rightarrow \mathcal{I}(K_1) \rightarrow \mathcal{I}(K_2) \rightarrow \dots$$

computes $R\Gamma((\mathcal{C}/K)_{site}, g^{-1}\mathcal{I})$. This is exactly the Čech complex of \mathcal{I} with respect to the simplicial object K of $SR(\mathcal{C})$ as defined in Hypercoverings, Section 24.4. Thus Hypercoverings, Lemma 24.5.3 shows that this complex computes $R\Gamma(\mathcal{G}, \mathcal{I})$ (which has zero higher cohomology groups as \mathcal{I} is injective). In other words, we have $H^0(\mathcal{G}, \mathcal{I}) = H^0((\mathcal{C}/K)_{site}, \mathcal{I})$ and $H^p(\mathcal{G}, \mathcal{I}) = H^p((\mathcal{C}/K)_{site}, \mathcal{I}) = 0$ for all $p > 0$.

The lemma now follows formally. Namely, let $A \in D^+(\mathcal{C})$ be arbitrary. We can represent A by a bounded below complex \mathcal{I}^\bullet of injective abelian sheaves. By Leray's

acyclicity lemma (Derived Categories, Lemma 13.17.7) $R\Gamma((\mathcal{C}/K)_{site}, A)$ is computed by the complex $\Gamma((\mathcal{C}/K)_{site}, g^{-1}\mathcal{I}^\bullet)$ and $R\Gamma(\mathcal{G}, A)$ is computed by $\Gamma(\mathcal{G}, \mathcal{I}^\bullet)$. Since these complexes are the same we obtain the conclusion.

The final statement refers to the special case where $\mathcal{G} = *$ is the final object in the category of presheaves on \mathcal{C} . \square

Lemma 64.4.4. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X , see Hypercoverings, Definition 24.2.6. Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/K)_{site}, g^{-1}E)$$

for $E \in D^+(\mathcal{C})$.

Proof. If \mathcal{C} also has equalizers, then this is a special case of Lemma 64.4.3 because a hypercovering of X is a hypercovering of h_X by Hypercoverings, Lemma 24.2.10. This also uses that $H^q(h_X, \mathcal{F}) = H^q(h_X^\#, \mathcal{F}) = H^q(X, \mathcal{F})$, see discussion in Hypercoverings, Section 24.5 and Cohomology on Sites, Section 21.13. In general (when \mathcal{C} does not have equalizers) one proves this using *exactly* the same argument as in the proof of Lemma 64.4.3 but substituting Hypercoverings, Lemma 24.4.2 for Hypercoverings, Lemma 24.5.3. \square

64.5. Hypercovering in a site

In the previous section we worked out, in great generality, how hypercoverings give rise to simplicial sites and how cohomology of (say) constant sheaves on this site computes the cohomology of the object the hypercovering is augmented towards. In this section we explain what this means in a special case.

Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} and let X_\bullet be a simplicial object of \mathcal{C} . Assume we have an augmentation

$$a : X_\bullet \rightarrow X$$

The discussion above turns this into a morphism of topoi

$$g : (\mathcal{C}/X_\bullet)_{site} \longrightarrow \mathcal{C}/X$$

Here an object of the site $(\mathcal{C}/X_\bullet)_{site}$ is given by a U/X_n and a morphism $(\varphi, f) : U/X_n \rightarrow V/X_m$ is given by a morphism $\varphi : [m] \rightarrow [n]$ in Δ and a morphism $f : U \rightarrow V$ such that the diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \searrow f & \downarrow \\ X_n & \xrightarrow{\varphi} & X_m \end{array}$$

is commutative. The morphism of topoi g is given by the cocontinuous functor $U/X_n \mapsto U/X$. That's all folks!

Thus we may translate some of the results above to this setting. For example, let us say that the augmentation is a *hypercovering* if the following hold

- (1) $\{X_0 \rightarrow X\}$ is a covering of \mathcal{C} ,
- (2) $\{X_1 \rightarrow X_0 \times_X X_0\}$ is a covering of \mathcal{C} ,
- (3) $\{X_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n X_\bullet)_{n+1}\}$ is a covering of \mathcal{C} for $n \geq 1$.

The category \mathcal{C}/X has all finite limits, hence the coskeleta used in the formulation above exist.

Lemma 64.5.1. *In the situation above assume that X_\bullet is a hypercovering of X . Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/X_\bullet)_{site}, g^{-1}E)$$

for $E \in D^+(\mathcal{C}/X)$.

Proof. This is a special case of Lemma 64.4.4. \square

64.6. Proper hypercoverings in topology

Let's work in the category LC of Hausdorff and locally quasi-compact topological spaces and continuous maps, see Cohomology on Sites, Section 21.23. Let X be an object of LC and let X_\bullet be a simplicial object of LC . Assume we have an augmentation

$$a : X_\bullet \rightarrow X$$

We say that X_\bullet is a *proper hypercovering* of X if

- (1) $X_0 \rightarrow X$ is a proper surjective map,
- (2) $X_1 \rightarrow X_0 \times_X X_0$ is a proper surjective map,
- (3) $X_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n X_\bullet)_{n+1}$ is a proper surjective map for $n \geq 1$.

The category LC has all finite limits, hence the coskeleta used in the formulation above exist.

Principle: Proper hypercoverings can be used to compute cohomology.

A key idea behind the proof of the principle is to find a topology on LC which is stronger than the usual one such that (A) a surjective proper map defines a covering, and (B) cohomology of usual sheaves with respect to this stronger topology agrees with the usual cohomology. Properties (A) and (B) hold for the qc topology, see Cohomology on Sites, Section 21.23. Once we have (A) and (B) we deduce the principle via a combination of the spectral sequences of Hypercoverings, Lemma 24.4.3 and Lemma 64.2.11. The following lemma is just a first step.

Lemma 64.6.1. *In the situation above, let \mathcal{F} be an abelian sheaf on X . Let \mathcal{F}_n be the pullback to X_n . If X_\bullet is a proper hypercovering of X , then there exists a canonical spectral sequence*

$$E_1^{p,q} = H^q(X_p, \mathcal{F}_p)$$

converging to $H^{p+q}(X, \mathcal{F})$.

Proof. By Cohomology on Sites, Lemma 21.23.6 we have

$$H^*(X, \mathcal{F}) = H^*(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F}).$$

Since a proper surjective map defines a qc covering (Cohomology on Sites, Lemma 21.23.7) we see that $X_\bullet \rightarrow X$ is a hypercovering in the site LC_{qc} as in Section 64.5. Thus we have

$$R\Gamma(X, \mathcal{F}) = R\Gamma(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F}) = R\Gamma((LC/X_\bullet)_{site}, g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F})$$

by Lemma 64.5.1. By Lemma 64.3.8 there is a spectral sequence with

$$E_1^{p,q} = H^q(LC_{qc}/X_p, (g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F})_p)$$

converging to the cohomology of $g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F}$. Finally, the restriction $(g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F})_p$ is just the restriction to LC_{qc}/X_p of $\epsilon^{-1}\pi^{-1}\mathcal{F}$ which by Cohomology on Sites, Lemma 21.23.5 is the pullback of \mathcal{F}_p to LC_{qc}/X_p . By Cohomology on Sites, Lemma 21.23.6 again we conclude that

$$H^q(LC_{qc}/X_p, (g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F})_p) = H^q(X_p, \mathcal{F}_p)$$

and the proof is finished. □

Lemma 64.6.2. *In the situation above, let \mathcal{F} be an abelian sheaf on X . Let \mathcal{F}_\bullet be the pullback of \mathcal{F} via $a : X_\bullet \rightarrow X$. If X_\bullet is a proper hypercovering of X , then*

$$H^*(X, \mathcal{F}) = H^*((X_\bullet)_{Zar}, \mathcal{F}_\bullet)$$

Proof. Consider the continuous functor

$$(X_\bullet)_{Zar} \longrightarrow (LC_{qc}/X_\bullet)_{site}, \quad U \longmapsto U$$

We obtain a commutative diagram of topoi

$$\begin{array}{ccc} Sh((LC_{qc}/X_\bullet)_{site}) & \longrightarrow & Sh((X_\bullet)_{Zar}) \\ g \downarrow & & g \downarrow \\ Sh(LC_{qc}/X) & \xrightarrow{\pi \circ \epsilon} & Sh(X_{Zar}) \end{array}$$

Thus our sheaf \mathcal{F} gives rise to a compatible collection of abelian sheaves in each topos. In the proof of Lemma 64.6.1 we have seen that the sheaf \mathcal{F} has the same cohomology as the sheaf $\epsilon^{-1}\pi^{-1}\mathcal{F}$ and $g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F}$. On the other hand, the terms of the spectral sequence of Lemma 64.2.11 for \mathcal{F}_\bullet are the same as those in the statement and proof of Lemma 64.6.1. A simple argument with spectral sequences then shows that the map

$$R\Gamma((X_\bullet)_{Zar}, \mathcal{F}_\bullet) \longrightarrow R\Gamma((LC_{qc}/X_\bullet)_{site}, g^{-1}\epsilon^{-1}\pi^{-1}\mathcal{F})$$

is an isomorphism. Some details omitted. □

Lemma 64.6.3. *In the situation above, assume $a : X_\bullet \rightarrow X$ gives a proper hypercovering of X . Then for all $K \in D^+(X)$*

$$K \rightarrow Ra_*(a^{-1}K)$$

is an isomorphism where $a : Sh((X_\bullet)_{Zar}) \rightarrow Sh(X)$ is as in Lemma 64.2.9.

Proof. Observe that for any abelian sheaf \mathcal{F} on X the sheaf $R^q a_*(a^{-1}\mathcal{F})$ is the sheaf associated to the presheaf

$$U \mapsto H^q((U_\bullet)_{Zar}, a^{-1}\mathcal{F}) = H^q(U, \mathcal{F})$$

where $U_\bullet = a^{-1}(U)$. The last equality holds by Lemma 64.6.2. Thus $R^q a_*(a^{-1}\mathcal{F})$ is zero for $q > 0$ and equal to \mathcal{F} for $q = 0$. This proves the result in case K consists of a single abelian sheaf in a single degree. The general case follows from this immediately. □

64.7. Simplicial schemes

A *simplicial scheme* is a simplicial object in the category of schemes, see *Simplicial*, Definition 14.3.1. Recall that a simplicial scheme looks like

$$X_2 \begin{matrix} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{matrix} X_1 \begin{matrix} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{matrix} X_0$$

Here there are two morphisms $d_0^1, d_1^1 : X_1 \rightarrow X_0$ and a single morphism $s_0^0 : X_0 \rightarrow X_1$, etc. It is important to keep in mind that $d_i^n : X_n \rightarrow X_{n-1}$ should be thought of as a “projection forgetting the i th coordinate” and $s_j^n : X_n \rightarrow X_{n+1}$ as the diagonal map repeating the j th coordinate.

64.8. Descent in terms of simplicial schemes

Cartesian morphisms are defined as follows.

Definition 64.8.1. Let $a : Y \rightarrow X$ be a morphism of simplicial schemes. We say a is *cartesian*, or that Y is *cartesian over* X , if for every morphism $\varphi : [n] \rightarrow [m]$ of Δ the corresponding diagram

$$\begin{array}{ccc} Y_m & \xrightarrow{a} & X_m \\ Y(\varphi) \downarrow & & \downarrow X(\varphi) \\ Y_n & \xrightarrow{a} & X_n \end{array}$$

is a fibre square in the category of schemes.

Cartesian morphisms are related to descent data. First we prove a general lemma describing the category of cartesian simplicial schemes over a fixed simplicial scheme. In this lemma we denote $f^* : Sch/X \rightarrow Sch/Y$ the base change functor associated to a morphism of schemes $Y \rightarrow X$.

Lemma 64.8.2. *Let X be a simplicial scheme. The category of simplicial schemes cartesian over X is equivalent to the category of pairs (V, φ) where V is a scheme over X_0 and*

$$\varphi : V \times_{X_0, d_1^1} X_1 \longrightarrow X_1 \times_{d_0^1, X_0} V$$

is an isomorphism over X_1 such that $(s_0^0)^ \varphi = id_V$ and such that*

$$(d_1^2)^* \varphi = (d_0^2)^* \varphi \circ (d_2^2)^* \varphi$$

as morphisms of schemes over X_2 .

Proof. The statement of the displayed equality makes sense because $d_1^1 \circ d_2^2 = d_1^1 \circ d_1^2$, $d_1^1 \circ d_0^2 = d_0^1 \circ d_2^2$, and $d_0^1 \circ d_0^2 = d_0^1 \circ d_1^2$ as morphisms $X_2 \rightarrow X_0$, see *Simplicial*, Remark 14.3.3 hence we can picture these maps as follows

$$\begin{array}{ccccc} & & X_2 \times_{d_1^1 \circ d_0^2, X_0} V & \xrightarrow{(d_0^2)^* \varphi} & X_2 \times_{d_0^1 \circ d_0^2, X_0} V & & \\ & & \parallel & & \parallel & & \\ X_2 \times_{d_0^1 \circ d_2^2, X_0} V & & & & & & X_2 \times_{d_0^1 \circ d_1^2, X_0} V \\ & \swarrow (d_2^2)^* \varphi & & & \swarrow (d_1^2)^* \varphi & & \\ & & X_2 \times_{d_1^1 \circ d_2^2, X_0} V & \equiv & X_2 \times_{d_1^1 \circ d_1^2, X_0} V & & \end{array}$$

and the condition signifies the diagram is commutative. It is clear that given a simplicial scheme Y cartesian over X we can set $V = Y_0$ and φ equal to the composition

$$V \times_{X_0, d_1^1} X_1 = Y_0 \times_{X_0, d_1^1} X_1 = Y_1 = X_1 \times_{X_0, d_0^1} Y_0 = X_1 \times_{X_0, d_0^1} V$$

of identifications given by the cartesian structure. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 34.3 from which we borrow the notation $\tau_i^n : [0] \rightarrow [n], 0 \mapsto i$ and $\tau_{ij}^n : [1] \rightarrow [n], 0 \mapsto i, 1 \mapsto j$. Namely, given a pair (V, φ) as in the lemma we set $Y_n = X_n \times_{X(\tau_n^n), X_0} V$. Then given $\beta : [n] \rightarrow [m]$ we define $V(\beta) : Y_m \rightarrow Y_n$ as the pullback by $X(\tau_{\beta(n)m}^m)$ of the map φ postcomposed by the projection $X_m \times_{X(\beta), X_n} Y_n \rightarrow Y_n$. This makes sense because

$$X_m \times_{X(\tau_{\beta(n)m}^m), X_1} X_1 \times_{d_1^1, X_0} V = X_m \times_{X(\tau_m^m), X_0} V = Y_m$$

and

$$X_m \times_{X(\tau_{\beta(n)m}^m), X_1} X_1 \times_{d_0^1, X_0} V = X_m \times_{X(\tau_m^m), X_0} V = X_m \times_{X(\beta), X_n} Y_n.$$

We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly. We also omit the verification that the two functors are quasi-inverse to each other. \square

Definition 64.8.3. Let $f : X \rightarrow S$ be a morphism of schemes. The *simplicial scheme associated to f* , denoted $(X/S)_\bullet$, is the functor $\Delta^{opp} \rightarrow Sch, [n] \mapsto X \times_S \dots \times_S X$ described in Simplicial, Example 14.3.5.

Thus $(X/S)_n$ is the $(n + 1)$ -fold fibre product of X over S . The morphism $d_0^1 : X \times_S X \rightarrow X$ is the map $(x_0, x_1) \mapsto x_1$ and the morphism d_1^1 is the other projection. The morphism s_0^0 is the diagonal morphism $X \rightarrow X \times_S X$.

Lemma 64.8.4. Let $f : X \rightarrow S$ be a morphism of schemes. Let $\pi : Y \rightarrow (X/S)_\bullet$ be a cartesian morphism of simplicial schemes. Set $V = Y_0$ considered as a scheme over X . The morphisms $d_0^1, d_1^1 : Y_1 \rightarrow Y_0$ and the morphism $\pi_1 : Y_1 \rightarrow X \times_S X$ induce isomorphisms

$$V \times_S X \xleftarrow{(d_1^1, \pi_1 \circ \pi_1)} Y_1 \xrightarrow{(\pi_0 \circ \pi_1, d_0^1)} X \times_S V.$$

Denote $\varphi : V \times_S X \rightarrow X \times_S V$ the resulting isomorphism. Then the pair (V, φ) is a descent datum relative to $X \rightarrow S$.

Proof. This is a special case of (part of) Lemma 64.8.2 as the displayed equation of that lemma is equivalent to the cocycle condition of Descent, Definition 34.30.1. \square

Lemma 64.8.5. Let $f : X \rightarrow S$ be a morphism of schemes. The construction

$$\begin{array}{ccc} \text{category of cartesian} & \longrightarrow & \text{category of descent data} \\ \text{schemes over } (X/S)_\bullet & & \text{relative to } X/S \end{array}$$

of Lemma 64.8.4 is an equivalence of categories.

Proof. The functor from left to right is given in Lemma 64.8.4. Hence this is a special case of Lemma 64.8.2. \square

We may reinterpret the pullback of Descent, Lemma 34.30.6 as follows. Suppose given a morphism of simplicial schemes $f : X' \rightarrow X$ and a cartesian morphism of simplicial schemes $Y \rightarrow X$. Then the fibre product (viewed as a “pullback”)

$$f^*Y = Y \times_X X'$$

of simplicial schemes is a simplicial scheme cartesian over X' . Suppose given a commutative diagram of morphisms of schemes

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & & \downarrow \\ S' & \xrightarrow{\quad} & S. \end{array}$$

This gives rise to a morphism of simplicial schemes

$$f_\bullet : (X'/S')_\bullet \longrightarrow (X/S)_\bullet.$$

We claim that the “pullback” f_\bullet^* along the morphism $f_\bullet : (X'/S')_\bullet \rightarrow (X/S)_\bullet$ corresponds via Lemma 64.8.5 with the pullback defined in terms of descent data in the aforementioned Descent, Lemma 34.30.6.

64.9. Quasi-coherent modules on simplicial schemes

In the following definition we make use of the description of sheaves on a simplicial space given in Lemma 64.2.2.

Definition 64.9.1. Let S be a scheme. Let U be a simplicial scheme over S .

- (1) A *quasi-coherent sheaf* on U is given by a sheaf of \mathcal{O}_U -modules \mathcal{F} such that \mathcal{F}_n is quasi-coherent for all $n \geq 0$.
- (2) A quasi-coherent sheaf \mathcal{F} on U is *cartesian* if and only if all the maps $\mathcal{F}(\varphi) : \mathcal{F}_n \rightarrow \mathcal{F}_m$ induce isomorphisms $U(\varphi)^*\mathcal{F}_n \rightarrow \mathcal{F}_m$.

The property on pullbacks needs only be checked for the degeneracies.

Lemma 64.9.2. Let S be a scheme. Let U be a simplicial scheme over S . Let \mathcal{F} be a quasi-coherent module on U . Then \mathcal{F} is cartesian if and only if the induced maps $(d_j^n)^*\mathcal{F}_{n-1} \rightarrow \mathcal{F}_n$ are isomorphisms.

Proof. The category Δ is generated by the morphisms the morphisms δ_j^n and σ_j^n , see Simplicial, Lemma 14.2.2. Hence we only need to check the maps $(d_j^n)^*\mathcal{F}_{n-1} \rightarrow \mathcal{F}_n$ and $(s_j^n)^*\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$ are isomorphisms, see Simplicial, Lemma 14.3.2 for notation. But $d_j^{n+1} \circ s_j^n = \text{id}_{U_n}$ so it the result for d_j^{n+1} implies the result for s_j^n . \square

Lemma 64.9.3. Let S be a scheme. Let U be a simplicial scheme over S . The category of cartesian quasi-coherent modules over U is equivalent to the category of pairs (\mathcal{F}, α) where \mathcal{F} is a quasi-coherent module over U_0 and

$$\alpha : (d_1^1)^*\mathcal{F} \longrightarrow (d_0^1)^*\mathcal{F}$$

is an isomorphism such that $(s_0^0)^*\alpha = \text{id}_{\mathcal{F}}$ and such that

$$(d_1^2)^*\alpha = (d_0^2)^*\alpha \circ (d_2^2)^*\alpha$$

on X_2 .

Proof. The statement of the displayed equality makes sense because $d_1^1 \circ d_2^2 = d_1^1 \circ d_1^2$, $d_1^1 \circ d_0^2 = d_0^1 \circ d_2^2$, and $d_0^1 \circ d_0^2 = d_0^1 \circ d_1^2$ as morphisms $X_2 \rightarrow X_0$, see Simplicial, Remark 14.3.3 hence we can picture these maps as follows

$$\begin{array}{ccc}
 & (d_0^2)^*(d_1^1)^*\mathcal{F} \xrightarrow{(d_0^2)^*\alpha} (d_0^2)^*(d_0^1)^*\mathcal{F} & \\
 & \parallel & \parallel \\
 (d_2^2)^*(d_0^1)^*\mathcal{F} & & (d_1^2)^*(d_0^1)^*\mathcal{F} \\
 & \swarrow (d_2^2)^*\alpha & \searrow (d_1^2)^*\alpha \\
 & (d_2^2)^*(d_1^1)^*\mathcal{F} = (d_1^2)^*(d_1^1)^*\mathcal{F} &
 \end{array}$$

and the condition signifies the diagram is commutative. It is clear that given a cartesian quasi-coherent sheaf \mathcal{F} we can set $\mathcal{F} = \mathcal{F}_0$ and α equal to the composition

$$(d_1^0)^*\mathcal{F}_0 = \mathcal{F}_1 = (d_0^0)^*\mathcal{F}_0$$

of identifications given by the cartesian structure. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 34.3 from which we borrow the notation $\tau_i^n : [0] \rightarrow [n]$, $0 \mapsto i$ and $\tau_{ij}^n : [1] \rightarrow [n]$, $0 \mapsto i$, $1 \mapsto j$. Namely, given a pair (\mathcal{F}, α) as in the lemma we set $\mathcal{F}_n = X(\tau_n^n)^*\mathcal{F}$. Then given $\beta : [n] \rightarrow [m]$ we define $\mathcal{F}(\beta) : \mathcal{F}_n \rightarrow \mathcal{F}_m$ as the pullback by $X(\tau_{\beta(n)m}^m)$ of the map α precomposed with the canonical $X(\beta)$ -map $\mathcal{F}_n \rightarrow X(\beta)^*\mathcal{F}_n$. We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly. We also omit the verification that the two functors are quasi-inverse to each other. \square

Lemma 64.9.4. *Let $f : V \rightarrow U$ be a morphism of simplicial schemes. Given a cartesian quasi-coherent module \mathcal{F} on U the pullback $f^*\mathcal{F}$ is a cartesian quasi-coherent module on V .*

Proof. This is immediate from the definitions. \square

Lemma 64.9.5. *Let $f : V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_j^n : U_n \rightarrow U_{n-1}$ are flat and the morphisms $V_n \rightarrow U_n$ are quasi-compact and quasi-separated. For a cartesian quasi-coherent module \mathcal{G} on V the pushforward $f_*\mathcal{G}$ is a cartesian quasi-coherent module on U .*

Proof. If $\mathcal{F} = f_*\mathcal{G}$, then $\mathcal{F}_n = f_{n,*}\mathcal{G}_n$ and the maps $\mathcal{F}(\varphi)$ are defined using the base change maps, see Cohomology, Section 20.18. The sheaves \mathcal{F}_n are quasi-coherent by Schemes, Lemma 25.24.1. The base change maps along the degeneracies d_j^n are isomorphisms by Cohomology of Schemes, Lemma 29.5.2. Hence we are done by Lemma 64.9.2. \square

Lemma 64.9.6. *Let $f : V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_j^n : U_n \rightarrow U_{n-1}$ are flat and the morphisms $V_n \rightarrow U_n$ are quasi-compact and quasi-separated. Then f^* and f_* form an adjoint pair of functors between the categories of cartesian quasi-coherent modules on U and V .*

Proof. We have seen in Lemmas 64.9.4 and 64.9.5 that the statement makes sense. The adjointness property follows immediately from the fact that each f_n^* is adjoint to $f_{n,*}$. \square

Lemma 64.9.7. *Let $f : X \rightarrow S$ be a morphism of schemes which has a section². Let $(X/S)_\bullet$ be the simplicial scheme associated to $X \rightarrow S$, see Definition 64.8.3. Then pullback defines an equivalence between the category of quasi-coherent \mathcal{O}_S -modules and the category of cartesian quasi-coherent modules on $(X/S)_\bullet$.*

Proof. Let $\sigma : S \rightarrow X$ be a section of f . Let (\mathcal{F}, α) be a pair as in Lemma 64.9.3. Set $\mathcal{G} = \sigma^* \mathcal{F}$. Consider the diagram

$$\begin{array}{ccccc} X & \xrightarrow{\quad} & X \times_S X & \xrightarrow{\quad} & X \\ f \downarrow & & (\sigma \circ f, 1) \downarrow & & \downarrow \text{pr}_0 \\ S & \xrightarrow{\quad \sigma \quad} & X & & X \end{array}$$

Note that $\text{pr}_0 = d_1^1$ and $\text{pr}_1 = d_0^1$. Hence we see that $(\sigma \circ f, 1)^* \alpha$ defines an isomorphism

$$f^* \mathcal{G} = (\sigma \circ f, 1)^* \text{pr}_0^* \mathcal{F} \longrightarrow (\sigma \circ f, 1)^* \text{pr}_1^* \mathcal{F} = \mathcal{F}$$

We omit the verification that this isomorphism is compatible with α and the canonical isomorphism $\text{pr}_0^* f^* \mathcal{G} \rightarrow \text{pr}_1^* f^* \mathcal{G}$. □

64.10. Groupoids and simplicial schemes

Given a groupoid in schemes we can build a simplicial scheme. It will turn out that the category of quasi-coherent sheaves on a groupoid is equivalent to the category of cartesian quasi-coherent sheaves on the associated simplicial scheme.

Lemma 64.10.1. *Let (U, R, s, t, c, e, i) be a groupoid scheme over S . There exists a simplicial scheme X over S with the following properties*

- (1) $X_0 = U, X_1 = R, X_2 = R \times_{s,U,t} R,$
- (2) $s_0^0 = e : X_0 \rightarrow X_1,$
- (3) $d_0^1 = s : X_1 \rightarrow X_0, d_1^1 = t : X_1 \rightarrow X_0,$
- (4) $s_0^1 = (e \circ t, 1) : X_1 \rightarrow X_2, s_1^1 = (1, e \circ t) : X_1 \rightarrow X_2,$
- (5) $d_0^2 = \text{pr}_1 : X_2 \rightarrow X_1, d_1^2 = c : X_2 \rightarrow X_1, d_2^2 = \text{pr}_0,$ and
- (6) $X = \text{cosk}_2 \text{sk}_2 X.$

For all n we have $X_n = R \times_{s,U,t} \dots \times_{s,U,t} R$ with n factors. The map $d_j^n : X_n \rightarrow X_{n-1}$ is given on functors of points by

$$(r_1, \dots, r_n) \longmapsto (r_1, \dots, c(r_j, r_{j+1}), \dots, r_n)$$

for $1 \leq j \leq n - 1$ whereas $d_0^n(r_1, \dots, r_n) = (r_2, \dots, r_n)$ and $d_n^n(r_1, \dots, r_n) = (r_1, \dots, r_{n-1}).$

Proof. We only have to verify that the rules prescribed in (1), (2), (3), (4), (5) define a 2-truncated simplicial scheme U' over S , since then (6) allows us to set $X = \text{cosk}_2 U'$, see Simplicial, Lemma 14.18.2. Using the functor of points approach,

²In fact, it would be enough to assume that f has fpqc locally on S a section, since we have descent of quasi-coherent modules by Descent, Section 34.5.

all we have to verify is that if $(\text{Ob}, \text{Arrows}, s, t, c, e, i)$ is a groupoid, then

$$\begin{array}{ccccc}
 & \text{Arrows} \times_{s, \text{Ob}, t} \text{Arrows} & & & \\
 \text{pr}_1 \downarrow & \uparrow 1, e & c \downarrow & \uparrow e, 1 & \downarrow \text{pr}_0 \\
 & \text{Arrows} & & & \\
 & s \downarrow & e \uparrow & t \downarrow & \\
 & \text{Ob} & & &
 \end{array}$$

is a 2-truncated simplicial set. We omit the details.

Finally, the description of X_n for $n > 2$ follows by induction from the description of X_0, X_1, X_2 , and *Simplicial*, Remark 14.18.9 and Lemma 14.18.6. Alternately, one shows that cosk_2 applied to the 2-truncated simplicial set displayed above gives a simplicial set whose n th term equals $\text{Arrows} \times_{s, \text{Ob}, t} \dots \times_{s, \text{Ob}, t} \text{Arrows}$ with n factors and degeneracy maps as given in the lemma. Some details omitted. \square

Lemma 64.10.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let X be the simplicial scheme over S constructed in Lemma 64.10.1. Then the category of quasi-coherent modules on (U, R, s, t, c) is equivalent to the category of cartesian quasi-coherent modules on X .*

Proof. This is clear from Lemma 64.9.3 and *Groupoids*, Definition 38.12.1. \square

In the following lemma we will use the concept of a cartesian morphism $V \rightarrow U$ of simplicial schemes as defined in Definition 64.8.1.

Lemma 64.10.3. *Let (U, R, s, t, c) be a groupoid scheme over a scheme S . Let X be the simplicial scheme over S constructed in Lemma 64.10.1. Let $(R/U)_\bullet$ be the simplicial scheme associated to $s : R \rightarrow U$, see Definition 64.8.3. There exists a cartesian morphism $t_\bullet : (R/U)_\bullet \rightarrow X$ of simplicial schemes with low degree morphisms given by*

$$\begin{array}{ccccccc}
 & & & \xrightarrow{\text{pr}_{12}} & & & \\
 R \times_{s, U, s} & R \times_{s, U, s} & R & \xrightarrow{\text{pr}_{02}} & R \times_{s, U, s} & R & \xrightarrow{\text{pr}_1} & R \\
 & & & \xrightarrow{\text{pr}_{01}} & & & \xrightarrow{\text{pr}_0} & \\
 \downarrow (r_0, r_1, r_2) \mapsto (r_0 \circ r_1^{-1}, r_1 \circ r_2^{-1}) & & & \downarrow (r_0, r_1) \mapsto r_0 \circ r_1^{-1} & & & \downarrow t & \\
 R \times_{s, U, t} & R & \xrightarrow{\text{pr}_1} & R & \xrightarrow{s} & U & & \\
 & & \xrightarrow{c} & & \xrightarrow{t} & & & \\
 & & \xrightarrow{\text{pr}_0} & & & & &
 \end{array}$$

Proof. For arbitrary n we define $(R/U)_\bullet \rightarrow X_n$ by the rule

$$(r_0, \dots, r_n) \longrightarrow (r_0 \circ r_1^{-1}, \dots, r_{n-1} \circ r_n^{-1})$$

Compatibility with degeneracy maps is clear from the description of the degeneracies in Lemma 64.10.1. We omit the verification that the maps respect the morphisms s_j^n . *Groupoids*, Lemma 38.11.5 (with the roles of s and t reversed) shows that the two right squares are cartesian. In exactly the same manner one shows all the other squares are cartesian too. Hence the morphism is cartesian. \square

64.11. Descent data give equivalence relations

In Section 64.8 we saw how descent data relative to $X \rightarrow S$ can be formulated in terms of cartesian simplicial schemes over $(X/S)_\bullet$. Here we link this to equivalence relations as follows.

Lemma 64.11.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $\pi : Y \rightarrow (X/S)_\bullet$ be a cartesian morphism of simplicial schemes, see Definitions 64.8.1 and 64.8.3. Then the morphism*

$$j = (d_1^1, d_0^1) : Y_1 \rightarrow Y_0 \times_S Y_0$$

defines an equivalence relation on Y_0 over S , see Groupoids, Definition 38.3.1.

Proof. Note that j is a monomorphism. Namely the composition $Y_1 \rightarrow Y_0 \times_S Y_0 \rightarrow Y_0 \times_S X$ is an isomorphism as π is cartesian.

Consider the morphism

$$(d_2^2, d_0^2) : Y_2 \rightarrow Y_1 \times_{d_0^1, Y_0, d_1^1} Y_1.$$

This works because $d_0 \circ d_2 = d_1 \circ d_0$, see Simplicial, Remark 14.3.3. Also, it is a morphism over $(X/S)_2$. It is an isomorphism because $Y \rightarrow (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $Y_0 \times_{\pi_0, X, \text{pr}_1} (X \times_S X \times_S X) = X \times_S Y_0 \times_S X$ because π is cartesian. Details omitted.

As in Groupoids, Definition 38.3.1 we denote $t = \text{pr}_0 \circ j = d_1^1$ and $s = \text{pr}_1 \circ j = d_0^1$. The isomorphism above, combined with the morphism $d_1^2 : Y_2 \rightarrow Y_1$ give us a composition morphism

$$c : Y_1 \times_{s, Y_0, t} Y_1 \longrightarrow Y_1$$

over $Y_0 \times_S Y_0$. This immediately implies that for any scheme T/S the relation $Y_1(T) \subset Y_0(T) \times Y_0(T)$ is transitive.

Reflexivity follows from the fact that the restriction of the morphism j to the diagonal $\Delta : X \rightarrow X \times_S X$ is an isomorphism (again use the cartesian property of π).

To see symmetry we consider the morphism

$$(d_2^2, d_1^2) : Y_2 \rightarrow Y_1 \times_{d_1^1, Y_0, d_0^1} Y_1.$$

This works because $d_1 \circ d_2 = d_1 \circ d_1$, see Simplicial, Remark 14.3.3. It is an isomorphism because $Y \rightarrow (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $Y_0 \times_{\pi_0, X, \text{pr}_0} (X \times_S X \times_S X) = Y_0 \times_S X \times_S X$ because π is cartesian. Details omitted.

Let T/S be a scheme. Let $a \sim b$ for $a, b \in Y_0(T)$ be synonymous with $(a, b) \in Y_1(T)$. The isomorphism (d_2^2, d_1^2) above implies that if $a \sim b$ and $a \sim c$, then $b \sim c$. Combined with reflexivity this shows that \sim is an equivalence relation. \square

64.12. An example case

In this section we show that disjoint unions of spectra of Artinian rings can be descended along a quasi-compact surjective flat morphism of schemes.

Lemma 64.12.1. *Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow (X/S)_\bullet$ is a cartesian morphism of simplicial schemes. For $y \in Y_0$ a point define*

$$T_y = \{y' \in Y_0 \mid \exists y_1 \in Y_1 : d_1^1(y_1) = y, d_0^1(y_1) = y'\}$$

as a subset of Y_0 . Then $y \in T_y$ and $T_y \cap T_{y'} \neq \emptyset \Rightarrow T_y = T_{y'}$.

Proof. Combine Lemma 64.11.1 and Groupoids, Lemma 38.3.4. \square

Lemma 64.12.2. *Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow (X/S)_\bullet$ is a cartesian morphism of simplicial schemes. Let $y \in Y_0$ be a point. If $X \rightarrow S$ is quasi-compact, then*

$$T_y = \{y' \in Y_0 \mid \exists y_1 \in Y_1 : d_1^1(y_1) = y, d_0^1(y_1) = y'\}$$

is a quasi-compact subset of Y_0 .

Proof. Let F_y be the scheme theoretic fibre of $d_1^1 : Y_1 \rightarrow Y_0$ at y . Then we see that T_y is the image of the morphism

$$\begin{array}{ccc} F_y & \longrightarrow & Y_1 \xrightarrow{d_0^1} Y_0 \\ \downarrow & & \downarrow d_1^1 \\ y & \longrightarrow & Y_0 \end{array}$$

Note that F_y is quasi-compact. This proves the lemma. \square

Lemma 64.12.3. *Let $X \rightarrow S$ be a quasi-compact flat surjective morphism. Let (V, φ) be a descent datum relative to $X \rightarrow S$. If V is a disjoint union of spectra of Artinian rings, then (V, φ) is effective.*

Proof. Let $Y \rightarrow (X/S)_\bullet$ be the cartesian morphism of simplicial schemes corresponding to (V, φ) by Lemma 64.8.5. Observe that $Y_0 = V$. Write $V = \coprod_{i \in I} \text{Spec}(A_i)$ with each A_i local Artinian. Moreover, let $v_i \in V$ be the unique closed point of $\text{Spec}(A_i)$ for all $i \in I$. Write $i \sim j$ if and only if $v_i \in T_{v_j}$ with notation as in Lemma 64.12.1 above. By Lemmas 64.12.1 and 64.12.2 this is an equivalence relation with finite equivalence classes. Let $\bar{I} = I / \sim$. Then we can write $V = \coprod_{\bar{i} \in \bar{I}} V_{\bar{i}}$ with $V_{\bar{i}} = \coprod_{i \in \bar{i}} \text{Spec}(A_i)$. By construction we see that $\varphi : V \times_S X \rightarrow X \times_S V$ maps the open and closed subspaces $V_{\bar{i}} \times_S X$ into the open and closed subspaces $X \times_S V_{\bar{i}}$. In other words, we get descent data $(V_{\bar{i}}, \varphi_{\bar{i}})$, and (V, φ) is the coproduct of them in the category of descent data. Since each of the $V_{\bar{i}}$ is a finite union of spectra of Artinian local rings the morphism $V_{\bar{i}} \rightarrow X$ is affine, see Morphisms, Lemma 28.13.13. Since $\{X \rightarrow S\}$ is an fpqc covering we see that all the descent data $(V_{\bar{i}}, \varphi_{\bar{i}})$ are effective by Descent, Lemma 34.33.1. \square

To be sure, the lemma above has very limited applicability!

Formal Algebraic Spaces

65.1. Introduction

Formal schemes were introduced in [DG67]. A more general version of formal schemes was introduced in [McQ02] and another in [Yas09]. Formal algebraic spaces were introduced in [Knu71]. Related material and much besides can be found in [Abb10] and [FK]. This chapter introduces the notion of formal algebraic spaces we will work with. Our definition is general enough to allow most classes of formal schemes/spaces in the literature as full subcategories.

Although we do discuss the comparison of some of these alternative theories with ours, we do not always give full details when it is not necessary for the logical development of the theory.

Besides introducing formal algebraic spaces, we also prove a few very basic properties and we discuss a few types of morphisms.

65.2. Formal schemes à la EGA

In this section we review the construction of formal schemes in [DG67]. This notion, although very useful in algebraic geometry, may not always be the correct one to consider. Perhaps it is better to say that in the setup of the theory a number of choices are made, where for different purposes others might work better. And indeed in the literature one can find many different closely related theories adapted to the problem the authors may want to consider. Still, one of the major advantages of the theory as sketched here is that one gets to work with definite geometric objects.

Before we start we should point out an issue with the sheaf condition for sheaves of topological rings or more generally sheaves of topological spaces. Namely, the big categories

- (1) category of topological spaces,
- (2) category of topological abelian groups,
- (3) category of topological rings,
- (4) category of topological modules over a given topological ring,

endowed with their natural forgetful functors to *Sets* are not examples of types of algebraic structures as defined in Sheaves, Section 6.15. Thus we cannot blithely apply to them the machinery developed in that chapter. On the other hand, each of the categories listed above has products, so we can define the notion of a sheaf as in Sheaves, Definition 6.9.1. Moreover, products still commute with the forgetful functor to *Sets* so the underlying presheaf of sets of a sheaf of topological spaces (for example) is a sheaf of sets. The key difference is that for an open covering

$U = \bigcup_{i \in I} U_i$ the diagram

$$\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i) \rightrightarrows \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

has to be an equalizer diagram in the category of topological spaces, groups, rings, modules, i.e., that the first map identifies $\mathcal{F}(U)$ with a subspace of $\prod_{i \in I} \mathcal{F}(U_i)$ which is endowed with the product topology.

The stalk \mathcal{F}_x of a sheaf \mathcal{F} of topological spaces, abelian groups, rings, or modules at a point $x \in X$ is defined as the colimit over open neighbourhoods

$$\mathcal{F}_x = \operatorname{colim}_{x \in U} \mathcal{F}(U)$$

in the corresponding category, which is the same as taking the colimit on the level of underlying sheaves of sets, groups, rings, or modules but comes equipped with a topology (the colimit topology). One can sheafify presheaves of topological spaces, abelian groups, rings, or modules and taking stalks commutes with this operation, see Remark 65.2.4.

Let $f : X \rightarrow Y$ be a continuous map of topological spaces. There is a functor f_* from the category of sheaves of topological spaces, abelian groups, rings, modules, to the corresponding category of sheaves on Y which is defined by setting $f_*\mathcal{F}(V) = \mathcal{F}(f^{-1}V)$ as usual. (We delay discussing the pullback in this setting till later.) We define the notion of an f -map $\xi : \mathcal{G} \rightarrow \mathcal{F}$ between a sheaf of topological spaces \mathcal{G} on Y and a sheaf of topological spaces \mathcal{F} on X in exactly the same manner as in Sheaves, Definition 6.21.7 with the additional constraint that $\xi_V : \mathcal{G}(V) \rightarrow \mathcal{F}(f^{-1}V)$ be continuous for every open $V \subset Y$. We have

$$\{f\text{-maps from } \mathcal{G} \text{ to } \mathcal{F}\} = \operatorname{Mor}_{\operatorname{Sh}(Y, \operatorname{Top})}(\mathcal{G}, f_*\mathcal{F})$$

as in Sheaves, Lemma 6.21.8. Similarly for sheaves of topological abelian groups, rings, modules. Finally, let $\xi : \mathcal{G} \rightarrow \mathcal{F}$ be an f -map as above. Then given $x \in X$ with image $y = f(x)$ there is a continuous map

$$\xi_x : \mathcal{G}_y \longrightarrow \mathcal{F}_x$$

of stalks defined in exactly the same manner as in the discussion following Sheaves, Definition 6.21.9.

Using the discussion above, we can define a category *LTRS* of “locally topologically ringed spaces”. An object is a pair (X, \mathcal{O}_X) consisting of a topological space X and a sheaf of topological rings \mathcal{O}_X whose stalks $\mathcal{O}_{X,x}$ are local rings (if one forgets about the topology). A morphism $(X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ of *LTRS* is a pair $(f, f^\#)$ where $f : X \rightarrow Y$ is a continuous map of topological spaces and $f^\# : \mathcal{O}_Y \rightarrow \mathcal{O}_X$ is an f -map such that for every $x \in X$ the induced map

$$f_x^\# : \mathcal{O}_{Y, f(x)} \longrightarrow \mathcal{O}_{X, x}$$

is a local homomorphism of local rings (forgetting about the topologies). The composition works in exactly the same manner as composition of morphisms of locally ringed spaces.

Assume now that the topological space X has a basis consisting of quasi-compact opens. Given a sheaf \mathcal{G} of sets, abelian groups, rings, modules over a ring, one can endow \mathcal{G} with the structure of a sheaf of topological spaces, abelian groups, rings, modules. Namely, if $U \subset X$ is quasi-compact open, we endow $\mathcal{F}(U)$ with the discrete topology. If $U \subset X$ is arbitrary, then we choose an open covering $U =$

$\bigcup_{i \in I} U_i$ by quasi-compact opens and we endow $\mathcal{F}(U)$ with the induced topology from $\prod_{i \in I} \mathcal{F}(U_i)$ (as we should do according to our discussion above). The reader may verify (omitted) that we obtain a sheaf of topological spaces, groups, rings, modules in this fashion. Let us say that a sheaf of topological spaces, groups, rings, modules is *pseudo-discrete* if the topology on $\mathcal{F}(U)$ is discrete for every quasi-compact open $U \subset X$. Then the construction given above is an adjoint to the forgetful functor and induces an equivalence between the category of sheaves of sets and the category of pseudo-discrete sheaves of topological space (similarly for groups, rings, modules).

Grothendieck and Dieudonné first define formal affine schemes. These correspond to admissible topological rings A , see More on Algebra, Definition 15.26.1. Namely, given A one considers a fundamental system I_λ of ideals of definition for the ring A . (In any admissible topological ring the family of all ideals of definition forms a fundamental system.) For each λ we can consider the scheme $\text{Spec}(A/I_\lambda)$. For $I_\lambda \subset I_\mu$ the induced morphism

$$\text{Spec}(A/I_\mu) \rightarrow \text{Spec}(A/I_\lambda)$$

is a thickening because $I_\mu^n \subset I_\lambda$ for some n . Another way to see this, is to notice that the image of each of the maps

$$\text{Spec}(A/I_\lambda) \rightarrow \text{Spec}(A)$$

is a homeomorphism onto the set of open prime ideals of A . This motivates the definition

$$\text{Spf}(A) = \{\text{open prime ideals } \mathfrak{p} \subset A\}$$

endowed with the topology coming from $\text{Spec}(A)$. For each λ we can consider the structure sheaf $\mathcal{O}_{\text{Spec}(A/I_\lambda)}$ as a sheaf on $\text{Spf}(A)$. Let \mathcal{O}_λ be the corresponding pseudo-discrete sheaf of topological rings, see above. Then we set

$$\mathcal{O}_{\text{Spf}(A)} = \lim \mathcal{O}_\lambda$$

where the limit is taken in the category of sheaves of topological rings. The pair $(\text{Spf}(A), \mathcal{O}_{\text{Spf}(A)})$ is called the *formal spectrum* of A .

At this point one should check several things. The first is that the stalks $\mathcal{O}_{\text{Spf}(A), x}$ are local rings (forgetting about the topology). The second is that given $f \in A$, for the corresponding open $D(f) \cap \text{Spf}(A)$ we have

$$\Gamma(D(f) \cap \text{Spf}(A), \mathcal{O}_{\text{Spf}(A)}) = A_{\{f\}} = \lim(A/I_\lambda)_f$$

as topological rings where I_λ is a fundamental system of ideals of definition as above. Moreover, the ring $A_{\{f\}}$ is admissible too and $(\text{Spf}(A_f), \mathcal{O}_{\text{Spf}(A_{\{f\}})})$ is isomorphic to $(D(f) \cap \text{Spf}(A), \mathcal{O}_{\text{Spf}(A)}|_{D(f) \cap \text{Spf}(A)})$. Finally, given a pair of admissible topological rings A, B we have

$$(65.2.0.1) \quad \text{Mor}_{LTRS}((\text{Spf}(B), \mathcal{O}_{\text{Spf}(B)}), (\text{Spf}(A), \mathcal{O}_{\text{Spf}(A)})) = \text{Hom}_{\text{cont}}(A, B)$$

where $LTRS$ is the category of “locally topologically ringed spaces” as defined above.

Having said this, in [DG67] a *formal scheme* is defined as a pair $(\mathfrak{X}, \mathcal{O}_\mathfrak{X})$ where \mathfrak{X} is a topological space and $\mathcal{O}_\mathfrak{X}$ is a sheaf of topological rings such that every point has an open neighbourhood isomorphic (in $LTRS$) to an affine formal scheme. A *morphism of formal schemes* $f : (\mathfrak{X}, \mathcal{O}_\mathfrak{X}) \rightarrow (\mathfrak{Y}, \mathcal{O}_\mathfrak{Y})$ is a morphism in the category $LTRS$.

Let A be a ring endowed with the discrete topology. Then A is admissible and the formal scheme $\mathrm{Spf}(A)$ is equal to $\mathrm{Spec}(A)$. The structure sheaf $\mathcal{O}_{\mathrm{Spf}(A)}$ is the pseudo-discrete sheaf of topological rings associated to $\mathcal{O}_{\mathrm{Spec}(A)}$, in other words, its underlying sheaf of rings is equal to $\mathcal{O}_{\mathrm{Spec}(A)}$ and the ring $\mathcal{O}_{\mathrm{Spf}(A)}(U) = \mathcal{O}_{\mathrm{Spec}(A)}(U)$ over a quasi-compact open U has the discrete topology, but not in general. Thus we can associate to every affine scheme a formal affine scheme. In exactly the same manner we can start with a general scheme (X, \mathcal{O}_X) and associate to it (X, \mathcal{O}'_X) where \mathcal{O}'_X is the pseudo-discrete sheaf of topological rings whose underlying sheaf of rings is \mathcal{O}_X . This construction is compatible with morphisms and defines a functor

$$(65.2.0.2) \quad \text{Schemes} \longrightarrow \text{Formal Schemes}$$

It follows in a straightforward manner from (65.2.0.1) that this functor is fully faithful.

Let \mathfrak{X} be a formal scheme. Let us define the *size* of the formal scheme by the formula $\mathrm{size}(\mathfrak{X}) = \max(\aleph_0, \kappa_1, \kappa_2)$ where κ_1 is the cardinality of the formal affine opens of \mathfrak{X} and κ_2 is the supremum of the cardinalities of $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ where $\mathfrak{U} \subset \mathfrak{X}$ is such a formal affine open.

Lemma 65.2.1. *Choose a category of schemes Sch_α as in Sets, Lemma 3.9.2. Given a formal scheme \mathfrak{X} let*

$$h_{\mathfrak{X}} : (Sch_\alpha)^{opp} \longrightarrow \text{Sets}, \quad h_{\mathfrak{X}}(S) = \mathrm{Mor}_{\text{Formal Schemes}}(S, \mathfrak{X})$$

be its functor of points. Then we have

$$\mathrm{Mor}_{\text{Formal Schemes}}(\mathfrak{X}, \mathfrak{Y}) = \mathrm{Mor}_{\mathrm{PSh}(Sch_\alpha)}(h_{\mathfrak{X}}, h_{\mathfrak{Y}})$$

provided the size of \mathfrak{X} is not too large.

Proof. First we observe that $h_{\mathfrak{X}}$ satisfies the sheaf property for the Zariski topology for any formal scheme \mathfrak{X} (see Schemes, Definition 25.15.3). This follows from the local nature of morphisms in the category of formal schemes. Also, for an open immersion $\mathfrak{V} \rightarrow \mathfrak{W}$ of formal schemes, the corresponding transformation of functors $h_{\mathfrak{W}} \rightarrow h_{\mathfrak{V}}$ is injective and representable by open immersions (see Schemes, Definition 25.15.3). Choose an open covering $\mathfrak{X} = \bigcup \mathfrak{U}_i$ of a formal scheme by affine formal schemes \mathfrak{U}_i . Then the collection of functors $h_{\mathfrak{U}_i}$ covers $h_{\mathfrak{X}}$ (see Schemes, Definition 25.15.3). Finally, note that

$$h_{\mathfrak{U}_i} \times_{h_{\mathfrak{X}}} h_{\mathfrak{U}_j} = h_{\mathfrak{U}_i \cap \mathfrak{U}_j}$$

Hence in order to give a map $h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ is equivalent to giving a family of maps $h_{\mathfrak{U}_i} \rightarrow h_{\mathfrak{Y}}$ which agree on overlaps. Thus we can reduce the bijectivity (resp. injectivity) of the map of the lemma to bijectivity (resp. injectivity) for the pairs $(\mathfrak{U}_i, \mathfrak{Y})$ and injectivity (resp. nothing) for $(\mathfrak{U}_i \cap \mathfrak{U}_j, \mathfrak{Y})$. In this way we reduce to the case where \mathfrak{X} is an affine formal scheme. Say $\mathfrak{X} = \mathrm{Spf}(A)$ for some admissible topological ring A . Also, choose a fundamental system of ideals of definition $I_\lambda \subset A$.

We can also localize on \mathfrak{Y} . Namely, suppose that $\mathfrak{V} \subset \mathfrak{Y}$ is an open formal subscheme and $\varphi : h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$. Then

$$h_{\mathfrak{V}} \times_{h_{\mathfrak{Y}}, \varphi} h_{\mathfrak{X}} \rightarrow h_{\mathfrak{X}}$$

is representable by open immersions. Pulling back to $\mathrm{Spec}(A/I_\lambda)$ for all λ we find an open subscheme $U_\lambda \subset \mathrm{Spec}(A/I_\lambda)$. However, for $I_\lambda \subset I_\mu$ the morphism

$\mathrm{Spec}(A/I_\lambda) \rightarrow \mathrm{Spec}(A/I_\mu)$ pulls back U_μ to U_λ . Thus these glue to give an open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$. A straightforward argument (omitted) shows that

$$h_{\mathfrak{U}} = h_{\mathfrak{Y}} \times_{h_{\mathfrak{X}}} h_{\mathfrak{X}}$$

In this way we see that given an open covering $\mathfrak{Y} = \bigcup \mathfrak{Y}_j$ and a transformation of functors $\varphi : h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ we obtain a corresponding open covering of \mathfrak{X} . Since \mathfrak{X} is affine, we can refine this covering by a finite open covering $\mathfrak{X} = \mathfrak{U}_1 \cup \dots \cup \mathfrak{U}_n$ by affine formal subschemes. In other words, for each i there is a j and a map $\varphi_i : h_{\mathfrak{U}_i} \rightarrow h_{\mathfrak{Y}_j}$ such that

$$\begin{array}{ccc} h_{\mathfrak{U}_i} & \xrightarrow{\varphi_i} & h_{\mathfrak{Y}_j} \\ \downarrow & & \downarrow \\ h_{\mathfrak{X}} & \xrightarrow{\varphi} & h_{\mathfrak{Y}} \end{array}$$

commutes. With a few additional arguments (which we omit) this implies that it suffices to prove the bijectivity of the lemma in case both \mathfrak{X} and \mathfrak{Y} are affine formal schemes.

Assume \mathfrak{X} and \mathfrak{Y} are affine formal schemes. Say $\mathfrak{X} = \mathrm{Spf}(A)$ and $\mathfrak{Y} = \mathrm{Spf}(B)$. Let $\varphi : h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ be a transformation of functors. Let $I_\lambda \subset A$ be a fundamental system of ideals of definition. The canonical inclusion morphism $i_\lambda : \mathrm{Spec}(A/I_\lambda) \rightarrow \mathfrak{X}$ maps to a morphism $\varphi(i_\lambda) : \mathrm{Spec}(A/I_\lambda) \rightarrow \mathfrak{Y}$. By (65.2.0.1) this corresponds to a continuous map $\chi_\lambda : B \rightarrow A/I_\lambda$. Since φ is a transformation of functors it follows that for $I_\lambda \subset I_\mu$ the composition $B \rightarrow A/I_\lambda \rightarrow A/I_\mu$ is equal to χ_μ . In other words we obtain a ring map

$$\chi = \lim \chi_\lambda : B \longrightarrow \lim A/I_\lambda = A$$

This is a continuous homomorphism because the inverse image of I_λ is open for all λ (as A/I_λ has the discrete topology and χ_λ is continuous). Thus we obtain a morphism $\mathrm{Spf}(\chi) : \mathfrak{X} \rightarrow \mathfrak{Y}$ by (65.2.0.1). We omit the verification that this construction is the inverse to the map of the lemma in this case.

Set theoretic remarks. To make this work on the given category of schemes Sch_α we just have to make sure all the schemes used in the proof above are isomorphic to objects of Sch_α . In fact, a careful analysis shows that it suffices if the schemes $\mathrm{Spec}(A/I_\lambda)$ occurring above are isomorphic to objects of Sch_α . For this it certainly suffices to assume the size of \mathfrak{X} is at most the size of a scheme contained in Sch_α . \square

Lemma 65.2.2. *Let \mathfrak{X} be a formal scheme. The functor of points $h_{\mathfrak{X}}$ (see Lemma 65.2.1) satisfies the sheaf condition for fpqc coverings.*

Proof. Topologies, Lemma 33.8.13 reduces us to the case of a Zariski covering and a covering $\{\mathrm{Spec}(S) \rightarrow \mathrm{Spec}(R)\}$ with $R \rightarrow S$ faithfully flat. We observed in the proof of Lemma 65.2.1 that $h_{\mathfrak{X}}$ satisfies the sheaf condition for Zariski coverings.

Suppose that $R \rightarrow S$ is a faithfully flat ring map. Denote $\pi : \mathrm{Spec}(S) \rightarrow \mathrm{Spec}(R)$ the corresponding morphism of schemes. It is surjective and flat. Let $f : \mathrm{Spec}(S) \rightarrow \mathfrak{X}$ be a morphism such that $f \circ \mathrm{pr}_1 = f \circ \mathrm{pr}_2$ as maps $\mathrm{Spec}(S \otimes_R S) \rightarrow \mathfrak{X}$. By Descent, Lemma 34.9.1 we see that as a map on the underlying sets f is of the form $f = g \circ \pi$ for some (set theoretic) map $g : \mathrm{Spec}(R) \rightarrow \mathfrak{X}$. By Morphisms, Lemma 28.26.10 and the fact that f is continuous we see that g is continuous.

Pick $y \in \text{Spec}(R)$. Choose $\mathfrak{U} \subset \mathfrak{X}$ an affine formal open subscheme containing $g(y)$. Say $\mathfrak{U} = \text{Spf}(A)$ for some admissible topological ring A . By the above we may choose an $r \in R$ such that $x \in D(r) \subset g^{-1}(\mathfrak{U})$. The restriction of f to $\pi^{-1}(D(r))$ into \mathfrak{U} corresponds to a continuous ring map $A \rightarrow S_r$ by (65.2.0.1). The two induced ring maps $A \rightarrow S_r \otimes_{R_r} S_r = (S \otimes_R S)_r$ are equal by assumption on f . Note that $R_r \rightarrow S_r$ is faithfully flat. By Descent, Lemma 34.3.6 the equalizer of the two arrows $S_r \rightarrow S_r \otimes_{R_r} S_r$ is R_r . We conclude that $A \rightarrow S_r$ factors uniquely through a map $A \rightarrow R_r$ which is also continuous as it has the same (open) kernel as the map $A \rightarrow S_r$. This map in turn gives a morphism $D(r) \rightarrow \mathfrak{U}$ by (65.2.0.1).

What have we proved so far? We have shown that for any $y \in \text{Spec}(R)$ there exists a standard affine open $y \in D(r) \subset \text{Spec}(R)$ such that the morphism $f|_{\pi^{-1}(D(r))} : \pi^{-1}(D(r)) \rightarrow \mathfrak{X}$ factors uniquely through some morphism $D(r) \rightarrow \mathfrak{X}$. We omit the verification that these morphisms glue to the desired morphism $\text{Spec}(R) \rightarrow \mathfrak{X}$. \square

Remark 65.2.3 (McQuillan's variant). There is a variant of the construction of formal schemes due to McQuillan, see [McQ02]. He suggests a slight weakening of the condition of admissibility. Namely, recall that an admissible topological ring is a complete (and separated by our conventions) topological ring A which is linearly topologized such that there exists an ideal of definition: an open ideal I such that any neighbourhood of 0 contains I^n . McQuillan works with what we will call *weakly admissible* topological rings. A weakly admissible topological ring A is a complete (and separated by our conventions) topological ring which is linearly topologized such that there exists an *weak ideal of definition*: an open ideal I such that for all $f \in I$ we have $f^n \rightarrow 0$ for $n \rightarrow \infty$. Similarly to the admissible case, if I is a weak ideal of definition and $J \subset A$ is an open ideal, then $I \cap J$ is a weak ideal of definition. Thus the weak ideals of definition form a fundamental system of open neighbourhoods of 0 and one can proceed along much the same route as above to define a larger category of formal schemes based on this notion. The analogues of Lemmas 65.2.1 and 65.2.2 still hold in this setting (with the same proof).

Remark 65.2.4 (Sheafification of presheaves of topological spaces). In this remark we briefly discuss sheafification of presheaves of topological spaces. The exact same arguments work for presheaves of topological abelian groups, topological rings, and topological modules (over a given topological ring). In order to do this in the correct generality let us work over a site \mathcal{C} . The reader who is interested in the case of (pre)sheaves over a topological space X should think of objects of \mathcal{C} as the opens of X , of morphisms of \mathcal{C} as inclusions of opens, and of coverings in \mathcal{C} as coverings in X , see Sites, Example 7.6.4. Denote $Sh(\mathcal{C}, Top)$ the category of sheaves of topological spaces on \mathcal{C} and denote $PSh(\mathcal{C}, Top)$ the category of presheaves of topological spaces on \mathcal{C} . Let \mathcal{F} be a presheaf of topological spaces on \mathcal{C} . The sheafification $\mathcal{F}^\#$ should satisfy the formula

$$\text{Mor}_{PSh(\mathcal{C}, Top)}(\mathcal{F}, \mathcal{G}) = \text{Mor}_{Sh(\mathcal{C}, Top)}(\mathcal{F}^\#, \mathcal{G})$$

functorially in \mathcal{G} from $Sh(\mathcal{C}, Top)$. In other words, we are trying to construct the left adjoint to the inclusion functor $Sh(\mathcal{C}, Top) \rightarrow PSh(\mathcal{C}, Top)$. We first claim that $Sh(\mathcal{C}, Top)$ has limits and that the inclusion functor commutes with them. Namely, given a category \mathcal{I} and a functor $i \mapsto \mathcal{G}_i$ into $Sh(\mathcal{C}, Top)$ we simply define

$$(\lim \mathcal{G}_i)(U) = \lim \mathcal{G}_i(U)$$

where we take the limit in the category of topological spaces (Topology, Lemma 5.13.1). This defines a sheaf because limits commute with limits (Categories, Lemma 4.14.9) and in particular products and equalizers (which are the operations used in the sheaf axiom). Finally, a morphism of presheaves from $\mathcal{F} \rightarrow \lim \mathcal{G}_i$ is clearly the same thing as a compatible system of morphisms $\mathcal{F} \rightarrow \mathcal{G}_i$. In other words, the object $\lim \mathcal{G}_i$ is the limit in the category of presheaves of topological spaces and a fortiori in the category of sheaves of topological spaces. Our second claim is that any morphism of presheaves $\mathcal{F} \rightarrow \mathcal{G}$ with \mathcal{G} an object of $Sh(\mathcal{C}, Top)$ factors through a subsheaf $\mathcal{G}' \subset \mathcal{G}$ whose size is bounded. Here we define the *size* $|\mathcal{H}|$ of a sheaf of topological spaces \mathcal{H} to be the cardinal $\sup_{U \in \text{Ob}(\mathcal{C})} |\mathcal{H}(U)|$. To prove our claim we let

$$\mathcal{G}'(U) = \left\{ s \in \mathcal{G}(U) \mid \begin{array}{l} \text{there exists a covering } \{U_i \rightarrow U\}_{i \in I} \\ \text{such that } s|_{U_i} \in \text{Im}(\mathcal{F}(U_i) \rightarrow \mathcal{G}(U_i)) \end{array} \right\}$$

We endow $\mathcal{G}'(U)$ with the induced topology. Then \mathcal{G}' is a sheaf of topological spaces (details omitted) and $\mathcal{G}' \rightarrow \mathcal{G}$ is a morphism through which the given map $\mathcal{F} \rightarrow \mathcal{G}$ factors. Moreover, the size of \mathcal{G}' is bounded by some cardinal κ depending only on \mathcal{C} and the presheaf \mathcal{F} (hint: use that coverings in \mathcal{C} form a set by our conventions). Putting everything together we see that the assumptions of Categories, Theorem 4.40.3 are satisfied and we obtain sheafification as the left adjoint of the inclusion functor from sheaves to presheaves. Finally, let p be a point of the site \mathcal{C} given by a functor $u : \mathcal{C} \rightarrow Sets$, see Sites, Definition 7.31.2. For a topological space M the presheaf defined by the rule

$$U \mapsto \text{Map}(u(U), M) = \prod_{x \in u(U)} M$$

endowed with the product topology is a sheaf of topological spaces. Hence the exact same argument as given in the proof of Sites, Lemma 7.31.5 shows that $\mathcal{F}_p = \mathcal{F}_p^\#$, in other words, sheafification commutes with taking stalks at a point.

65.3. Conventions and notation

The conventions from now on will be similar to the conventions in Properties of Spaces, Section 48.2. Thus from now on the standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site. For topological rings A we assume only that all discrete quotients have this property (but usually we assume more, compare with Remark 65.7.6).

Let S be a scheme and let X be a “space” over S , i.e., a sheaf on $(Sch/S)_{fppf}$. In this chapter we will write $X \times_S X$ for the product of X with itself in the category of sheaves on $(Sch/S)_{fppf}$ instead of $X \times X$. Moreover, if X and Y are “spaces” then we say “let $f : X \rightarrow Y$ be a morphism” to indicate that f is a natural transformation of functors, i.e., a map of sheaves on $(Sch/S)_{fppf}$. Similarly, if U is a scheme over S and X is a “space” over S , then we say “let $f : U \rightarrow X$ be a morphism” or “let $g : X \rightarrow U$ be a morphism” to indicate that f or g is a map of sheaves $h_U \rightarrow X$ or $X \rightarrow h_U$ where h_U is as in Categories, Example 4.3.4.

65.4. Topological rings and modules

This section is a continuation of More on Algebra, Section 15.26. Let R be a topological ring and let M be a linearly topologized R -module. When we say “let

M_λ be a fundamental system of open submodules” we will mean that each M_λ is an open submodule and that any neighbourhood of 0 contains one of the M_λ . In other words, this means that M_λ is a fundamental system of neighbourhoods of 0 in M consisting of submodules. Similarly, if R is a linearly topologized ring, then we say “let I_λ be a fundamental system of open ideals” to mean that I_λ is a fundamental system of neighbourhoods of 0 in R consisting of ideals.

Example 65.4.1. Let R be a linearly topologized ring and let M be a linearly topologized A -module. Let I_λ be a fundamental system of open ideals in R and let M_μ be a fundamental system of open submodules of M . The continuity of $+$: $M \times M \rightarrow M$ is automatic and the continuity of $R \times M \rightarrow M$ signifies

$$\forall f, x, \mu \exists \lambda, \nu, (f + I_\lambda)(x + M_\nu) \subset fx + M_\mu$$

Since $fM_\nu + I_\lambda M_\nu \subset M_\mu$ if $M_\nu \subset M_\mu$ we see that the condition is equivalent to

$$\forall x, \mu \exists \lambda I_\lambda x \subset M_\mu$$

However, it need not be the case that given μ there is a λ such that $I_\lambda M \subset M_\mu$. For example, consider $R = k[[t]]$ with the t -adic topology and $M = \bigoplus_{n \in \mathbf{N}} R$ with fundamental system of open submodules given by

$$M_m = \bigoplus_{n \in \mathbf{N}} t^{nm} R$$

Since every $x \in M$ has finitely many nonzero coordinates we see that, given m and x there exists a k such that $t^k x \in M_m$. Thus M is a linearly topologized R -module, but it isn't true that given m there is a k such that $t^k M \subset M_m$. On the other hand, if $R \rightarrow S$ is a continuous map of linearly topologized rings, then the corresponding statement does hold, i.e., for every open ideal $J \subset S$ there exists an open ideal $I \subset R$ such that $IS \subset J$ (as the reader can easily deduce from continuity of the map $R \rightarrow S$).

Lemma 65.4.2. Let R be a topological ring. Let M be a linearly topologized R -module and let $M_\lambda, \lambda \in \Lambda$ be a fundamental system of open submodules. Let $N \subset M$ be a submodule. The closure of N is $\bigcap_{\lambda \in \Lambda} (N + M_\lambda)$.

Proof. Since each $N + M_\lambda$ is open, it is also closed. Hence the intersection is closed. If $x \in M$ is not in the closure of N , then $(x + M_\lambda) \cap N = 0$ for some λ . Hence $x \notin N + M_\lambda$. This proves the lemma. \square

Unless otherwise mentioned we endow submodules and quotient modules with the induced topology. Let M be a linearly topologized module over a topological ring R , and let $0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0$ is a short exact sequence of R -modules. If M_λ is a fundamental system of open submodules of M , then $N \cap M_\lambda$ is a fundamental system of open submodules of N . If $\pi : M \rightarrow Q$ is the quotient map, then $\pi(M_\lambda)$ is a fundamental system of open submodules of Q . In particular these induced topologies are linear topologies.

Lemma 65.4.3. Let R be a topological ring. Let M be a linearly topologized R -module. Let $N \subset M$ be a submodule. Then

- (1) $0 \rightarrow N^\wedge \rightarrow M^\wedge \rightarrow (M/N)^\wedge$ is exact, and
- (2) N^\wedge is the closure of the image of $N \rightarrow M^\wedge$.

Proof. Let M_λ , $\lambda \in \Lambda$ be a fundamental system of open submodules. Then $N \cap M_\lambda$ is a fundamental system of open submodules of N and $M_\lambda + N/N$ is a fundamental system of open submodules of M/N . Thus we see that (1) follows from the exactness of the sequences

$$0 \rightarrow N/N \cap M_\lambda \rightarrow M/M_\lambda \rightarrow M/(M_\lambda + N) \rightarrow 0$$

and the fact that taking limits commutes with limits. The second statement follows from this and the fact that $N \rightarrow N^\wedge$ has dense image and that the kernel of $M^\wedge \rightarrow (M/N)^\wedge$ is closed. \square

Lemma 65.4.4. *Let R be a topological ring. Let M be a complete, linearly topologized R -module. Let $N \subset M$ be a closed submodule. If M has a countable fundamental system of neighbourhoods of 0, then M/N is complete and the map $M \rightarrow M/N$ is open.*

Proof. Let M_n , $n \in \mathbf{N}$ be a fundamental system of open submodules of M . We may assume $M_{n+1} \subset M_n$ for all n . The $(M_n + N)/N$ is a fundamental system in M/N . Hence we have to show that $M/N = \lim M/(M_n + N)$. Consider the short exact sequences

$$0 \rightarrow N/N \cap M_n \rightarrow M/M_n \rightarrow M/(M_n + N) \rightarrow 0$$

Since the transition maps of the system $\{N/N \cap M_n\}$ are surjective we see that $M = \lim M/M_n$ (by completeness of M) surjects onto $\lim M/(M_n + N)$ by Algebra, Lemma 10.83.4. As N is closed we see that the kernel of $M \rightarrow \lim M/(M_n + N)$ is N (see Lemma 65.4.2). Finally, $M \rightarrow M/N$ is open by definition of the quotient topology. \square

Lemma 65.4.5. *Let R be a topological ring. Let M be a linearly topologized R -module. Let $N \subset M$ be a submodule. Assume M has a countable fundamental system of neighbourhoods of 0. Then*

- (1) $0 \rightarrow N^\wedge \rightarrow M^\wedge \rightarrow (M/N)^\wedge \rightarrow 0$ is exact,
- (2) N^\wedge is the closure of the image of $N \rightarrow M^\wedge$,
- (3) $M^\wedge \rightarrow (M/N)^\wedge$ is open.

Proof. We have $0 \rightarrow N^\wedge \rightarrow M^\wedge \rightarrow (M/N)^\wedge$ is exact and statement (2) by Lemma 65.4.3. This produces a canonical map $c : M^\wedge/N^\wedge \rightarrow (M/N)^\wedge$. The module M^\wedge/N^\wedge is complete and $M^\wedge \rightarrow M^\wedge/N^\wedge$ is open by Lemma 65.4.4. By the universal property of completion we obtain a canonical map $b : (M/N)^\wedge \rightarrow M^\wedge/N^\wedge$. Then b and c are mutually inverse as they are on a dense subset. \square

Definition 65.4.6. Let R be a topological ring. Let M and N be linearly topologized R -modules. The *tensor product* of M and N is the (usual) tensor product $M \otimes_R N$ endowed with the linear topology defined by declaring

$$\text{Im}(M_\mu \otimes_R N + M \otimes_R N_\nu \rightarrow M \otimes_R N)$$

to be a fundamental system of open submodules, where $M_\mu \subset M$ and $N_\nu \subset N$ run through fundamental systems of open submodules in M and N . The *completed tensor product*

$$M \widehat{\otimes}_R N = \lim M \otimes_R N / (M_\mu \otimes_R N + M \otimes_R N_\nu) = \lim M/M_\mu \otimes_R N/N_\nu$$

is the completion of the tensor product.

Observe that the topology on R is immaterial for the construction of the tensor product or the completed tensor product. If $R \rightarrow A$ and $R \rightarrow B$ are continuous maps of linearly topologized rings, then the construction above gives a tensor product $A \otimes_R B$ and a completed tensor product $A \widehat{\otimes}_R B$.

We record here the notions introduced in Remark 65.2.3.

Definition 65.4.7. Let A be a linearly topologized ring.

- (1) An element $f \in A$ is called *topologically nilpotent* if $f^n \rightarrow 0$ as $n \rightarrow \infty$.
- (2) A *weak ideal of definition* for A is an open ideal $I \subset A$ consisting entirely of topologically nilpotent elements.
- (3) We say A is *weakly pre-admissible* if A has a weak ideal of definition.
- (4) We say A is *weakly admissible* if A is weakly pre-admissible and complete¹.

Given a weak ideal of definition I in a linearly topologized ring A and an open ideal J the intersection $I \cap J$ is a weak ideal of definition. Hence if there is one weak ideal of definition, then there is a fundamental system of open ideals consisting of weak ideals of definition. In particular, given a weakly admissible topological ring A then $A = \lim A/I_\lambda$ where $\{I_\lambda\}$ is a fundamental system of weak ideals of definition.

Lemma 65.4.8. Let $\varphi : A \rightarrow B$ be a continuous map of linearly topologized rings.

- (1) If $f \in A$ is topologically nilpotent, then $\varphi(f)$ is topologically nilpotent.
- (2) If $I \subset A$ consists of topologically nilpotent elements, then the closure of $\varphi(I)B$ consists of topologically nilpotent elements.

Proof. Part (1) is clear. Let g be an element of the closure of $\varphi(I)B$. Let $J \subset B$ be an open ideal. We have to show $g^e \in J$ for some e . We have $g \in \varphi(I)B + J$ by Lemma 65.4.2. Hence $g = \sum_{i=1, \dots, n} f_i b_i + h$ for some $f_i \in I$, $b_i \in B$ and $h \in J$. Pick e_i such that $\varphi(f_i^{e_i}) \in J$. Then $g^{e_1 + \dots + e_n + 1} \in J$. \square

Definition 65.4.9. Let $\varphi : A \rightarrow B$ be a continuous map of linearly topologized rings. We say φ is *taut*² if for every open ideal $I \subset A$ the closure of the ideal $\varphi(I)B$ is open and these closures form a fundamental system of open ideals.

If $\varphi : A \rightarrow B$ is a continuous map of linearly topologized rings and I_λ a fundamental system of open ideals of A , then φ is taut if and only if the closures of $I_\lambda B$ are open and form a fundamental system of open ideals in A .

Lemma 65.4.10. Let $\varphi : A \rightarrow B$ be a continuous map of weakly admissible topological rings. The following are equivalent

- (1) φ is taut,
- (2) for every weak ideal of definition $I \subset A$ the closure of $\varphi(I)B$ is a weak ideal of definition of B and these form a fundamental system of weak ideals of definition of B .

Proof. It is clear that (2) implies (1). The other implication follows from Lemma 65.4.8. \square

Lemma 65.4.11. Let $A \rightarrow B$ be a continuous map of linearly topologized rings. Let $I \subset A$ be an ideal. The closure of IB is the kernel of $B \rightarrow B \widehat{\otimes}_A A/I$.

¹By our conventions this includes separated.

²This is nonstandard notation. The definition generalizes to modules, by saying a linearly topologized A -module M is A -taut if for every open ideal $I \subset A$ the closure of IM in M is open and these closures form a fundamental system of neighbourhoods of 0 in M .

Proof. Let J_μ be a fundamental system of open ideals of B . The closure of IB is $\bigcap (IB + J_\lambda)$ by Lemma 65.4.2. Let I_μ be a fundamental system of open ideals in A . Then

$$B\widehat{\otimes}_A A/I = \lim(B/J_\lambda \otimes_A A/(I_\mu + I)) = \lim B/(J_\lambda + I_\mu B + IB)$$

Since $A \rightarrow B$ is continuous, for every λ there is a μ such that $I_\mu B \subset J_\lambda$, see discussion in Example 65.4.1. Hence the limit can be written as $\lim B/(J_\lambda + IB)$ and the result is clear. \square

Lemma 65.4.12. *Let $\varphi : A \rightarrow B$ be a continuous homomorphism of linearly topologized rings. If*

- (1) φ is taut,
- (2) φ has dense image,
- (3) A is complete,
- (4) B is separated, and
- (5) A has a countable fundamental system of neighbourhoods of 0.

Then φ is surjective and open, B is complete, and $B = A/K$ for some closed ideal $K \subset A$.

Proof. We may choose a sequence of open ideals $A \supset I_1 \supset I_2 \supset I_3 \supset \dots$ which form a fundamental system of neighbourhoods of 0. For each i let $J_i \subset B$ be the closure of $\varphi(I_i)B$. As φ is taut we see that these form a fundamental system of open ideals of B . Set $I_0 = A$ and $J_0 = B$. Let $n \geq 0$ and let $y_n \in J_n$. Since J_{n+1} is the closure of $\varphi(I_n)B$ we can write

$$y_n = \sum_t \varphi(f_t)b_t + y'_{n+1}$$

for some $f_t \in I_n$, $b_t \in B$, and $y'_{n+1} \in J_{n+1}$. Since φ has dense image we can choose $a_t \in A$ with $\varphi(a_t) = b_t \bmod J_{n+1}$. Thus

$$y_n = \varphi(f_n) + y_{n+1}$$

with $f_n = \sum f_t a_t \in I_n$ and $y_{n+1} = y'_{n+1} + \sum f_t (b_t - \varphi(a_t)) \in J_{n+1}$. Thus, starting with any $y = y_0 \in B$, we can find by induction a sequence $f_m \in I_m$, $m \geq 0$ such that

$$y = y_0 = \varphi(f_0 + f_1 + \dots + f_n) + y_{n+1}$$

with $y_{n+1} \in J_{n+1}$. Since A is complete we see that

$$x = x_0 = f_0 + f_1 + f_2 + \dots$$

exists. Since the partial sums approximate x in A , since φ is continuous, and since B is separated we find that $\varphi(x) = y$ because above we've shown that the images of the partial sums approximate y in B . Thus φ is surjective. In exactly the same manner we find that $\varphi(I_n) = J_n$ for all $n \geq 1$. This proves the lemma. \square

The next lemma says “ φ is taut” if and only if “ φ is adic” for continuous maps $\varphi : A \rightarrow B$ between adic rings if A has a finitely generated ideal of definition. In some sense the previously introduced notion of tautness for continuous ring maps supersedes the notion of an adic map between adic rings. See also Section 65.17.

Lemma 65.4.13. *Let $\varphi : A \rightarrow B$ be a continuous map of linearly topologized rings. Let $I \subset A$ be an ideal. Assume*

- (1) I is finitely generated,
- (2) A has the I -adic topology,

- (3) B is complete, and
- (4) φ is taut.

Then the topology on B is the I -adic topology.

Proof. Let J_n be the closure of $\varphi(I^n)B$ in B . Since B is complete we have $B = \lim B/J_n$. Let $B' = \lim B/I^n B$ be the I -adic completion of B . By Algebra, Lemmas 10.93.6 and 10.93.7, the I -adic topology on B' is complete and $B'/I^n B' = B/I^n B$. Thus the ring map $B' \rightarrow B$ is continuous and has dense image as $B' \rightarrow B/I^n B \rightarrow B/J_n$ is surjective for all n . Finally, the map $B' \rightarrow B$ is taut because $(I^n B')B = I^n B$ and $A \rightarrow B$ is taut. By Lemma 65.4.12 we see that $B' \rightarrow B$ is open and surjective which implies the lemma. \square

65.5. Affine formal algebraic spaces

In this section we introduce affine formal algebraic spaces. These will in fact be the same as what are called affine formal schemes in [BD]. However, we will call them affine formal algebraic spaces, in order to prevent confusion with the notion of an affine formal scheme as defined in [DG67].

Recall that a thickening of schemes is a closed immersion which induces a surjection on underlying topological spaces, see More on Morphisms, Definition 36.2.1.

Definition 65.5.1. Let S be a scheme. We say a sheaf X on $(Sch/S)_{fppf}$ is an *affine formal algebraic space* if there exist

- (1) a directed partially ordered set Λ ,
- (2) a system $(X_\lambda, f_{\lambda\mu})$ over Λ in $(Sch/S)_{fppf}$ where
 - (a) each X_λ is affine,
 - (b) each $f_{\lambda\mu} : X_\lambda \rightarrow X_\mu$ is a thickening,

such that

$$X \cong \operatorname{colim}_{\lambda \in \Lambda} X_\lambda$$

as fppf sheaves and X satisfies a set theoretic condition (see Remark 65.7.6). A *morphism of affine formal algebraic spaces* over S is a map of sheaves.

Observe that the system $(X_\lambda, f_{\lambda\mu})$ is not part of the data. Suppose that U is a quasi-compact scheme over S . Since the transition maps are monomorphisms, we see that

$$X(U) = \operatorname{colim} X_\lambda(U)$$

by Sites, Lemma 7.11.2. Thus the fppf sheafification inherent in the colimit of the definition is a Zariski sheafification which does not do anything for quasi-compact schemes.

Lemma 65.5.2. *Let S be a scheme. If X is an affine formal algebraic space over S , then the diagonal morphism $\Delta : X \rightarrow X \times_S X$ is representable and a closed immersion.*

Proof. Suppose given $U \rightarrow X$ and $V \rightarrow X$ where U, V are schemes over S . Let us show that $U \times_X V$ is representable. Write $X = \operatorname{colim} X_\lambda$ as in Definition 65.5.1. The discussion above shows that Zariski locally on U and V the morphisms factors through some X_λ . In this case $U \times_X V = U \times_{X_\lambda} V$ which is a scheme. Thus the diagonal is representable, see Spaces, Lemma 47.5.10. Given $(a, b) : W \rightarrow X \times_S X$ where W is a scheme over S consider the map $X \times_{\Delta, X \times_S X, (a,b)} W \rightarrow W$. As before locally on W the morphisms a and b map into the affine scheme X_λ for some λ and

then we get the morphism $X_\lambda \times_{\Delta_\lambda, X_\lambda \times_S X_\lambda, (a,b)} W \rightarrow W$. This is the base change of $\Delta_\lambda : X_\lambda \rightarrow X_\lambda \times_S X_\lambda$ which is a closed immersion as $X_\lambda \rightarrow S$ is separated (because X_λ is affine). Thus $X \rightarrow X \times_S X$ is a closed immersion. \square

A morphism of schemes $X \rightarrow X'$ is a thickening if it is a closed immersion and induces a surjection on underlying sets of points, see (More on Morphisms, Definition 36.2.1). Hence the property of being a thickening is preserved under arbitrary base change and fpqc local on the target, see Spaces, Section 47.4. Thus Spaces, Definition 47.5.1 applies to “thickening” and we know what it means for a representable transformation $F \rightarrow G$ of presheaves on $(Sch/S)_{fppf}$ to be a thickening. We observe that this does not clash with our definition (More on Morphisms of Spaces, Definition 58.8.1) of thickenings in case F and G are algebraic spaces.

Lemma 65.5.3. *Let $X_\lambda, \lambda \in \Lambda$ and $X = \text{colim } X_\lambda$ be as in Definition 65.5.1. Then $X_\lambda \rightarrow X$ is representable and a thickening.*

Proof. The statement makes sense by the discussion in Spaces, Section 47.3 and 47.5. By Lemma 65.5.2 the morphisms $X_\lambda \rightarrow X$ are representable. Given $U \rightarrow X$ where U is a scheme, then the discussion following Definition 65.5.1 shows that Zariski locally on U the morphism factors through some X_μ with $\lambda \leq \mu$. In this case $U \times_X X_\lambda = U \times_{X_\mu} X_\lambda$ so that $U \times_X X_\lambda \rightarrow U$ is a base change of the thickening $X_\lambda \rightarrow X_\mu$. \square

Lemma 65.5.4. *Let $X_\lambda, \lambda \in \Lambda$ and $X = \text{colim } X_\lambda$ be as in Definition 65.5.1. If Y is a quasi-compact algebraic space over S , then any morphism $Y \rightarrow X$ factors through an X_λ .*

Proof. Choose an affine scheme V and a surjective étale morphism $V \rightarrow Y$. The composition $V \rightarrow Y \rightarrow X$ factors through X_λ for some λ by the discussion following Definition 65.5.1. Since $V \rightarrow Y$ is a surjection of sheaves, we conclude. \square

Lemma 65.5.5. *Let S be a scheme. Let X be a sheaf on $(Sch/S)_{fppf}$. Then X is an affine formal algebraic space if and only if the following hold*

- (1) *any morphism $U \rightarrow X$ where U is an affine scheme over S factors through a morphism $T \rightarrow X$ which is representable and a thickening with T an affine scheme over S , and*
- (2) *a set theoretic condition as in Remark 65.7.6.*

Proof. It follows from Lemmas 65.5.3 and 65.5.4 that an affine formal algebraic space satisfies (1) and (2). In order to prove the converse we may assume X is not empty. Let Λ be the category of representable morphisms $T \rightarrow X$ which are thickenings where T is an affine scheme over S . This category is directed. Since X is not empty, Λ contains at least one object. If $T \rightarrow X$ and $T' \rightarrow X$ are in Λ , then we can factor $T \amalg T' \rightarrow X$ through $T'' \rightarrow X$ in Λ . Between any two objects of Λ there is a unique arrow or none. Thus Λ is a directed partially ordered set and by assumption $X = \text{colim}_{T \rightarrow X \text{ in } \Lambda} T$. \square

For a general affine formal algebraic space X there is no guarantee that X has enough functions to separate points (for example). See Examples, Section 82.62. To characterize those that do we offer the following lemma.

Lemma 65.5.6. *Let S be a scheme. Let X be an fppf sheaf on $(Sch/S)_{fppf}$ which satisfies the set theoretic condition of Remark 65.7.6. The following are equivalent:*

- (1) *there exists a weakly admissible topological ring A over S (see Remark 65.2.3) such that $X = \operatorname{colim}_{I \subset A} \operatorname{Spec}(A/I)$,*
- (2) *X is an affine formal algebraic space and there exists an S -algebra A and a map $X \rightarrow \operatorname{Spec}(A)$ such that for a closed immersion $T \rightarrow X$ with T an affine scheme the composition $T \rightarrow \operatorname{Spec}(A)$ is a closed immersion,*
- (3) *X is an affine formal algebraic space and there exists an S -algebra A and a map $X \rightarrow \operatorname{Spec}(A)$ such that for a closed immersion $T \rightarrow X$ with T a scheme the composition $T \rightarrow \operatorname{Spec}(A)$ is a closed immersion,*
- (4) *X is an affine formal algebraic space and for some choice of $X = \operatorname{colim} X_\lambda$ as in Definition 65.5.1 the projections $\lim \Gamma(X_\lambda, \mathcal{O}_{X_\lambda}) \rightarrow \Gamma(X_\lambda, \mathcal{O}_{X_\lambda})$ are surjective,*
- (5) *X is an affine formal algebraic space and for any choice of $X = \operatorname{colim} X_\lambda$ as in Definition 65.5.1 the projections $\lim \Gamma(X_\lambda, \mathcal{O}_{X_\lambda}) \rightarrow \Gamma(X_\lambda, \mathcal{O}_{X_\lambda})$ are surjective.*

Moreover, the weakly admissible topological ring is $A = \lim \Gamma(X_\lambda, \mathcal{O}_{X_\lambda})$ endowed with its limit topology and the weak ideals of definition classify exactly the morphisms $T \rightarrow X$ which are representable and thickenings.

Proof. It is clear that (5) implies (4).

Assume (4) for $X = \operatorname{colim} X_\lambda$ as in Definition 65.5.1. Set $A = \lim \Gamma(X_\lambda, \mathcal{O}_{X_\lambda})$. Let $T \rightarrow X$ be a closed immersion with T a scheme (note that $T \rightarrow X$ is representable by Lemma 65.5.2). Since $X_\lambda \rightarrow X$ is a thickening, so is $X_\lambda \times_X T \rightarrow T$. On the other hand, $X_\lambda \times_X T \rightarrow X_\lambda$ is a closed immersion, hence $X_\lambda \times_X T$ is affine. Hence T is affine by Limits, Proposition 31.10.2. Then $T \rightarrow X$ factors through X_λ for some λ by Lemma 65.5.4. Thus $A \rightarrow \Gamma(X_\lambda, \mathcal{O}) \rightarrow \Gamma(T, \mathcal{O})$ is surjective. In this way we see that (3) holds.

It is clear that (3) implies (2).

Assume (2) for A and $X \rightarrow \operatorname{Spec}(A)$. Write $X = \operatorname{colim} X_\lambda$ as in Definition 65.5.1. Then $A_\lambda = \Gamma(X_\lambda, \mathcal{O})$ is a quotient of A by assumption (2). Hence $A^\wedge = \lim A_\lambda$ is a complete topological ring, see discussion in More on Algebra, Section 15.26. The maps $A^\wedge \rightarrow A_\lambda$ are surjective as $A \rightarrow A_\lambda$ is. We claim that for any λ the kernel $I_\lambda \subset A^\wedge$ of $A^\wedge \rightarrow A_\lambda$ is a weak ideal of definition. Namely, it is open by definition of the limit topology. If $f \in I_\lambda$, then for any $\mu \in \Lambda$ the image of f in A_μ is zero in all the residue fields of the points of X_μ . Hence it is a nilpotent element of A_μ . Hence some power $f^n \in I_\mu$. Thus $f^n \rightarrow 0$ as $n \rightarrow 0$. Thus A^\wedge is weakly admissible. Finally, suppose that $I \subset A^\wedge$ is a weak ideal of definition. Then $I \subset A^\wedge$ is open and hence there exists some λ such that $I \supset I_\lambda$. Thus we obtain a morphism $\operatorname{Spec}(A^\wedge/I) \rightarrow \operatorname{Spec}(A_\lambda) \rightarrow X$. Then it follows that $X = \operatorname{colim} \operatorname{Spec}(A^\wedge/I)$ where now the colimit is over all weak ideals of definition. Thus (1) holds.

Assume (1). In this case it is clear that X is an affine formal algebraic space. Let $X = \operatorname{colim} X_\lambda$ be any presentation as in Definition 65.5.1. For each λ we can find a weak ideal of definition $I \subset A$ such that $X_\lambda \rightarrow X$ factors through $\operatorname{Spec}(A/I) \rightarrow X$, see Lemma 65.5.4. Then $X_\lambda = \operatorname{Spec}(A/I_\lambda)$ with $I \subset I_\lambda$. Conversely, for any weak ideal of definition $I \subset A$ the morphism $\operatorname{Spec}(A/I) \rightarrow X$ factors through X_λ for some λ , i.e., $I_\lambda \subset I$. It follows that each I_λ is a weak ideal of definition and that they form a cofinal subset of the set of weak ideals of definition. Hence $A = \lim A/I = \lim A/I_\lambda$ and we see that (5) is true and moreover that $A = \lim \Gamma(X_\lambda, \mathcal{O}_{X_\lambda})$. \square

With this lemma in hand we can make the following definition.

Definition 65.5.7. Let S be a scheme. Let X be an affine formal algebraic space over S . We say X is *McQuillan* if X satisfies the equivalent conditions of Lemma 65.5.6. Let A be the weakly admissible topological ring associated to X . We say

- (1) X is *classical* if X is McQuillan and A is admissible,
- (2) X is *adic* if X is McQuillan and A is adic,
- (3) X is *adic** if X is McQuillan, A is adic, and A has a finitely generated ideal of definition, and
- (4) X is *Noetherian* if X is McQuillan and A is both Noetherian and adic.

In [FK] they use the terminology “of finite ideal type” for the property that an adic topological ring A contains a finitely generated ideal of definition.

Remark 65.5.8. The classical affine formal algebraic spaces correspond to the affine formal schemes considered in EGA ([DG67]). To explain this we assume our base scheme is $\text{Spec}(\mathbf{Z})$. Let $\mathfrak{X} = \text{Spf}(A)$ be an affine formal scheme. Let $h_{\mathfrak{X}}$ be its functor of points as in Lemma 65.2.1. Then $h_{\mathfrak{X}} = \text{colim } h_{\text{Spec}(A/I)}$ where the colimit is over the collection of ideals of definition of the admissible topological ring A . This follows from (65.2.0.1) when evaluating on affine schemes and it suffices to check on affine schemes as both sides are fppf sheaves, see Lemma 65.2.2. Thus $h_{\mathfrak{X}}$ is an affine formal algebraic space. In fact, it is a classical affine formal algebraic space by Definition 65.5.7. Thus Lemma 65.2.1 tells us the category of affine formal schemes is equivalent to the category of classical affine formal algebraic spaces.

Having made the connection with affine formal schemes above, it seems natural to make the following definition.

Definition 65.5.9. Let S be a scheme. Let A be a weakly admissible topological ring over S , see Definition 65.4.7³. The *formal spectrum* of A is the affine formal algebraic space

$$\text{Spf}(A) = \text{colim } \text{Spec}(A/I)$$

where the colimit is over the set of weak ideals of definition of A and taken in the category $\text{Sh}((\text{Sch}/S)_{\text{fppf}})$.

Such a formal spectrum is McQuillan by construction and conversely every McQuillan affine formal algebraic space is isomorphic to a formal spectrum. To be sure, in our theory there exist affine formal algebraic spaces which are not the formal spectrum of any weakly admissible topological ring. Following [Yas09] we could introduce S -pro-rings to be pro-objects in the category of S -algebras, see Categories, Remark 4.22.4. Then every affine formal algebraic space over S would be the formal spectrum of such an S -pro-ring. We will not do this and instead we will work directly with the corresponding affine formal algebraic spaces.

The construction of the formal spectrum is functorial. To explain this let $\varphi : B \rightarrow A$ be a continuous map of weakly admissible topological rings over S . Then

$$\text{Spf}(\varphi) : \text{Spf}(B) \rightarrow \text{Spf}(A)$$

³See More on Algebra, Definition 15.26.1 for the classical case and see Remark 65.2.3 for a discussion of differences.

is the unique morphism of affine formal algebraic spaces such that the diagrams

$$\begin{array}{ccc} \mathrm{Spec}(B/J) & \longrightarrow & \mathrm{Spec}(A/I) \\ \downarrow & & \downarrow \\ \mathrm{Spf}(B) & \longrightarrow & \mathrm{Spf}(A) \end{array}$$

commute for all weak ideals of definition $I \subset A$ and $J \subset B$ with $\varphi(I) \subset J$. Since continuity of φ implies that for every weak ideal of definition $J \subset B$ there is a weak ideal of definition $I \subset A$ with the required property, we see that the required commutativities uniquely determine and define $\mathrm{Spf}(\varphi)$.

Lemma 65.5.10. *Let S be a scheme. Let A, B be weakly admissible topological rings over S . Any morphism $f : \mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ of affine formal algebraic spaces over S is equal to $\mathrm{Spf}(f^\#)$ for a unique continuous S -algebra map $f^\# : A \rightarrow B$.*

Proof. Let $f : \mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ be as in the lemma. Let $J \subset B$ be a weak ideal of definition. By Lemma 65.5.4 there exists a weak ideal of definition $I \subset A$ such that $\mathrm{Spec}(B/J) \rightarrow \mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ factors through $\mathrm{Spec}(A/I)$. By Schemes, Lemma 25.6.4 we obtain an S -algebra map $A/I \rightarrow B/J$. These maps are compatible for varying J and define the map $f^\# : A \rightarrow B$. This map is continuous because for every weak ideal of definition $J \subset B$ there is a weak ideal of definition $I \subset A$ such that $f^\#(I) \subset J$. The equality $f = \mathrm{Spf}(f^\#)$ holds by our choice of the ring maps $A/I \rightarrow B/J$ which make up $f^\#$. \square

Lemma 65.5.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a map of presheaves on $(\mathrm{Sch}/S)_{\mathrm{fppf}}$. If X is an affine formal algebraic space and f is representable by algebraic spaces and locally quasi-finite, then f is representable (by schemes).*

Proof. Let T be a scheme over S and $T \rightarrow Y$ a map. We have to show that the algebraic space $X \times_Y T$ is a scheme. Write $X = \mathrm{colim} X_\lambda$ as in Definition 65.5.1. Let $W \subset X \times_Y T$ be a quasi-compact open subspace. The restriction of the projection $X \times_Y T \rightarrow X$ to W factors through X_λ for some λ . Then

$$W \rightarrow X_\lambda \times_S T$$

is a monomorphism (hence separated) and locally quasi-finite (because $W \rightarrow X \times_Y T \rightarrow T$ is locally quasi-finite by our assumption on $X \rightarrow Y$, see Morphisms of Spaces, Lemma 49.26.8). Hence W is a scheme by Morphisms of Spaces, Proposition 49.44.2. Thus $X \times_Y T$ is a scheme by Properties of Spaces, Lemma 48.10.1. \square

65.6. Countably indexed affine formal algebraic spaces

These are the affine formal algebraic spaces as in the following lemma.

Lemma 65.6.1. *Let S be a scheme. Let X be an affine formal algebraic space over S . The following are equivalent*

- (1) *there exists a system $X_1 \rightarrow X_2 \rightarrow X_3 \rightarrow \dots$ of thickenings of affine schemes over S such that $X = \mathrm{colim} X_n$,*
- (2) *there exists a choice $X = \mathrm{colim} X_\lambda$ as in Definition 65.5.1 such that Λ is countable.*

Proof. This follows from the observation that a countable directed partially ordered set has a cofinal subset isomorphic to (\mathbf{N}, \geq) . See proof of Algebra, Lemma 10.83.3. \square

Definition 65.6.2. Let S be a scheme. Let X be an affine formal algebraic space over S . We say X is *countably indexed* if the equivalent conditions of Lemma 65.6.1 are satisfied.

In the language of [BD] this is expressed by saying that X is an \aleph_0 -ind scheme.

Lemma 65.6.3. *Let X be an affine formal algebraic space over a scheme S .*

- (1) *If X is Noetherian, then X is adic*.*
- (2) *If X is adic*, then X is adic.*
- (3) *If X is adic, then X is countably indexed.*
- (4) *If X is countably indexed, then X is McQuillan.*

Proof. Parts (1) and (2) are immediate from the definitions.

Proof of (3). By definition there exists an adic topological ring A such that $X = \text{colim Spec}(A/I)$ where the colimit is over the ideals of definition of A . As A is adic, there exists an ideal I such that $\{I^n\}$ forms a fundamental system of neighbourhoods of 0. Then each I^n is an ideal of definition and $X = \text{colim Spec}(A/I^n)$. Thus X is countably indexed.

Proof of (4). Write $X = \lim X_n$ for some system $X_1 \rightarrow X_2 \rightarrow X_3 \rightarrow \dots$ of thickenings of affine schemes over S . Then

$$A = \lim \Gamma(X_n, \mathcal{O}_{X_n})$$

surjects onto each $\Gamma(X_n, \mathcal{O}_{X_n})$ because the transition maps are surjections as the morphisms $X_n \rightarrow X_{n+1}$ are closed immersions. □

Lemma 65.6.4. *Let S be a scheme. Let X be a presheaf on $(\text{Sch}/S)_{\text{fpf}}$. The following are equivalent*

- (1) *X is a countably indexed affine formal algebraic space,*
- (2) *$X = \text{Spf}(A)$ where A is a weakly admissible topological S -algebra which has a countable fundamental system of neighbourhoods of 0,*
- (3) *$X = \text{Spf}(A)$ where A is a weakly admissible topological S -algebra which has a fundamental system $A \supset I_1 \supset I_2 \supset I_3 \supset \dots$ of weak ideals of definition,*
- (4) *$X = \text{Spf}(A)$ where A is a complete topological S -algebra with a fundamental system of open neighbourhoods of 0 given by a countable sequence $A \supset I_1 \supset I_2 \supset I_3 \supset \dots$ of ideals such that I_n/I_{n+1} is locally nilpotent, and*
- (5) *$X = \text{Spf}(A)$ where $A = \lim B/J_n$ with the limit topology where $B \supset J_1 \supset J_2 \supset J_3 \supset \dots$ is a sequence of ideals in an S -algebra B with J_n/J_{n+1} locally nilpotent.*

Proof. Assume (1). By Lemma 65.6.3 we can write $X = \text{Spf}(A)$ where A is a weakly admissible topological S -algebra. For any presentation $X = \text{colim } X_n$ as in Lemma 65.6.1 part (1) we see that $A = \lim A_n$ with $X_n = \text{Spec}(A_n)$ and $A_n = A/I_n$ for some weak ideal of definition $I_n \subset A$. This follows from the final statement of Lemma 65.5.6 which moreover implies that $\{I_n\}$ is a fundamental system of open neighbourhoods of 0. Thus we have a sequence

$$A \supset I_1 \supset I_2 \supset I_3 \supset \dots$$

of weak ideals of definition with $A = \lim A/I_n$. In this way we see that condition (1) implies each of the conditions (2) – (5).

Assume (5). First note that the limit topology on $A = \lim B/J_n$ is a linearly topologized, complete topology, see More on Algebra, Section 15.26. If $f \in A$ maps to zero in B/J_1 , then some power maps to zero in B/J_2 as its image in J_1/J_2 is nilpotent, then a further power maps to zero in J_2/J_3 , etc, etc. In this way we see the open ideal $\text{Ker}(A \rightarrow B/J_1)$ is a weak ideal of definition. Thus A is weakly admissible. In this way we see that (5) implies (2).

It is clear that (4) is a special case of (5) by taking $B = A$. It is clear that (3) is a special case of (2).

Assume A is as in (2). Let E_n be a countable fundamental system of neighbourhoods of 0 in A . Since A is a weakly admissible topological ring we can find open ideals $I_n \subset E_n$. We can also choose a weak ideal of definition $J \subset A$. Then $J \cap I_n$ is a fundamental system of weak ideals of definition of A and we get $X = \text{Spf}(A) = \text{colim Spec}(A/(J \cap I_n))$ which shows that X is a countably indexed affine formal algebraic space. \square

Lemma 65.6.5. *Let S be a scheme. Let X be an affine formal algebraic space. The following are equivalent*

- (1) X is Noetherian,
- (2) X is adic* and for some choice of $X = \text{colim } X_\lambda$ as in Definition 65.5.1 the schemes X_λ are Noetherian,
- (3) X is adic* and for a closed immersion $T \rightarrow X$ with T a scheme, T is Noetherian.

Proof. This follows from the fact that if A is a ring complete with respect to a finitely generated ideal I , then A is Noetherian if and only if A/I is Noetherian, see Algebra, Lemma 10.93.9. Details omitted. \square

65.7. Formal algebraic spaces

We take a break from our habit of introducing new concepts first for rings, then for schemes, and then for algebraic spaces, by introducing formal algebraic spaces without first introducing formal schemes. The general idea will be that a formal algebraic space is a sheaf in the fppf topology which étale locally is an affine formal scheme in the sense of [BD]. Related material can be found in [Yas09].

In the definition of a formal algebraic space we are going to borrow some terminology from Bootstrap, Sections 62.3 and 62.4.

Definition 65.7.1. Let S be a scheme. We say a sheaf X on $(\text{Sch}/S)_{\text{fppf}}$ is a *formal algebraic space* if there exist a family of maps $\{X_i \rightarrow X\}_{i \in I}$ of sheaves such that

- (1) X_i is an affine formal algebraic space,
- (2) $X_i \rightarrow X$ is representable by algebraic spaces and étale,
- (3) $\coprod X_i \rightarrow X$ is surjective as a map of sheaves

and X satisfies a set theoretic condition (see Remark 65.7.6). A *morphism of formal algebraic spaces* over S is a map of sheaves.

Discussion. Sanity check: an affine formal algebraic space is a formal algebraic space. In the situation of the definition the morphisms $X_i \rightarrow X$ are representable (by schemes), see Lemma 65.5.11. By Bootstrap, Lemma 62.4.6 we could instead of

asking $\coprod X_i \rightarrow X$ to be surjective as a map of sheaves, require that it be surjective (which makes sense because it is representable).

Our notion of a formal algebraic space is **very general**. In fact, even affine formal algebraic spaces as defined above are very nasty objects. However, they do have an underlying reduced algebraic space as the following lemma demonstrates.

Lemma 65.7.2. *Let S be a scheme. Let X be a formal algebraic space over S . There exists a reduced algebraic space X_{red} and a representable morphism $X_{red} \rightarrow X$ which is a thickening. A morphism $U \rightarrow X$ with U a reduced algebraic space factors uniquely through X_{red} .*

Proof. First assume that X is an affine formal algebraic space. Say $X = \text{colim } X_\lambda$ as in Definition 65.5.1. Since the transition morphisms are thickenings, the affine schemes X_λ all have isomorphic reductions X_{red} . The morphism $X_{red} \rightarrow X$ is representable and a thickening by Lemma 65.5.3 and the fact that compositions of thickenings are thickenings. We omit the verification of the universal property (use Schemes, Definition 25.12.5, Schemes, Lemma 25.12.6, Properties of Spaces, Definition 48.9.5, and Properties of Spaces, Lemma 48.9.4).

Let X and $\{X_i \rightarrow X\}_{i \in I}$ be as in Definition 65.7.1. For each i let $X_{i,red} \rightarrow X_i$ be the reduction as constructed above. For $i, j \in I$ the projection $X_{i,red} \times_X X_j \rightarrow X_{i,red}$ is an étale (by assumption) morphism of schemes (by Lemma 65.5.11). Hence $X_{i,red} \times_X X_j$ is reduced (see Descent, Lemma 34.14.1). Thus the projection $X_{i,red} \times_X X_j \rightarrow X_j$ factors through $X_{j,red}$ by the universal property. We conclude that

$$R_{ij} = X_{i,red} \times_X X_j = X_{i,red} \times_X X_{j,red} = X_i \times_X X_{j,red}$$

because the morphisms $X_{i,red} \rightarrow X_i$ are injections of sheaves. Set $U = \coprod X_{i,red}$, set $R = \coprod R_{ij}$, and denote $s, t : R \rightarrow U$ the two projections. As a sheaf $R = U \times_X U$ and s and t are étale. Then $(t, s) : R \rightarrow U$ defines an étale equivalence relation by our observations above. Thus $X_{red} = U/R$ is an algebraic space by Spaces, Theorem 47.10.5. By construction the diagram

$$\begin{array}{ccc} \coprod X_{i,red} & \longrightarrow & \coprod X_i \\ \downarrow & & \downarrow \\ X_{red} & \longrightarrow & X \end{array}$$

is cartesian. Since the right vertical arrow is étale surjective and the top horizontal arrow is representable and a thickening we conclude that $X_{red} \rightarrow X$ is representable by Bootstrap, Lemma 62.5.2 (to verify the assumptions of the lemma use that a surjective étale morphism is surjective, flat, and locally of finite presentation and use that thickenings are separated and locally quasi-finite). Then we can use Spaces, Lemma 47.5.6 to conclude that $X_{red} \rightarrow X$ is a thickening (use that being a thickening is equivalent to being a surjective closed immersion).

Finally, suppose that $U \rightarrow X$ is a morphism with U a reduced algebraic space over S . Then each $X_i \times_X U$ is étale over U and therefore reduced (by our definition of reduced algebraic spaces in Properties of Spaces, Section 48.7). Then $X_i \times_X U \rightarrow X_i$ factors through $X_{i,red}$. Hence $U \rightarrow X$ factors through X_{red} because $\{X_i \times_X U \rightarrow U\}$ is an étale covering. \square

Lemma 65.7.3. *Let S be a scheme. If X is a formal algebraic space over S , then the diagonal morphism $\Delta : X \rightarrow X \times_S X$ is representable, a monomorphism, locally quasi-finite, locally of finite type, and separated.*

Proof. Suppose given $U \rightarrow X$ and $V \rightarrow X$ with U, V schemes over S . Then $U \times_X V$ is a sheaf. Choose $\{X_i \rightarrow X\}$ as in Definition 65.7.1. For every i the morphism

$$(U \times_X X_i) \times_{X_i} (V \times_X X_i) = (U \times_X V) \times_X X_i \rightarrow U \times_X V$$

is representable and étale as a base change of $X_i \rightarrow X$ and its source is a scheme (use Lemmas 65.5.2 and 65.5.11). These maps are jointly surjective hence $U \times_X V$ is an algebraic space by Bootstrap, Theorem 62.10.1. The morphism $U \times_X V \rightarrow U \times_S V$ is a monomorphism. It is also locally quasi-finite, because on precomposing with the morphism displayed above we obtain the composition

$$(U \times_X X_i) \times_{X_i} (V \times_X X_i) \rightarrow (U \times_X X_i) \times_S (V \times_X X_i) \rightarrow U \times_S V$$

which is locally quasi-finite as a composition of a closed immersion (Lemma 65.5.2) and an étale morphism, see Descent on Spaces, Lemma 56.17.2. Hence we conclude that $U \times_X V$ is a scheme by Morphisms of Spaces, Proposition 49.44.2. Thus Δ is representable, see Spaces, Lemma 47.5.10.

Let $W \rightarrow X \times_S X$ be a morphism where W is a scheme over S . For each i consider the diagram

$$\begin{array}{ccc} W \times_{(X \times_S X)} X_i & \longrightarrow & W \times_{(X \times_S X)} (X_i \times_S X_i) \\ \downarrow & & \downarrow \\ W \times_{(X \times_S X)} X & \longrightarrow & W \end{array}$$

The vertical arrows are étale because $X_i \rightarrow X$ is étale. The top horizontal arrow is a closed immersion by Lemma 65.5.2. Because the maps $X_i \rightarrow X$ are jointly surjective, this certainly implies that the lower horizontal arrow is locally of finite type, see Morphisms of Spaces, Lemma 49.23.4. Since it is clearly a monomorphism, we conclude that it is locally quasi-finite (Morphisms of Spaces, Lemma 49.26.10). It is separated because any monomorphism is separated (Morphisms of Spaces, Lemma 49.10.3). This finishes the proof. \square

Lemma 65.7.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism from an algebraic space over S to a formal algebraic space over S . Then f is representable by algebraic spaces.*

Proof. Let $Z \rightarrow Y$ be a morphism where Z is a scheme over S . We have to show that $X \times_Y Z$ is an algebraic space. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Then $U \times_Y Z \rightarrow X \times_Y Z$ is representable surjective étale (Spaces, Lemma 47.5.5) and $U \times_Y Z$ is a scheme by Lemma 65.7.3. Hence the result by Bootstrap, Theorem 62.10.1. \square

Remark 65.7.5. Modulo set theoretic issues the category of formal schemes à la EGA (see Section 65.2) is equivalent to a full subcategory of the category of formal algebraic spaces. To explain this we assume our base scheme is $\text{Spec}(\mathbf{Z})$. By Lemma 65.2.2 the functor of points $h_{\mathfrak{X}}$ associated to a formal scheme \mathfrak{X} is a sheaf in the fppf topology. By Lemma 65.2.1 the assignment $\mathfrak{X} \mapsto h_{\mathfrak{X}}$ is a fully faithful embedding of the category of formal schemes into the category of fppf sheaves. Given a formal

scheme \mathfrak{X} we choose an open covering $\mathfrak{X} = \bigcup \mathfrak{X}_i$ with \mathfrak{X}_i affine formal schemes. Then $h_{\mathfrak{X}_i}$ is an affine formal algebraic space by Remark 65.5.8. The morphisms $h_{\mathfrak{X}_i} \rightarrow h_{\mathfrak{X}}$ are representable and open immersions. Thus $\{h_{\mathfrak{X}_i} \rightarrow h_{\mathfrak{X}}\}$ is a family as in Definition 65.7.1 and we see that $h_{\mathfrak{X}}$ is a formal algebraic space.

Remark 65.7.6. Let S be a scheme and let $(Sch/S)_{fppf}$ be a big fppf site as in Topologies, Definition 33.7.8. As our set theoretic condition on X in Definitions 65.5.1 and 65.7.1 we take: there exist objects U, R of $(Sch/S)_{fppf}$, a morphism $U \rightarrow X$ which is a surjection of fppf sheaves, and a morphism $R \rightarrow U \times_X U$ which is a surjection of fppf sheaves. In other words, we require our sheaf to be a coequalizer of two maps between representable sheaves. Here are some observations which imply this notion behaves reasonably well:

- (1) Suppose $X = \text{colim}_{\lambda \in \Lambda} X_\lambda$ and the system satisfies conditions (1) and (2) of Definition 65.5.1. Then $U = \prod_{\lambda \in \Lambda} X_\lambda \rightarrow X$ is a surjection of fppf sheaves. Moreover, $U \times_X U$ is a closed subscheme of $U \times_S U$ by Lemma 65.5.2. Hence if U is representable by an object of $(Sch/S)_{fppf}$ then $U \times_S U$ is too (see Sets, Lemma 3.9.9) and the set theoretic condition is satisfied. This is always the case if Λ is countable, see Sets, Lemma 3.9.9.
- (2) Sanity check. Let $\{X_i \rightarrow X\}_{i \in I}$ be as in Definition 65.7.1 (with the set theoretic condition as formulated above) and assume that each X_i is actually an affine scheme. Then X is an algebraic space. Namely, if we choose a larger big fppf site $(Sch'/S)_{fppf}$ such that $U' = \prod X_i$ and $R' = \prod X_i \times_X X_j$ are representable by objects in it, then $X' = U'/R'$ will be an object of the category of algebraic spaces for this choice. Then an application of Spaces, Lemma 47.15.2 shows that X is an algebraic space for $(Sch/S)_{fppf}$.
- (3) Let $\{X_i \rightarrow X\}_{i \in I}$ be a family of maps of sheaves satisfying conditions (1), (2), (3) of Definition 65.7.1. For each i we can pick $U_i \in \text{Ob}((Sch/S)_{fppf})$ and $U_i \rightarrow X_i$ which is a surjection of sheaves. Thus if I is not too large (for example countable) then $U = \prod U_i \rightarrow X$ is a surjection of sheaves and U is representable by an object of $(Sch/S)_{fppf}$. To get $R \in \text{Ob}((Sch/S)_{fppf})$ surjecting onto $U \times_X U$ it suffices to assume the diagonal $\Delta : X \rightarrow X \times_S X$ is not too wild, for example this always works if the diagonal of X is quasi-compact, i.e., X is quasi-separated.

65.8. Colimits of algebraic spaces along thickenings

A special type of formal algebraic space is one which can globally be written as a cofiltered colimit of algebraic spaces along thickenings as in the following lemma. We will see later (in Section 65.13) that any quasi-compact and quasi-separated formal algebraic space is such a global colimit.

Lemma 65.8.1. *Let S be a scheme. Suppose given a directed partially ordered set Λ and a system of algebraic spaces $(X_\lambda, f_{\lambda\mu})$ over Λ where each $f_{\lambda\mu} : X_\lambda \rightarrow X_\mu$ is a thickening. Then $X = \text{colim}_{\lambda \in \Lambda} X_\lambda$ is a formal algebraic space over S .*

Proof. Since we take the colimit in the category of fppf sheaves, we see that X is a sheaf. Choose and fix $\lambda \in \Lambda$. Choose an étale covering $\{X_{i,\lambda} \rightarrow X_\lambda\}$ where $X_{i,\lambda}$ is an affine scheme over S , see Properties of Spaces, Lemma 48.6.1. For each $\mu \geq \lambda$

there exists a cartesian diagram

$$\begin{array}{ccc} X_{i,\lambda} & \longrightarrow & X_{i,\mu} \\ \downarrow & & \downarrow \\ X_\lambda & \longrightarrow & X_\mu \end{array}$$

with étale vertical arrows, see More on Morphisms of Spaces, Theorem 58.7.1 (this also uses that a thickening is a surjective closed immersion which satisfies the conditions of the theorem). Moreover, these diagrams are unique up to unique isomorphism and hence $X_{i,\mu} = X_\mu \times_{X_{\mu'}} X_{i,\mu'}$ for $\mu' \geq \mu$. The morphisms $X_{i,\mu} \rightarrow X_{i,\mu'}$ is a thickening as a base change of a thickening. Each $X_{i,\mu}$ is an affine scheme by Limits of Spaces, Proposition 52.15.2 and the fact that $X_{i,\lambda}$ is affine. Set $X_i = \operatorname{colim}_{\mu \geq \lambda} X_{i,\mu}$. Then X_i is an affine formal algebraic space. The morphism $X_i \rightarrow X$ is étale because given an affine scheme U any $U \rightarrow X$ factors through X_μ for some $\mu \geq \lambda$ (details omitted). In this way we see that X is a formal algebraic space. \square

Let S be a scheme. Let X be a formal algebraic space over S . How does one prove or check that X is a global colimit as in Lemma 65.8.1? To do this we look for maps $i : Z \rightarrow X$ where Z is an algebraic space over S and i is surjective and a closed immersion, in other words, i is a thickening. This makes sense as i is representable by algebraic spaces (Lemma 65.7.4) and we can use Bootstrap, Definition 62.4.1 as before.

Remark 65.8.2 (Weak ideals of definition). Let \mathfrak{X} be a formal scheme in the sense of McQuillan, see Remark 65.2.3. An *weak ideal of definition* for \mathfrak{X} is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{\mathfrak{X}}$ such that for all $\mathfrak{U} \subset \mathfrak{X}$ affine formal open subscheme the ideal $\mathcal{I}(\mathfrak{U}) \subset \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ is a weak ideal of definition of the weakly admissible topological ring $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$. It suffices to check the condition on the members of an affine open covering. There is a one-to-one correspondence

$$\{\text{weak ideals of definition for } \mathfrak{X}\} \leftrightarrow \{\text{thickenings } i : Z \rightarrow h_{\mathfrak{X}} \text{ as above}\}$$

This correspondence associates to \mathcal{I} the scheme $Z = (\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}/\mathcal{I})$ together with the obvious morphism to \mathfrak{X} . A *fundamental system of weak ideals of definition* is a collection of weak ideals of definition \mathcal{I}_λ such that on every affine open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$ the ideals

$$I_\lambda = \mathcal{I}_\lambda(\mathfrak{U}) \subset A = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$$

form a fundamental system of weak ideals of definition of the weakly admissible topological ring A . It suffices to check on the members of an affine open covering. We conclude that the formal algebraic space $h_{\mathfrak{X}}$ associated to the McQuillan formal scheme \mathfrak{X} is a colimit of schemes as in Lemma 65.8.1 if and only if there exists a fundamental system of weak ideals of definition for \mathfrak{X} .

Remark 65.8.3 (Ideals of definition). Let \mathfrak{X} be a formal scheme à la EGA. An *ideal of definition* for \mathfrak{X} is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{\mathfrak{X}}$ such that for all $\mathfrak{U} \subset \mathfrak{X}$ affine formal open subscheme the ideal $\mathcal{I}(\mathfrak{U}) \subset \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ is an ideal of definition of the admissible topological ring $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$. It suffices to check the condition on the members of an affine open covering. We do **not** get the same correspondence between ideals of definition and thickenings $Z \rightarrow \mathfrak{X}$ as in Remark 65.8.2. A *fundamental system of*

ideals of definition is a collection of ideals of definition \mathcal{I}_λ such that on every affine open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$ the ideals

$$I_\lambda = \mathcal{I}_\lambda(\mathfrak{U}) \subset A = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$$

form a fundamental system of ideals of definition of the admissible topological ring A . It suffices to check on the members of an affine open covering. Suppose that \mathfrak{X} is quasi-compact and that $\{\mathcal{I}_\lambda\}_{\lambda \in \Lambda}$ is a fundamental system of weak ideals of definition. If A is an admissible topological ring A then all sufficiently small open ideals are ideals of definition (namely any open ideal contained in an ideal of definition is an ideal of definition). Thus since we only need to check on the finitely many members of an affine open covering we see that \mathcal{I}_λ is an ideal of definition for λ sufficiently large. Using the discussion in Remark 65.8.2 we conclude that the formal algebraic space $h_{\mathfrak{X}}$ associated to the quasi-compact formal scheme \mathfrak{X} à la EGA is a colimit of schemes as in Lemma 65.8.1 if and only if there exists a fundamental system of ideals of definition for \mathfrak{X} .

65.9. Completion along a closed subset

Our notion of a formal algebraic space is well adapted to taking the completion along a closed.

Lemma 65.9.1. *Let S be a scheme. Let X be an affine scheme over S . Let $T \subset |X|$ be a closed subset. Then the functor*

$$(Sch/S)_{fppf} \longrightarrow Sets, \quad U \longmapsto \{f : U \rightarrow X \mid f(|U|) \subset T\}$$

is a McQuillan affine formal algebraic space.

Proof. Say $X = \text{Spec}(A)$ and T corresponds to the radical ideal $I \subset A$. Let $U = \text{Spec}(B)$ be an affine scheme over S and let $f : U \rightarrow X$ be an element of $F(U)$. Then f corresponds to a ring map $\varphi : A \rightarrow B$ such that every prime of B contains $\varphi(I)B$. Thus every element of $\varphi(I)$ is nilpotent in B , see Algebra, Lemma 10.16.2. Setting $J = \text{Ker}(\varphi)$ we conclude that I/J is a locally nilpotent ideal in A/J . Equivalently, $V(J) = V(I) = T$. In other words, the functor of the lemma equals $\text{colim Spec}(A/J)$ where the colimit is over the collection of ideals J with $V(J) = T$. Thus our functor is an affine formal algebraic space. It is McQuillan (Definition 65.5.7) because the maps $A \rightarrow A/J$ are surjective and hence $A^\wedge = \lim A/J \rightarrow A/J$ is surjective, see Lemma 65.5.6. \square

Lemma 65.9.2. *Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. Then the functor*

$$(Sch/S)_{fppf} \longrightarrow Sets, \quad U \longmapsto \{f : U \rightarrow X \mid f(|U|) \subset T\}$$

is a formal algebraic space.

Proof. Denote F the functor. Let $\{U_i \rightarrow U\}$ be an fppf covering. Then $\coprod |U_i| \rightarrow |U|$ is surjective. Since X is an fppf sheaf, it follows that F is an fppf sheaf.

Let $\{g_i : X_i \rightarrow X\}$ be an étale covering such that X_i is affine for all i , see Properties of Spaces, Lemma 48.6.1. The morphisms $F \times_X X_i \rightarrow F$ are étale (see Spaces, Lemma 47.5.5) and the map $\coprod F \times_X X_i \rightarrow F$ is a surjection of sheaves. Thus it suffices to prove that $F \times_X X_i$ is an affine formal algebraic space. A U -valued point of $F \times_X X_i$ is a morphism $U \rightarrow X_i$ whose image is contained in the closed subset $g_i^{-1}(T) \subset |X_i|$. Thus this follows from Lemma 65.9.1. \square

Definition 65.9.3. Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. The formal algebraic space of Lemma 65.9.2 is called the *completion of X along T* .

In [DG67, Chapter I, Section 10.8] the notation $X_{/T}$ is used to denote the completion and we will occasionally use this notation as well. Let $f : X \rightarrow X'$ be a morphism of algebraic spaces over a scheme S . Suppose that $T \subset |X|$ and $T' \subset |X'|$ are closed subsets such that $|f|(T) \subset T'$. Then it is clear that f defines a morphism of formal algebraic spaces

$$X_{/T} \longrightarrow X'_{/T'}$$

between the completions.

Lemma 65.9.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $T \subset |Y|$ be a closed subset and let $T' = |f|^{-1}(T) \subset |X|$. Then $X_{/T'} \rightarrow Y_{/T}$ is representable by algebraic spaces.*

Proof. Namely, suppose that $V \rightarrow Y$ is a morphism from a scheme into Y such that $|V|$ maps into T . Then $V \times_Y X \rightarrow X$ is a morphism of algebraic spaces such that $|V \times_Y X|$ maps into T' . Hence the functor $V \times_{Y_{/T'}} X_{/T}$ is represented by $V \times_Y X$ and we see that the lemma holds. \square

The following lemma is due to Ofer Gabber.

Lemma 65.9.5. *Let S be a scheme. Let $X = \text{Spec}(A)$ be an affine scheme over S . Let $T \subset X$ be a closed subscheme.*

- (1) *If the formal completion $X_{/T}$ is countably indexed and there exist countably many $f_1, f_2, f_3, \dots \in A$ such that $T = V(f_1, f_2, f_3, \dots)$, then $X_{/T}$ is adic*.*
- (2) *The conclusion of (1) is wrong if we omit the assumption that T can be cut out by countably many functions in X .*

Proof. The assumption that $X_{/T}$ is countably indexed means that there exists a sequence of ideals

$$A \supset J_1 \supset J_2 \supset J_3 \supset \dots$$

with $V(J_n) = T$ such that every ideal $J \subset A$ with $V(J) = T$ there exists an n such that $J \supset J_n$.

To construct an example for (2) let ω_1 be the first uncountable ordinal. Let k be a field and let A be the k -algebra generated by $x_\alpha, \alpha \in \omega_1$ and $y_{\alpha\beta}$ with $\alpha \in \beta \in \omega_1$ subject to the relations $x_\alpha = y_{\alpha\beta}x_\beta$. Let $T = V(x_\alpha)$. Let $J_n = (x_\alpha^n)$. If $J \subset A$ is an ideal such that $V(J) = T$, then $x_\alpha^{n_\alpha} \in J$ for some $n_\alpha \geq 1$. One of the sets $\{\alpha \mid n_\alpha = n\}$ must be unbounded in ω_1 . Then the relations imply that $J_n \subset J$.

To see that (2) holds it now suffices to show that $A^\wedge = \lim A/J_n$ is not a ring complete with respect to a finitely generated ideal. For $\gamma \in \omega_1$ let A_γ be the quotient of A by the ideal generated by $x_\alpha, \alpha \in \gamma$ and $y_{\alpha\beta}, \alpha \in \gamma$. As A/J_1 is reduced, every topologically nilpotent element f of $\lim A/J_n$ is in $J_1^\wedge = \lim J_1/J_n$. This means f is an infinite series involving only a countable number of generators. Hence f dies in $A_\gamma^\wedge = \lim A_\gamma/J_n A_\gamma$ for some γ . Note that $A^\wedge \rightarrow A_\gamma^\wedge$ is continuous and open by Lemma 65.4.5. If the topology on A^\wedge was I -adic for some finitely generated ideal $I \subset A^\wedge$, then I would go to zero in some A_γ^\wedge . This would mean that A_γ^\wedge is discrete, which is not the case as there is a surjective continuous and

open (by Lemma 65.4.5) map $A_\gamma^\wedge \rightarrow k[[t]]$ given by $x_\alpha \mapsto t, y_{\alpha\beta} \mapsto 1$ for $\gamma = \alpha$ or $\gamma \in \alpha$.

Before we prove (1) we first prove the following: If $I \subset A^\wedge$ is a finitely generated ideal whose closure \bar{I} is open, then $I = \bar{I}$. Since $V(J_n^2) = T$ there exists an m such that $J_n^2 \supset J_m$. Thus, we may assume that $J_n^2 \supset J_{n+1}$ for all n by passing to a subsequence. Set $J_n^\wedge = \lim_{k \geq n} J_n/J_k \subset A^\wedge$. Since the closure $\bar{I} = \bigcap (I + J_n^\wedge)$ (Lemma 65.4.2) is open we see that there exists an m such that $I + J_n^\wedge \supset J_m^\wedge$ for all $n \geq m$. Fix such an m . We have

$$J_{n-1}^\wedge I + J_{n+1}^\wedge \supset J_{n-1}^\wedge (I + J_{n+1}^\wedge) \supset J_{n-1}^\wedge J_m^\wedge \supset J_n^\wedge$$

for all $n \geq m+1$. Namely, the first inclusion is trivial. The second was shown above. The third as $J_{n-1} J_m \supset J_{n-1}^2 \supset J_n$, hence $J_{n-1}^\wedge J_m^\wedge \supset J_n^\wedge$. Say $I = (g_1, \dots, g_t)$. Pick $f \in J_{m+1}^\wedge$. Using the displayed inclusions above, valid for all $n \geq m+1$, we can write by induction on $c \geq 0$

$$f = \sum f_{i,c} g_i \pmod{J_{m+1+c}^\wedge}$$

with $f_{i,c} \in J_m^\wedge$ and $f_{i,c} \equiv f_{i,c-1} \pmod{J_{m+c}^\wedge}$. It follows that $I J_m^\wedge \supset J_{m+1}^\wedge$. Combined with $I + J_{m+1}^\wedge \supset J_m^\wedge$ we conclude that I is open.

Proof of (1). Assume $T = V(f_1, f_2, f_3, \dots)$. Let $I_m \subset A^\wedge$ be the ideal generated by f_1, \dots, f_m . Case I: For some m the closure of I_m is open. Then I_m is open by the result of the previous paragraph. Since in A^\wedge the product of open ideals is open, we see that I_m^k is open for all k . As each element of I_m is topologically nilpotent, we conclude that I_m is an ideal of definition which proves that A^\wedge is adic with a finitely generated ideal of definition, i.e., X is adic*.

Case II. For all m the closure \bar{I}_m of I_m is not open. Then the topology on A^\wedge/\bar{I}_m is not discrete. This means we can pick $\phi(m) \geq m$ such that

$$\text{Im}(J_{\phi(m)} \rightarrow A/(f_1, \dots, f_m)) \neq \text{Im}(J_{\phi(m)+1} \rightarrow A/(f_1, \dots, f_m))$$

To see this we have used that $A^\wedge/(\bar{I}_m + J_n^\wedge) = A/((f_1, \dots, f_m) + J_n)$. Choose exponents $e_i > 0$ such that $f_i^{e_i} \in J_{\phi(m)+1}$ for $0 < m < i$. Let $J = (f_1^{e_1}, f_2^{e_2}, f_3^{e_3}, \dots)$. Then $V(J) = T$. We claim that $J \not\supset J_n$ for all n which is a contradiction proving Case II does not occur. Namely, the image of J in $A/(f_1, \dots, f_m)$ is contained in the image of $J_{\phi(m)+1}$ which is properly contained in the image of J_m . \square

65.10. Fibre products

Obligatory section about fibre products of formal algebraic spaces.

Lemma 65.10.1. *Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be a family of maps of sheaves on $(\text{Sch}/S)_{\text{ppf}}$. Assume (a) X_i is a formal algebraic space over S , (b) $X_i \rightarrow X$ is representable by algebraic spaces and étale, and (c) $\coprod X_i \rightarrow X$ is a surjection of sheaves. Then X is a formal algebraic space over S .*

Proof. For each i pick $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$ as in Definition 65.7.1. Then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a family as in Definition 65.7.1 for X . \square

Lemma 65.10.2. *Let S be a scheme. Let X, Y be formal algebraic spaces over S and let Z be a sheaf whose diagonal is representable by algebraic spaces. Then $X \times_Z Y$ is a formal algebraic space.*

Proof. Choose $\{X_i \rightarrow X\}$ and $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1. Then $\{X_i \times_Z Y_j \rightarrow X \times_Z Y\}$ is a family of maps which are representable by algebraic spaces and étale. Thus Lemma 65.10.1 tells us it suffices to show that $X \times_Z Y$ is a formal algebraic space when X and Y are affine formal algebraic spaces.

Assume X and Y are affine formal algebraic spaces. Write $X = \operatorname{colim} X_\lambda$ and $Y = \operatorname{colim} Y_\mu$ as in Definition 65.5.1. Then $X \times_Z Y = \operatorname{colim} X_\lambda \times_Z Y_\mu$. Each $X_\lambda \times_Z Y_\mu$ is an algebraic space. For $\lambda \leq \lambda'$ and $\mu \leq \mu'$ the morphism

$$X_\lambda \times_Z Y_\mu \rightarrow X_\lambda \times_Z Y_{\mu'} \rightarrow X_{\lambda'} \times_Z Y_{\mu'}$$

is a thickening as a composition of base changes of thickenings. Thus we conclude by applying Lemma 65.8.1. \square

Lemma 65.10.3. *Let S be a scheme. The category of formal algebraic spaces over S has fibre products.*

Proof. Special case of Lemma 65.10.2 because formal algebraic spaces have representable diagonals, see Lemma 65.7.3. \square

We have already proved the following lemma (without knowing that fibre products exist).

Lemma 65.10.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The diagonal morphism $\Delta : X \rightarrow X \times_Y X$ is representable (by schemes), a monomorphism, locally quasi-finite, locally of finite type, and separated.*

Proof. Let T be a scheme and let $T \rightarrow X \times_Y X$ be a morphism. Then

$$T \times_{(X \times_Y X)} X = T \times_{(X \times_S X)} X$$

Hence the result follows immediately from Lemma 65.7.3. \square

65.11. Separation axioms for formal algebraic spaces

This section is about “absolute” separation conditions on formal algebraic spaces. We will discuss separation conditions for morphisms of formal algebraic spaces later.

Lemma 65.11.1. *Let S be a scheme. Let X be a formal algebraic space over S . The following are equivalent*

- (1) *the reduction of X (Lemma 65.7.2) is a quasi-separated algebraic space,*
- (2) *for $U \rightarrow X, V \rightarrow X$ with U, V quasi-compact schemes the fibre product $U \times_X V$ is quasi-compact,*
- (3) *for $U \rightarrow X, V \rightarrow X$ with U, V affine the fibre product $U \times_X V$ is quasi-compact.*

Proof. Observe that $U \times_X V$ is a scheme by Lemma 65.7.3. Let $U_{red}, V_{red}, X_{red}$ be the reduction of U, V, X . Then

$$U_{red} \times_{X_{red}} V_{red} = U_{red} \times_X V_{red} \rightarrow U \times_X V$$

is a thickening of schemes. From this the equivalence of (1) and (2) is clear, keeping in mind the analogous lemma for algebraic spaces, see Properties of Spaces, Lemma 48.3.3. We omit the proof of the equivalence of (2) and (3). \square

Lemma 65.11.2. *Let S be a scheme. Let X be a formal algebraic space over S . The following are equivalent*

- (1) the reduction of X (Lemma 65.7.2) is a separated algebraic space,
 (2) for $U \rightarrow X, V \rightarrow X$ with U, V affine the fibre product $U \times_X V$ is affine
 and

$$\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \longrightarrow \mathcal{O}(U \times_X V)$$

is surjective.

Proof. If (2) holds, then X_{red} is a separated algebraic space by applying Properties of Spaces, Lemma 48.3.3 to morphisms $U \rightarrow X_{red}$ and $V \rightarrow X_{red}$ with U, V affine and using that $U \times_{X_{red}} V = U \times_X V$.

Assume (1). Let $U \rightarrow X$ and $V \rightarrow X$ be as in (2). Observe that $U \times_X V$ is a scheme by Lemma 65.7.3. Let $U_{red}, V_{red}, X_{red}$ be the reduction of U, V, X . Then

$$U_{red} \times_{X_{red}} V_{red} = U_{red} \times_X V_{red} \rightarrow U \times_X V$$

is a thickening of schemes. It follows that $(U \times_X V)_{red} = (U_{red} \times_{X_{red}} V_{red})_{red}$. In particular, we see that $(U \times_X V)_{red}$ is an affine scheme and that

$$\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \longrightarrow \mathcal{O}((U \times_X V)_{red})$$

is surjective, see Properties of Spaces, Lemma 48.3.3. Then $U \times_X V$ is affine by Limits of Spaces, Proposition 52.15.2. On the other hand, the morphism $U \times_X V \rightarrow U \times V$ of affine schemes is the composition

$$U \times_X V = X \times_{(X \times_S X)} (U \times_S V) \rightarrow U \times_S V \rightarrow U \times V$$

The first morphism is a monomorphism and locally of finite type (Lemma 65.7.3). The second morphism is an immersion (Schemes, Lemma 25.21.10). Hence the composition is a monomorphism which is locally of finite type. On the other hand, the composition is integral as the map on underlying reduced affine schemes is a closed immersion by the above and hence universally closed (use Morphisms, Lemma 28.44.7). Thus the ring map

$$\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \longrightarrow \mathcal{O}(U \times_X V)$$

is an epimorphism which is integral of finite type hence finite hence surjective (use Morphisms, Lemma 28.44.4 and Algebra, Lemma 10.103.6). \square

Definition 65.11.3. Let S be a scheme. Let X be a formal algebraic space over S . We say

- (1) X is *quasi-separated* if the equivalent conditions of Lemma 65.11.1 are satisfied.
 (2) X is *separated* if the equivalent conditions of Lemma 65.11.2 are satisfied.

The following lemma implies in particular that the completed tensor product of weakly admissible topological rings is a weakly admissible topological ring.

Lemma 65.11.4. Let S be a scheme. Let $X \rightarrow Z$ and $Y \rightarrow Z$ be morphisms of formal algebraic spaces over S . Assume Z separated.

- (1) If X and Y are affine formal algebraic spaces, then so is $X \times_Z Y$.
 (2) If X and Y are McQuillan affine formal algebraic spaces, then so is $X \times_Z Y$.
 (3) If $X, Y,$ and Z are McQuillan formal algebraic spaces corresponding to the weakly admissible topological S -algebras $A, B,$ and $C,$ then $X \times_Z Y$ corresponds to $A \widehat{\otimes}_C B$.

Proof. Write $X = \operatorname{colim} X_\lambda$ and $Y = \operatorname{colim} Y_\mu$ as in Definition 65.5.1. Then $X \times_Z Y = \operatorname{colim} X_\lambda \times_Z Y_\mu$. Since Z is separated the fibre products are affine, hence we see that (1) holds. Assume X and Y corresponds to the weakly admissible topological S -algebras A and B and $X_\lambda = \operatorname{Spec}(A/I_\lambda)$ and $Y_\mu = \operatorname{Spec}(B/J_\mu)$. Then

$$X_\lambda \times_Z Y_\mu \rightarrow X_\lambda \times Y_\mu \rightarrow \operatorname{Spec}(A \otimes B)$$

is a closed immersion. Thus one of the conditions of Lemma 65.5.6 holds and we conclude that $X \times_Z Y$ is McQuillan. If also Z is McQuillan corresponding to C , then

$$X_\lambda \times_Z Y_\mu = \operatorname{Spec}(A/I_\lambda \otimes_C B/J_\mu)$$

hence we see that the weakly admissible topological ring corresponding to $X \times_Z Y$ is the completed tensor product (see Definition 65.4.6). \square

Lemma 65.11.5. *Let S be a scheme. Let X be a formal algebraic space over S . Let $U \rightarrow X$ be a morphism where U is a separated algebraic space over S . Then $U \rightarrow X$ is separated.*

Proof. The statement makes sense because $U \rightarrow X$ is representable by algebraic spaces (Lemma 65.7.4). Let T be a scheme and $T \rightarrow X$ a morphism. We have to show that $U \times_X T \rightarrow T$ is separated. Since $U \times_X T \rightarrow U \times_S T$ is a monomorphism, it suffices to show that $U \times_S T \rightarrow T$ is separated. As this is the base change of $U \rightarrow S$ this follows. We used in the argument above: Morphisms of Spaces, Lemmas 49.4.4, 49.4.8, 49.10.3, and 49.4.11. \square

65.12. Quasi-compact formal algebraic spaces

Here is the characterization of quasi-compact formal algebraic spaces.

Lemma 65.12.1. *Let S be a scheme. Let X be a formal algebraic space over S . The following are equivalent*

- (1) *the reduction of X (Lemma 65.7.2) is a quasi-compact algebraic space,*
- (2) *we can find $\{X_i \rightarrow X\}_{i \in I}$ as in Definition 65.7.1 with I finite,*
- (3) *there exists a morphism $Y \rightarrow X$ representable by algebraic spaces which is étale and surjective and where Y is an affine formal algebraic space.*

Proof. Omitted. \square

Definition 65.12.2. Let S be a scheme. Let X be a formal algebraic space over S . We say X is *quasi-compact* if the equivalent conditions of Lemma 65.12.1 are satisfied.

Lemma 65.12.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The following are equivalent*

- (1) *the induced map $f_{\text{red}} : X_{\text{red}} \rightarrow Y_{\text{red}}$ between reductions (Lemma 65.7.2) is a quasi-compact morphism of algebraic spaces,*
- (2) *for every quasi-compact scheme T and morphism $T \rightarrow Y$ the fibre product $X \times_Y T$ is a quasi-compact formal algebraic space,*
- (3) *for every affine scheme T and morphism $T \rightarrow Y$ the fibre product $X \times_Y T$ is a quasi-compact formal algebraic space, and*
- (4) *there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 such that each $X \times_Y Y_j$ is a quasi-compact formal algebraic space.*

Proof. Omitted. □

Definition 65.12.4. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . We say f is *quasi-compact* if the equivalent conditions of Lemma 65.12.3 are satisfied.

This agrees with the already existing notion when the morphism is representable by algebraic spaces (and in particular when it is representable).

Lemma 65.12.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S which is representable by algebraic spaces. Then f is quasi-compact in the sense of Definition 65.12.4 if and only if f is quasi-compact in the sense of Bootstrap, Definition 62.4.1.*

Proof. This is immediate from the definitions and Lemma 65.12.3. □

65.13. Quasi-compact and quasi-separated formal algebraic spaces

The following result is due to Yasuda, see [Yas09, Proposition 3.32].

Lemma 65.13.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated formal algebraic space over S . Then $X = \operatorname{colim} X_\lambda$ for a system of algebraic spaces $(X_\lambda, f_{\lambda\mu})$ over a directed partially ordered set Λ where each $f_{\lambda\mu} : X_\lambda \rightarrow X_\mu$ is a thickening.*

Proof. By Lemma 65.12.1 we may choose an affine formal algebraic space Y and a representable surjective étale morphism $Y \rightarrow X$. Write $Y = \operatorname{colim} Y_\lambda$ as in Definition 65.5.1.

Pick $\lambda \in \Lambda$. Then $Y_\lambda \times_X Y$ is a scheme by Lemma 65.5.11. The reduction (Lemma 65.7.2) of $Y_\lambda \times_X Y$ is equal to the reduction of $Y_{red} \times_{X_{red}} Y_{red}$ which is quasi-compact as X is quasi-separated and Y_{red} is affine. Therefore $Y_\lambda \times_X Y$ is a quasi-compact scheme. Hence there exists a $\mu \geq \lambda$ such that $\operatorname{pr}_2 : Y_\lambda \times_X Y \rightarrow Y$ factors through Y_μ , see Lemma 65.5.4. Let Z_λ be the scheme theoretic image of the morphism $\operatorname{pr}_2 : Y_\lambda \times_X Y \rightarrow Y$. This is independent of the choice of μ and we can and will think of $Z_\lambda \subset Y$ as the scheme theoretic image of the morphism $\operatorname{pr}_2 : Y_\lambda \times_X Y \rightarrow Y$. Observe that Z_λ is also equal to the scheme theoretic image of the morphism $\operatorname{pr}_1 : Y \times_X Y_\lambda \rightarrow Y$ since this is isomorphic to the morphism used to define Z_λ . We claim that $Z_\lambda \times_X Y = Y \times_X Z_\lambda$ as subfunctors of $Y \times_X Y$. Namely, since $Y \rightarrow X$ is étale we see that $Z_\lambda \times_X Y$ is the scheme theoretic image of the morphism

$$\operatorname{pr}_{13} = \operatorname{pr}_1 \times \operatorname{id}_Y : Y \times_X Y_\lambda \times_X Y \longrightarrow Y \times_X Y$$

by Morphisms of Spaces, Lemma 49.16.3. By the same token, $Y \times_X Z_\lambda$ is the scheme theoretic image of the morphism

$$\operatorname{pr}_{13} = \operatorname{id}_Y \times \operatorname{pr}_2 : Y \times_X Y_\lambda \times_X Y \longrightarrow Y \times_X Y$$

The claim follows. Then $R_\lambda = Z_\lambda \times_X Y = Y \times_X Z_\lambda$ together with the morphism $R_\lambda \rightarrow Z_\lambda \times_S Z_\lambda$ defines an étale equivalence relation. In this way we obtain an algebraic space $X_\lambda = Z_\lambda/R_\lambda$. By construction the diagram

$$\begin{array}{ccc} Z_\lambda & \longrightarrow & Y \\ \downarrow & & \downarrow \\ X_\lambda & \longrightarrow & X \end{array}$$

is cartesian (because X is the coequalizer of the two projections $R = Y \times_X Y \rightarrow Y$, because $Z_\lambda \subset Y$ is R -invariant, and because R_λ is the restriction of R to Z_λ). Hence $X_\lambda \rightarrow X$ is representable and a closed immersion, see Spaces, Lemma 47.11.3. On the other hand, since $Y_\lambda \subset Z_\lambda$ we see that $(X_\lambda)_{red} = X_{red}$, in other words, $X_\lambda \rightarrow X$ is a thickening. Finally, we claim that

$$X = \operatorname{colim} X_\lambda$$

We have $Y \times_X X_\lambda = Z_\lambda \supset Y_\lambda$. Every morphism $T \rightarrow X$ where T is a scheme over S lifts étale locally to a morphism into Y which lifts étale locally into a morphism into some Y_λ . Hence $T \rightarrow X$ lifts étale locally on T to a morphism into X_λ . This finishes the proof. \square

Remark 65.13.2. In this remark we translate the statement and proof of Lemma 65.13.1 into the language of formal schemes à la EGA. Looking at Remark 65.8.3 we see that the lemma can be translated as follows

- (*) Every quasi-compact and quasi-separated formal scheme has a fundamental system of ideals of definition.

To prove this we first use the induction principle (reformulated for quasi-compact and quasi-separated formal schemes) of Cohomology of Schemes, Lemma 29.4.1 to reduce to the following situation: $\mathfrak{X} = \mathfrak{U} \cup \mathfrak{V}$ with $\mathfrak{U}, \mathfrak{V}$ open formal subschemes, with \mathfrak{V} affine, and the result is true for $\mathfrak{U}, \mathfrak{V}$, and $\mathfrak{U} \cap \mathfrak{V}$. Pick any ideals of definition $\mathcal{I} \subset \mathcal{O}_\mathfrak{U}$ and $\mathcal{J} \subset \mathcal{O}_\mathfrak{V}$. By our assumption that we have a fundamental system of ideals of definition on \mathfrak{U} and \mathfrak{V} and because $\mathfrak{U} \cap \mathfrak{V}$ is quasi-compact, we can find ideals of definition $\mathcal{I}' \subset \mathcal{I}$ and $\mathcal{J}' \subset \mathcal{J}$ such that

$$\mathcal{I}'|_{\mathfrak{U} \cap \mathfrak{V}} \subset \mathcal{J}|_{\mathfrak{U} \cap \mathfrak{V}} \quad \text{and} \quad \mathcal{J}'|_{\mathfrak{U} \cap \mathfrak{V}} \subset \mathcal{I}|_{\mathfrak{U} \cap \mathfrak{V}}$$

Let $U \rightarrow U' \rightarrow \mathfrak{U}$ and $V \rightarrow V' \rightarrow \mathfrak{V}$ be the closed immersions determined by the ideals of definition $\mathcal{I}' \subset \mathcal{I} \subset \mathcal{O}_\mathfrak{U}$ and $\mathcal{J}' \subset \mathcal{J} \subset \mathcal{O}_\mathfrak{V}$. Let $\mathfrak{U} \cap V$ denote the open subscheme of V whose underlying topological space is that of $\mathfrak{U} \cap \mathfrak{V}$. Similarly for $U \cap \mathfrak{V}$. Then we consider

$$Z_U = \text{scheme theoretic image of } U \amalg (\mathfrak{U} \cap V) \longrightarrow U'$$

and

$$Z_V = \text{scheme theoretic image of } (U \cap \mathfrak{V}) \amalg V \longrightarrow V'$$

Since taking scheme theoretic images of quasi-compact morphisms commutes with restriction to opens (Morphisms, Lemma 28.6.3) we see that $Z_U \cap \mathfrak{V} = \mathfrak{U} \cap Z_V$. Thus Z_U and Z_V glue to a scheme Z which comes equipped with a morphism $Z \rightarrow \mathfrak{X}$. Analogous to the discussion in Remark 65.8.2 we see that Z corresponds to a weak ideal of definition $\mathcal{I}_Z \subset \mathcal{O}_\mathfrak{X}$. Note that $U \subset Z_U \subset Z$ and that $V \subset Z_V \subset Z$. Thus the collection of all \mathcal{I}_Z constructed in this manner forms a fundamental system of weak ideals of definition. Hence a subfamily gives a fundamental system of ideals of definition, see Remark 65.8.3.

65.14. Morphisms representable by algebraic spaces

Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces which is representable by algebraic spaces. For these types of morphisms we have a lot of theory at our disposal, thanks to the work done in the chapters on algebraic spaces.

Lemma 65.14.1. *The composition of morphisms representable by algebraic spaces is representable by algebraic spaces. The same holds for representable (by schemes).*

Proof. See Bootstrap, Lemma 62.3.8. \square

Lemma 65.14.2. *A base change of a morphism representable by algebraic spaces is representable by algebraic spaces. The same holds for representable (by schemes).*

Proof. See Bootstrap, Lemma 62.3.3. \square

Lemma 65.14.3. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of formal algebraic spaces over S . If $g \circ f : X \rightarrow Z$ is representable by algebraic spaces, then $f : X \rightarrow Y$ is representable by algebraic spaces.*

Proof. Note that the diagonal of $Y \rightarrow Z$ is representable by Lemma 65.10.4. Thus $U \rightarrow V$ is representable by algebraic spaces by Bootstrap, Lemma 62.3.10. \square

The property of being representable by algebraic spaces is local on the source and the target.

Lemma 65.14.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The following are equivalent:*

- (1) *the morphism f is representable by algebraic spaces,*
- (2) *there exists a commutative diagram*

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are formal algebraic spaces, the vertical arrows are representable by algebraic spaces, $U \rightarrow X$ is surjective étale, and $U \rightarrow V$ is representable by algebraic spaces,

- (3) *for any commutative diagram*

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are formal algebraic spaces and the vertical arrows are representable by algebraic spaces, the morphism $U \rightarrow V$ is representable by algebraic spaces,

- (4) *there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 and for each j a covering $\{X_{ji} \rightarrow Y_j \times_Y X\}$ as in Definition 65.7.1 such that $X_{ji} \rightarrow Y_j$ is representable by algebraic spaces for each j and i ,*
- (5) *there exist a covering $\{X_i \rightarrow X\}$ as in Definition 65.7.1 and for each i a factorization $X_i \rightarrow Y_i \rightarrow Y$ where Y_i is an affine formal algebraic space, $Y_i \rightarrow Y$ is representable by algebraic spaces, such that $X_i \rightarrow Y_i$ is representable by algebraic spaces, and*
- (6) *add more here.*

Proof. It is clear that (1) implies (2) because we can take $U = X$ and $V = Y$. Conversely, (2) implies (1) by Bootstrap, Lemma 62.11.3 applied to $U \rightarrow X \rightarrow Y$.

Assume (1) is true and consider a diagram as in (3). Then $U \rightarrow Y$ is representable by algebraic spaces (as the composition $U \rightarrow X \rightarrow Y$, see Bootstrap, Lemma

62.3.8) and factors through V . Thus $U \rightarrow V$ is representable by algebraic spaces by Lemma 65.14.3.

It is clear that (3) implies (2). Thus now (1) – (3) are equivalent.

Observe that the condition in (4) makes sense as the fibre product $Y_j \times_Y X$ is a formal algebraic space by Lemma 65.10.3. It is clear that (4) implies (5).

Assume $X_i \rightarrow Y_i \rightarrow Y$ as in (5). Then we set $V = \coprod Y_i$ and $U = \coprod X_i$ to see that (5) implies (2).

Finally, assume (1) – (3) are true. Thus we can choose any covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 and for each j any covering $\{X_{ji} \rightarrow Y_j \times_Y X\}$ as in Definition 65.7.1. Then $X_{ij} \rightarrow Y_j$ is representable by algebraic spaces by (3) and we see that (4) is true. This concludes the proof. \square

Lemma 65.14.5. *Let S be a scheme. Let Y be an affine formal algebraic space over S . Let $f : X \rightarrow Y$ be a map of sheaves on $(Sch/S)_{fppf}$ which is representable by algebraic spaces. Then X is a formal algebraic space.*

Proof. Write $Y = \text{colim } Y_\lambda$ as in Definition 65.5.1. For each λ the fibre product $X \times_Y Y_\lambda$ is an algebraic space. Hence $X = \text{colim } X \times_Y Y_\lambda$ is a formal algebraic space by Lemma 65.8.1. \square

Lemma 65.14.6. *Let S be a scheme. Let Y be a formal algebraic space over S . Let $f : X \rightarrow Y$ be a map of sheaves on $(Sch/S)_{fppf}$ which is representable by algebraic spaces. Then X is a formal algebraic space.*

Proof. Let $\{Y_i \rightarrow Y\}$ be as in Definition 65.7.1. Then $X \times_Y Y_i \rightarrow X$ is a family of morphisms representable by algebraic spaces, étale, and jointly surjective. Thus it suffices to show that $X \times_Y Y_i$ is a formal algebraic space, see Lemma 65.10.1. This follows from Lemma 65.14.5. \square

Lemma 65.14.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of affine formal algebraic spaces which is representable by algebraic spaces. Then f is representable (by schemes) and affine.*

Proof. The first assertion follows from Lemma 65.5.11. Write $Y = \text{colim } Y_\mu$ and $X = \text{colim } X_\lambda$ as in Definition 65.5.1. For the second, let $T \rightarrow Y$ be a morphism where T is a scheme over S . We have to show that $X \times_Y T \rightarrow T$ is affine, see Spaces, Definition 47.5.1. To do this we may assume that T is affine and we have to prove that $X \times_Y T$ is affine. In this case $T \rightarrow Y$ factors through $Y_\mu \rightarrow Y$ for some μ , see Lemma 65.5.4. Since f is quasi-compact we see that $X \times_Y T$ is quasi-compact (Lemma 65.12.3). Hence $X \times_Y T \rightarrow X$ factors through X_λ for some λ . Similarly $X_\lambda \rightarrow Y$ factors through Y_μ after increasing μ . Then $X \times_Y T = X_\lambda \times_{Y_\mu} T$. We conclude as fibre products of affine schemes are affine. \square

Lemma 65.14.8. *Let S be a scheme. Let Y be an affine formal algebraic space. Let $f : X \rightarrow Y$ be a map of sheaves on $(Sch/S)_{fppf}$ which is representable and affine. Then*

- (1) X is an affine formal algebraic space.
- (2) if Y is countably indexed, then X is countably indexed.
- (3) if Y is adic*, then X is adic*.
- (4) if Y is Noetherian and f is (locally) of finite type, then X is Noetherian.

Proof. Proof of (1). Write $Y = \operatorname{colim}_{\lambda \in \Lambda} Y_\lambda$ as in Definition 65.5.1. Since f is representable and affine, the fibre products $X_\lambda = Y_\lambda \times_Y X$ are affine. And $X = \operatorname{colim} Y_\lambda \times_Y X$. Thus X is an affine formal algebraic space.

Proof of (2). If Y is countably indexed, then in the argument above we may assume Λ is countable. Then we immediately see that X is countably indexed too.

Proof of (3). Assume Y is adic^* . Then $Y = \operatorname{Spf}(B)$ for some adic topological ring B which has a finitely generated ideal J such that $\{J^n\}$ is a fundamental system of open ideals. Of course, then $Y = \operatorname{colim} \operatorname{Spec}(B/J^n)$. The schemes $X \times_Y \operatorname{Spec}(B/J^n)$ are affine and we can write $X \times_Y \operatorname{Spec}(B/J^n) = \operatorname{Spec}(A_n)$. Then $X = \operatorname{colim} \operatorname{Spec}(A_n)$. The B -algebra maps $A_{n+1} \rightarrow A_n$ are surjective and induce isomorphisms $A_{n+1}/J^n A_{n+1} \rightarrow A_n$. By Algebra, Lemma 10.94.1 the ring $A = \lim A_n$ is J -adically complete and $A/J^n A = A_n$. Hence $X = \operatorname{Spf}(A^\wedge)$ is adic^* .

Proof of (4). Combining (3) with Lemma 65.6.3 we see that X is adic^* . Thus we can use the criterion of Lemma 65.6.5. First, it tells us the affine schemes Y_λ are Noetherian. Then $X_\lambda \rightarrow Y_\lambda$ is of finite type, hence X_λ is Noetherian too (Morphisms, Lemma 28.16.6). Then the criterion tells us X is Noetherian and the proof is complete. \square

Lemma 65.14.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of affine formal algebraic spaces which is representable by algebraic spaces. Then*

- (1) *if Y is countably indexed, then X is countably indexed.*
- (2) *if Y is adic^* , then X is adic^* ,*
- (3) *if Y is Noetherian and f is (locally) of finite type, then X is Noetherian.*

Proof. Combine Lemmas 65.14.7 and 65.14.8. \square

Lemma 65.14.10. *Let S be a scheme. Let $\varphi : A \rightarrow B$ be a continuous map of weakly admissible topological rings over S . The following are equivalent*

- (1) *$\operatorname{Spf}(\varphi) : \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is representable by algebraic spaces,*
- (2) *$\operatorname{Spf}(\varphi) : \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is representable (by schemes),*
- (3) *φ is taut, see Definition 65.4.9.*

Proof. Parts (1) and (2) are equivalent by Lemma 65.14.7.

Assume the equivalent conditions (1) and (2) hold. If $I \subset A$ is a weak ideal of definition, then $\operatorname{Spec}(A/I) \rightarrow \operatorname{Spf}(A)$ is representable and a thickening (this is clear from the construction of the formal spectrum but it also follows from Lemma 65.5.6). Then $\operatorname{Spec}(A/I) \times_{\operatorname{Spf}(A)} \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(B)$ is representable and a thickening as a base change. Hence by Lemma 65.5.6 there is a weak ideal of definition $J(I) \subset B$ such that $\operatorname{Spec}(A/I) \times_{\operatorname{Spf}(A)} \operatorname{Spf}(B) = \operatorname{Spec}(B/J(I))$ as subfunctors of $\operatorname{Spf}(B)$. We obtain a cartesian diagram

$$\begin{array}{ccc} \operatorname{Spec}(B/J(I)) & \longrightarrow & \operatorname{Spec}(A/I) \\ \downarrow & & \downarrow \\ \operatorname{Spf}(B) & \longrightarrow & \operatorname{Spf}(A) \end{array}$$

By Lemma 65.11.4 we see that $B/J(I) = B \widehat{\otimes}_A A/I$. It follows that $J(I)$ is the closure of the ideal $\varphi(I)B$, see Lemma 65.4.11. Since $\operatorname{Spf}(A) = \operatorname{colim} \operatorname{Spec}(A/I)$ with I as above, we find that $\operatorname{Spf}(B) = \operatorname{colim} \operatorname{Spec}(B/J(I))$. Thus the ideals $J(I)$

form a fundamental system of weak ideals of definition (see Lemma 65.5.6). Hence (3) holds.

Assume (3) holds. For a weak ideal of definition $I \subset A$ denote $J(I)$ the closure of $\varphi(I)B$. By Lemma 65.4.8 the ideal $J(I)$ is a weak ideal of definition of B . Using Lemmas 65.11.4 and 65.4.11 we see that the diagram displayed above is cartesian. Since every morphism $T \rightarrow \mathrm{Spf}(A)$ with T quasi-compact factors through $\mathrm{Spec}(A/I)$ for some weak ideal of definition I (Lemma 65.5.4) we conclude that $\mathrm{Spf}(\varphi)$ is representable, i.e., (2) holds. This finishes the proof. \square

Example 65.14.11. Let B be a weakly admissible topological ring. Let $B \rightarrow A$ be a ring map (no topology). Then we can consider

$$A^\wedge = \lim A/JA$$

where the limit is over all weak ideals of definition J of B . Then A^\wedge (endowed with the limit topology) is a complete linearly topologized ring. The (open) kernel I of the surjection $A^\wedge \rightarrow A/JA$ is the closure of JA^\wedge , see Lemma 65.4.2. By Lemma 65.4.8 we see that I consists of topologically nilpotent elements. Thus I is a weak ideal of definition of A^\wedge and we conclude A^\wedge is a weakly admissible topological ring. Thus $\varphi : B \rightarrow A^\wedge$ is taut map of weakly admissible topological rings and

$$\mathrm{Spf}(A^\wedge) \longrightarrow \mathrm{Spf}(B)$$

is a special case of the phenomenon studied in Lemma 65.14.10.

Remark 65.14.12 (Warning). Lemma 65.14.10 does **not** mean that given a morphism $f : X \rightarrow Y$ of affine formal algebraic spaces with f representable and Y McQuillan we have that X is McQuillan.

The warning above notwithstanding, we do have the following result.

Lemma 65.14.13. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of affine formal algebraic spaces over S . Assume*

- (1) *Y is McQuillan, i.e., equal to $\mathrm{Spf}(B)$ for some weakly admissible topological S -algebra B , and*
- (2) *$f : Y \rightarrow X$ is representable by algebraic spaces and étale.*

Then there exists an étale ring map $B \rightarrow A$ such that

$$Y = \mathrm{Spf}(A^\wedge) \quad \text{where} \quad A^\wedge = \lim A/JA$$

with $J \subset B$ running over the weak ideals of definition of B . In particular, Y is McQuillan.

Proof. Choose a weak ideal of definition $J_0 \subset B$. Set $Y_0 = \mathrm{Spec}(B/J_0)$ and $X_0 = Y_0 \times_Y X$. Then $X_0 \rightarrow Y_0$ is an étale morphism of affine schemes (see Lemma 65.14.7). Say $X_0 = \mathrm{Spec}(A_0)$. By Algebra, Lemma 10.138.11 we can find an étale algebra map $B \rightarrow A$ such that $A_0 \cong A/J_0A$. Consider an ideal of definition $J \subset J_0$. As above we may write $\mathrm{Spec}(B/J) \times_Y X = \mathrm{Spec}(\bar{A})$ for some étale ring map $B/J \rightarrow \bar{A}$. Then both $B/J \rightarrow \bar{A}$ and $B/J \rightarrow A/JA$ are étale ring maps lifting the étale ring map $B/J_0 \rightarrow A_0$. By More on Algebra, Lemma 15.7.2 there is a unique B/J -algebra isomorphism $\varphi_J : A/JA \rightarrow \bar{A}$ lifting the identification modulo J_0 . Since the maps φ_J are unique they are compatible for varying J . Thus

$$X = \mathrm{colim} \mathrm{Spec}(B/J) \times_Y X = \mathrm{colim} \mathrm{Spec}(A/JA)$$

and we see that the lemma holds. \square

Lemma 65.14.14. *With notation and assumptions as in Lemma 65.14.13. The following are equivalent*

- (1) $f : X \rightarrow Y$ is surjective,
- (2) $B \rightarrow A$ is faithfully flat,
- (3) for every weak ideal of definition $J \subset B$ the ring map $B \rightarrow A/JA$ is faithfully flat, and
- (4) for some weak ideal of definition $J \subset B$ the ring map $B \rightarrow A/JA$ is faithfully flat.

Proof. Let $J \subset B$ be an ideal of definition. As every element of J is topologically nilpotent, we see that every element of $1+J$ is a unit. It follows that J is contained in the Jacobson radical of B (Algebra, Lemma 10.18.1). Hence a flat ring map $B \rightarrow A$ is faithfully flat if and only if $B/J \rightarrow A/JA$ is faithfully flat (Algebra, Lemma 10.38.15). In this way we see that (2) – (4) are equivalent. If (1) holds, then for every weak ideal of definition $J \subset B$ the morphism $\text{Spec}(A/JA) = \text{Spec}(B/J) \times_Y X \rightarrow \text{Spec}(B/J)$ is surjective which implies (3). Conversely, assume (3). A morphism $T \rightarrow Y$ with T quasi-compact factors through $\text{Spec}(B/J)$ for some ideal of definition J of B (Lemma 65.5.4). Hence $X \times_Y T = \text{Spec}(A/JA) \times_{\text{Spec}(B/J)} T \rightarrow T$ is surjective as a base change of the surjective morphism $\text{Spec}(A/JA) \rightarrow \text{Spec}(B/J)$. Thus (1) holds. \square

65.15. Types of formal algebraic spaces

In this section we define Noetherian, adic*, and countably indexed formal algebraic spaces. The types adic, classical, and McQuillan are missing as we do not know how to prove the analogue of the following lemmas for those cases.

Lemma 65.15.1. *Let S be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, and flat. Then X is countably indexed if and only if Y is countably indexed.*

Proof. Assume X is countably indexed. We write $X = \text{colim } X_n$ as in Lemma 65.6.1. Write $Y = \text{colim } Y_\lambda$ as in Definition 65.5.1. For every n we can pick a λ_n such that $X_n \rightarrow Y$ factors through Y_{λ_n} , see Lemma 65.5.4. On the other hand, for every λ the scheme $Y_\lambda \times_Y X$ is affine (Lemma 65.14.7) and hence $Y_\lambda \times_Y X \rightarrow X$ factors through X_n for some n (Lemma 65.5.4). Picture

If we can show the dotted arrow exists, then we conclude that $Y = \text{colim } Y_{\lambda_n}$ and Y is countably indexed. To do this we pick a μ such that we have the solid arrows in the diagram. Say $Y_\mu = \text{Spec}(B_\mu)$, the closed subscheme Y_λ corresponds to $J \subset B_\mu$, and the closed subscheme Y_{λ_n} corresponds to $J' \subset B_\mu$. We are trying to show that $J \subset J'$. By the diagram above we know $JA_\mu \subset J'A_\mu$ where $Y_\mu \times_Y X = \text{Spec}(A_\mu)$. Since $X \rightarrow Y$ is surjective and flat the morphism $Y_\lambda \times_Y X \rightarrow Y_\lambda$ is a faithfully

flat morphism of affine schemes, hence $B_\mu \rightarrow A_\mu$ is faithfully flat. Thus $J \subset J'$ as desired.

Assume Y is countably indexed. Then X is countably indexed by Lemma 65.14.9. \square

Lemma 65.15.2. *Let S be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, and flat. Then X is adic* if and only if Y is adic*.*

Proof. Assume Y is adic*. Then X is adic* by Lemma 65.14.9.

Assume X is adic*. Write $X = \text{Spf}(A)$ for some adic ring A which has a finitely generated ideal I such that $\{I^n\}$ is a fundamental system of open ideals. By Lemmas 65.15.1 we see that Y is countably indexed. Thus, by Lemma 65.6.4, we can write $Y = \text{Spf}(B)$ where B is a weakly admissible topological ring with a countable fundamental system $\{J_m\}$ of weak ideals of definition. Set $Y_m = \text{Spec}(B/J_m)$ so that $Y = \text{colim } Y_m$. The scheme $Y_m \times_Y X$ is affine (Lemma 65.14.7) and we have $X = \text{colim } Y_m \times_Y X$. Say $Y_m \times_Y X = \text{Spec}(A_m)$ so that $B/J_m \rightarrow A_m$ is a faithfully flat ring map. It follows from Lemma 65.11.4 that $\text{Ker}(A \rightarrow A_m)$ is the closure of $J_m A$.

Choose $n \geq 1$. There exists an m such that $\text{Spec}(A/I^n) \rightarrow Y$ factors through Y_m . In terms of ideals

$$(65.15.2.1) \quad \forall n \exists m, J_m A \subset I^n.$$

Choose $m \geq 1$. We can find an n such that the morphism $\text{Spec}(A_m) \rightarrow X$ factors through $\text{Spec}(A/I^n)$. In terms of ideals

$$(65.15.2.2) \quad \forall m \exists n, I^n \subset \text{Ker}(A \rightarrow A_m).$$

Fix an m . Pick n such that $I^n \subset \text{Ker}(A \rightarrow A_m)$ (65.15.2.2). Choose generators f_1, \dots, f_r of I . For any $E = (e_1, \dots, e_r)$ with $|E| = \sum e_i = n$ write

$$f_1^{e_1} \dots f_r^{e_r} = \sum g_{E,j} a_{E,j} + \delta_E$$

with $g_{E,j} \in J_m$, $a_{E,j} \in A$, and $\delta_E \in I^{n+1}$ (possible by the above). Let $J = (g_{E,j}) \subset B$. Then we see that

$$I^n \subset JA + I^{n+1}$$

As I is contained in the radical of A and I^n is finitely generated we see that $I^n \subset JA$ by Algebra, Lemma 10.19.1.

We first apply what we just proved as follows: since $I^n \subset J_m A$ we see that $J_m A$ is open in A , hence closed, hence $\text{Ker}(A \rightarrow A_m) = J_m A$, in other words, $A_m = A/J_m A$. This holds for every m .

Next, we pick m with $J_m A \subset I$ (65.15.2.1). Then choose $J \subset J_m$ with $I^n \subset JA \subset I$ as above. For every $k \geq 1$ we define $\mathfrak{b}_k = \text{Ker}(B \rightarrow A/J^k A)$. For every k there exists an m' with $J_{m'} \subset \mathfrak{b}_k$ as we have $I^{nk} \subset J^k A$ and we can apply (65.15.2.1). On the other hand, for every m' there exists a k such that $I^k \subset J_{m'} A$ because $J_{m'} A$ is open. Then \mathfrak{b}_k maps to zero in $A/J_{m'} A$ which is faithfully flat over $B/J_{m'}$. Hence $\mathfrak{b}_k \subset J_{m'}$. In other words, we see that the topology on B is defined by the sequence of ideals \mathfrak{b}_k . Note that $J^k \subset \mathfrak{b}_k$ which implies that $\mathfrak{b}_k A = J^k A$. In other words, we have reduced the problem to the situation discussed in the following paragraph.

We are given a ring map $B \rightarrow A$ where

- (1) B is a weakly admissible topological ring with a fundamental system $J_1 \supset J_2 \supset J_3 \supset \dots$ of ideals of definition,
- (2) A is a ring complete with respect to a finitely generated ideal I ,
- (3) we have $J_k A = I^k$ for all k , and
- (4) $B/J_k \rightarrow A/I^k$ is faithfully flat.

Pick $g_1, \dots, g_r \in J_1$ whose images in A/I^2 generate I/I^2 ; this is possible because $J_1 A/J_2 A = I/I^2$. Then for all $k \geq 1$ we see that the elements $g^E = g_1^{e_1} \dots g_r^{e_r}$ with $|E| = k$ are in J_k and their classes in J_k/J_{k+1} map to generators of I^k/I^{k+1} . Since $B/J_{k+1} \rightarrow A/I^{k+1}$ and $B/J_k \rightarrow A/I^k$ are flat we see that

$$J_k/J_{k+1} \otimes_{B/J_1} A/I = J_k/J_{k+1} \otimes_{B/J_{k+1}} A/I^{k+1} \rightarrow I^k/I^{k+1}$$

is an isomorphism (see More on Morphisms, Lemma 36.8.1). Since $B/J_1 \rightarrow A/I$ is faithfully flat, we conclude that the classes of the elements g^E , $|E| = k$ generate J_k/J_{k+1} . We claim that $J_k = (g^E, |E| = k)$. Namely, suppose that $x_k \in J_k$. By the above we can write

$$x_k = \sum_{|E|=k} b_{E,0} g^E + x_{k+1}$$

with $x_{k+1} \in J_{k+1}$ and some $b_{E,0} \in B$. Now we can write x_{k+1} as follows

$$x_{k+1} = \sum_{|E|=k} \left(\sum_{|E'|=1} b_{E,E'} g^{E'} \right) g^E + x_{k+2}$$

because every multi-index of degree $k+1$ is a sum of a multi-index of degree k and a multi-index of degree 1. Continuing in this manner we can find $b_{E,E'} \in B$ such that for every $l > 1$ we have

$$x_k = \sum_{|E|=k} \left(\sum_{0 \leq |E'| < l} b_{E,E'} g^{E'} \right) g^E + x_{k+l}$$

with some $x_{k+l} \in J_{k+l}$. Then we can finally define

$$b_E = \sum_{E'} b_{E,E'} g^{E'}$$

as an element in B and we see that $x_k = \sum b_E g^E$ as desired. This finishes the proof as now J_1 is finitely generated and $J_k = J_1^k$ for all $k \geq 1$. \square

Lemma 65.15.3. *Let S be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, flat, and (locally) of finite type. Then X is Noetherian if and only if Y is Noetherian.*

Proof. Observe that a Noetherian affine formal algebraic space is adic^* , see Lemma 65.6.3. Thus by Lemma 65.15.2 we may assume that both X and Y are adic^* . We will use the criterion of Lemma 65.6.5 to see that the lemma holds. Namely, write $Y = \text{colim } Y_n$ as in Lemma 65.6.1. For each n set $X_n = Y_n \times_Y X$. Then X_n is an affine scheme (Lemma 65.14.7) and $X = \text{colim } X_n$. Each of the morphisms $X_n \rightarrow Y_n$ is faithfully flat and of finite type. Thus the lemma follows from the fact that in this situation X_n is Noetherian if and only if Y_n is Noetherian, see Algebra, Lemma 10.152.1 (to go down) and Algebra, Lemma 10.30.1 (to go up). \square

Lemma 65.15.4. *Let S be a scheme. Let $P \in \{\text{countably indexed, } \text{adic}^*, \text{Noetherian}\}$. Let X be a formal algebraic space over S . The following are equivalent*

- (1) if Y is an affine formal algebraic space and $f : Y \rightarrow X$ is representable by algebraic spaces and étale, then Y has property P ,
 (2) for some $\{X_i \rightarrow X\}_{i \in I}$ as in Definition 65.7.1 each X_i has property P .

Proof. It is clear that (1) implies (2). Assume (2) and let $Y \rightarrow X$ be as in (1). Since the fibre products $X_i \times_Y X$ are formal algebraic spaces (Lemma 65.10.2) we can pick coverings $\{X_{ij} \rightarrow X_i \times_X Y\}$ as in Definition 65.7.1. Since Y is quasi-compact, there exist $(i_1, j_1), \dots, (i_n, j_n)$ such that

$$X_{i_1 j_1} \amalg \dots \amalg X_{i_n j_n} \longrightarrow Y$$

is surjective. Then $X_{i_k j_k} \rightarrow X_{i_k}$ is representable by algebraic spaces and étale hence $X_{i_k j_k}$ has property P by Lemma 65.14.9. Then $X_{i_1 j_1} \amalg \dots \amalg X_{i_n j_n}$ is an affine formal algebraic space with property P (small detail omitted on finite disjoint unions of affine formal algebraic spaces). Hence we conclude by applying one of Lemmas 65.15.1, 65.15.2, and 65.15.3. \square

The previous lemma clears the way for the following definition.

Definition 65.15.5. Let S be a scheme. Let X be a formal algebraic space over S . We say X is *locally countably indexed*, *locally adic**, or *locally Noetherian* if the equivalent conditions of Lemma 65.15.4 hold for the corresponding property.

The formal completion of a locally Noetherian algebraic space along a closed is a locally Noetherian formal algebraic space.

Lemma 65.15.6. *Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $X_{/T}$ be the formal completion of X along T .*

- (1) *If $X \setminus T \rightarrow X$ is quasi-compact, then $X_{/T}$ is locally adic*.*
 (2) *If X is locally Noetherian, then $X_{/T}$ is locally Noetherian.*

Proof. Choose a surjective étale morphism $U \rightarrow X$ with $U = \coprod U_i$ a disjoint union of affine schemes, see Properties of Spaces, Lemma 48.6.1. Let $T_i \subset U_i$ be the inverse image of T . We have $X_{/T} \times_X U_i = (U_i)_{/T_i}$ (small detail omitted). Hence $\{(U_i)_{/T_i} \rightarrow X_{/T}\}$ is a covering as in Definition 65.7.1. Moreover, if $X \setminus T \rightarrow X$ is quasi-compact, so is $U_i \setminus T_i \rightarrow U_i$ and if X is locally Noetherian, so is U_i . Thus it suffices to prove the lemma in case X is affine.

Assume $X = \text{Spec}(A)$ is affine and $X \setminus T \rightarrow X$ is quasi-compact. Then there exists a finitely generated ideal $I = (f_1, \dots, f_r) \subset A$ cutting out T (Algebra, Lemma 10.28.1). If $Z = \text{Spec}(B)$ is an affine scheme and $g : Z \rightarrow X$ is a morphism with $g(Z) \subset T$ (set theoretically), then $g^\sharp(f_i)$ is nilpotent in B for each i . Thus I^n maps to zero in B for some n . Hence we see that $X_{/T} = \text{colim Spec}(A/I^n)$ and X is adic*.

Assume $X = \text{Spec}(A)$ is affine with A Noetherian. By the above we see that $X_{/T} = \text{Spf}(A^\wedge)$ where A^\wedge is the I -adic completion of A with respect to some ideal $I \subset A$. Then $X_{/T}$ is Noetherian because A^\wedge is so, see Algebra, Lemma 10.93.10. \square

65.16. Morphisms and continuous ring maps

In this section we denote $WAdm$ the category of weakly admissible topological rings and continuous ring homomorphisms. We define full subcategories

$$WAdm \supset WAdm^{\text{count}} \supset WAdm^{\text{adic}^*} \supset WAdm^{\text{Noeth}}$$

whose objects are

- (1) $WAdm^{count}$: those weakly admissible topological rings A which have a countable fundamental system of neighbourhoods of 0 ,
- (2) $WAdm^{adic^*}$: the adic topological rings which have a finitely generated ideal of definition, and
- (3) $WAdm^{Noeth}$: the adic topological rings which are Noetherian.

Clearly, the formal spectra of these types of rings are the basic building blocks of locally countably indexed, locally adic*, and locally Noetherian formal algebraic spaces.

We briefly review the relationship between morphisms of countably indexed, affine formal algebraic spaces and morphisms of $WAdm^{count}$. Let S be a scheme. Let X and Y be countably indexed, affine formal algebraic spaces. Write $X = Spf(A)$ and $Y = Spf(B)$ topological S -algebras A and B in $WAdm^{count}$, see Lemma 65.6.4. By Lemma 65.5.10 there is a 1-to-1 correspondence between morphisms $f : X \rightarrow Y$ and continuous maps

$$\varphi : B \longrightarrow A$$

of topological S -algebras. The relationship is given by $f \mapsto f^\#$ and $\varphi \mapsto Spf(\varphi)$.

Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally countably indexed formal algebraic spaces. Consider a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

with U and V affine formal algebraic spaces and $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale. By Definition 65.15.5 (and hence via Lemma 65.15.4) we see that U and V are countably indexed affine formal algebraic spaces. By the discussion in the previous paragraph we see that $U \rightarrow V$ is isomorphic to $Spf(\varphi)$ for some continuous map

$$\varphi : B \longrightarrow A$$

of topological S -algebras in $WAdm^{count}$.

Lemma 65.16.1. *Let $A \in \text{Ob}(WAdm)$. Let $A \rightarrow A'$ be a ring map (no topology). Let $(A')^\wedge = \lim_{I \subset A} w.i.d A'/IA'$ be the object of $WAdm$ constructed in Example 65.14.11.*

- (1) *If A is in $WAdm^{count}$, so is $(A')^\wedge$.*
- (2) *If A is in $WAdm^{adic^*}$, so is $(A')^\wedge$.*
- (3) *If A is in $WAdm^{Noeth}$ and A' is Noetherian, then $(A')^\wedge$ is in $WAdm^{Noeth}$.*

Proof. Part (1) is clear from the construction. Assume A has a finitely generated ideal of definition $I \subset A$. Then $I^n(A')^\wedge = \text{Ker}((A')^\wedge \rightarrow A'/I^n A')$ by Algebra, Lemmas 10.93.6 and 10.93.7. Thus $I(A')^\wedge$ is a finitely generated ideal of definition and we see that (2) holds. Finally, assume that A is Noetherian and adic. By (2) we know that $(A')^\wedge$ is adic. By Algebra, Lemma 10.93.10 we see that $(A')^\wedge$ is Noetherian. Hence (3) holds. □

Let P be a property of morphisms of $WAdm^{count}$. Consider commutative diagrams

$$(65.16.1.1) \quad \begin{array}{ccc} A & \longrightarrow & (A')^\wedge \\ \uparrow \varphi & & \uparrow \varphi' \\ B & \longrightarrow & (B')^\wedge \end{array}$$

satisfying the following conditions

- (1) A and B are objects of $WAdm^{count}$,
- (2) $A \rightarrow A'$ and $B \rightarrow B'$ are étale ring maps,
- (3) $(A')^\wedge = \lim A'/IA'$, resp. $(B')^\wedge = \lim B'/JB'$ where $I \subset A$, resp. $J \subset B$ runs through the weakly admissible ideals of definition of A , resp. B ,
- (4) $\varphi : A \rightarrow B$ and $\varphi' : (A')^\wedge \rightarrow (B')^\wedge$ are continuous.

By Lemma 65.16.1 the topological rings $(A')^\wedge$ and $(B')^\wedge$ are objects of $WAdm^{count}$. We say P is a *local property* if the following axioms hold:

- (1) for any diagram (65.16.1.1) we have $P(\varphi) \Rightarrow P(\varphi')$,
- (2) for any diagram (65.16.1.1) with $A \rightarrow A'$ faithfully flat we have $P(\varphi') \Rightarrow P(\varphi)$,
- (3) if $P(A \rightarrow B_i)$ for $i = 1, \dots, n$, then $P(A \rightarrow \prod_{i=1, \dots, n} B_i)$.

Axiom (3) makes sense as $WAdm^{count}$ has finite products.

Lemma 65.16.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally countably indexed formal algebraic spaces over S . Let P be a local property of morphisms of $WAdm^{count}$. The following are equivalent*

- (1) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

with U and V affine formal algebraic spaces, $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale, the morphism $U \rightarrow V$ corresponds to a morphism of $WAdm^{count}$ with property P ,

- (2) there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 and for each j a covering $\{X_{j_i} \rightarrow Y_j \times_Y X\}$ as in Definition 65.7.1 such that each $X_{j_i} \rightarrow Y_j$ corresponds to a morphism of $WAdm^{count}$ with property P , and
- (3) there exist a covering $\{X_i \rightarrow X\}$ as in Definition 65.7.1 and for each i a factorization $X_i \rightarrow Y_i \rightarrow Y$ where Y_i is an affine formal algebraic space, $Y_i \rightarrow Y$ is representable by algebraic spaces and étale, and $X_i \rightarrow Y_i$ corresponds to a morphism of $WAdm^{count}$ with property P .

Proof. It is clear that (1) implies (2) and that (2) implies (3). Assume $\{X_i \rightarrow X\}$ and $X_i \rightarrow Y_i \rightarrow Y$ as in (3) and let a diagram as in (1) be given. Since $Y_i \times_Y V$ is a formal algebraic space (Lemma 65.10.2) we may pick coverings $\{Y_{ij} \rightarrow Y_i \times_Y V\}$ as in Definition 65.7.1. For each (i, j) we may similarly choose coverings we can pick coverings $\{X_{ijk} \rightarrow Y_{ij} \times_{Y_i} X_i \times_X U\}$ as in Definition 65.7.1. Since U is quasi-compact we can choose $(i_1, j_1, k_1), \dots, (i_n, j_n, k_n)$ such that

$$X_{i_1 j_1 k_1} \amalg \dots \amalg X_{i_n j_n k_n} \longrightarrow U$$

is surjective. For $s = 1, \dots, n$ consider the commutative diagram

Let us say that P holds for a morphism of countably indexed affine formal algebraic spaces if it holds for the corresponding morphism of $WAdm^{count}$. Observe that the maps $X_{i_s j_s k_s} \rightarrow X_{i_s}$, $Y_{i_s j_s} \rightarrow Y_{i_s}$ are given by completions of étale ring maps, see Lemma 65.14.13. Hence we see that $P(X_{i_s} \rightarrow Y_{i_s})$ implies $P(X_{i_s j_s k_s} \rightarrow Y_{i_s j_s})$ by axiom (1). By axiom (2) (and the fact that identities are faithfully flat ring maps) we conclude that $P(X_{i_s j_s k_s} \rightarrow V)$ holds. By axiom (3) we find that $P(\coprod_{s=1, \dots, n} X_{i_s j_s k_s} \rightarrow V)$ holds. Since the morphism $\coprod X_{i_s j_s k_s} \rightarrow U$ is surjective by construction, the corresponding morphism of $WAdm^{count}$ is the completion of a faithfully flat étale ring map, see Lemma 65.14.14. One more application of axiom (2) implies that $P(U \rightarrow V)$ is true as desired. \square

Remark 65.16.3 (Variant for adic-star). Let P be a property of morphisms of $WAdm^{adic*}$. We say P is a *local property* if axioms (1), (2), (3), hold for diagrams (65.16.1.1) with φ a morphism of $WAdm^{adic*}$. In exactly the same way we obtain a variant of Lemma 65.16.2 for morphisms between locally adic* formal algebraic spaces over S .

Remark 65.16.4 (Variant for Noetherian). Let P be a property of morphisms of $WAdm^{Noeth}$. We say P is a *local property* if axioms (1), (2), (3), hold for diagrams (65.16.1.1) with φ a morphism of $WAdm^{Noeth}$. In exactly the same way we obtain a variant of Lemma 65.16.2 for morphisms between locally Noetherian formal algebraic spaces over S .

Lemma 65.16.5. *Let $B \rightarrow A$ be an arrow of $WAdm^{count}$. The following are equivalent*

- (a) $B \rightarrow A$ is taut (Definition 65.4.9),
- (b) for $B \supset J_1 \supset J_2 \supset J_3 \supset \dots$ a fundamental system of weak ideals of definitions there exist a commutative diagram

such that $A_{n+1}/J_n A_{n+1} = A_n$ and $A = \lim A_n$ as topological ring.

Moreover, these equivalent conditions define a local property, i.e., they satisfy axioms (1), (2), (3).

Proof. The equivalence of (a) and (b) is immediate. Below we will give an algebraic proof of the axioms, but it turns out we’ve already proven them. Namely, using Lemma 65.14.10 (a) and (b) translate to saying the corresponding morphism of

affine formal schemes is representable, and this condition is “étale local on the source and target” by Lemma 65.14.4.

Let a diagram (65.16.1.1) be given. By Example 65.14.11 the maps $A \rightarrow (A')^\wedge$ and $B \rightarrow (B')^\wedge$ satisfy (a) and (b).

Assume (a) and (b) hold for φ . Let $J \subset B$ be a weak ideal of definition. Then the closure of JA , resp. $J(B')^\wedge$ is a weak ideal of definition $I \subset A$, resp. $J' \subset (B')^\wedge$. Then the closure of $I(A')^\wedge$ is a weak ideal of definition $I' \subset (A')^\wedge$. A topological argument shows that I' is also the closure of $J(A')^\wedge$ and of $J'(A')^\wedge$. Finally, as J runs over a fundamental system of weak ideals of definition of B so do the ideals I and I' in A and $(A')^\wedge$. It follows that (a) holds for φ' . This proves (1).

Assume $A \rightarrow A'$ is faithfully flat and that (a) and (b) hold for φ' . Let $J \subset B$ be a weak ideal of definition. Using (a) and (b) for the maps $B \rightarrow (B')^\wedge \rightarrow (A')^\wedge$ we find that the closure I' of $J(A')^\wedge$ is a weak ideal of definition. In particular, I' is open and hence the inverse image of I' in A is open. Now we have (explanation below)

$$\begin{aligned} A \cap I' &= A \cap \bigcap (J(A')^\wedge + \text{Ker}((A')^\wedge \rightarrow A'/I_0A')) \\ &= A \cap \bigcap \text{Ker}((A')^\wedge \rightarrow A'/JA' + I_0A') \\ &= \bigcap (JA + I_0) \end{aligned}$$

which is the closure of JA by Lemma 65.4.2. The intersections are over weak ideals of definition $I_0 \subset A$. The first equality because a fundamental system of neighbourhoods of 0 in $(A')^\wedge$ are the kernels of the maps $(A')^\wedge \rightarrow A'/I_0A'$. The second equality is trivial. The third equality because $A \rightarrow A'$ is faithfully flat, see Algebra, Lemma 10.79.11. Thus the closure of JA is open. By Lemma 65.4.8 the closure of JA is a weak ideal of definition of A . Finally, given a weak ideal of definition $I \subset A$ we can find J such that $J(A')^\wedge$ is contained in the closure of $I(A')^\wedge$ by property (a) for $B \rightarrow (B')^\wedge$ and φ' . Thus we see that (a) holds for φ . This proves (2).

We omit the proof of (3). □

Lemma 65.16.6. *Let $P = \text{“taut”}$ viewed as a property of morphisms of $WAdm^{count}$. Then under the assumptions of Lemma 65.16.2 the equivalent conditions (1), (2), and (3) are also equivalent to the condition*

(4) *f is representable by algebraic spaces.*

Proof. Property P is a local property by Lemma 65.16.5. By Lemma 65.14.10 condition P on morphisms of $WAdm^{count}$ corresponds to “representable by algebraic spaces” for the corresponding morphisms of countably indexed affine formal algebraic spaces. Thus the lemma follows from Lemma 65.14.4. □

65.17. Adic morphisms

Suppose that $\varphi : A \rightarrow B$ is a continuous map between adic topological rings. One says φ is *adic* if there exists an ideal of definition $I \subset A$ such that the topology on B is I -adic. However, this is not a good notion unless we assume A has a finitely generated ideal of definition. In this case, the condition is equivalent to φ being taut, see Lemma 65.4.13.

Let P be the property of morphisms $\varphi : A \rightarrow B$ of $WAdm^{adic*}$ defined by

$$P(\varphi) = \text{“}\varphi \text{ is adic”} = \text{“}\varphi \text{ is taut”}$$

(see above for the equivalence). Since $WAdm^{adic*}$ is a full subcategory of $WAdm^{count}$ it follows trivially from Lemma 65.16.5 that P is a local property on morphisms of $WAdm^{adic*}$, see Remark 65.16.3. Combining Lemmas 65.16.2 and 65.16.6 we obtain the result stated in the next paragraph.

Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally adic* formal algebraic spaces over S . Then the following are equivalent

- (1) f is representable by algebraic spaces (in other words, the equivalent conditions of Lemma 65.14.4 hold),
- (2) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

with U and V affine formal algebraic spaces, $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale, the morphism $U \rightarrow V$ corresponds to an adic map in $WAdm^{adic*}$ (in other words, the equivalent conditions of Lemma 65.16.2 hold with P as above).

In this situation we will sometimes say that f is an *adic morphism*. Here it is understood that this notion is only defined for morphisms between formal algebraic spaces which are locally adic*.

Definition 65.17.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . Assume X and Y are locally adic*. We say f is an *adic morphism* if f is representable by algebraic spaces. See discussion above.

65.18. Morphisms of finite type

Due to how things are setup in the Stacks project, the following is really the correct thing to do and stronger notions should have a different name.

Definition 65.18.1. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of formal algebraic spaces over S .

- (1) We say f is *locally of finite type* if f is representable by algebraic spaces and is locally of finite type in the sense of Bootstrap, Definition 62.4.1.
- (2) We say f is of *finite type* if f is locally of finite type and quasi-compact (Definition 65.12.4).

We will discuss the relationship between finite type morphisms of certain formal algebraic spaces and continuous ring maps $A \rightarrow B$ which are topologically of finite type in Restricted Power Series, Section 66.3.

Lemma 65.18.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The following are equivalent*

- (1) f is of finite type,
- (2) f is representable by algebraic spaces and is of finite type in the sense of Bootstrap, Definition 62.4.1.

Proof. This follows from Bootstrap, Lemma 62.4.5, the implication “quasi-compact + locally of finite type \Rightarrow finite type” for morphisms of algebraic spaces, and Lemma 65.12.5. \square

Lemma 65.18.3. *The composition of finite type morphisms is of finite type. The same holds for locally of finite type.*

Proof. See Bootstrap, Lemma 62.4.3 and use Morphisms of Spaces, Lemma 49.23.2. \square

Lemma 65.18.4. *A base change of a finite type morphism is finite type. The same holds for locally of finite type.*

Proof. See Bootstrap, Lemma 62.4.2 and use Morphisms of Spaces, Lemma 49.23.3. \square

Lemma 65.18.5. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of formal algebraic spaces over S . If $g \circ f : X \rightarrow Z$ is locally of finite type, then $f : X \rightarrow Y$ is locally of finite type.*

Proof. By Lemma 65.14.3 we see that f is representable by algebraic spaces. Let T be a scheme and let $T \rightarrow Z$ be a morphism. Then we can apply Morphisms of Spaces, Lemma 49.23.6 to the morphisms $T \times_Z X \rightarrow T \times_Z Y \rightarrow T$ of algebraic spaces to conclude. \square

Being locally of finite type is local on the source and the target.

Lemma 65.18.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The following are equivalent:*

- (1) *the morphism f is locally of finite type,*
- (2) *there exists a commutative diagram*

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are formal algebraic spaces, the vertical arrows are representable by algebraic spaces and étale, $U \rightarrow X$ is surjective, and $U \rightarrow V$ is locally of finite type,

- (3) *for any commutative diagram*

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are formal algebraic spaces and vertical arrows representable by algebraic spaces and étale, the morphism $U \rightarrow V$ is locally of finite type,

- (4) *there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 and for each j a covering $\{X_{ji} \rightarrow Y_j \times_Y X\}$ as in Definition 65.7.1 such that $X_{ji} \rightarrow Y_j$ is locally of finite type for each j and i ,*

- (5) there exist a covering $\{X_i \rightarrow X\}$ as in Definition 65.7.1 and for each i a factorization $X_i \rightarrow Y_i \rightarrow Y$ where Y_i is an affine formal algebraic space, $Y_i \rightarrow Y$ is representable by algebraic spaces and étale, such that $X_i \rightarrow Y_i$ is locally of finite type, and
- (6) add more here.

Proof. In each of the 5 cases the morphism $f : X \rightarrow Y$ is representable by algebraic spaces, see Lemma 65.14.4. We will use this below without further mention.

It is clear that (1) implies (2) because we can take $U = X$ and $V = Y$. Conversely, assume given a diagram as in (2). Let T be a scheme and let $T \rightarrow Y$ be a morphism. Then we can consider

$$\begin{array}{ccc} U \times_Y T & \longrightarrow & V \times_Y T \\ \downarrow & & \downarrow \\ X \times_Y T & \longrightarrow & T \end{array}$$

The vertical arrows are étale and the top horizontal arrow is locally of finite type as base changes of such morphisms. Hence by Morphisms of Spaces, Lemma 49.23.4 we conclude that $X \times_Y T \rightarrow T$ is locally of finite type. In other words (1) holds.

Assume (1) is true and consider a diagram as in (3). Then $U \rightarrow Y$ is locally of finite type (as the composition $U \rightarrow X \rightarrow Y$, see Bootstrap, Lemma 62.4.3). Let T be a scheme and let $T \rightarrow V$ be a morphism. Then the projection $T \times_V U \rightarrow U$ factors as

$$T \times_V U = (T \times_Y U) \times_{(V \times_Y V)} V \rightarrow T \times_Y U \rightarrow U$$

The second arrow is locally of finite type (see above) and the first is the base change of the diagonal $V \rightarrow V \times_Y V$ which is locally of finite type by Lemma 65.10.4.

It is clear that (3) implies (2). Thus now (1) – (3) are equivalent.

Observe that the condition in (4) makes sense as the fibre product $Y_j \times_Y X$ is a formal algebraic space by Lemma 65.10.3. It is clear that (4) implies (5).

Assume $X_i \rightarrow Y_i \rightarrow Y$ as in (5). Then we set $V = \coprod Y_i$ and $U = \coprod X_i$ to see that (5) implies (2).

Finally, assume (1) – (3) are true. Thus we can choose any covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 and for each j any covering $\{X_{ji} \rightarrow Y_j \times_Y X\}$ as in Definition 65.7.1. Then $X_{ij} \rightarrow Y_j$ is locally of finite type by (3) and we see that (4) is true. This concludes the proof. \square

Example 65.18.7. Let S be a scheme. Let A be a weakly admissible topological ring over S . Let $A \rightarrow A'$ be a finite type ring map. Then

$$(A')^\wedge = \lim_{I \subset A \text{ w.i.d.}} A'/IA'$$

is a weakly admissible ring and the corresponding morphism $\mathrm{Spf}((A')^\wedge) \rightarrow \mathrm{Spf}(A)$ is representable, see Example 65.14.11. If $T \rightarrow \mathrm{Spf}(A)$ is a morphism where T is a quasi-compact scheme, then this factors through $\mathrm{Spec}(A/I)$ for some weak ideal of definition $I \subset A$ (Lemma 65.5.4). Then $T \times_{\mathrm{Spf}(A)} \mathrm{Spf}((A')^\wedge)$ is equal to $T \times_{\mathrm{Spec}(A/I)} \mathrm{Spec}(A'/IA')$ and we see that $\mathrm{Spf}((A')^\wedge) \rightarrow \mathrm{Spf}(A)$ is of finite type.

Lemma 65.18.8. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . If Y is locally Noetherian and f locally of finite type, then X is locally Noetherian.

Proof. Pick $\{Y_j \rightarrow Y\}$ and $\{X_{ij} \rightarrow Y_j \times_Y X\}$ as in Lemma 65.18.6. Then it follows from Lemma 65.14.8 that each X_{ij} is Noetherian. This proves the lemma. \square

Lemma 65.18.9. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of formal algebraic spaces over S . If Z is locally Noetherian and f locally of finite type, then $Z \times_Y X$ is locally Noetherian.*

Proof. The morphism $Z \times_Y X \rightarrow Z$ is locally of finite type by Lemma 65.18.4. Hence this follows from Lemma 65.18.8. \square

Lemma 65.18.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is locally of finite type. Let $T \subset |Y|$ be a closed subset and let $T' = |f|^{-1}(T) \subset |X|$. Then $X_{/T'} \rightarrow Y_{/T}$ is locally of finite type.*

Proof. Namely, suppose that $V \rightarrow Y$ is a morphism from a scheme into Y such that $|V|$ maps into T . In the proof of Lemma 65.9.4 we have seen that $V \times_Y X \rightarrow X$ is an algebraic space representing $V \times_{Y_{/T'}} X_{/T}$. Since $V \times_Y X \rightarrow V$ is locally of finite type (by Morphisms of Spaces, Lemma 49.23.3) we conclude. \square

65.19. Monomorphisms

Here is the definition.

Definition 65.19.1. Let S be a scheme. A morphism of formal algebraic spaces over S is called a *monomorphism* if it is an injective map of sheaves.

An example is the following. Let X be an algebraic space and let $T \subset |X|$ be a closed subset. Then the morphism $X_{/T} \rightarrow X$ from the formal completion of X along T to X is a monomorphism. In particular, monomorphisms of formal algebraic spaces are in general not representable.

65.20. Closed immersions

Here is the definition.

Definition 65.20.1. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of formal algebraic spaces over S . We say f is a *closed immersion* if f is representable by algebraic spaces and a closed immersion in the sense of Bootstrap, Definition 62.4.1.

Lemma 65.20.2. *Let S be a scheme. Let X be a McQuillan affine formal algebraic space over S . Let $f : Y \rightarrow X$ be a closed immersion of formal algebraic spaces over S . Then Y is a McQuillan affine formal algebraic space and f corresponds to a continuous homomorphism $A \rightarrow B$ of weakly admissible topological S -algebras which is taut, has closed kernel, and has dense image.*

Proof. Write $X = \text{Spf}(A)$ where A is a weakly admissible topological ring. Let I_λ be a fundamental system of weakly admissible ideals of definition in A . Then $Y \times_X \text{Spec}(A/I_\lambda)$ is a closed subscheme of $\text{Spec}(A/I_\lambda)$ and hence affine (Definition 65.20.1). Say $Y \times_X \text{Spec}(A/I_\lambda) = \text{Spec}(B_\lambda)$. The ring map $A/I_\lambda \rightarrow B_\lambda$ is surjective. Hence the projections

$$B = \lim B_\lambda \longrightarrow B_\lambda$$

are surjective as the compositions $A \rightarrow B \rightarrow B_\lambda$ are surjective. It follows that Y is McQuillan by Lemma 65.5.6. The ring map $A \rightarrow B$ is taut by Lemma 65.14.10. The kernel is closed because B is complete and $A \rightarrow B$ is continuous. Finally, as $A \rightarrow B_\lambda$ is surjective for all λ we see that the image of A in B is dense. \square

Even though we have the result above, in general we do not know how closed immersions behave when the target is a McQuillan affine formal algebraic space, see Restricted Power Series, Remark 66.3.4.

Example 65.20.3. Let S be a scheme. Let A be a weakly admissible topological ring over S . Let $K \subset A$ be a closed ideal. Setting

$$B = (A/K)^\wedge = \lim_{I \subset A \text{ w.i.d.}} A/(I + K)$$

the morphism $\mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ is representable, see Example 65.14.11. If $T \rightarrow \mathrm{Spf}(A)$ is a morphism where T is a quasi-compact scheme, then this factors through $\mathrm{Spec}(A/I)$ for some weak ideal of definition $I \subset A$ (Lemma 65.5.4). Then $T \times_{\mathrm{Spf}(A)} \mathrm{Spf}(B)$ is equal to $T \times_{\mathrm{Spec}(A/I)} \mathrm{Spec}(A/(K + I))$ and we see that $\mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ is a closed immersion. The kernel of $A \rightarrow B$ is K as K is closed, but beware that in general the ring map $A \rightarrow B = (A/K)^\wedge$ need not be surjective.

65.21. Separation axioms for morphisms

This section is the analogue of Morphisms of Spaces, Section 49.4 for morphisms of formal algebraic spaces.

Definition 65.21.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . Let $\Delta_{X/Y} : X \rightarrow X \times_Y X$ be the diagonal morphism.

- (1) We say f is *separated* if $\Delta_{X/Y}$ is a closed immersion.
- (2) We say f is *quasi-separated* if $\Delta_{X/Y}$ is quasi-compact.

Since $\Delta_{X/Y}$ is representable (by schemes) by Lemma 65.10.4 we can test this by considering morphisms $T \rightarrow X \times_Y X$ from affine schemes T and checking whether

$$E = T \times_{X \times_Y X} X \longrightarrow T$$

is quasi-compact or a closed immersion, see Lemma 65.12.5 or Definition 65.20.1. Note that the scheme E is the equalizer of two morphisms $a, b : T \rightarrow X$ which agree as morphisms into Y and that $E \rightarrow T$ is a monomorphism and locally of finite type.

Lemma 65.21.2. *All of the separation axioms listed in Definition 65.21.1 are stable under base change.*

Proof. Let $f : X \rightarrow Y$ and $Y' \rightarrow Y$ be morphisms of formal algebraic spaces. Let $f' : X' \rightarrow Y'$ be the base change of f by $Y' \rightarrow Y$. Then $\Delta_{X'/Y'}$ is the base change of $\Delta_{X/Y}$ by the morphism $X' \times_{Y'} X' \rightarrow X \times_Y X$. Each of the properties of the diagonal used in Definition 65.21.1 is stable under base change. Hence the lemma is true. \square

Lemma 65.21.3. *Let S be a scheme. Let $f : X \rightarrow Z$, $g : Y \rightarrow Z$ and $Z \rightarrow T$ be morphisms of formal algebraic spaces over S . Consider the induced morphism $i : X \times_Z Y \rightarrow X \times_T Y$. Then*

- (1) i is representable (by schemes), locally of finite type, locally quasi-finite, separated, and a monomorphism,
- (2) if $Z \rightarrow T$ is separated, then i is a closed immersion, and
- (3) if $Z \rightarrow T$ is quasi-separated, then i is quasi-compact.

Proof. By general category theory the following diagram

$$\begin{array}{ccc} X \times_Z Y & \xrightarrow{i} & X \times_T Y \\ \downarrow & & \downarrow \\ Z & \xrightarrow{\Delta_{Z/T}} & Z \times_T Z \end{array}$$

is a fibre product diagram. Hence i is the base change of the diagonal morphism $\Delta_{Z/T}$. Thus the lemma follows from Lemma 65.10.4. \square

Lemma 65.21.4. *All of the separation axioms listed in Definition 65.21.1 are stable under composition of morphisms.*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of formal algebraic spaces to which the axiom in question applies. The diagonal $\Delta_{X/Z}$ is the composition

$$X \rightarrow X \times_Y X \rightarrow X \times_Z X.$$

Our separation axiom is defined by requiring the diagonal to have some property \mathcal{P} . By Lemma 65.21.3 above we see that the second arrow also has this property. Hence the lemma follows since the composition of (representable) morphisms with property \mathcal{P} also is a morphism with property \mathcal{P} . \square

Lemma 65.21.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . Let \mathcal{P} be any of the separation axioms of Definition 65.21.1. The following are equivalent*

- (1) f is \mathcal{P} ,
- (2) for every scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is \mathcal{P} ,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is \mathcal{P} ,
- (4) for every affine scheme Z and every morphism $Z \rightarrow Y$ the formal algebraic space $Z \times_Y X$ is \mathcal{P} (see Definition 65.11.3),
- (5) there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 such that the base change $Y_j \times_Y X \rightarrow Y_j$ has \mathcal{P} for all j .

Proof. We will repeatedly use Lemma 65.21.2 without further mention. In particular, it is clear that (1) implies (2) and (2) implies (3).

Assume (3) and let $Z \rightarrow Y$ be a morphism where Z is an affine scheme. Let U, V be affine schemes and let $a : U \rightarrow Z \times_Y X$ and $b : V \rightarrow Z \times_Y X$ be morphisms. Then

$$U \times_{Z \times_Y X} V = (Z \times_Y X) \times_{\Delta, (Z \times_Y X) \times_Z (Z \times_Y X)} (U \times_Z V)$$

and we see that this is quasi-compact if \mathcal{P} = “quasi-separated” or an affine scheme equipped with a closed immersion into $U \times_Z V$ if \mathcal{P} = “separated”. Thus (4) holds.

Assume (4) and let $Z \rightarrow Y$ be a morphism where Z is an affine scheme. Let U, V be affine schemes and let $a : U \rightarrow Z \times_Y X$ and $b : V \rightarrow Z \times_Y X$ be morphisms. Reading the argument above backwards, we see that $U \times_{Z \times_Y X} V \rightarrow U \times_Z V$ is quasi-compact if \mathcal{P} = “quasi-separated” or a closed immersion if \mathcal{P} = “separated”. Since we can find an étale covering of $Z \times_Y X$ by U and V as above, we find that the corresponding morphisms

$$U \times_Z V \rightarrow (Z \times_Y X) \times_Z (Z \times_Y X)$$

form an étale covering by affines. Hence we conclude that $\Delta : (Z \times_Y X) \rightarrow (Z \times_Y X) \times_Z (Z \times_Y X)$ is quasi-compact, resp. a closed immersion. Thus (3) holds.

Let us prove that (3) implies (5). Assume (3) and let $\{Y_j \rightarrow Y\}$ be as in Definition 65.7.1. We have to show that the morphisms

$$\Delta_j : Y_j \times_Y X \longrightarrow (Y_j \times_Y X) \times_{Y_j} (Y_j \times_Y X) = Y_j \times_Y X \times_Y X$$

has the corresponding property (i.e., is quasi-compact or a closed immersion). Write $Y_j = \text{colim } Y_{j,\lambda}$ as in Definition 65.5.1. Replacing Y_j by $Y_{j,\lambda}$ in the formula above, we have the property by our assumption that (3) holds. Since the displayed arrow is the colimit of the arrows $\Delta_{j,\lambda}$ and since we can test whether Δ_j has the corresponding property by testing after base change by affine schemes mapping into $Y_j \times_Y X \times_Y X$, we conclude by Lemma 65.5.4.

Let us prove that (5) implies (1). Let $\{Y_j \rightarrow Y\}$ be as in (5). Then we have the fibre product diagram

$$\begin{array}{ccc} \coprod Y_j \times_Y X & \longrightarrow & X \\ \downarrow & & \downarrow \\ \coprod Y_j \times_Y X \times_Y X & \longrightarrow & X \times_Y X \end{array}$$

By assumption the left vertical arrow is quasi-compact or a closed immersion. It follows from Spaces, Lemma 47.5.6 that also the right vertical arrow is quasi-compact or a closed immersion. \square

65.22. Proper morphisms

Here is the definition we will use.

Definition 65.22.1. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of formal algebraic spaces over S . We say f is *proper* if f is representable by algebraic spaces and is proper in the sense of Bootstrap, Definition 62.4.1.

It follows from the definitions that a proper morphism is of finite type.

Lemma 65.22.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . The following are equivalent*

- (1) f is proper,
- (2) for every scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is proper,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is proper,
- (4) for every affine scheme Z and every morphism $Z \rightarrow Y$ the formal algebraic space $Z \times_Y X$ is an algebraic space proper over Z ,
- (5) there exists a covering $\{Y_j \rightarrow Y\}$ as in Definition 65.7.1 such that the base change $Y_j \times_Y X \rightarrow Y_j$ is proper for all j .

Proof. Omitted. \square

65.23. Formal algebraic spaces and fpqc coverings

This section is the analogue of Properties of Spaces, Section 48.14. Please read that section first.

Lemma 65.23.1. *Let S be a scheme. Let X be a formal algebraic space over S . Then X satisfies the sheaf property for the fpqc topology.*

Proof. The proof is **identical** to the proof of Properties of Spaces, Proposition 48.14.1. Since X is a sheaf for the Zariski topology it suffices to show the following. Given a surjective flat morphism of affines $f : T' \rightarrow T$ we have: $X(T)$ is the equalizer of the two maps $X(T') \rightarrow X(T' \times_T T')$. See Topologies, Lemma 33.8.13. Let $a, b : T \rightarrow X$ be two morphisms such that $a \circ f = b \circ f$. We have to show $a = b$. Consider the fibre product

$$E = X \times_{\Delta_{X/S}, X \times_S X, (a,b)} T.$$

By Lemma 65.7.3 the morphism $\Delta_{X/S}$ is a representable monomorphism. Hence $E \rightarrow T$ is a monomorphism of schemes. Our assumption that $a \circ f = b \circ f$ implies that $T' \rightarrow T$ factors (uniquely) through E . Consider the commutative diagram

$$\begin{array}{ccc} T' \times_T E & \longrightarrow & E \\ \downarrow & \nearrow & \downarrow \\ T' & \longrightarrow & T \end{array}$$

Since the projection $T' \times_T E \rightarrow T'$ is a monomorphism with a section we conclude it is an isomorphism. Hence we conclude that $E \rightarrow T$ is an isomorphism by Descent, Lemma 34.19.15. This means $a = b$ as desired.

Next, let $c : T' \rightarrow X$ be a morphism such that the two compositions $T' \times_T T' \rightarrow T' \rightarrow X$ are the same. We have to find a morphism $a : T \rightarrow X$ whose composition with $T' \rightarrow T$ is c . Choose a formal affine scheme U and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow |X_{red}|$ contains the image of $|c| : |T'| \rightarrow |X_{red}|$. This is possible by Definition 65.7.1, Properties of Spaces, Lemma 48.4.6, the fact that a finite union of formal affine algebraic spaces is a formal affine algebraic space, and the fact that $|T'|$ is quasi-compact (small argument omitted). The morphism $U \rightarrow X$ is representable by schemes (Lemma 65.5.11) and separated (Lemma 65.11.5). Thus

$$V = U \times_{X,c} T' \longrightarrow T'$$

is an étale and separated morphism of schemes. It is also surjective by our choice of $U \rightarrow X$ (if you do not want to argue this you can replace U by a disjoint union of formal affine algebraic spaces so that $U \rightarrow X$ is surjective everything else still works as well). The fact that $c \circ \text{pr}_0 = c \circ \text{pr}_1$ means that we obtain a descent datum on $V/T'/T$ (Descent, Definition 34.30.1) because

$$\begin{aligned} V \times_{T'} (T' \times_T T') &= U \times_{X, c \circ \text{pr}_0} (T' \times_T T') \\ &= (T' \times_T T') \times_{c \circ \text{pr}_1, X} U \\ &= (T' \times_T T') \times_{T'} V \end{aligned}$$

The morphism $V \rightarrow T'$ is ind-quasi-affine by More on Morphisms, Lemma 36.46.4 (because étale morphisms are locally quasi-finite, see Morphisms, Lemma 28.37.6). By More on Groupoids, Lemma 39.14.3 the descent datum is effective. Say $W \rightarrow T$

is a morphism such that there is an isomorphism $\alpha : T' \times_T W \rightarrow V$ compatible with the given descent datum on V and the canonical descent datum on $T' \times_T W$. Then $W \rightarrow T$ is surjective and étale (Descent, Lemmas 34.19.6 and 34.19.27). Consider the composition

$$b' : T' \times_T W \longrightarrow V = U \times_{X,c} T' \longrightarrow U$$

The two compositions $c' \circ (\text{pr}_0, 1), c' \circ (\text{pr}_1, 1) : (T' \times_T T') \times_T W \rightarrow T' \times_T W \rightarrow U$ agree by our choice of α and the corresponding property of c (computation omitted). Hence b' descends to a morphism $b : W \rightarrow U$ by Descent, Lemma 34.9.3. The diagram

$$\begin{array}{ccc} T' \times_T W & \longrightarrow & W & \xrightarrow{b} & U \\ \downarrow & & & & \downarrow \\ T' & \xrightarrow{c} & & & X \end{array}$$

is commutative. What this means is that we have proved the existence of a étale locally on T , i.e., we have an $a' : W \rightarrow X$. However, since we have proved uniqueness in the first paragraph, we find that this étale local solutions satisfy the glueing condition, i.e., we have $\text{pr}_0^* a' = \text{pr}_1^* a'$ as elements of $X(W \times_T W)$. Since X is an étale sheaf we find a unique $a \in X(T)$ restricting to a' on W . \square

65.24. Maps out of affine formal schemes

We prove a few results that will be useful later. In the paper [Bha14] the reader can find very general results of a similar nature.

Lemma 65.24.1. *Let S be a scheme. Let A be a weakly admissible topological S -algebra. Let X be an affine scheme over S . Then the natural map*

$$\text{Mor}_S(\text{Spec}(A), X) \longrightarrow \text{Mor}_S(\text{Spf}(A), X)$$

is bijective.

Proof. If X is affine, say $X = \text{Spec}(B)$, then we see from Lemma 65.5.10 that morphisms $\text{Spf}(A) \rightarrow \text{Spec}(B)$ correspond to continuous S -algebra maps $B \rightarrow A$ where B has the discrete topology. These are just S -algebra maps, which correspond to morphisms $\text{Spec}(A) \rightarrow \text{Spec}(B)$. \square

Lemma 65.24.2. *Let S be a scheme. Let A be a weakly admissible topological S -algebra such that A/I is a local ring for some weak ideal of definition $I \subset A$. Let X be a scheme over S . Then the natural map*

$$\text{Mor}_S(\text{Spec}(A), X) \longrightarrow \text{Mor}_S(\text{Spf}(A), X)$$

is bijective.

Proof. Let $\varphi : \text{Spf}(A) \rightarrow X$ be a morphism. Since $\text{Spec}(A/I)$ is local we see that φ maps $\text{Spec}(A/I)$ into an affine open $U \subset X$. However, this then implies that $\text{Spec}(A/J)$ maps into U for every ideal of definition J . Hence we may apply Lemma 65.24.1 to see that φ comes from a morphism $\text{Spec}(A) \rightarrow X$. This proves surjectivity of the map. We omit the proof of injectivity. \square

Lemma 65.24.3. *Let S be a scheme. Let R be a complete local Noetherian S -algebra. Let X be an algebraic space over S . Then the natural map*

$$\text{Mor}_S(\text{Spec}(R), X) \longrightarrow \text{Mor}_S(\text{Spf}(R), X)$$

is bijective.

Proof. Let \mathfrak{m} be the maximal ideal of R . We have to show that

$$\text{Mor}_S(\text{Spec}(R), X) \longrightarrow \lim \text{Mor}_S(\text{Spec}(R/\mathfrak{m}^n), X)$$

is bijective for R as above.

Injectivity: Let $x, x' : \text{Spec}(R) \rightarrow X$ be two morphisms mapping to the same element in the right hand side. Consider the fibre product

$$T = \text{Spec}(R) \times_{(x, x'), X \times_S X, \Delta} X$$

Then T is a scheme and $T \rightarrow \text{Spec}(R)$ is locally of finite type, monomorphism, separated, and locally quasi-finite, see Morphisms of Spaces, Lemma 49.4.1. In particular T is locally Noetherian, see Morphisms, Lemma 28.16.6. Let $t \in T$ be the unique point mapping to the closed point of $\text{Spec}(R)$ which exists as x and x' agree over R/\mathfrak{m} . Then $R \rightarrow \mathcal{O}_{T,t}$ is a local ring map of Noetherian rings such that $R/\mathfrak{m}^n \rightarrow \mathcal{O}_{T,t}/\mathfrak{m}^n \mathcal{O}_{T,t}$ is an isomorphism for all n (because x and x' agree over $\text{Spec}(R/\mathfrak{m}^n)$ for all n). Since $\mathcal{O}_{T,t}$ maps injectively into its completion (see Algebra, Lemma 10.49.4) we conclude that $R = \mathcal{O}_{T,t}$. Hence x and x' agree over R .

Surjectivity: Let (x_n) be an element of the right hand side. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Denote $x_0 : \text{Spec}(k) \rightarrow X$ the morphism induced on the residue field $k = R/\mathfrak{m}$. The morphism of schemes $U \times_{X, x_0} \text{Spec}(k) \rightarrow \text{Spec}(k)$ is surjective étale. Thus $U \times_{X, x_0} \text{Spec}(k)$ is a nonempty disjoint union of spectra of finite separable field extensions of k , see Morphisms, Lemma 28.37.7. Hence we can find a finite separable field extension $k \subset k'$ and a k' -point $u_0 : \text{Spec}(k') \rightarrow U$ such that

$$\begin{array}{ccc} \text{Spec}(k') & \xrightarrow{u_0} & U \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \xrightarrow{x_0} & X \end{array}$$

commutes. Let $R \subset R'$ be the finite étale extension of Noetherian complete local rings which induces $k \subset k'$ on residue fields (see Algebra, Lemmas 10.145.8 and 10.145.10). Denote x'_n the restriction of x_n to $\text{Spec}(R'/\mathfrak{m}^n R')$. By More on Morphisms of Spaces, Lemma 58.13.8 we can find an element $(u'_n) \in \lim \text{Mor}_S(\text{Spec}(R'/\mathfrak{m}^n R'), U)$ mapping to (x'_n) . By Lemma 65.24.2 the family (u'_n) comes from a unique morphism $u' : \text{Spec}(R') \rightarrow U$. Denote $x' : \text{Spec}(R') \rightarrow X$ the composition. Note that $R' \otimes_R R'$ is a finite product of spectra of Noetherian complete local rings to which our current discussion applies. Hence the diagram

$$\begin{array}{ccc} \text{Spec}(R' \otimes_R R') & \longrightarrow & \text{Spec}(R') \\ \downarrow & & \downarrow x' \\ \text{Spec}(R') & \xrightarrow{x'} & X \end{array}$$

is commutative by the injectivity shown above and the fact that x'_n is the restriction of x_n which is defined over R/\mathfrak{m}^n . Since $\{\text{Spec}(R') \rightarrow \text{Spec}(R)\}$ is an fppf covering we conclude that x' descends to a morphism $x : \text{Spec}(R) \rightarrow X$. We omit the proof that x_n is the restriction of x to $\text{Spec}(R/\mathfrak{m}^n)$. \square

Restricted Power Series

66.1. Introduction

In this chapter we discuss algebras topologically of finite type over pre-adic topological rings and their homomorphisms. Many of the results discussed here can be found in the paper [Elk73]. Other general references for this chapter are [DG67], [Abb10], and [FK].

66.2. Restricted power series

Let A be a topological ring complete with respect to a linear topology (More on Algebra, Definition 15.26.1). Let I_λ be a fundamental system of open ideals. Let $r \geq 0$ be an integer. In this setting one often denotes

$$A\{x_1, \dots, x_r\} = \lim_\lambda A/I_\lambda[x_1, \dots, x_r] = \lim_\lambda (A[x_1, \dots, x_r]/I_\lambda A[x_1, \dots, x_r])$$

endowed with the limit topology. In other words, this is the completion of the polynomial ring with respect to the ideals I_λ . We can think of elements of $A\{x_1, \dots, x_r\}$ as power series

$$f = \sum_{E=(e_1, \dots, e_r)} a_E x_1^{e_1} \dots x_r^{e_r}$$

in x_1, \dots, x_r with coefficients $a_E \in A$ which tend to zero in the topology of A . In other words, for any λ all but a finite number of a_E are in I_λ . For this reason elements of $A\{x_1, \dots, x_r\}$ are sometimes called *restricted power series*. Sometimes this ring is denoted $A\langle x_1, \dots, x_r \rangle$; we will refrain from using this notation.

Remark 66.2.1 (Universal property restricted power series). Let $A \rightarrow C$ be a continuous map of complete linearly topologized rings. Then any A -algebra map $A[x_1, \dots, x_r] \rightarrow C$ extends uniquely to a continuous map $A\{x_1, \dots, x_r\} \rightarrow C$ on restricted power series.

Remark 66.2.2. Let A be a ring and let $I \subset A$ be an ideal. If A is I -adically complete, then the I -adic completion $A[x_1, \dots, x_r]^\wedge$ of $A[x_1, \dots, x_r]$ is the restricted power series ring over A as a ring. However, it is not clear that $A[x_1, \dots, x_r]^\wedge$ is I -adically complete. We think of the topology on $A\{x_1, \dots, x_r\}$ as the limit topology (which is always complete) whereas we often think of the topology on $A[x_1, \dots, x_r]^\wedge$ as the I -adic topology (not always complete). If I is finitely generated, then $A\{x_1, \dots, x_r\} = A[x_1, \dots, x_r]^\wedge$ as topological rings, see Algebra, Lemmas 10.93.6 and 10.93.7.

66.3. Algebras topologically of finite type

Here is our definition. This definition is not generally agreed upon. Many authors impose further conditions, often because they are only interested in specific types of rings and not the most general case.

Definition 66.3.1. Let $A \rightarrow B$ be a continuous map of topological rings (More on Algebra, Definition 15.26.1). We say B is *topologically of finite type over A* if there exists an A -algebra map $A[x_1, \dots, x_n] \rightarrow B$ whose image is dense in B .

If A is a complete, linearly topologized ring, then the restricted power series ring $A\{x_1, \dots, x_r\}$ is topologically of finite type over A . For continuous taut maps of weakly admissible topological rings, this notion corresponds exactly to morphisms of finite type between the associated affine formal algebraic spaces.

Lemma 66.3.2. *Let S be a scheme. Let $\varphi : A \rightarrow B$ be a continuous map of weakly admissible topological rings over S . The following are equivalent*

- (1) $\mathrm{Spf}(\varphi) : \mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ is of finite type,
- (2) φ is taut and B is topologically of finite type over A .

Proof. We can use Formal Spaces, Lemma 65.14.10 to relate tautness of φ to representability of $\mathrm{Spf}(\varphi)$. We will use this without further mention below. Note that $X = \mathrm{colim} \mathrm{Spec}(A/I)$ and $Y = \mathrm{colim} \mathrm{Spec}(B/J(I))$ where $I \subset A$ runs over the weak ideals of definition of A and $J(I)$ is the closure of IB in B .

Assume (2). Choose a ring map $A[x_1, \dots, x_r] \rightarrow B$ whose image is dense. Then $A[x_1, \dots, x_r] \rightarrow B \rightarrow B/J(I)$ has dense image too which means that it is surjective. Therefore $B/J(I)$ is of finite type over A/I . Let $T \rightarrow X$ be a morphism with T a quasi-compact scheme. Then $T \rightarrow X$ factors through $\mathrm{Spec}(B/I)$ for some I (Formal Spaces, Lemma 65.5.4). Then $T \times_X Y = T \times_{\mathrm{Spec}(A/I)} \mathrm{Spec}(B/J(I))$, see proof of Formal Spaces, Lemma 65.14.10. Hence $T \times_Y X \rightarrow T$ is of finite type as the base change of the morphism $\mathrm{Spec}(B/J(I)) \rightarrow \mathrm{Spec}(A/I)$ which is of finite type. Thus (1) is true.

Assume (1). Pick any $I \subset A$ as above. Since $\mathrm{Spec}(A/I) \times_X Y = \mathrm{Spec}(B/J(I))$ we see that $A/I \rightarrow B/J(I)$ is of finite type. Choose $b_1, \dots, b_r \in B$ mapping to generators of $B/J(I)$ over A/I . We claim that the image of the ring map $A[x_1, \dots, x_r] \rightarrow B$ sending x_i to b_i is dense. To prove this, let $I' \subset I$ be a second weak ideal of definition. Then we have

$$B/(J(I') + IB) = B/J(I)$$

because $J(I)$ is the closure of IB and because $J(I')$ is open. Hence we may apply Algebra, Lemma 10.122.8 to see that $A/I'[x_1, \dots, x_r] \rightarrow B/J(I')$ is surjective. Thus (2) is true, concluding the proof. \square

Let A be a topological ring complete with respect to a linear topology. Let I_λ be a fundamental system of open ideals. Let \mathcal{C} be the category of systems (B_λ) where

- (1) B_λ is a finite type A/I_λ -algebra, and
- (2) $B_\mu \rightarrow B_\lambda$ is an A/I_μ -algebra homomorphism which induces an isomorphism $B_\mu/I_\lambda B_\mu \rightarrow B_\lambda$.

Morphisms in \mathcal{C} are given by systems of homomorphisms.

Lemma 66.3.3. *Let S be a scheme. Let X be an affine formal scheme over S . Assume X is McQuillan and let A be the weakly admissible topological ring associated to X . Then there is an anti-equivalence of categories between*

- (1) the category \mathcal{C} introduced above, and
- (2) the category of maps $Y \rightarrow X$ of finite type of affine formal algebraic spaces.

Proof. Let I_λ be a fundamental system of weakly admissible ideals of definition in A . Then $Y \times_X \text{Spec}(A/I_\lambda)$ is affine (Formal Spaces, Definition 65.18.1 and Lemma 65.14.7). Say $Y \times_X \text{Spec}(A/I_\lambda) = \text{Spec}(B_\lambda)$. Then (B_λ) is an object of \mathcal{C} . Conversely, given a system (B_λ) we can set $Y = \text{colim Spec}(B_\lambda)$. Some details omitted. \square

Remark 66.3.4. Let A be a weakly admissible topological ring and let I_λ be a fundamental system of weak ideals of definition. Let $X = \text{Spf}(A)$, in other words, X is a McQuillan affine formal algebraic space. Let $f : Y \rightarrow X$ be a morphism of affine formal algebraic spaces. In general it will not be true that Y is McQuillan. More specifically, we can ask the following questions:

- (1) Assume that $f : Y \rightarrow X$ is a closed immersion. Then Y is McQuillan and f corresponds to a continuous map $\varphi : A \rightarrow B$ of weakly admissible topological rings which is taut, whose kernel $K \subset A$ is a closed ideal, and whose image $\varphi(A)$ is dense in B , see Formal Spaces, Lemma 65.20.2. What conditions on A guarantee that $B = (A/K)^\wedge$ as in Formal Spaces, Example 65.20.3?
- (2) What conditions on A guarantee that closed immersions $f : Y \rightarrow X$ correspond to quotients A/K of A by closed ideals, in other words, the corresponding continuous map φ is surjective and open?
- (3) Suppose that $f : Y \rightarrow X$ is of finite type. Then we get $Y = \text{colim Spec}(B_\lambda)$ where (B_λ) is an object of \mathcal{C} by Lemma 66.3.3. In this case it is true that there exists a fixed integer r such that B_λ is generated by r elements over A/I_λ for all λ (hint: use Algebra, Lemma 10.122.8). However, it is not clear that the projections $\text{lim } B_\lambda \rightarrow B_\lambda$ are surjective, i.e., it is not clear that Y is McQuillan. Is there an example where Y is not McQuillan?
- (4) Suppose that $f : Y \rightarrow X$ is of finite type and Y is McQuillan. Then f corresponds to a continuous map $\varphi : A \rightarrow B$ of weakly admissible topological rings. In fact φ is taut and B is topologically of finite type over A , see Lemma 66.3.2. In other words, f factors as

$$Y \longrightarrow \mathbf{A}_X^r \longrightarrow X$$

where the first arrow is a closed immersion of McQuillan affine formal algebraic spaces. However, then questions (1) and (2) are in force for $Y \rightarrow \mathbf{A}_X^r$.

Below we will answer these questions when X is countably indexed, i.e., when A has a countable fundamental system of open ideals. If you have answers to these questions in greater generality, or if you have counter examples, please email stacks.project@gmail.com.

Lemma 66.3.5. *Let S be a scheme. Let X be a countably indexed affine formal algebraic space over S . Let $f : Y \rightarrow X$ be a closed immersion of formal algebraic spaces over S . Then Y is a countably indexed affine formal algebraic space and f corresponds to $A \rightarrow A/K$ where A is an object of $\text{WAdm}^{\text{count}}$ and $K \subset A$ is a closed ideal.*

Proof. we can use Formal Spaces, Lemmas 65.6.4, 65.14.8, and 65.20.2 to reduce to a morphism $A \rightarrow B$ of $\text{WAdm}^{\text{count}}$ which is taut and has dense image. To finish the proof we apply Formal Spaces, Lemma 65.4.12. \square

Lemma 66.3.6. *Let $B \rightarrow A$ be an arrow of $WAdm^{count}$, see Formal Spaces, Section 65.16. The following are equivalent*

- (a) $B \rightarrow A$ is taut and $B/J \rightarrow A/I$ is of finite type for every weak ideal of definition $J \subset B$ where $I \subset A$ is the closure of JA ,
- (b) $B \rightarrow A$ is taut and $B/J \rightarrow A/I$ is of finite type for some weak ideal of definition $J \subset B$ with $I \subset A$ the closure of JA ,
- (c) $B \rightarrow A$ is taut and A is topologically of finite type over B ,
- (d) A is isomorphic to a quotient of $B\{x_1, \dots, x_n\}$ by a closed ideal.

Moreover, these equivalent conditions define a local property, i.e., they satisfy Formal Spaces, Axioms (1), (2), (3).

Proof. The implications (a) \Rightarrow (b), (c) \Rightarrow (a), (d) \Rightarrow (c) are straightforward from the definitions. Assume (b) holds and let $J \subset B$ and $I \subset A$ be as in (b). Choose a commutative diagram

$$\begin{array}{ccccccc}
 A & \longrightarrow & \dots & \longrightarrow & A_3 & \longrightarrow & A_2 & \longrightarrow & A_1 \\
 \uparrow & & & & \uparrow & & \uparrow & & \uparrow \\
 B & \longrightarrow & \dots & \longrightarrow & B/J_3 & \longrightarrow & B/J_2 & \longrightarrow & B/J_1
 \end{array}$$

such that $A_{n+1}/J_n A_{n+1} = A_n$ and such that $A = \lim A_n$ as in Formal Spaces, Lemma 65.16.5. We may assume $J = J_1$ by replacing J_1 by $J_1 + J$ if necessary. Let $\alpha_1, \dots, \alpha_n \in A_1$ be generators of A_1 over $B/J_1 = B/J$. Since A is a countable limit of a system with surjective transition maps, we can find $a_1, \dots, a_n \in A$ mapping to $\alpha_1, \dots, \alpha_n$ in A_1 . By Remark 66.2.1 we find a continuous map $B\{x_1, \dots, x_n\} \rightarrow A$ mapping x_i to a_i . This map induces surjections $B/J_m[x_1, \dots, x_n] \rightarrow A_m$ by Algebra, Lemma 10.122.8. For $m \geq 1$ we obtain a short exact sequence

$$0 \rightarrow K_m \rightarrow B/J_m[x_1, \dots, x_n] \rightarrow A_m \rightarrow 0$$

The induced transition maps $K_{m+1} \rightarrow K_m$ are surjective because $A_{m+1}/J_m A_{m+1} = A_m$. Hence the inverse limit of these short exact sequences is exact, see Algebra, Lemma 10.83.4. Since $B\{x_1, \dots, x_n\} = \lim B/J_m[x_1, \dots, x_n]$ and $A = \lim A_m$ we conclude that $B\{x_1, \dots, x_n\} \rightarrow A$ is surjective. As A is complete the kernel is a closed ideal. In this way we see that (a), (b), (c), and (d) are equivalent.

Let a diagram as in Formal Spaces, Diagram (65.16.1.1) be given. By Formal Spaces, Example 65.18.7 the maps $A \rightarrow (A')^\wedge$ and $B \rightarrow (B')^\wedge$ satisfy (a), (b), (c), and (d). Moreover, by Formal Spaces, Lemma 65.16.5 in order to prove Formal Spaces, Axioms (1) and (2) we may assume both $A \rightarrow B$ and $(B')^\wedge \rightarrow (A')^\wedge$ are taut. Now pick a weak ideal of definition $J \subset B$. Let $J' \subset (B')^\wedge$, $I \subset A$, $I' \subset (A')^\wedge$ be the closure of $J(B')^\wedge$, JA , $J(A')^\wedge$. By what was said above, it suffices to consider the commutative diagram

$$\begin{array}{ccc}
 A/I & \longrightarrow & (A')^\wedge/I' \\
 \uparrow \bar{\varphi} & & \uparrow \bar{\varphi}' \\
 B/J & \longrightarrow & (B')^\wedge/J'
 \end{array}$$

and to show (1) $\bar{\varphi}$ finite type $\Rightarrow \bar{\varphi}'$ finite type, and (2) if $A \rightarrow A'$ is faithfully flat, then $\bar{\varphi}'$ finite type $\Rightarrow \bar{\varphi}$ finite type. Note that $(B')^\wedge/J' = B'/JB'$ and $(A')^\wedge/I' = A'/IA'$ by the construction of the topologies on $(B')^\wedge$ and $(A')^\wedge$. In particular

the horizontal maps in the diagram are étale. Part (1) now follows from Algebra, Lemma 10.6.2 and part (2) from Descent, Lemma 34.10.2 as the ring map $A/I \rightarrow (A')^\wedge/I' = A'/IA'$ is faithfully flat and étale.

We omit the proof of Formal Spaces, Axiom (3). □

Lemma 66.3.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of affine formal algebraic spaces. Assume Y countably indexed. The following are equivalent*

- (1) f is locally of finite type,
- (2) f is of finite type,
- (3) f corresponds to a morphism $B \rightarrow A$ of $WAdm^{count}$ satisfying the equivalent conditions of Lemma 66.3.6.

Proof. Since X and Y are affine it is clear that conditions (1) and (2) are equivalent. In cases (1) and (2) we see that X is countably indexed as well by Formal Spaces, Lemma 65.14.8. Write $X = \text{Spf}(A)$ and $Y = \text{Spf}(B)$ for topological S -algebras A and B in $WAdm^{count}$, see Formal Spaces, Lemma 65.6.4. By Formal Spaces, Lemma 65.5.10 we see that f corresponds to a continuous map $B \rightarrow A$. Hence now the result follows from Lemma 66.3.2. □

Lemma 66.3.8. *Let P be the property of morphisms of $WAdm^{count}$ defined by the equivalent conditions (a), (b), (c), and (d) of Lemma 66.3.6. Then under the assumptions of Formal Spaces, Lemma 65.16.2 the equivalent conditions (1), (2), and (3) are also equivalent to the condition*

- (4) f is locally of finite type.

Proof. By Lemma 66.3.7 the condition on morphisms of $WAdm^{count}$ translates into morphisms of countably indexed, affine formal algebraic spaces being of finite type. Thus the lemma follows from Formal Spaces, Lemma 65.18.6. □

66.4. Two categories

Let A be a ring and let $I \subset A$ be an ideal. In this section \wedge will mean I -adic completion. Set $A_n = A/I^n$ so that the I -adic completion of A is $A^\wedge = \lim A_n$. Let \mathcal{C} be the category

$$(66.4.0.1) \quad \mathcal{C} = \left\{ \begin{array}{l} \text{systems } (B_n, B_{n+1} \rightarrow B_n)_{n \in \mathbb{N}} \text{ where} \\ B_n \text{ is a finite type } A_n\text{-algebra,} \\ B_{n+1} \rightarrow B_n \text{ is an } A_{n+1}\text{-algebra map} \\ \text{which induces } B_{n+1}/I^n B_{n+1} \cong B_n \end{array} \right\}$$

Morphisms in \mathcal{C} are given by systems of homomorphisms. Let \mathcal{C}' be the category

$$(66.4.0.2) \quad \mathcal{C}' = \left\{ \begin{array}{l} A\text{-algebras } B \text{ which are } I\text{-adically complete} \\ \text{such that } B/IB \text{ is of finite type over } A/I \end{array} \right\}$$

Morphisms in \mathcal{C}' are A -algebra maps. There is a functor

$$(66.4.0.3) \quad \mathcal{C}' \longrightarrow \mathcal{C}, \quad B \longmapsto (B/I^n B)$$

Indeed, since B/IB is of finite type over A/I the ring maps $A_n = A/I^n \rightarrow B/I^n B$ are of finite type (apply Algebra, Lemma 10.19.1 to a ring map $A/I^n[x_1, \dots, x_r] \rightarrow B/I^n B$ such that the images of x_1, \dots, x_r generate B/IB over A/I).

Lemma 66.4.1. *Let A be a ring and let $I \subset A$ be a finitely generated ideal. The functor*

$$\mathcal{C} \longrightarrow \mathcal{C}', \quad (B_n) \longmapsto B = \lim B_n$$

is a quasi-inverse to (66.4.0.3). The completions $A[x_1, \dots, x_r]^\wedge$ are in \mathcal{C}' and any object of \mathcal{C}' is of the form

$$B = A[x_1, \dots, x_r]^\wedge / J$$

for some ideal $J \subset A[x_1, \dots, x_r]^\wedge$.

Proof. Let (B_n) be an object of \mathcal{C} . By Algebra, Lemma 10.94.1 we see that $B = \lim B_n$ is I -adically complete and $B/I^n B = B_n$. Hence we see that B is an object of \mathcal{C}' and that we can recover the object (B_n) by taking the quotients. Conversely, if B is an object of \mathcal{C}' , then $B = \lim B/I^n B$ by assumption. Thus $B \mapsto (B/I^n B)$ is a quasi-inverse to the functor of the lemma.

Since $A[x_1, \dots, x_r]^\wedge = \lim A_n[x_1, \dots, x_r]$ it is an object of \mathcal{C}' by the first statement of the lemma. Finally, let B be an object of \mathcal{C}' . Choose $b_1, \dots, b_r \in B$ whose images in B/IB generate B/IB as an algebra over A/I . Since B is I -adically complete, the A -algebra map $A[x_1, \dots, x_r] \rightarrow B, x_i \mapsto b_i$ extends to an A -algebra map $A[x_1, \dots, x_r]^\wedge \rightarrow B$. To finish the proof we have to show this map is surjective which follows from Algebra, Lemma 10.93.1 as our map $A[x_1, \dots, x_r] \rightarrow B$ is surjective modulo I and as $B = B^\wedge$. \square

We warn the reader that, in case A is not Noetherian, the quotient of an object of \mathcal{C}' may not be an object of \mathcal{C}' . See Examples, Lemma 82.7.1. Next we show this does not happen when A is Noetherian.

Lemma 66.4.2. *Let A be a Noetherian ring and let $I \subset A$ be an ideal. Then*

- (1) *every object of the category \mathcal{C}' , in particular the completion $A[x_1, \dots, x_r]^\wedge$, is Noetherian,*
- (2) *if B is an object of \mathcal{C}' and $J \subset B$ is an ideal, then B/J is an object of \mathcal{C}' .*

Proof. To see (1) by Lemma 66.4.1 we reduce to the case of the completion of the polynomial ring. This case follows from Algebra, Lemma 10.93.10 as $A[x_1, \dots, x_r]$ is Noetherian (Algebra, Lemma 10.30.1). Part (2) follows from Algebra, Lemma 10.93.2 which tells us that every finite B -module is IB -adically complete. \square

Remark 66.4.3 (Base change). Let $\varphi : A_1 \rightarrow A_2$ be a ring map and let $I_i \subset A_i$ be ideals such that $\varphi(I_1^c) \subset I_2$ for some $c \geq 1$. This induces ring maps $A_{1,cn} = A_1/I_1^{cn} \rightarrow A_2/I_2^n = A_{2,n}$ for all $n \geq 1$. Let \mathcal{C}_i be the category (66.4.0.1) for (A_i, I_i) . There is a base change functor

$$(66.4.3.1) \quad \mathcal{C}_1 \longrightarrow \mathcal{C}_2, \quad (B_n) \longmapsto (B_{cn} \otimes_{A_{1,cn}} A_{2,n})$$

Let \mathcal{C}'_i be the category (66.4.0.2) for (A_i, I_i) . If I_2 is finitely generated, then there is a base change functor

$$(66.4.3.2) \quad \mathcal{C}'_1 \longrightarrow \mathcal{C}'_2, \quad B \longmapsto (B \otimes_{A_1} A_2)^\wedge$$

because in this case the completion is complete (Algebra, Lemma 10.93.7). If both I_1 and I_2 are finitely generated, then the two base change functors agree via the functors (66.4.0.3) which are equivalences by Lemma 66.4.1.

Remark 66.4.4 (Base change by closed immersion). Let A be a Noetherian ring and $I \subset A$ an ideal. Let $\mathfrak{a} \subset A$ be an ideal. Denote $\bar{A} = A/\mathfrak{a}$. Let $\bar{I} \subset \bar{A}$ be an ideal such that $I^c \bar{A} \subset \bar{I}$ and $\bar{I}^d \subset I \bar{A}$ for some $c, d \geq 1$. In this case the base change functor (66.4.3.2) for (A, I) to (\bar{A}, \bar{I}) is given by $B \mapsto \bar{B} = B/\mathfrak{a}B$. Namely, we have

$$(66.4.4.1) \quad \bar{B} = (B \otimes_A \bar{A})^\wedge = (B/\mathfrak{a}B)^\wedge = B/\mathfrak{a}B$$

the last equality because any finite B -module is I -adically complete by Algebra, Lemma 10.93.2 and if annihilated by \mathfrak{a} also \bar{I} -adically complete by Algebra, Lemma 10.93.14.

66.5. A naive cotangent complex

Let A be a Noetherian ring and let $I \subset A$ be an ideal. Let B be an A -algebra which is I -adically complete such that $A/I \rightarrow B/IB$ is of finite type, i.e., an object of (66.4.0.2). By Lemma 66.4.2 we can write

$$B = A[x_1, \dots, x_r]^\wedge / J$$

for some finitely generated ideal J . For a choice of presentation as above we define the naive cotangent complex in this setting by the formula

$$(66.5.0.2) \quad NL_{B/A}^\wedge = (J/J^2 \rightarrow \bigoplus B dx_i)$$

with terms sitting in degrees -1 and 0 where the map sends the residue class of $g \in J$ to the differential $dg = \sum (\partial g / \partial x_i) dx_i$. Here the partial derivative is taken by thinking of g as a power series. The following lemma shows that $NL_{B/A}^\wedge$ is well defined in $D(B)$, i.e., independent of the chosen presentation, although this could be shown directly by comparing presentations as in Algebra, Section 10.129.

Lemma 66.5.1. *Let A be a Noetherian ring and let $I \subset A$ be an ideal. Let B be an object of (66.4.0.2). Then $NL_{B/A}^\wedge = R \lim NL_{B_n/A_n}$ in $D(B)$.*

Proof. In fact, the presentation $B = A[x_1, \dots, x_r]^\wedge / J$ defines presentations

$$B_n = B/I^n B = A_n[x_1, \dots, x_r] / J_n$$

where

$$J_n = JA_n[x_1, \dots, x_r] = J / (J \cap I^n A[x_1, \dots, x_r]^\wedge)$$

By Artin-Rees (Algebra, Lemma 10.49.2) in the Noetherian ring $A[x_1, \dots, x_r]^\wedge$ (Lemma 66.4.2) we see that we have canonical surjections

$$J/I^n J \rightarrow J_n \rightarrow J/I^{n-c} J, \quad n \geq c$$

for some $c \geq 0$. It follows that $\lim J_n/J_n^2 = J/J^2$ as any finite $A[x_1, \dots, x_r]^\wedge$ -module is I -adically complete (Algebra, Lemma 10.93.2). Thus

$$NL_{B/A}^\wedge = \lim (J_n/J_n^2 \rightarrow \bigoplus B_n dx_i)$$

(termwise limit) and the transition maps in the system are termwise surjective. The two term complex $J_n/J_n^2 \rightarrow \bigoplus B_n dx_i$ represents NL_{B_n/A_n} by Algebra, Section 10.129. It follows that $NL_{B/A}^\wedge$ represents $R \lim NL_{B_n/A_n}$ in the derived category by More on Algebra, Lemma 15.61.9. \square

Lemma 66.5.2. *Let A be a Noetherian ring and let $I \subset A$ be an ideal. Let $B \rightarrow C$ be a morphism of (66.4.0.2). Then there is an exact sequence*

$$\begin{array}{ccccccc}
 C \otimes_B H^0(NL_{B/A}^\wedge) & \longrightarrow & H^0(NL_{C/A}^\wedge) & \longrightarrow & H^0(NL_{C/B}^\wedge) & \longrightarrow & 0 \\
 & & & & \swarrow & & \\
 H^{-1}(NL_{B/A}^\wedge \otimes_B C) & \longrightarrow & H^{-1}(NL_{C/A}^\wedge) & \longrightarrow & H^{-1}(NL_{C/B}^\wedge) & &
 \end{array}$$

Proof. Choose a presentation $B = A[x_1, \dots, x_r]^\wedge/J$. Note that (B, IB) is a pair consisting of a Noetherian ring and an ideal, and C is in the corresponding category (66.4.0.2) for this pair. Hence we can choose a presentation $C = B[y_1, \dots, y_s]^\wedge/J'$. Combining these presentations gives a presentation

$$C = A[x_1, \dots, x_r, y_1, \dots, y_s]^\wedge/K$$

Then the reader verifies that we obtain a commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \bigoplus C dx_i & \longrightarrow & \bigoplus C dx_i \oplus \bigoplus C dy_j & \longrightarrow & \bigoplus C dy_j \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & J/J^2 \otimes_B C & \longrightarrow & K/K^2 & \longrightarrow & J'/(J')^2 \longrightarrow 0
 \end{array}$$

with exact rows. Note that the vertical arrow on the left hand side is the tensor product of the arrow defining $NL_{B/A}^\wedge$ with id_C . The lemma follows by applying the snake lemma (Algebra, Lemma 10.4.1). \square

Lemma 66.5.3. *With assumptions as in Lemma 66.5.2 assume that $B/I^n B \rightarrow C/I^n C$ is a local complete intersection homomorphism for all n . Then $H^{-1}(NL_{B/A}^\wedge \otimes_B C) \rightarrow H^{-1}(NL_{C/A}^\wedge)$ is injective.*

Proof. By More on Algebra, Lemma 15.23.6 we see that this holds for the map between naive cotangent complexes of the situation modulo I^n for all n . In other words, we obtain a distinguished triangle in $D(C/I^n C)$ for every n . Using Lemma 66.5.1 this implies the lemma; details omitted. \square

Maps in the derived category out of a complex such as (66.5.0.2) are easy to understand by the result of the following lemma.

Lemma 66.5.4. *Let R be a ring. Let M^\bullet be a complex of modules over R with $M^i = 0$ for $i > 0$ and M^0 a projective R -module. Let K^\bullet be a second complex.*

- (1) *If $K^i = 0$ for $i \leq -2$, then $\text{Hom}_{D(R)}(M^\bullet, K^\bullet) = \text{Hom}_{K(R)}(M^\bullet, K^\bullet)$,*
- (2) *If $K^i = 0$ for $i \leq -3$ and $\alpha \in \text{Hom}_{D(R)}(M^\bullet, K^\bullet)$ composed with $K^\bullet \rightarrow K^{-2}[2]$ comes from an R -module map $a : M^{-2} \rightarrow K^{-2}$ with $a \circ d_M^{-3} = 0$, then α can be represented by a map of complexes $a^\bullet : M^\bullet \rightarrow K^\bullet$ with $a^{-2} = a$.*
- (3) *In (2) for any second map of complexes $(a')^\bullet : M^\bullet \rightarrow K^\bullet$ representing α with $a = (a')^{-2}$ there exist $h' : M^0 \rightarrow K^{-1}$ and $h : M^{-1} \rightarrow K^{-2}$ such that*

$$h \circ d_M^{-2} = 0, \quad (a')^{-1} = a^{-1} + d_K^{-2} \circ h + h' \circ d_M^{-1}, \quad (a')^0 = a^0 + d_K^{-1} \circ h'$$

Proof. Set $F^0 = M^0$. Choose a free R -module F^{-1} and a surjection $F^{-1} \rightarrow M^{-1}$. Choose a free R -module F^{-2} and a surjection $F^{-2} \rightarrow M^{-2} \times_{M^{-1}} F^{-1}$. Continuing in this way we obtain a quasi-isomorphism $p^\bullet : F^\bullet \rightarrow M^\bullet$ which is termwise surjective and with F^i free for all i .

Proof of (1). By Derived Categories, Lemma 13.19.8 we have

$$\text{Hom}_{D(R)}(M^\bullet, K^\bullet) = \text{Hom}_{K(R)}(F^\bullet, K^\bullet)$$

If $K^i = 0$ for $i \leq -2$, then any morphism of complexes $F^\bullet \rightarrow K^\bullet$ factors through p^\bullet . Similarly, any homotopy $\{h^i : F^i \rightarrow K^{i-1}\}$ factors through p^\bullet . Thus (1) holds.

Proof of (2). Choose $b^\bullet : F^\bullet \rightarrow K^\bullet$ representing α . The composition of α with $K^\bullet \rightarrow K^{-2}[2]$ is represented by $b^{-2} : F^{-2} \rightarrow K^{-2}$. As this is homotopic to $a \circ p^{-2} : F^{-2} \rightarrow M^{-2} \rightarrow K^{-2}$, there is a map $h : F^{-1} \rightarrow K^{-2}$ such that $b^{-2} = a \circ p^{-2} + h \circ d_F^{-2}$. Adjusting b^\bullet by h viewed as a homotopy from F^\bullet to K^\bullet , we find that $b^{-2} = a \circ p^{-2}$. Hence b^{-2} factors through p^{-2} . Since $F^0 = M^0$ the kernel of p^{-2} surjects onto the kernel of p^{-1} (for example because the kernel of p^\bullet is an acyclic complex or by a diagram chase). Hence b^{-1} necessarily factors through p^{-1} as well and we see that (2) holds for these factorizations and $a^0 = b^0$.

Proof of (3) is omitted. Hint: There is a homotopy between $a^\bullet \circ p^\bullet$ and $(a')^\bullet \circ p^\bullet$ and we argue as before that this homotopy factors through p^\bullet . □

Lemma 66.5.5. *Let R be a ring. Let M^\bullet be a two term complex $M^{-1} \rightarrow M^0$ over R . If $\varphi, \psi \in \text{End}_{D(R)}(M^\bullet)$ are zero on $H^i(M^\bullet)$, then $\varphi \circ \psi = 0$.*

Proof. Apply Derived Categories, Lemma 13.12.5 to see that $\varphi \circ \psi$ factors through $\tau_{\leq -2} M^\bullet = 0$. □

66.6. Rig-étale homomorphisms

In this and some of the later sections we will study ring maps as in Lemma 66.6.1. Condition (4) is one of the conditions used in [Art70] to define modifications. Ring maps like this are sometimes called rig-étale or rigid-étale ring maps in the literature. These and the analogously defined rig-smooth ring maps were studied in [Elk73]. A detailed exposition can also be found in [Abb10]. Our main goal will be to show that rig-étale ring maps are completions of finite type algebras, a result very similar to results found in Elkik’s paper [Elk73].

Lemma 66.6.1. *Let A be a Noetherian ring and let $I \subset A$ be an ideal. Let B be an object of (66.4.0.2). The following are equivalent*

- (1) *there exists a $c \geq 0$ such that multiplication by a on $NL_{B/A}^\wedge$ is zero in $D(B)$ for all $a \in I^c$,*
- (2) *there exists a $c \geq 0$ such that $H^i(NL_{B/A}^\wedge)$, $i = -1, 0$ is annihilated by I^c ,*
- (3) *there exists a $c \geq 0$ such that $H^i(NL_{B_n/A_n})$, $i = -1, 0$ is annihilated by I^c for all $n \geq 1$,*
- (4) *$B = A[x_1, \dots, x_r]^\wedge / J$ and for every $a \in I$ there exists a $c \geq 0$ such that*
 - (a) *a^c annihilates $H^0(NL_{B/A}^\wedge)$, and*
 - (b) *there exist $f_1, \dots, f_r \in J$ such that $a^c J \subset (f_1, \dots, f_r) + J^2$.*

Proof. The equivalence of (1) and (2) follows from Lemma 66.5.5. The equivalence of (1) + (2) and (3) follows from Lemma 66.5.1. Some details omitted.

Assume the equivalent conditions (1), (2), (3) holds and let $B = A[x_1, \dots, x_r]^\wedge/J$ be a presentation (see Lemma 66.4.1). Let $a \in I$. Let c be such that multiplication by a^c is zero on $NL_{B/A}^\wedge$ which exists by (1). By Lemma 66.5.4 there exists a map $\alpha : \bigoplus Bdx_i \rightarrow J/J^2$ such that $d \circ \alpha$ and $\alpha \circ d$ are both multiplication by a^c . Let $f_i \in J$ be an element whose class modulo J^2 is equal to $\alpha(dx_i)$. Then we see that (4)(a), (b) hold.

Assume (4) holds. Say $I = (a_1, \dots, a_t)$. Let $c_i \geq 0$ be the integer such that (4)(a), (b) hold for $a_i^{c_i}$. Then we see that $I^{\sum c_i}$ annihilates $H^0(NL_{B/A}^\wedge)$. Let $f_{i,1}, \dots, f_{i,r} \in J$ be as in (4)(b) for a_i . Consider the composition

$$B^{\oplus r} \rightarrow J/J^2 \rightarrow \bigoplus Bdx_i$$

where the j th basis vector is mapped to the class of $f_{i,j}$ in J/J^2 . By (4)(a) and (b) the cokernel of the composition is annihilated by $a_i^{2c_i}$. Thus this map is surjective after inverting $a_i^{c_i}$, and hence an isomorphism (Algebra, Lemma 10.15.4). Thus the kernel of $B^{\oplus r} \rightarrow \bigoplus Bdx_i$ is a_i -power torsion, and hence $H^{-1}(NL_{B/A}^\wedge) = \text{Ker}(J/J^2 \rightarrow \bigoplus Bdx_i)$ is a_i -power torsion. Since B is Noetherian (Lemma 66.4.2), all modules including $H^{-1}(NL_{B/A}^\wedge)$ are finite. Thus $a_i^{d_i}$ annihilates $H^{-1}(NL_{B/A}^\wedge)$ for some $d_i \geq 0$. It follows that $I^{\sum d_i}$ annihilates $H^{-1}(NL_{B/A}^\wedge)$ and we see that (2) holds. \square

Lemma 66.6.2. *Let A be a Noetherian ring and let I be an ideal. Let B be a finite type A -algebra.*

- (1) *If $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$, then B^\wedge satisfies the equivalent conditions of Lemma 66.6.1.*
- (2) *If B^\wedge satisfies the equivalent conditions of Lemma 66.6.1, then there exists $g \in 1 + IB$ such that $\text{Spec}(B_g)$ is étale over $\text{Spec}(A) \setminus V(I)$.*

Proof. Assume B^\wedge satisfies the equivalent conditions of Lemma 66.6.1. The naive cotangent complex $NL_{B/A}$ is a complex of finite type B -modules and hence H^{-1} and H^0 are finite B -modules. Completion is an exact functor on finite B -modules (Algebra, Lemma 10.93.3) and $NL_{B^\wedge/A}^\wedge$ is the completion of the complex $NL_{B/A}$ (this is easy to see by choosing presentations). Hence the assumption implies there exists a $c \geq 0$ such that $H^{-1}/I^n H^{-1}$ and $H^0/I^n H^0$ are annihilated by I^c for all n . By Nakayama’s lemma (Algebra, Lemma 10.19.1) this means that $I^c H^{-1}$ and $I^c H^0$ are annihilated by an element of the form $g = 1 + x$ with $x \in IB$. After inverting g (which does not change the quotients $B/I^n B$) we see that $NL_{B/A}$ has cohomology annihilated by I^c . Thus $A \rightarrow B$ is étale at any prime of B not lying over $V(I)$ by the definition of étale ring maps, see Algebra, Definition 10.138.1.

Conversely, assume that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$. Then for every $a \in I$ there exists a $c \geq 0$ such that multiplication by a^c is zero $NL_{B/A}$. Since $NL_{B^\wedge/A}^\wedge$ is the derived completion of $NL_{B/A}$ (see Lemma 66.5.1) it follows that B^\wedge satisfies the equivalent conditions of Lemma 66.6.1. \square

Lemma 66.6.3. *Assume the map $(A_1, I_1) \rightarrow (A_2, I_2)$ is as in Remark 66.4.3 with A_1 and A_2 Noetherian. Let B_1 be in (66.4.0.2) for (A_1, I_1) . Let B_2 be the base change of B_1 . If multiplication by $f_1 \in B_1$ on NL_{B_1/A_1}^\wedge is zero in $D(B_1)$, then multiplication by the image $f_2 \in B_2$ on NL_{B_2/A_2}^\wedge is zero in $D(B_2)$.*

Proof. Choose a presentation $B_1 = A_1[x_1, \dots, x_r]^\wedge / J_1$. Since $A_2/I_2^n[x_1, \dots, x_r] = A_1/I_1^{cn}[x_1, \dots, x_r] \otimes_{A_1/I_1^{cn}} A_2/I_2^n$ we have

$$A_2[x_1, \dots, x_r]^\wedge = (A_1[x_1, \dots, x_r]^\wedge \otimes_{A_1} A_2)^\wedge$$

where we use I_2 -adic completion on both sides (but of course I_1 -adic completion for $A_1[x_1, \dots, x_r]^\wedge$). Set $J_2 = J_1 A_2[x_1, \dots, x_r]^\wedge$. Arguing similarly we get the presentation

$$\begin{aligned} B_2 &= (B_1 \otimes_{A_1} A_2)^\wedge \\ &= \lim \frac{A_1/I_1^{cn}[x_1, \dots, x_r]}{J_1(A_1/I_1^{cn}[x_1, \dots, x_r])} \otimes_{A_1/I_1^{cn}} A_2/I_2^n \\ &= \lim \frac{A_2/I_2^n[x_1, \dots, x_r]}{J_2(A_2/I_2^n[x_1, \dots, x_r])} \\ &= A_2[x_1, \dots, x_r]^\wedge / J_2 \end{aligned}$$

for B_2 over A_2 . Consider the commutative diagram

$$\begin{array}{ccc} NL_{B_1/A_1}^\wedge : & J_1/J_1^2 & \xrightarrow{d} \bigoplus B_1 dx_i \\ \downarrow & \downarrow & \downarrow \\ NL_{B_2/A_2}^\wedge : & J_2/J_2^2 & \longrightarrow \bigoplus B_2 dx_i \end{array}$$

The induced arrow $J_1/J_1^2 \otimes_{B_1} B_2 \rightarrow J_2/J_2^2$ is surjective because J_2 is generated by the image of J_1 . By Lemma 66.5.4 there is a map $\alpha_1 : \bigoplus B_1 dx_i \rightarrow J_1/J_1^2$ such that $f_1 \text{id}_{\bigoplus B_1 dx_i} = d \circ \alpha_1$ and $f_1 \text{id}_{J_1/J_1^2} = \alpha_1 \circ d$. We define $\alpha_2 : \bigoplus B_1 dx_i \rightarrow J_2/J_2^2$ by mapping dx_i to the image of $\alpha_1(dx_i)$ in J_2/J_2^2 . Because the image of the vertical arrows contains generators of the modules J_2/J_2^2 and $\bigoplus B_2 dx_i$ it follows that α_2 also defines a homotopy between multiplication by f_2 and the zero map. \square

Lemma 66.6.4. *Let A be a Noetherian ring and I an ideal. Let B be a finite type A -algebra. Let $B^\wedge \rightarrow C$ be a surjective ring map with kernel J . If J/J^2 is annihilated by I^c for some $c \geq 0$, then C is isomorphic to the completion of a finite type A -algebra.*

Proof. Since B^\wedge is Noetherian (Lemma 66.4.2), we see that J is a finitely generated ideal. Hence we conclude from Algebra, Lemma 10.20.5 that

$$\text{Spec}(C) \setminus V(IC) \longrightarrow \text{Spec}(B^\wedge) \setminus V(IB^\wedge)$$

is an open and closed immersion. Let $V \subset \text{Spec}(B^\wedge) \setminus V(IB^\wedge)$ be the complement of the image viewed as an open and closed subscheme. Let $Z \subset \text{Spec}(B^\wedge)$ be the scheme theoretic closure of V . Write $Z = \text{Spec}(C')$. Then

$$\text{Spec}(C \times C') = \text{Spec}(C) \amalg Z \longrightarrow \text{Spec}(B^\wedge)$$

is a finite morphism of schemes which is an isomorphism away from $V(IB^\wedge)$. Hence the corresponding ring map $B^\wedge \rightarrow C \times C'$ is finite and becomes an isomorphism on inverting any element of I . By More on Algebra, Proposition 15.63.15 and Remark 15.63.19 applied to $B \rightarrow B^\wedge$ and the finitely generated ideal IB , we conclude that $C \times C'$ is isomorphic to $D \otimes_B B^\wedge$ for some finite B -algebra D . (The reader can also prove this using Pushouts of Spaces, Lemma 59.4.1.) Then $D/ID \cong C/IC \times C'/IC'$. Let $\bar{e} \in D/ID$ be the idempotent corresponding to the factor C/IC . By More on Algebra, Lemma 15.6.9 there exists an étale ring map $B \rightarrow$

B' which induces an isomorphism $B/IB \rightarrow B'/IB'$ such that $D' = D \otimes_B B'$ contains an idempotent e lifting \bar{e} . Since $C \times C'$ is I -adically complete the pair $(C \times C', IC \times IC')$ is henselian (More on Algebra, Lemma 15.7.3). Thus we can factor the map $B \rightarrow C \times C'$ through B' . Doing so we may replace B by B' and D by D' . Then we find that $D = D_e \times D_{1-e} = D/(1-e) \times D/(e)$ is a product of finite type A -algebras and the completion of the first part is C and the completion of the second part is C' . \square

Lemma 66.6.5. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let B be a finite type A -algebra such that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$. Let C be a Noetherian A -algebra. Then any A -algebra map $B^\wedge \rightarrow C^\wedge$ of I -adic completions comes from a unique A -algebra map*

$$B \rightarrow C^h$$

where C^h is the henselization of the pair (C, IC) as in More on Algebra, Lemma 15.7.13. Moreover, any A -algebra homomorphism $B \rightarrow C^h$ factors through some étale C -algebra C' such that $C/IC \rightarrow C'/IC'$ is an isomorphism.

Proof. Uniqueness follows from the fact that C^h is a subring of C^\wedge , see for example More on Algebra, Lemma 15.7.16. The final assertion follows from the fact that C^h is the filtered colimit of these C -algebras C' , see proof of More on Algebra, Lemma 15.7.13. Having said this we now turn to the proof of existence.

Let $\varphi : B^\wedge \rightarrow C^\wedge$ be the given map. This defines a section

$$\sigma : (B \otimes_A C)^\wedge \rightarrow C^\wedge$$

of the completion of the map $C \rightarrow B \otimes_A C$. We may replace (A, I, B, C, φ) by $(C, IC, B \otimes_A C, C, \sigma)$. In this way we see that we may assume that $A = C$.

Proof of existence in the case $A = C$. In this case the map $\varphi : B^\wedge \rightarrow A^\wedge$ is necessarily surjective. By Lemmas 66.6.2 and 66.5.2 we see that the cohomology groups of $NL_{A^\wedge/\varphi B^\wedge}^\wedge$ are annihilated by a power of I . Since φ is surjective, this implies that $\text{Ker}(\varphi)/\text{Ker}(\varphi)^2$ is annihilated by a power of I . Hence $\varphi : B^\wedge \rightarrow A^\wedge$ is the completion of a finite type B -algebra $B \rightarrow D$, see Lemma 66.6.4. Hence $A \rightarrow D$ is a finite type algebra map which induces an isomorphism $A^\wedge \rightarrow D^\wedge$. By Lemma 66.6.2 we may replace D by a localization and assume that $A \rightarrow D$ is étale away from $V(I)$. Since $A^\wedge \rightarrow D^\wedge$ is an isomorphism, we see that $\text{Spec}(D) \rightarrow \text{Spec}(A)$ is also étale in a neighbourhood of $V(ID)$ (for example by More on Morphisms, Lemma 36.10.3). Thus $\text{Spec}(D) \rightarrow \text{Spec}(A)$ is étale. Therefore D maps to A^h and the lemma is proved. \square

66.7. Rig-étale morphisms

We can use the notion introduced in the previous section to define a new type of morphism of locally Noetherian formal algebraic spaces. Before we do so, we have to check it is a local property.

Lemma 66.7.1. *For morphisms $A \rightarrow B$ of the category $WAdm^{\text{Noeth}}$ consider the condition $P =$ “for some ideal of definition I of A the topology on B is the I -adic topology, the ring map $A/I \rightarrow B/IB$ is of finite type and $A \rightarrow B$ satisfies the equivalent conditions of Lemma 66.6.1”. Then P is a local property, see Formal Spaces, Remark 65.16.4.*

Proof. We have to show that Formal Spaces, Axioms (1), (2), and (3) hold for maps between Noetherian adic rings. For a Noetherian adic ring A with ideal of definition I we have $A\{x_1, \dots, x_r\} = A[x_1, \dots, x_r]^\wedge$ as topological A -algebras (see Remark 66.2.2). We will use without further mention that we know the axioms hold for the property “ B is a quotient of $A[x_1, \dots, x_r]^\wedge$ ”, see Lemma 66.3.6.

Let a diagram as in Formal Spaces, Diagram (65.16.1.1) be given with A and B in the category $WAdm^{Noeth}$. Pick an ideal of definition $I \subset A$. By the remarks above the topology on each ring in the diagram is the I -adic topology. Since $A \rightarrow A'$ and $B \rightarrow B'$ are étale we see that $NL_{(A')^\wedge/A}^\wedge$ and $NL_{(B')^\wedge/B}^\wedge$ are zero. By Lemmas 66.5.2 and 66.5.3 we get

$$H^i(NL_{(B')^\wedge/(A')^\wedge}^\wedge) \cong H^i(NL_{(B')^\wedge/A}^\wedge) \quad \text{and} \quad H^i(NL_{B/A}^\wedge \otimes_B (B')^\wedge) \cong H^i(NL_{(B')^\wedge/A}^\wedge)$$

for $i = -1, 0$. Since B is Noetherian the ring map $B \rightarrow B' \rightarrow (B')^\wedge$ is flat (Algebra, Lemma 10.93.3) hence the tensor product comes out. Moreover, as B is I -adically complete, then if $B \rightarrow B'$ is faithfully flat, so is $B \rightarrow (B')^\wedge$. From these observations Formal Spaces, Axioms (1) and (2) follow immediately.

We omit the proof of Formal Spaces, Axiom (3). □

Definition 66.7.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally Noetherian formal algebraic spaces over S . We say f is *rig-étale* if f satisfies the equivalent conditions of Formal Spaces, Lemma 65.16.2 (in the setting of locally Noetherian formal algebraic spaces, see Formal Spaces, Remark 65.16.3) for the property P of Lemma 66.7.1.

To be sure, a rig-étale morphism is locally of finite type.

Lemma 66.7.3. *A rig-étale morphism of locally Noetherian formal algebraic spaces is locally of finite type.*

Proof. The property P in Lemma 66.7.1 implies the equivalent conditions (a), (b), (c), and (d) in Lemma 66.3.6. Hence this follows from Lemma 66.3.8. □

66.8. Glueing rings along a principal ideal

In this situation we prove some results about the categories \mathcal{C} and \mathcal{C}' of Section 66.4 in case A is a Noetherian ring and $I = (a)$ is a principal ideal.

Remark 66.8.1 (Linear approximation). Let A be a ring and $I \subset A$ be a finitely generated ideal. Let C be an I -adically complete A -algebra. Let $\psi : A[x_1, \dots, x_r]^\wedge \rightarrow C$ be a continuous A -algebra map. Suppose given $\delta_i \in C$, $i = 1, \dots, r$. Then we can consider

$$\psi' : A[x_1, \dots, x_r]^\wedge \rightarrow C, \quad x_i \mapsto \psi(x_i) + \delta_i$$

see Remark 66.2.1. Then we have

$$\psi'(g) = \psi(g) + \sum \psi(\partial g / \partial x_i) \delta_i + \xi$$

with error term $\xi \in (\delta_i \delta_j)$. This follows by writing g as a power series and working term by term. Convergence is automatic as the coefficients of g tend to zero. Details omitted.

Lemma 66.8.2. *Let A be a Noetherian ring and $I = (a)$ a principal ideal. Let B be an objects of (66.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by a^c on $NL_{B/A}^\wedge$ is zero in $D(B)$. Let C be an I -adically complete A -algebra such that a is a nonzerodivisor on C . Let $n > 2c$. For any A_n -algebra map $\psi_n : B/a^n B \rightarrow C/a^n C$ there exists an A -algebra map $\varphi : B \rightarrow C$ such that $\psi_n \bmod a^{n-c} = \varphi \bmod a^{n-c}$.*

Proof. Choose a presentation $B = A[x_1, \dots, x_r]^\wedge / J$. Choose a lift

$$\psi : A[x_1, \dots, x_r]^\wedge \rightarrow C$$

of ψ_n . Then $\psi(J) \subset a^n C$ and $\psi(J^2) \subset a^{2n} C$ which determines a linear map

$$J/J^2 \rightarrow a^n C/a^{2n} C, \quad g \mapsto \psi(g)$$

By assumption and Lemma 66.5.4 there is a B -module map $\bigoplus B dx_i \rightarrow a^n C/a^{2n} C$, $dx_i \mapsto \delta_i$ such that $a^c \psi(g) = \sum \psi(\partial g / \partial x_i) \delta_i$ for all $g \in J$. Write $\delta_i = -a^c \delta'_i$ for some $\delta'_i \in a^{n-c} C$. Since a is a nonzerodivisor on C we see that $\psi(g) = -\sum \psi(\partial g / \partial x_i) \delta'_i$ in $C/a^{2n-c} C$. Then we look at the map

$$\psi' : A[x_1, \dots, x_r]^\wedge \rightarrow C, \quad x_i \mapsto \psi(x_i) + \delta'_i$$

A computation with power series (see Remark 66.8.1) shows that $\psi'(J) \subset a^{2n-2c} C$. Since $n > 2c$ we see that $n' = 2n - 2c = n + (n - 2c) > n$. Thus we obtain a morphism $\psi_{n'} : B/a^{n'} B \rightarrow C/a^{n'} C$ agreeing with ψ_n modulo a^{n-c} . Continuing in this fashion and taking the limit into $C = \lim C/a^t C$ we obtain the lemma. \square

Lemma 66.8.3. *Let A be a Noetherian ring and $I = (a)$ a principal ideal. Let B be an object of (66.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by a^c on $NL_{B/A}^\wedge$ is zero in $D(B)$. Let C be an I -adically complete A -algebra. Assume given an integer $d \geq 0$ such that $C[a^\infty] \cap a^d C = 0$. Let $n > \max(2c, c + d)$. For any A_n -algebra map $\psi_n : B/a^n B \rightarrow C/a^n C$ there exists an A -algebra map $\varphi : B \rightarrow C$ such that $\psi_n \bmod a^{n-c} = \varphi \bmod a^{n-c}$.*

If C is Noetherian we have $C[a^\infty] = C[a^e]$ for some $e \geq 0$. By Artin-Rees (Algebra, Lemma 10.49.2) there exists an integer f such that $a^n C \cap C[a^\infty] \subset a^{n-f} C[a^\infty]$ for all $n \geq f$. Then $d = e + f$ is an integer as in the lemma. This argument works in particular if C is an object of (66.4.0.2) by Lemma 66.4.2.

Proof. Let $C \rightarrow C'$ be the quotient of C by $C[a^\infty]$. The A -algebra C' is I -adically complete by Algebra, Lemma 10.93.15 and the fact that $\bigcap (C[a^\infty] + a^n C) = C[a^\infty]$ because for $n \geq d$ the sum $C[a^\infty] + a^n C$ is direct. For $m \geq d$ the diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & C[a^\infty] & \longrightarrow & C & \longrightarrow & C' \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & C[a^\infty] & \longrightarrow & C/a^m C & \longrightarrow & C'/a^m C' \longrightarrow 0 \end{array}$$

has exact rows. Thus C is the fibre product of C' and $C/a^m C$ over $C'/a^m C'$. Thus the lemma now follows formally from the lifting result of Lemma 66.8.2. \square

Lemma 66.8.4. *Let A be a Noetherian ring and $I = (a)$ a principal ideal. Let B be an object of (66.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by a^c on $NL_{B/A}^\wedge$ is zero in $D(B)$. Then there exists a finite type A -algebra C and an isomorphism $B \cong C^\wedge$.*

Proof. Choose a presentation $B = A[x_1, \dots, x_r]^\wedge / J$. By Lemma 66.5.4 we can find a map $\alpha : \bigoplus B dx_i \rightarrow J/J^2$ such that $d \circ \alpha$ and $\alpha \circ d$ are both multiplication by a^c . Pick an element $f_i \in J$ whose class modulo J^2 is equal to $\alpha(dx_i)$. Then we see that $df_i = a^c dx_i$ in $\bigoplus dx_i$. In particular we have a ring map

$$A[x_1, \dots, x_r]^\wedge / (f_1, \dots, f_r, \Delta(f_1, \dots, f_r) - a^{rc}) \longrightarrow B$$

where $\Delta(f_1, \dots, f_r) \in A[x_1, \dots, x_r]^\wedge$ is the determinant of the matrix of partial derivatives of the f_i .

Pick a large integer N . Pick $F_1, \dots, F_r \in A[x_1, \dots, x_r]$ such that $F_i - f_i \in I^N A[x_1, \dots, x_r]^\wedge$. Set

$$C = A[x_1, \dots, x_r, z] / (F_1, \dots, F_r, z\Delta(F_1, \dots, F_r) - a^{rc})$$

We claim that multiplication by a^{2rc} is zero on $NL_{C/A}$ in $D(C)$. Namely, the determinant of the matrix of the partial derivatives of the $r+1$ generators of the ideal of C with respect to the variables x_1, \dots, x_{r+1}, z is $\Delta(F_1, \dots, F_r)^2$. Since $\Delta(F_1, \dots, F_r)$ divides a^{rc} we in C the claim follows for example from Algebra, Lemma 10.14.4. Let C^\wedge be the I -adic completion of C . Since $NL_{C^\wedge/A}$ is the I -adic completion of $NL_{C/A}$ we conclude that multiplication by a^{2rc} is zero on $NL_{C^\wedge/A}$ as well.

By construction there is a (surjective) map $\psi_N : C/I^N C \rightarrow B/I^N B$ sending x_i to x_i and z to 1. By Lemma 66.8.3 (with the roles of B and C reversed) for N large enough we get a map $\varphi : C^\wedge \rightarrow B$ which agrees with ψ_N modulo I^{N-2rc} .

Since $\varphi : C^\wedge \rightarrow B$ is surjective modulo I we see that it is surjective (for example use Algebra, Lemma 10.93.1). By construction and assumption the naive cotangent complexes $NL_{C^\wedge/A}$ and $NL_{B/A}$ have cohomology annihilated by a fixed power of a . Thus the same thing is true for NL_{B/C^\wedge} by Lemma 66.5.2. Since φ is surjective we conclude that $\text{Ker}(\varphi)/\text{Ker}(\varphi)^2$ is annihilated by a power of a . The result of the lemma now follows from Lemma 66.6.4. \square

66.9. Glueing rings along an ideal

Let A be a Noetherian ring. Let $I \subset A$ be an ideal. In this section we study I -adically complete A -algebras which are, in some vague sense, étale over the complement of $V(I)$ in $\text{Spec}(A)$.

Lemma 66.9.1. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let t be the minimal number of generators for I . Let C be a Noetherian I -adically complete A -algebra. There exists an integer $d \geq 0$ depending only on $I \subset A \rightarrow C$ with the following property: given*

- (1) $c \geq 0$ and B in (66.4.0.2) such that for $a \in I^c$ multiplication by a on $NL_{B/A}$ is zero in $D(B)$,
- (2) an integer $n > 2t \max(c, d)$,
- (3) an A/I^n -algebra map $\psi_n : B/I^n B \rightarrow C/I^n C$,

there exists a map $\varphi : B \rightarrow C$ of A -algebras such that $\psi_n \bmod I^{m-c} = \varphi \bmod I^{m-c}$ with $m = \lfloor \frac{n}{t} \rfloor$.

Proof. We prove this lemma by induction on the number of generators of I . Say $I = (a_1, \dots, a_t)$. If $t = 0$, then $I = 0$ and there is nothing to prove. If $t = 1$,

then the lemma follows from Lemma 66.8.3 because $2 \max(c, d) \geq \max(2c, c + d)$. Assume $t > 1$.

Set $m = \lfloor \frac{n}{t} \rfloor$ as in the lemma. Set $\bar{A} = A/(a_t^m)$. Consider the ideal $\bar{I} = (\bar{a}_1, \dots, \bar{a}_{t-1})$ in \bar{A} . Set $\bar{C} = C/(a_t^m)$. Note that \bar{C} is a \bar{I} -adically complete Noetherian \bar{A} -algebra (use Algebra, Lemmas 10.93.2 and 10.93.14). Let \bar{d} be the integer for $\bar{I} \subset \bar{A} \rightarrow \bar{C}$ which exists by induction hypothesis.

Let $d_1 \geq 0$ be an integer such that $C[a_t^\infty] \cap a_t^{d_1} C = 0$ as in Lemma 66.8.3 (see discussion following the lemma and before the proof).

We claim the lemma holds with $d = \max(\bar{d}, d_1)$. To see this, let c, B, n, ψ_n be as in the lemma.

Note that $\bar{I} \subset I\bar{A}$. Hence by Lemma 66.6.3 multiplication by an element of \bar{I}^c on the cotangent complex of $\bar{B} = B/(a_t^m)$ is zero in $D(\bar{B})$. Also, we have

$$\bar{I}^{n-m+1} \supset I^n \bar{A}$$

Thus ψ_n gives rise to a map

$$\bar{\psi}_{n-m+1} : \bar{B}/\bar{I}^{n-m+1} \bar{B} \rightarrow \bar{C}/\bar{I}^{n-m+1} \bar{C}$$

Since $n > 2t \max(c, d)$ and $d \geq \bar{d}$ we see that

$$n - m + 1 \geq (t - 1)n/t > 2(t - 1) \max(c, d) \geq 2(t - 1) \max(c, \bar{d})$$

Hence we can find a morphism $\varphi_m : \bar{B} \rightarrow \bar{C}$ agreeing with $\bar{\psi}_{n-m+1}$ modulo the ideal $\bar{I}^{m'-c}$ where $m' = \lfloor \frac{n-m+1}{t-1} \rfloor$.

Since $m \geq n/t > 2 \max(c, d) \geq 2 \max(c, d_1) \geq \max(2c, c + d_1)$, we can apply Lemma 66.8.3 for the ring map $A \rightarrow B$ and the ideal (a_t) to find a morphism $\varphi : B \rightarrow C$ agreeing modulo a_t^{m-c} with φ_m .

All in all we find $\varphi : B \rightarrow C$ which agrees with ψ_n modulo

$$(a_t^{m-c}) + (a_1, \dots, a_{t-1})^{m'-c} \subset I^{\min(m-c, m'-c)}$$

We leave it to the reader to see that $\min(m - c, m' - c) = m - c$. This concludes the proof. \square

Lemma 66.9.2. *Let A be a Noetherian ring and $I \subset A$ an ideal. Let $J \subset A$ be a nilpotent ideal. Consider a diagram*

$$\begin{array}{ccc} C & \longrightarrow & C/JC \\ \uparrow & & \uparrow \\ & & B_0 \\ \uparrow & & \uparrow \\ A & \longrightarrow & A/J \end{array}$$

whose vertical arrows are of finite type such that

- (1) $\text{Spec}(C) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$,
- (2) $\text{Spec}(B_0) \rightarrow \text{Spec}(A/J)$ is étale over $\text{Spec}(A/J) \setminus V((I + J)/J)$, and
- (3) $B_0 \rightarrow C/JC$ is étale and induces an isomorphism $B_0/IB_0 = C/(I + J)C$.

Then we can fill in the diagram

$$\begin{array}{ccc}
 C & \longrightarrow & C/JC \\
 \uparrow & & \uparrow \\
 B & \longrightarrow & B_0 \\
 \uparrow & & \uparrow \\
 A & \longrightarrow & A/J
 \end{array}$$

with $A \rightarrow B$ of finite type, $B/JB = B_0$, $B \rightarrow C$ étale, and $\text{Spec}(B) \rightarrow \text{Spec}(A)$ étale over $\text{Spec}(A) \setminus V(I)$.

Proof. By induction on the smallest n such that $J^n = 0$ we reduce to the case $J^2 = 0$. Denote by a subscript zero the base change of objects to $A_0 = A/J$. Since $J^2 = 0$ we see that JC is a C_0 -module.

Consider the canonical map

$$\gamma : J \otimes_{A_0} C_0 \longrightarrow JC$$

Since $\text{Spec}(C) \rightarrow \text{Spec}(A)$ is étale over the complement of $V(I)$ (and hence flat) we see that γ is an isomorphism away from $V(IC_0)$, see More on Morphisms, Lemma 36.8.1. In particular, the kernel and cokernel of γ are annihilated by a power of I (use that C_0 is Noetherian and that the modules in question are finite). Observe that $J \otimes_{A_0} C_0 = (J \otimes_{A_0} B_0) \otimes_{B_0} C_0$. Hence by More on Algebra, Lemma 15.63.16 there exists a unique B_0 -module homomorphism

$$c : J \otimes_{A_0} B_0 \rightarrow N$$

with $c \otimes \text{id}_{C_0} = \gamma$ and $\text{Ker}(\gamma) = \text{Ker}(c)$ and $\text{Coker}(\gamma) = \text{Coker}(c)$. Moreover, N is a finite B_0 -module, see More on Algebra, Remark 15.63.19.

Choose a presentation $B_0 = A[x_1, \dots, x_r]/K$. To construct B we try to find the dotted arrow m fitting into the following pushout diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & N & \xrightarrow{\dots\dots\dots} & B & \xrightarrow{\dots\dots\dots} & B_0 \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \parallel \\
 0 & \longrightarrow & K/K^2 & \longrightarrow & A[x_1, \dots, x_r]/K^2 & \longrightarrow & A[x_1, \dots, x_r]/K \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \\
 & & J \otimes_{A_0} B_0 & & & &
 \end{array}$$

(Note: A curved arrow labeled c points from $J \otimes_{A_0} B_0$ to N , and a dotted arrow labeled m points from $J \otimes_{A_0} B_0$ to N .)

where the curved arrow is the map c constructed above and the map $J \otimes_{A_0} B_0 \rightarrow K/K^2$ is the obvious one.

As $B_0 \rightarrow C_0$ is étale we can write $C_0 = B_0[y_1, \dots, y_r]/(g_{0,1}, \dots, g_{0,r})$ such that the determinant of the partial derivatives of the $g_{0,j}$ is invertible in C_0 , see Algebra, Lemma 10.138.2. We combine this with the chosen presentation of B_0 to get a presentation $C_0 = A[x_1, \dots, x_r, y_1, \dots, y_s]/L$. Choose a lift $\psi : A[x_i, y_j] \rightarrow C$ of

the map to C_0 . Then it is the case that C fits into the diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & JC & \longrightarrow & C & \longrightarrow & C_0 \longrightarrow 0 \\
 & & \uparrow \mu & & \uparrow & & \parallel \\
 0 & \longrightarrow & L/L^2 & \longrightarrow & A[x_i, y_j]/L^2 & \longrightarrow & A[x_i, y_j]/L \longrightarrow 0 \\
 & & \uparrow & & & & \\
 & & J \otimes_{A_0} C_0 & & & &
 \end{array}$$

where the curved arrow is the map γ constructed above and the map $J \otimes_{A_0} C_0 \rightarrow L/L^2$ is the obvious one. By our choice of presentations and the fact that C_0 is a complete intersection over B_0 we have

$$L/L^2 = K/K^2 \otimes_{B_0} C_0 \oplus \bigoplus C_0 g_j$$

where $g_j \in L$ is any lift of $g_{0,j}$, see More on Algebra, Lemma 15.23.6.

Consider the three term complex

$$K^\bullet : J \otimes_{A_0} B_0 \rightarrow K/K^2 \rightarrow \bigoplus B_0 dx_i$$

where the second arrow is the differential in the naive cotangent complex of B_0 over A for the given presentation and the last term is placed in degree 0. Since $\text{Spec}(B_0) \rightarrow \text{Spec}(A_0)$ is étale away from $V(I)$ the cohomology modules of this complex are supported on $V(IB_0)$. Namely, for $a \in I$ after inverting a we can apply More on Algebra, Lemma 15.23.6 for the ring maps $A_a \rightarrow A_{0,a} \rightarrow B_{0,a}$ and use that $NL_{A_{0,a}/A_a} = J_a$ and $NL_{B_{0,a}/A_{0,a}} = 0$ (some details omitted). Hence these cohomology groups are annihilated by a power of I .

Similarly, consider the three term complex

$$L^\bullet : J \otimes_{A_0} C_0 \rightarrow L/L^2 \rightarrow \bigoplus C_0 dx_i \oplus \bigoplus C_0 dy_j$$

By our direct sum decomposition of L/L^2 above and the fact that the the determinant of the partial derivatives of the $g_{0,j}$ is invertible in C_0 we see that the natural map $K^\bullet \rightarrow L^\bullet$ induces a quasi-isomorphism

$$K^\bullet \otimes_{B_0} C_0 \longrightarrow L^\bullet$$

Applying Dualizing Complexes, Lemma 43.8.14 we find that

$$(66.9.2.1) \quad \text{Hom}_{D(B_0)}(K^\bullet, E) = \text{Hom}_{D(C_0)}(L^\bullet, E \otimes_{B_0} C_0)$$

for any object $E \in D(B_0)$.

The maps $\text{id}_{J \otimes_{A_0} C_0}$ and μ define an element in

$$\text{Hom}_{D(C_0)}(L^\bullet, (J \otimes_{A_0} C_0 \rightarrow JC))$$

(the target two term complex is placed in degree -2 and -1) such that the composition with the map to $J \otimes_{A_0} C_0[2]$ is the element in $\text{Hom}_{D(C_0)}(L^\bullet, J \otimes_{A_0} C_0[2])$ corresponding to $\text{id}_{J \otimes_{A_0} C_0}$. Picture

$$\begin{array}{ccccc}
 J \otimes_{A_0} C_0 & \longrightarrow & L/L^2 & \longrightarrow & \bigoplus C_0 dx_i \oplus \bigoplus C_0 dy_j \\
 \text{id}_{J \otimes_{A_0} C_0} \downarrow & & \downarrow \mu & & \\
 J \otimes_{A_0} C_0 & \xrightarrow{\gamma} & JC & &
 \end{array}$$

Applying (66.9.2.1) we obtain a unique element

$$\xi \in \text{Hom}_{D(B_0)}(K^\bullet, (J \otimes_{A_0} B_0 \rightarrow N))$$

Its composition with the map to $J \otimes_{A_0} B_0[2]$ is the element in $\text{Hom}_{D(C_0)}(K^\bullet, J \otimes_{A_0} B_0[2])$ corresponding to $\text{id}_{J \otimes_{A_0} B_0}$. By Lemma 66.5.4 we can find a map of complexes $K^\bullet \rightarrow (J \otimes_{A_0} B_0 \rightarrow N)$ representing ξ and equal to $\text{id}_{J \otimes_{A_0} B_0}$ in degree -2 . Denote $m : K/K^2 \rightarrow N$ the degree -1 part of this map. Picture

$$\begin{array}{ccccc} J \otimes_{A_0} B_0 & \longrightarrow & K/K^2 & \longrightarrow & \bigoplus B_0 dx_i \\ \text{id}_{J \otimes_{A_0} B_0} \downarrow & & \downarrow m & & \\ J \otimes_{A_0} B_0 & \xrightarrow{c} & N & & \end{array}$$

Thus we can use m to create an algebra B by push out as explained above. However, we may still have to change m a bit to make sure that B maps to C in the correct manner.

Denote $m \otimes \text{id}_{C_0} \oplus 0 : L/L^2 \rightarrow JC$ the map coming from the direct sum decomposition of L/L^2 (see above), using that $N \otimes_{B_0} C_0 = JC$, and using 0 on the second factor. By our choice of m above the maps of complexes $(\text{id}_{J \otimes_{A_0} C_0}, \mu, 0)$ and $(\text{id}_{J \otimes_{A_0} C_0}, m \otimes \text{id}_{C_0} \oplus 0, 0)$ define the same element of $\text{Hom}_{D(C_0)}(L^\bullet, (J \otimes_{A_0} C_0 \rightarrow JC))$. By Lemma 66.5.4 there exist maps $h : L^{-1} \rightarrow J \otimes_{A_0} C_0$ and $h' : L^0 \rightarrow JC$ which define a homotopy between $(\text{id}_{J \otimes_{A_0} C_0}, \mu, 0)$ and $(\text{id}_{J \otimes_{A_0} C_0}, m \otimes \text{id}_{C_0} \oplus 0, 0)$. Picture

$$\begin{array}{ccccc} J \otimes_{A_0} C_0 & \longrightarrow & K/K^2 \otimes_{B_0} C_0 \oplus \bigoplus C_0 g_j & \longrightarrow & \bigoplus C_0 dx_i \oplus \bigoplus C_0 dy_j \\ \text{id}_{J \otimes_{A_0} C_0} \downarrow & \nearrow h & \downarrow \mu \downarrow m \otimes \text{id}_{C_0} \oplus 0 & \searrow h' & \\ J \otimes_{A_0} C_0 & \xrightarrow{\gamma} & JC & & \end{array}$$

Since h precomposed with d_L^{-2} is zero it defines an element in $\text{Hom}_{D(C_0)}(L^\bullet, J \otimes_{A_0} C_0[1])$ which comes from a unique element χ of $\text{Hom}_{D(B_0)}(K^\bullet, J \otimes_{A_0} B_0[1])$ by (66.9.2.1). Applying Lemma 66.5.4 again we represent χ by a map $g : K/K^2 \rightarrow J \otimes_{A_0} B_0$. Then the base change $g \otimes \text{id}_{C_0}$ and h differ by a homotopy $h'' : L^0 \rightarrow J \otimes_{A_0} C$. Hence if we modify m into $m + c \circ g$, then we find that $m \otimes \text{id}_{C_0} \oplus 0$ and μ just differ by a map $h' : L^0 \rightarrow JC$.

Changing our choice of the map $\psi : A[x_i, y_j] \rightarrow C$ by sending x_i to $\psi(x_i) + h'(dx_i)$ and sending y_j to $\psi(y_j) + h'(dy_j)$, we find a commutative diagram

$$\begin{array}{ccc} N & \longrightarrow & JC \\ \uparrow m & & \uparrow \mu \\ K/K^2 & \longrightarrow & L/L^2 \\ \uparrow c & & \uparrow \gamma \\ J \otimes_{A_0} B_0 & \longrightarrow & J \otimes_{A_0} C_0 \end{array}$$

At this point we can define B as the pushout in the first commutative diagram of the proof. The commutativity of the diagram just displayed, shows that there is an A -algebra map $B \rightarrow C$ compatible with the given map $N = JB \rightarrow JC$. As

$N \otimes_{B_0} C_0 = JC$ it follows from More on Morphisms, Lemma 36.8.1 that $B \rightarrow C$ is flat. From this it easily follows that it is étale. We omit the proof of the other properties as they are mostly self evident at this point. \square

Lemma 66.9.3. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let B be an object of (66.4.0.2). Assume there is an integer $c \geq 0$ such that for $a \in I^c$ multiplication by a on $NL_{B/A}^\wedge$ is zero in $D(B)$. Then there exists a finite type A -algebra C and an isomorphism $B \cong C^\wedge$.*

In Section 66.10 we will give a simpler proof of this result in case A is a G-ring.

Proof. We prove this lemma by induction on the number of generators of I . Say $I = (a_1, \dots, a_t)$. If $t = 0$, then $I = 0$ and there is nothing to prove. If $t = 1$, then the lemma follows from Lemma 66.8.4. Assume $t > 1$.

For any $m \geq 1$ set $\bar{A}_m = A/(a_t^m)$. Consider the ideal $\bar{I}_m = (\bar{a}_1, \dots, \bar{a}_{t-1})$ in \bar{A}_m . Let $B_m = B/(a_t^m)$ be the base change of B for the map $(A, I) \rightarrow (\bar{A}_m, \bar{I}_m)$, see (66.4.4.1). By Lemma 66.6.3 the assumption of the lemma holds for $\bar{I}_m \subset \bar{A}_m \rightarrow B_m$.

By induction hypothesis (on t) we can find a finite type \bar{A}_m -algebra C_m and a map $C_m \rightarrow B_m$ which induces an isomorphism $C_m^\wedge \cong B_m$ where the completion is with respect to \bar{I}_m . By Lemma 66.6.2 we may assume that $\text{Spec}(C_m) \rightarrow \text{Spec}(\bar{A}_m)$ is étale over $\text{Spec}(\bar{A}_m) \setminus V(\bar{I}_m)$.

We claim that we may choose $A_m \rightarrow C_m \rightarrow B_m$ as in the previous paragraph such that moreover there are isomorphisms $C_m/(a_t^{m-1}) \rightarrow C_{m-1}$ compatible with the given A -algebra structure and the maps to $B_{m-1} = B_m/(a_t^{m-1})$. Namely, first fix a choice of $A_1 \rightarrow C_1 \rightarrow B_1$. Suppose we have found $C_{m-1} \rightarrow C_{m-2} \rightarrow \dots \rightarrow C_1$ with the desired properties. Note that $C_m/(a_t^{m-1})$ is étale over $\text{Spec}(\bar{A}_{m-1}) \setminus V(\bar{I}_{m-1})$. Hence by Lemma 66.6.5 there exists an étale extension $C_{m-1} \rightarrow C'_{m-1}$ which induces an isomorphism modulo \bar{I}_{m-1} and an \bar{A}_{m-1} -algebra map $C_m/(a_t^{m-1}) \rightarrow C'_{m-1}$ inducing the isomorphism $B_m/(a_t^{m-1}) \rightarrow B_{m-1}$ on completions. Note that $C_m/(a_t^{m-1}) \rightarrow C'_{m-1}$ is étale over the complement of $V(\bar{I}_{m-1})$ by Morphisms, Lemma 28.37.18 and over $V(\bar{I}_{m-1})$ induces an isomorphism on completions hence is étale there too (for example by More on Morphisms, Lemma 36.10.3). Thus $C_m/(a_t^{m-1}) \rightarrow C'_{m-1}$ is étale. By the topological invariance of étale morphisms (Étale Morphisms, Theorem 40.15.2) there exists an étale ring map $C_m \rightarrow C'_m$ such that $C_m/(a_t^{m-1}) \rightarrow C'_{m-1}$ is isomorphic to $C_m/(a_t^{m-1}) \rightarrow C'_m/(a_t^{m-1})$. Observe that the \bar{I}_m -adic completion of C'_m is equal to the \bar{I}_m -adic completion of C_m , i.e., to B_m (details omitted). We apply Lemma 66.9.2 to the diagram

$$\begin{array}{ccc}
 & C'_m & \longrightarrow & C'_m/(a_t^{m-1}) \\
 & \nearrow & & \uparrow \\
 C''_m & \dashrightarrow & C_{m-1} & \\
 & \nwarrow & & \uparrow \\
 & \bar{A}_m & \longrightarrow & \bar{A}_{m-1}
 \end{array}$$

to see that there exists a “lift” of C''_m of C_{m-1} to an algebra over \bar{A}_m with all the desired properties.

By construction (C_m) is an object of the category (66.4.0.1) for the principal ideal (a_t) . Thus the inverse limit $B' = \lim C_m$ is an (a_t) -adically complete A -algebra such that $B'/a_t B'$ is of finite type over $A/(a_t)$, see Lemma 66.4.1. By construction the I -adic completion of B' is isomorphic to B (details omitted). Consider the complex $NL_{B'/A}^\wedge$ constructed using the (a_t) -adic topology. Choosing a presentation for B' (which induces a similar presentation for B) the reader immediately sees that $NL_{B'/A}^\wedge \otimes_{B'} B = NL_{B/A}^\wedge$. Since $a_t \in I$ and since the cohomology modules of $NL_{B'/A}^\wedge$ are finite B' -modules (hence complete for the a_t -adic topology), we conclude that a_t^c acts as zero on these cohomologies as the same thing is true by assumption for $NL_{B/A}^\wedge$. Thus multiplication by a_t^{2c} is zero on $NL_{B'/A}^\wedge$ by Lemma 66.5.5. Hence finally, we may apply Lemma 66.8.4 to $(a_t) \subset A \rightarrow B'$ to finish the proof. \square

Lemma 66.9.4. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let B be an I -adically complete A -algebra with $A/I \rightarrow B/IB$ of finite type. The equivalent conditions of Lemma 66.6.1 are also equivalent to*

- (5) *there exists a finite type A -algebra C with $\text{Spec}(C) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$ such that $B \cong C^\wedge$.*

Proof. First, assume conditions (1) – (4) hold. Then there exists a finite type A -algebra C with such that $B \cong C^\wedge$ by Lemma 66.9.3. In other words, $B_n = C/I^n C$. The naive cotangent complex $NL_{C/A}$ is a complex of finite type C -modules and hence H^{-1} and H^0 are finite C -modules. By assumption there exists a $c \geq 0$ such that $H^{-1}/I^c H^{-1}$ and $H^0/I^c H^0$ are annihilated by I^c for some n . By Nakayama’s lemma this means that $I^c H^{-1}$ and $I^c H^0$ are annihilated by an element of the form $f = 1 + x$ with $x \in IC$. After inverting f (which does not change the quotients $B_n = C/I^n C$) we see that $NL_{C/A}$ has cohomology annihilated by I^c . Thus $A \rightarrow C$ is étale at any prime of C not lying over $V(I)$ by the definition of étale ring maps, see Algebra, Definition 10.138.1.

Conversely, assume that $A \rightarrow C$ of finite type is given such that $\text{Spec}(C) \rightarrow \text{Spec}(A)$ is étale over $\text{Spec}(A) \setminus V(I)$. Then for every $a \in I$ there exists an $c \geq 0$ such that multiplication by a^c is zero $NL_{C/A}$. Since $NL_{C^\wedge/A}^\wedge$ is the derived completion of $NL_{C/A}$ (see Lemma 66.5.1) it follows that $B = C^\wedge$ satisfies the equivalent conditions of Lemma 66.6.1. \square

66.10. In case the base ring is a G-ring

If the base ring A is a Noetherian G-ring, then some of the material above simplifies somewhat and we obtain some additional results.

Proof of Lemma 66.9.3 in case A is a G-ring. This proof is easier in that it does not depend on the somewhat delicate deformation theory argument given in the proof of Lemma 66.9.2, but of course it requires a very strong assumption on the Noetherian ring A .

Choose a presentation $B = A[x_1, \dots, x_r]^\wedge / J$. Choose generators $g_1, \dots, g_m \in J$. Choose generators k_1, \dots, k_t of the module of relations between g_1, \dots, g_m , i.e., such that

$$(A[x_1, \dots, x_r]^\wedge)^{\oplus t} \xrightarrow{k_1, \dots, k_t} (A[x_1, \dots, x_r]^\wedge)^{\oplus m} \xrightarrow{g_1, \dots, g_m} A[x_1, \dots, x_r]^\wedge$$

is exact in the middle. Write $k_i = (k_{i1}, \dots, k_{im})$ so that we have

$$(66.10.0.1) \quad \sum k_{ij}g_j = 0$$

for $i = 1, \dots, t$. Let $I^c = (a_1, \dots, a_s)$. For each $l \in \{1, \dots, s\}$ we know that multiplication by a_l on $NL_{B/A}^\wedge$ is zero in $D(B)$. By Lemma 66.5.4 we can find a map $\alpha_l : \bigoplus Bdx_i \rightarrow J/J^2$ such that $d \circ \alpha_l$ and $\alpha_l \circ d$ are both multiplication by a_l . Pick an element $f_{l,i} \in J$ whose class modulo J^2 is equal to $\alpha_l(dx_i)$. Then we have for all $l = 1, \dots, s$ and $i = 1, \dots, r$ that

$$(66.10.0.2) \quad \sum_{i'} (\partial f_{l,i} / \partial x_{i'}) dx_{i'} = a_l dx_i + \sum h_{l,i}^{j',i'} g_{j'} dx_{i'}$$

for some $h_{l,i}^{j',i'} \in A[x_1, \dots, x_r]^\wedge$. We also have for $j = 1, \dots, m$ and $l = 1, \dots, s$ that

$$(66.10.0.3) \quad a_l g_j = \sum h_{l,j}^i f_{l,i} + \sum h_{l,j}^{j',j''} g_{j'} g_{j''}$$

for some $h_{l,j}^i$ and $h_{l,j}^{j',j''}$ in $A[x_1, \dots, x_r]^\wedge$. Of course, since $f_{l,i} \in J$ we can write for $l = 1, \dots, s$ and $i = 1, \dots, r$

$$(66.10.0.4) \quad f_{l,i} = \sum h_{l,i}^j g_j$$

for some $h_{l,i}^j$ in $A[x_1, \dots, x_r]^\wedge$.

Let $A[x_1, \dots, x_r]^h$ be the henselization of the pair $(A[x_1, \dots, x_r], IA[x_1, \dots, x_r])$, see More on Algebra, Lemma 15.7.13. Since A is a Noetherian G-ring, so is $A[x_1, \dots, x_r]$, see More on Algebra, Proposition 15.39.10. Hence we have approximation for the map $A[x_1, \dots, x_r]^h \rightarrow A[x_1, \dots, x_r]^\wedge$ with respect to the ideal generated by I , see Smoothing Ring Maps, Lemma 16.14.1. Choose a large integer M . Choose

$$G_j, K_{ij}, F_{l,i}, H_{l,j}^i, H_{l,j}^{j',j''}, H_{l,i}^j \in A[x_1, \dots, x_r]^h$$

such that analogues of equations (66.10.0.1), (66.10.0.3), and (66.10.0.4) hold for these elements in $A[x_1, \dots, x_r]^h$, i.e.,

$$\sum K_{ij}G_j = 0, \quad a_l G_j = \sum H_{l,j}^i F_{l,i} + \sum H_{l,j}^{j',j''} G_{j'} G_{j''}, \quad F_{l,i} = \sum H_{l,i}^j G_j$$

and such that we have

$$G_j - g_j, K_{ij} - k_{ij}, F_{l,i} - f_{l,i}, H_{l,j}^i - h_{l,j}^i, H_{l,j}^{j',j''} - h_{l,j}^{j',j''}, H_{l,i}^j - h_{l,i}^j \in I^M A[x_1, \dots, x_r]^h$$

where we take liberty of thinking of $A[x_1, \dots, x_r]^h$ as a subring of $A[x_1, \dots, x_r]^\wedge$. Note that we cannot guarantee that the analogue of (66.10.0.2) holds in $A[x_1, \dots, x_r]^h$, because it is not a polynomial equation. But since taking partial derivatives is A -linear, we do get the analogue modulo I^M . More precisely, we see that

$$(66.10.0.5) \quad \sum_{i'} (\partial F_{l,i} / \partial x_{i'}) dx_{i'} - a_l dx_i - \sum h_{l,i}^{j',i'} G_{j'} dx_{i'} \in I^M A[x_1, \dots, x_r]^\wedge$$

for $l = 1, \dots, s$ and $i = 1, \dots, r$.

With these choices, consider the ring

$$C^h = A[x_1, \dots, x_r]^h / (G_1, \dots, G_r)$$

and denote C^\wedge its I -adic completion, namely

$$C^\wedge = A[x_1, \dots, x_r]^\wedge / J', \quad J' = (G_1, \dots, G_r)A[x_1, \dots, x_r]^\wedge$$

In the following paragraphs we establish the fact that C^\wedge is isomorphic to B . Then in the final paragraph we deal with show that C^h comes from a finite type algebra over A as in the statement of the lemma.

First consider the cokernel

$$\Omega = \text{Coker}(J'/(J')^2 \longrightarrow \bigoplus C^\wedge dx_i)$$

This C^\wedge module is generated by the images of the elements dx_i . Since $F_{l,i} \in J'$ by the analogue of (66.10.0.4) we see from (66.10.0.5) we see that $a_l dx_i \in I^M \Omega$. As $I^c = (a_l)$ we see that $I^c \Omega \subset I^M \Omega$. Since $M > c$ we conclude that $I^c \Omega = 0$ by Algebra, Lemma 10.19.1.

Next, consider the kernel

$$H_1 = \text{Ker}(J'/(J')^2 \longrightarrow \bigoplus C^\wedge dx_i)$$

By the analogue of (66.10.0.3) we see that $a_l J' \subset (F_{l,i}) + (J')^2$. On the other hand, the determinant Δ_l of the matrix $(\partial F_{l,i} / \partial x_{i'})$ satisfies $\Delta_l = a_l^r \text{ mod } I^M C^\wedge$ by (66.10.0.5). It follows that $a_l^{r+1} H_1 \subset I^M H_1$ (some details omitted; use Algebra, Lemma 10.14.4). Now $(a_1^{r+1}, \dots, a_s^{r+1}) \supset I^{(sr+1)c}$. Hence $I^{(sr+1)c} H_1 \subset I^M H_1$ and since $M > (sr + 1)c$ we conclude that $I^{(sr+1)c} H_1 = 0$.

By Lemma 66.5.5 we conclude that multiplication by an element of $I^{2(sr+1)c}$ on $NL_{C^\wedge/A}$ is zero (note that the bound does not depend on M or the choice of the approximation, as long as M is large enough). Since $G_j - g_j$ is in the ideal generated by I^M we see that there is an isomorphism

$$\psi_M : C^\wedge / I^M C^\wedge \rightarrow B / I^M B$$

As M is large enough we can use Lemma 66.9.1 with $d = d(I \subset A \rightarrow B)$, with C^\wedge playing the role of B , with $2(rs + 1)c$ instead of c , to find a morphism

$$\psi : C^\wedge \longrightarrow B$$

which agrees with ψ_M modulo $I^{q-2(rs+1)c}$ where q is the quotient of M by the number of generators of I . We claim ψ is an isomorphism. Since C^\wedge and B are I -adically complete the map ψ is surjective because it is surjective modulo I (see Algebra, Lemma 10.93.1). On the other hand, as M is large enough we see that

$$\text{Gr}_I(C^\wedge) \cong \text{Gr}_I(B)$$

as graded $\text{Gr}_I(A[x_1, \dots, x_r]^\wedge)$ -modules by More on Algebra, Lemma 15.3.2. Since ψ is compatible with this isomorphism as it agrees with ψ_M modulo I , this means that $\text{Gr}_I(\psi)$ is an isomorphism. As C^\wedge and B are I -adically complete, it follows that ψ is an isomorphism.

This paragraph serves to deal with the issue that C^h is not of finite type over A . Namely, the ring $A[x_1, \dots, x_r]^h$ is a filtered colimit of étale $A[x_1, \dots, x_r]$ algebras A' such that $A/I[x_1, \dots, x_r] \rightarrow A'/IA'$ is an isomorphism (see proof of More on Algebra, Lemma 15.7.13). Pick an A' such that G_1, \dots, G_m are the images of $G'_1, \dots, G'_m \in A'$. Setting $C = A'/(G'_1, \dots, G'_m)$ we get the finite type algebra we were looking for. \square

The following lemma isn't true in general if A is not a G-ring but just Noetherian. Namely, if (A, \mathfrak{m}) is local and $I = \mathfrak{m}$, then the lemma is equivalent to Artin

approximation for A^h (as in Smoothing Ring Maps, Theorem 16.13.1) which does not hold for every Noetherian local ring.

Lemma 66.10.1. *Let A be a Noetherian G -ring. Let $I \subset A$ be an ideal. Let B, C be finite type A -algebras. For any A -algebra map $\varphi : B^\wedge \rightarrow C^\wedge$ of I -adic completions and any $N \geq 1$ there exist*

- (1) *an étale ring map $C \rightarrow C'$ which induces an isomorphism $C/IC \rightarrow C'/IC'$,*
- (2) *an A -algebra map $\varphi : B \rightarrow C'$*

such that φ and ψ agree modulo I^N into $C^\wedge = (C')^\wedge$.

Proof. The statement of the lemma makes sense as $C \rightarrow C'$ is flat (Algebra, Lemma 10.138.3) hence induces an isomorphism $C/I^n C \rightarrow C'/I^n C'$ for all n (More on Algebra, Lemma 15.63.2) and hence an isomorphism on completions. Let C^h be the henselization of the pair (C, IC) , see More on Algebra, Lemma 15.7.13. Then C^h is the filtered colimit of the algebras C' and the maps $C \rightarrow C' \rightarrow C^h$ induce isomorphism on completions (More on Algebra, Lemma 15.7.16). Thus it suffices to prove there exists an A -algebra map $B \rightarrow C^h$ which is congruent to ψ modulo I^N . Write $B = A[x_1, \dots, x_n]/(f_1, \dots, f_m)$. The ring map ψ corresponds to elements $\hat{c}_1, \dots, \hat{c}_n \in C^\wedge$ with $f_j(\hat{c}_1, \dots, \hat{c}_n) = 0$ for $j = 1, \dots, m$. Namely, as A is a Noetherian G -ring, so is C , see More on Algebra, Proposition 15.39.10. Thus Smoothing Ring Maps, Lemma 16.14.1 applies to give elements $c_1, \dots, c_n \in C^h$ such that $f_j(c_1, \dots, c_n) = 0$ for $j = 1, \dots, m$ and such that $\hat{c}_i - c_i \in I^N C^h$. This determines the map $B \rightarrow C^h$ as desired. \square

66.11. Rig-surjective morphisms

For morphisms locally of finite type between locally Noetherian formal algebraic spaces a definition borrowed from [Art70] can be used. See Remark 66.11.10 for a discussion of what to do in more general cases.

Definition 66.11.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces over S . Assume that X and Y are locally Noetherian and that f is locally of finite type. We say f is *rig-surjective* if for every solid diagram

$$\begin{array}{ccc} \mathrm{Spf}(R') & \longrightarrow & X \\ \downarrow & & \downarrow f \\ \mathrm{Spf}(R) & \xrightarrow{p} & Y \end{array}$$

where R is a complete discrete valuation ring and where p is an adic morphism there exists an extension of complete discrete valuation rings $R \subset R'$ and a morphism $\mathrm{Spf}(R') \rightarrow X$ making the displayed diagram commute.

We prove a few lemmas to explain what this means.

Lemma 66.11.2. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of formal algebraic spaces over S . Assume X, Y, Z are locally Noetherian and f and g locally of finite type. Then if f and g are rig-surjective, so is $g \circ f$.*

Proof. Follows in a straightforward manner from the definitions (and Formal Spaces, Lemma 65.18.3). \square

Lemma 66.11.3. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of formal algebraic spaces over S . Assume X, Y, Z are locally Noetherian and f and g locally of finite type. If f is rig-surjective, then the base change $Z \times_Y X \rightarrow Z$ is too.*

Proof. Follows in a straightforward manner from the definitions (and Formal Spaces, Lemmas 65.18.9 and 65.18.4). \square

Lemma 66.11.4. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of formal algebraic spaces over S . Assume X, Y, Z locally Noetherian and f and g locally of finite type. If $g \circ f : X \rightarrow Z$ is rig-surjective, so is $g : Y \rightarrow Z$.*

Proof. Immediate from the definition. \square

Lemma 66.11.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces which is representable by algebraic spaces, étale, and surjective. Assume X and Y locally Noetherian. Then f is rig-surjective.*

Proof. Let $p : \mathrm{Spf}(R) \rightarrow Y$ be an adic morphism where R is a complete discrete valuation ring. Let $Z = \mathrm{Spf}(R) \times_Y X$. Then $Z \rightarrow \mathrm{Spf}(R)$ is representable by algebraic spaces, étale, and surjective. Hence Z is nonempty. Pick a nonempty affine formal algebraic space V and an étale morphism $V \rightarrow Z$ (possible by our definitions). Then $V \rightarrow \mathrm{Spf}(R)$ corresponds to $R \rightarrow A^\wedge$ where $R \rightarrow A$ is an étale ring map, see Formal Spaces, Lemma 65.14.13. Since $A^\wedge \neq 0$ (as $V \neq \emptyset$) we can find a maximal ideal \mathfrak{m} of A lying over \mathfrak{m}_R . Then $A_\mathfrak{m}$ is a discrete valuation ring (More on Algebra, Lemma 15.33.4). Then $R' = A_\mathfrak{m}^\wedge$ is a complete discrete valuation ring (More on Algebra, Lemma 15.32.5). Applying Formal Spaces, Lemma 65.5.10. we find the desired morphism $\mathrm{Spf}(R') \rightarrow V \rightarrow Z \rightarrow X$. \square

Remark 66.11.6. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally Noetherian formal algebraic spaces which is locally of finite type. The upshot of the lemmas above is that we may check whether $f : X \rightarrow Y$ is rig-surjective, étale locally on Y . For example, suppose that $\{Y_i \rightarrow Y\}$ is a covering as in Formal Spaces, Definition 65.7.1. Then f is rig-surjective if and only if $f_i : X \times_Y Y_i \rightarrow Y_i$ is rig-surjective. Namely, if f is rig-surjective, so is any base change (Lemma 66.11.3). Conversely, if all f_i are rig-surjective, so is $\coprod f_i : \coprod X \times_Y Y_i \rightarrow \coprod Y_i$. By Lemma 66.11.5 the morphism $\coprod Y_i \rightarrow Y$ is rig-surjective. Hence $\coprod X \times_Y Y_i \rightarrow Y$ is rig-surjective (Lemma 66.11.2). Since this morphism factors through $X \rightarrow Y$ we see that $X \rightarrow Y$ is rig-surjective by Lemma 66.11.4.

Lemma 66.11.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper surjective morphism of locally Noetherian algebraic spaces over S . Let $T \subset |Y|$ be a closed subset and let $T' = |f|^{-1}(T) \subset |X|$. Then $X_{/T'} \rightarrow Y_{/T}$ is rig-surjective.*

Proof. The statement makes sense by Formal Spaces, Lemmas 65.15.6 and 65.18.10. Let $Y_j \rightarrow Y$ be a jointly surjective family of étale morphism where Y_j is an affine scheme for each j . Denote $T_j \subset Y_j$ the inverse image of T . Then $\{(Y_j)_{/T_j} \rightarrow Y_{/T}\}$ is a covering as in Formal Spaces, Definition 65.7.1. Moreover, setting $X_j = Y_j \times_Y X$ and $T'_j \subset |X_j|$ the inverse image of T , we have

$$(X_j)_{/T'_j} = (Y_j)_{/T_j} \times_{(Y_{/T})} X_{/T'}$$

By the discussion in Remark 66.11.6 we reduce to the case where Y is an affine Noetherian scheme treated in the next paragraph.

Assume $Y = \text{Spec}(A)$ where A is a Noetherian ring. This implies that $Y/T = \text{Spf}(A^\wedge)$ where A^\wedge is the I -adic completion of A for some ideal $I \subset A$. Let $p : \text{Spf}(R) \rightarrow \text{Spf}(A^\wedge)$ be an adic morphism where R is a complete discrete valuation ring. Let K be the field of fractions of R . Consider the composition $A \rightarrow A^\wedge \rightarrow R$. Since $X \rightarrow Y$ is surjective, the fibre $X_K = \text{Spec}(K) \times_Y X$ is nonempty. Thus we may choose an affine scheme U and an étale morphism $U \rightarrow X$ such that U_K is nonempty. Let $u \in U_K$ be a closed point (possible as U_K is affine). By Morphisms, Lemma 28.21.3 the residue field $L = \kappa(u)$ is a finite extension of K . Let $R' \subset L$ be the integral closure of R in L . By More on Algebra, Remark 15.68.5 we see that R' is a discrete valuation ring. Because $X \rightarrow Y$ is proper we see that the given morphism $\text{Spec}(L) = u \rightarrow U_K \rightarrow X_K \rightarrow X$ extends to a morphism $\text{Spec}(R') \rightarrow X$ over the given morphism $\text{Spec}(R) \rightarrow Y$ (Decent Spaces, Lemma 50.14.5). By commutativity of the diagram the induced morphisms $\text{Spec}(R'/\mathfrak{m}_{R'}^n) \rightarrow X$ are points of $X_{/T'}$ and we find

$$\text{Spf}((R')^\wedge) = \text{colim } \text{Spf}(R'/\mathfrak{m}_{R'}^n) \longrightarrow X_{/T'}$$

as desired (note that $(R')^\wedge$ is a complete discrete valuation ring by More on Algebra, Lemma 15.32.5; in fact in the current situation $R' = (R')^\wedge$ but we do not need this). □

Lemma 66.11.8. *Let A be a Noetherian ring complete with respect to an ideal I . Let B be an I -adically complete A -algebra. If $A/I^n \rightarrow B/I^n B$ is of finite type and flat for all n and faithfully flat for $n = 1$, then $\text{Spf}(B) \rightarrow \text{Spf}(A)$ is rig-surjective.*

Proof. We will use without further mention that morphisms between formal spectra are given by continuous maps between the corresponding topological rings, see Formal Spaces, Lemma 65.5.10. Let $\varphi : A \rightarrow R$ be a continuous map into a complete discrete valuation ring A . This implies that $\varphi(I) \subset \mathfrak{m}_R$. On the other hand, since we only need to produce the lift $\varphi' : B' \rightarrow R'$ in the case that φ corresponds to an adic morphism, we may assume that $\varphi(I) \neq 0$. Thus we may consider the base change $C = B \widehat{\otimes}_A R$, see Remark 66.4.3 for example. Then C is an \mathfrak{m}_R -adically complete R -algebra such that $C/\mathfrak{m}_R^n C$ is of finite type and flat over R/\mathfrak{m}_R^n and such that $C/\mathfrak{m}_R C$ is nonzero. Pick any maximal ideal $\mathfrak{m} \subset C$ lying over \mathfrak{m}_R . By flatness (which implies going down) we see that $\text{Spec}(C_{\mathfrak{m}}) \setminus V(\mathfrak{m}_R C_{\mathfrak{m}})$ is a nonempty open. Hence we can pick a prime $\mathfrak{q} \subset \mathfrak{m}$ such that \mathfrak{q} defines a closed point of $\text{Spec}(C_{\mathfrak{m}}) \setminus \{\mathfrak{m}\}$ and such that $\mathfrak{q} \notin V(IC_{\mathfrak{m}})$, see Properties, Lemma 27.6.4. Then C/\mathfrak{q} is a dimension 1-local domain and we can find $C/\mathfrak{q} \subset R'$ with R' a discrete valuation ring (Algebra, Lemma 10.115.12). By construction $\mathfrak{m}_R R' \subset \mathfrak{m}_{R'}$ and we see that $C \rightarrow R'$ extends to a continuous map $C \rightarrow (R')^\wedge$ (in fact we can pick R' such that $R' = (R')^\wedge$ in our current situation but we do not need this). Since the completion of a discrete valuation ring is a discrete valuation ring, we see that the assumption gives a commutative diagram of rings

$$\begin{array}{ccccc} (R')^\wedge & \longleftarrow & C & \longleftarrow & B \\ \uparrow & & \uparrow & & \uparrow \\ R & \longleftarrow & R & \longleftarrow & A \end{array}$$

which gives the desired lift. □

Lemma 66.11.9. *Let A be a Noetherian ring complete with respect to an ideal I . Let B be an I -adically complete A -algebra. Assume that*

- (1) the I -torsion in A is 0,
- (2) $A/I^n \rightarrow B/I^n B$ is flat and of finite type for all n .

Then $\mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ is rig-surjective if and only if $A/I \rightarrow B/IB$ is faithfully flat.

Proof. Faithful flatness implies rig-surjectivity by Lemma 66.11.8. To prove the converse we will use without further mention that the vanishing of I -torsion is equivalent to the vanishing of I -power torsion (More on Algebra, Lemma 15.62.3). We will also use without further mention that morphisms between formal spectra are given by continuous maps between the corresponding topological rings, see Formal Spaces, Lemma 65.5.10.

Assume $\mathrm{Spf}(B) \rightarrow \mathrm{Spf}(A)$ is rig-surjective. Choose a maximal ideal $I \subset \mathfrak{m} \subset A$. The open $U = \mathrm{Spec}(A_{\mathfrak{m}}) \setminus V(I_{\mathfrak{m}})$ of $\mathrm{Spec}(A)$ is nonempty as the $I_{\mathfrak{m}}$ -torsion of $A_{\mathfrak{m}}$ is zero (use Algebra, Lemma 10.61.4). Thus we can find a prime $\mathfrak{q} \subset \mathfrak{m}$ which defines a point of U (i.e., $I \not\subset \mathfrak{q}$) and which corresponds to a closed point of $\mathrm{Spec}(A) \setminus \mathfrak{m}$, see Properties, Lemma 27.6.4. Then A/\mathfrak{q} is a dimension 1-local domain and we can find $A/\mathfrak{q} \subset R$ with R a discrete valuation ring (Algebra, Lemma 10.115.12). By construction $IR \subset \mathfrak{m}_R$ and we see that $A \rightarrow R$ extends to a continuous map $A \rightarrow R^\wedge$ (in fact $R = R^\wedge$ in our situation but we do not need this). Since the completion of a discrete valuation ring is a discrete valuation ring, we see that the assumption gives a commutative diagram of rings

$$\begin{array}{ccc} R' & \longleftarrow & B \\ \uparrow & & \uparrow \\ R^\wedge & \longleftarrow & A \end{array}$$

Thus we find a prime ideal of B lying over \mathfrak{m} . It follows that $\mathrm{Spec}(B/IB) \rightarrow \mathrm{Spec}(A/I)$ is surjective, whence $A/I \rightarrow B/IB$ is faithfully flat (Algebra, Lemma 10.38.15). \square

Remark 66.11.10. The condition as formulated in Definition 66.11.1 is not right for morphisms of locally adic* formal algebraic spaces. For example, if $A = (\bigcup_{n \geq 1} k[t^{1/n}])^\wedge$ where the completion is the t -adic completion, then there are no adic morphisms $\mathrm{Spf}(R) \rightarrow \mathrm{Spf}(A)$ where R is a complete discrete valuation ring. Thus any morphism $X \rightarrow \mathrm{Spf}(A)$ would be rig-surjective, but since A is a domain and $t \in A$ is not zero, we want to think of A as having at least one “rig-point”, and we do not want to allow $X = \emptyset$. To cover this particular case, one can consider adic morphisms

$$\mathrm{Spf}(R) \longrightarrow Y$$

where R is a valuation ring complete with respect to a principal ideal J whose radical is $\mathfrak{m}_R = \sqrt{J}$. In this case the value group of R can be embedded into $(\mathbf{R}, +)$ and one obtains the point of view used by Berkovich in defining an analytic space associated to Y , see [Ber90]. Another approach is championed by Huber. In his theory, one drops the hypothesis that $\mathrm{Spec}(R/J)$ is a singleton, see [Hub93a].

Lemma 66.11.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of formal algebraic spaces. Assume X and Y are locally Noetherian, f locally of finite type, and f a monomorphism. Then f is rig surjective if and only if every adic morphism $\mathrm{Spf}(R) \rightarrow Y$ where R is a complete discrete valuation ring factors through X .*

Proof. One direction is trivial. For the other, suppose that $\mathrm{Spf}(R) \rightarrow Y$ is an adic morphism such that there exists an extension of complete discrete valuation rings $R \subset R'$ with $\mathrm{Spf}(R') \rightarrow \mathrm{Spf}(R) \rightarrow X$ factoring through Y . Then $\mathrm{Spec}(R'/\mathfrak{m}_R^n R') \rightarrow \mathrm{Spec}(R/\mathfrak{m}_R^n)$ is surjective and flat, hence the morphisms $\mathrm{Spec}(R/\mathfrak{m}_R^n) \rightarrow X$ factor through X as X satisfies the sheaf condition for fpqc coverings, see Formal Spaces, Lemma 65.23.1. In other words, $\mathrm{Spf}(R) \rightarrow Y$ factors through X . \square

66.12. Algebraization

In this section we prove a generalization of the result on dilatations from the paper of Artin [Art70]. We first reformulate the algebra results proved above into the language of formal algebraic spaces.

Let S be a scheme. Let V be a locally Noetherian formal algebraic space over S . We denote \mathcal{C}_V the category of formal algebraic spaces W over V such that the structure morphism $W \rightarrow V$ is rig-étale.

Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. Recall that $X_{/T}$ denotes the formal completion of X along T , see Formal Spaces, Section 65.9. More generally, for any algebraic space Y over X we denote $Y_{/T}$ the completion of Y along the inverse image of T in $|Y|$, so that $Y_{/T}$ is a formal algebraic space over $X_{/T}$.

Lemma 66.12.1. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. If $Y \rightarrow X$ is a morphism of algebraic spaces which is locally of finite type and étale over $X \setminus T$, then $Y_{/T} \rightarrow X_{/T}$ is rig-étale, i.e., $Y_{/T}$ is an object of $\mathcal{C}_{X_{/T}}$ defined above.*

Proof. Choose a surjective étale morphism $U \rightarrow X$ with $U = \coprod U_i$ a disjoint union of affine schemes, see Properties of Spaces, Lemma 48.6.1. For each i choose a surjective étale morphism $V_i \rightarrow Y \times_X U_i$ where $V_i = \coprod V_{ij}$ is a disjoint union of affines. Write $U_i = \mathrm{Spec}(A_i)$ and $V_{ij} = \mathrm{Spec}(B_{ij})$. Let $I_i \subset A_i$ be an ideal cutting out the inverse image of T in U_i . Then we may apply Lemma 66.6.2 to see that the map of I_i -adic completions $A_i^\wedge \rightarrow B_{ij}^\wedge$ has the property P of Lemma 66.7.1. Since $\{\mathrm{Spf}(A_i^\wedge) \rightarrow X_{/T}\}$ and $\{\mathrm{Spf}(B_{ij}^\wedge) \rightarrow Y_{/T}\}$ are coverings as in Formal Spaces, Definition 65.7.1 we see that $Y_{/T} \rightarrow X_{/T}$ is rig-étale by definition. \square

Lemma 66.12.2. *Let X be a Noetherian affine scheme. Let $T \subset X$ be a closed subset. Let U be an affine scheme and let $U \rightarrow X$ a finite type morphism étale over $X \setminus T$. Let V be a Noetherian affine scheme over X . For any morphism $c' : V_{/T} \rightarrow U_{/T}$ over $X_{/T}$ there exists an étale morphism $b : V' \rightarrow V$ of affine schemes which induces an isomorphism $b_{/T} : V'_{/T} \rightarrow V_{/T}$ and a morphism $a : V' \rightarrow U$ such that $c' = a_{/T} \circ b_{/T}^{-1}$.*

Proof. This is a reformulation of Lemma 66.6.5. \square

Lemma 66.12.3. *Let X be a Noetherian affine scheme. Let $T \subset X$ be a closed subset. Let $W \rightarrow X_{/T}$ be a rig-étale morphism of formal algebraic spaces with W an affine formal algebraic space. Then there exists an affine scheme U , a finite type morphism $U \rightarrow X$ étale over $X \setminus T$ such that $W \cong U_{/T}$. Moreover, if $W \rightarrow X_{/T}$ is étale, then $U \rightarrow X$ is étale.*

Proof. The existence of U is a restatement of Lemma 66.9.4. The final statement follows from More on Morphisms, Lemma 36.10.3. \square

Let S be a scheme. Let X be a locally Noetherian algebraic space over S and let $T \subset |X|$ be a closed subset. Let us denote $\mathcal{C}_{X,T}$ the category of algebraic spaces Y over X such that the structure morphism $f : Y \rightarrow X$ is locally of finite type and an isomorphism over the complement of T . Formal completion defines a functor

$$(66.12.3.1) \quad F_{X,T} : \mathcal{C}_{X,T} \longrightarrow \mathcal{C}_{X/T}, \quad (f : Y \rightarrow X) \longmapsto (f_{/T} : Y_{/T} \rightarrow X_{/T})$$

see Lemma 66.12.1.

Lemma 66.12.4. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Z \rightarrow Y$ be morphisms of algebraic spaces. Let $T \subset |X|$ be closed. Assume that*

- (1) X is locally Noetherian,
- (2) g is a monomorphism and locally of finite type,
- (3) $f|_{X \setminus T} : X \setminus T \rightarrow Y$ factors through g , and
- (4) $f_{/T} : X_{/T} \rightarrow Y$ factors through g ,

then f factors through g .

Proof. Consider the fibre product $E = X \times_Y Z \rightarrow X$. By assumption the open immersion $X \setminus T \rightarrow X$ factors through E and any morphism $\varphi : X' \rightarrow X$ with $|\varphi|(|X'|) \subset T$ factors through E as well, see Formal Spaces, Section 65.9. By More on Morphisms of Spaces, Lemma 58.17.3 this implies that $E \rightarrow X$ is étale at every point of E mapping to a point of T . Hence $E \rightarrow X$ is an étale monomorphism, hence an open immersion (Morphisms of Spaces, Lemma 49.45.2). Then it follows that $E = X$ since our assumptions imply that $|X| = |E|$. \square

Lemma 66.12.5. *Let S be a scheme. Let X, Y be locally Noetherian algebraic spaces over S . Let $T \subset |X|$ and $T' \subset |Y|$ be closed subsets. Let $a, b : X \rightarrow Y$ be morphisms of algebraic spaces over S such that $a|_{X \setminus T} = b|_{X \setminus T}$, such that $|a|(T) \subset T'$ and $|b|(T) \subset T'$, and such that $a_{/T} = b_{/T}$ as morphisms $X_{/T} \rightarrow Y_{/T}$. Then $a = b$.*

Proof. Let E be the equalizer of a and b . Then E is an algebraic space and $E \rightarrow X$ is locally of finite type and a monomorphism, see Morphisms of Spaces, Lemma 49.4.1. Our assumptions imply we can apply Lemma 66.12.4 to the two morphisms $f = \text{id} : X \rightarrow X$ and $g : E \rightarrow X$ and the closed subset T of $|X|$. \square

Lemma 66.12.6. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $s, t : R \rightarrow U$ be two morphisms of algebraic spaces over X . Assume*

- (1) R, U are locally of finite type over X ,
- (2) the base change of s and t to $X \setminus T$ is an étale equivalence relation, and
- (3) the formal completion $(t_{/T}, s_{/T}) : R_{/T} \rightarrow U_{/T} \times_{X_{/T}} U_{/T}$ is an equivalence relation too.

Then $(t, s) : R \rightarrow U \times_X U$ is an étale equivalence relation.

Proof. The morphisms $s, t : R \rightarrow U$ are étale over $X \setminus T$ by assumption. Since the formal completions of the maps $s, t : R \rightarrow U$ are étale, we see that s and t are étale for example by More on Morphisms, Lemma 36.10.3. Applying Lemma 66.12.4 to the morphisms $\text{id} : R \times_{U \times_X U} R \rightarrow R \times_{U \times_X U} R$ and $\Delta : R \rightarrow R \times_{U \times_X U} R$ we conclude that (t, s) is a monomorphism. Applying it again to $(t \circ \text{pr}_0, s \circ \text{pr}_1) :$

$R \times_{s,U,t} R \rightarrow U \times_X U$ and $(t, s) : R \rightarrow U \times_X U$ we find that “transitivity” holds. We omit the proof of the other two axioms of an equivalence relation. \square

Remark 66.12.7. Let S , X , and $T \subset |X|$ be as in (66.12.3.1). Let $U \rightarrow X$ be an algebraic space over X such that $U \rightarrow X$ is locally of finite type and étale outside of T . We will construct a factorization

$$U \longrightarrow Y \longrightarrow X$$

with Y in $\mathcal{C}_{X,T}$ such that $U_{/T} \rightarrow Y_{/T}$ is an isomorphism. We may assume the image of $U \rightarrow X$ contains $X \setminus T$, otherwise we replace U by $U \amalg (X \setminus T)$. For an algebraic space Z over X , let us denote Z° the open subspace which is the inverse image of $X \setminus T$. Let

$$R = U \amalg_{U^\circ} (U \times_X U)^\circ$$

be the pushout of $U^\circ \rightarrow U$ and the diagonal morphism $U^\circ \rightarrow U^\circ \times_X U^\circ = (U \times_X U)^\circ$. Since $U^\circ \rightarrow X$ is étale, the diagonal is an open immersion and we see that R is an algebraic space (this follows for example from Spaces, Lemma 47.8.4). The two projections $(U \times_X U)^\circ \rightarrow U$ extend to R and we obtain two étale morphisms $s, t : R \rightarrow U$. Checking on each piece separately we find that R is an étale equivalence relation on U . Set $Y = U/R$ which is an algebraic space by Bootstrap, Theorem 62.10.1. Since $U^\circ \rightarrow X \setminus T$ is a surjective étale morphism and since $R^\circ = U^\circ \times_{X \setminus T} U^\circ$ we see that $Y^\circ \rightarrow X \setminus T$ is an isomorphism. In other words, $Y \rightarrow X$ is an object of $\mathcal{C}_{X,T}$. On the other hand, the morphism $U \rightarrow Y$ induces an isomorphism $U_{/T} \rightarrow Y_{/T}$. Namely, the formal completion of R along the inverse image of T is equal to the formal completion of U along the inverse image of T by our choice of R . By our construction of the formal completion in Formal Spaces, Section 65.9 we conclude that $U_{/T} = Y_{/T}$.

Lemma 66.12.8. *Let S be a scheme. Let X be a Noetherian affine algebraic space over S . Let $T \subset |X|$ be a closed subset. Then the functor $F_{X,T}$ is an equivalence.*

Before we prove this lemma let us discuss an example. Suppose that $S = \text{Spec}(k)$, $X = \mathbf{A}_k^1$, and $T = \{0\}$. Then $X_{/T} = \text{Spf}(k[[x]])$. Let $W = \text{Spf}(k[[x]] \times k[[x]])$. Then the corresponding Y is the affine line with zero doubled (Schemes, Example 25.14.3). Moreover, this is the output of the construction in Remark 66.12.7 starting with $U = X \amalg X$.

Proof. For any scheme or algebraic space Z over X , let us denote $Z_0 \subset Z$ the inverse image of T with the induced reduced closed subscheme or subspace structure. Note that $Z_0 = (Z_{/T})_{red}$ is the reduction of the formal completion.

The functor $F_{X,T}$ is faithful by Lemma 66.12.5.

Let Y, Y' be objects of $\mathcal{C}_{X,T}$ and let $a' : Y_{/T} \rightarrow Y'_{/T}$ be a morphism in $\mathcal{C}_{X_{/T}}$. To prove $F_{X,T}$ is fully faithful, we will construct a morphism $a : Y \rightarrow Y'$ in $\mathcal{C}_{X,T}$ such that $a' = a_{/T}$.

Let U be an affine scheme and let $U \rightarrow Y$ be an étale morphism. Because U is affine, U_0 is affine and the image of $U_0 \rightarrow Y_0 \rightarrow Y'_0$ is a quasi-compact subspace of $|Y'_0|$. Thus we can choose an affine scheme V and an étale morphism $V \rightarrow Y'$ such that the image of $|V_0| \rightarrow |Y'_0|$ contains this quasi-compact subset. Consider the formal algebraic space

$$W = U_{/T} \times_{Y'_{/T}} V_{/T}$$

By our choice of V the above, the map $W \rightarrow U_{/T}$ is surjective. Thus there exists an affine formal algebraic space W' and an étale morphism $W' \rightarrow W$ such that $W' \rightarrow W \rightarrow U_{/T}$ is surjective. Then $W' \rightarrow U_{/T}$ is étale. By Lemma 66.12.3 $W' = U'_{/T}$ for $U' \rightarrow U$ étale and U' affine. Write $V = \text{Spec}(C)$. By Lemma 66.12.2 there exists an étale morphism $U'' \rightarrow U'$ of affines which is an isomorphism on completions and a morphism $U'' \rightarrow V$ whose completion is the composition $U''_{/T} \rightarrow U'_{/T} \rightarrow W \rightarrow V_{/T}$. Thus we get

$$Y \longleftarrow U'' \longrightarrow Y'$$

over X agreeing with the given map on formal completions such that the image of $U''_0 \rightarrow Y_0$ is the same as the image of $U_0 \rightarrow Y_0$.

Taking a disjoint union of U'' as constructed in the previous paragraph, we find a scheme U , an étale morphism $U \rightarrow Y$, and a morphism $b : U \rightarrow Y'$ over X , such that the diagram

$$\begin{array}{ccc} U_{/T} & & \\ \downarrow & \searrow^{b_{/T}} & \\ Y_{/T} & \xrightarrow{a'} & Y'_{/T} \end{array}$$

is commutative and such that $U_0 \rightarrow Y_0$ is surjective. Taking a disjoint union with the open $X \setminus T$ (which is also open in Y and Y'), we find that we may even assume that $U \rightarrow Y$ is a surjective étale morphism. Let $R = U \times_Y U$. Then the two compositions $R \rightarrow U \rightarrow Y'$ agree both over $X \setminus T$ and after formal completion along T , whence are equal by Lemma 66.12.5. This means exactly that b factors as $U \rightarrow Y \rightarrow Y'$ to give us our desired morphism $a : Y \rightarrow Y'$.

Essential surjectivity. Let W be an object of $\mathcal{C}_{X/T}$. We prove W is in the essential image in a number of steps.

Step 1: W is an affine formal algebraic space. Then we can find $U \rightarrow X$ of finite type and étale over $X \setminus T$ such that $U_{/T}$ is isomorphic to W , see Lemma 66.12.3. Thus we see that W is in the essential image by the construction in Remark 66.12.7.

Step 2: W is separated. Choose $\{W_i \rightarrow W\}$ as in Formal Spaces, Definition 65.7.1. By Step 1 the formal algebraic spaces W_i and $W_i \times_W W_j$ are in the essential image. Say $W_i = (Y_i)_{/T}$ and $W_i \times_W W_j = (Y_{ij})_{/T}$. By fully faithfulness we obtain morphisms $t_{ij} : Y_{ij} \rightarrow Y_i$ and $s_{ij} : Y_{ij} \rightarrow Y_j$ matching the projections $W_i \times_W W_j \rightarrow W_i$ and $W_i \times_W W_j \rightarrow W_j$. Set $R = \coprod Y_{ij}$ and $U = \coprod Y_i$ and denote $s = \coprod s_{ij} : R \rightarrow U$ and $t = \coprod t_{ij} : R \rightarrow U$. Applying Lemma 66.12.6 we find that $(t, s) : R \rightarrow U \times_X U$ is an étale equivalence relation. Thus we can take the quotient $Y = U/R$ and it is an algebraic space, see Bootstrap, Theorem 62.10.1. Since completion commutes with fibre products and taking quotient sheaves, we find that $Y_{/T} \cong W$ in $\mathcal{C}_{X/T}$.

Step 3: W is general. Choose $\{W_i \rightarrow W\}$ as in Formal Spaces, Definition 65.7.1. The formal algebraic spaces W_i and $W_i \times_W W_j$ are separated. Hence by Step 2 the formal algebraic spaces W_i and $W_i \times_W W_j$ are in the essential image. Then we argue exactly as in the previous paragraph to see that W is in the essential image as well. This concludes the proof. \square

Theorem 66.12.9. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. The functor $F_{X,T}$ (66.12.3.1) is an equivalence.*

Proof. The theorem is essentially a formal consequence of Lemma 66.12.8. We give the details but we encourage the reader to think it through for themselves. Let $g : U \rightarrow X$ be a surjective étale morphism with $U = \coprod U_i$ and each U_i affine. Denote $F_{U,T}$ the functor for U and the inverse image of T in $|U|$.

Since $U = \coprod U_i$ both the category $\mathcal{C}_{U,T}$ and the category $\mathcal{C}_{U/T}$ decompose as a product of categories, one for each i . Since the functors $F_{U_i,T}$ are equivalences for all i by the lemma we find that the same is true for $F_{U,T}$.

Since $F_{U,T}$ is faithful, it follows that $F_{X,T}$ is faithful too. Namely, if $a, b : Y \rightarrow Y'$ are morphisms in $\mathcal{C}_{X,T}$ such that $a_{/T} = b_{/T}$, then we find on pulling back that the base changes $a_U, b_U : U \times_X Y \rightarrow U \times_X Y'$ are equal. Since $U \times_X Y \rightarrow Y$ is surjective étale, this implies that $a = b$.

At this point we know that $F_{X,T}$ is faithful for every situation as in the theorem. Let $R = U \times_X U$ where U is as above. Let $t, s : R \rightarrow U$ be the projections. Since X is Noetherian, so is R . Thus the functor $F_{R,T}$ (defined in the obvious manner) is faithful. Let $Y \rightarrow X$ and $Y' \rightarrow X$ be objects of $\mathcal{C}_{X,T}$. Let $a' : Y_{/T} \rightarrow Y'_{/T}$ be a morphism in the category $\mathcal{C}_{X_{/T}}$. Taking the base change to U we obtain a morphism $a'_U : (U \times_X Y)_{/T} \rightarrow (U \times_X Y')_{/T}$ in the category $\mathcal{C}_{U_{/T}}$. Since the functor $F_{U,T}$ is fully faithful we obtain a morphism $a_U : U \times_X Y \rightarrow U \times_X Y'$ with $F_{U,T}(a_U) = a'_U$. Since $s^*(a'_U) = t^*(a'_U)$ and since $F_{R,T}$ is faithful, we find that $s^*(a_U) = t^*(a_U)$. Since

$$R \times_X Y \rightrightarrows U \times_X Y \longrightarrow Y$$

is an equalizer diagram of sheaves, we find that a_U descends to a morphism $a : Y \rightarrow Y'$. We omit the proof that $F_{X,T}(a) = a'$.

At this point we know that $F_{X,T}$ is faithful for every situation as in the theorem. To finish the proof we show that $F_{X,T}$ is essentially surjective. Let $W \rightarrow X_{/T}$ be an object of $\mathcal{C}_{X_{/T}}$. Then $U \times_X W$ is an object of $\mathcal{C}_{U_{/T}}$. By the affine case we find an object $V \rightarrow U$ of $\mathcal{C}_{U,T}$ and an isomorphism $\alpha : F_{U,T}(V) \rightarrow U \times_X W$ in $\mathcal{C}_{U_{/T}}$. By fully faithfulness of $F_{R,T}$ we find a unique morphism $h : s^*V \rightarrow t^*V$ in the category $\mathcal{C}_{R,T}$ such that $F_{R,T}(h)$ corresponds, via the isomorphism α , to the canonical descent datum on $U \times_X W$ in the category $\mathcal{C}_{R_{/T}}$. Using faithfulness of our functor on $R \times_{s,U,t} R$ we see that h satisfies the cocycle condition. We conclude, for example by the much more general Bootstrap, Lemma 62.11.2, that there exists an object $Y \rightarrow X$ of $\mathcal{C}_{X,T}$ and an isomorphism $\beta : U \times_X Y \rightarrow V$ such that the descent datum h corresponds, via β , to the canonical descent datum on $U \times_X Y$. We omit the verification that $F_{X,T}(Y)$ is isomorphic to W ; hint: in the category of formal algebraic spaces there is descent for morphisms along étale coverings. \square

We are often interested as to whether the output of the construction of Theorem 66.12.9 is a separated algebraic space. In the next few lemmas we match properties of $Y \rightarrow X$ and the corresponding completion $Y_{/T} \rightarrow X_{/T}$.

Lemma 66.12.10. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $W \rightarrow X_{/T}$ be an object of*

the category $\mathcal{C}_{X/T}$ and let $Y \rightarrow X$ be the object corresponding to W via Theorem 66.12.9. Then $Y \rightarrow X$ is quasi-compact if and only if $W \rightarrow X/T$ is so.

Proof. These conditions may be checked after base change to an affine scheme étale over X , resp. a formal affine algebraic space étale over X/T , see Morphisms of Spaces, Lemma 49.8.7 as well as Formal Spaces, Lemma 65.12.3. If $U \rightarrow X$ ranges over étale morphisms with U affine, then the formal completions $U/T \rightarrow X/T$ give a family of formal affine coverings as in Formal Spaces, Definition 65.7.1. Thus we may and do assume X is affine.

Let $V \rightarrow Y$ be a surjective étale morphism where $V = \coprod_{j \in J} V_j$ is a disjoint union of affines. Then $V/T \rightarrow Y/T = W$ is a surjective étale morphism. Thus if Y is quasi-compact, we can choose J is finite, and we conclude that W is quasi-compact. Conversely, if W is quasi-compact, then we can find a finite subset $J' \subset J$ such that $\coprod_{j \in J'} (V_j)/T \rightarrow W$ is surjective. Then it follows that

$$(X \setminus T) \amalg \coprod_{j \in J'} V_j \longrightarrow Y$$

is surjective. This either follows from the construction of Y in the proof of Lemma 66.12.8 or it follows since we have

$$|Y| = |X \setminus T| \amalg |W_{red}|$$

as $Y/T = W$. □

Lemma 66.12.11. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $W \rightarrow X/T$ be an object of the category $\mathcal{C}_{X/T}$ and let $Y \rightarrow X$ be the object corresponding to W via Theorem 66.12.9. Then $Y \rightarrow X$ is quasi-separated if and only if $W \rightarrow X/T$ is so.*

Proof. These conditions may be checked after base change to an affine scheme étale over X , resp. a formal affine algebraic space étale over X/T , see Morphisms of Spaces, Lemma 49.4.12 as well as Formal Spaces, Lemma 65.21.5. If $U \rightarrow X$ ranges over étale morphisms with U affine, then the formal completions $U/T \rightarrow X/T$ give a family of formal affine coverings as in Formal Spaces, Definition 65.7.1. Thus we may and do assume X is affine.

Let $V \rightarrow Y$ be a surjective étale morphism where $V = \coprod_{j \in J} V_j$ is a disjoint union of affines. Then Y is quasi-separated if and only if $V_j \times_Y V_{j'}$ is quasi-compact for all $j, j' \in J$. Similarly, W is quasi-separated if and only if $(V_j \times_Y V_{j'})/T = (V_j)/T \times_{Y/T} (V_{j'})/T$ is quasi-compact for all $j, j' \in J$. Since X is Noetherian affine, we see that

$$(V_j \times_Y V_{j'}) \times_X (X \setminus T)$$

is quasi-compact. Hence we conclude the equivalence holds by the equality

$$|V_j \times_Y V_{j'}| = |(V_j \times_Y V_{j'}) \times_X (X \setminus T)| \amalg |(V_j \times_Y V_{j'})/T|$$

and the fact that the second summand is closed in the left hand side. □

Lemma 66.12.12. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $W \rightarrow X/T$ be an object of the category $\mathcal{C}_{X/T}$ and let $Y \rightarrow X$ be the object corresponding to W via Theorem 66.12.9. Then $Y \rightarrow X$ is separated if and only if $W \rightarrow X/T$ is separated and $\Delta : W \rightarrow W \times_{X/T} W$ is rig-surjective.*

Proof. These conditions may be checked after base change to an affine scheme étale over X , resp. a formal affine algebraic space étale over X/T , see Morphisms of Spaces, Lemma 49.4.12 as well as Formal Spaces, Lemma 65.21.5. If $U \rightarrow X$ ranges over étale morphisms with U affine, then the formal completions $U/T \rightarrow X/T$ give a family of formal affine coverings as in Formal Spaces, Definition 65.7.1. Thus we may and do assume X is affine. In the proof of both directions we may assume that $Y \rightarrow X$ and $W \rightarrow X/T$ are quasi-separated by Lemma 66.12.11.

Proof of easy direction. Assume $Y \rightarrow X$ is separated. Then $Y \rightarrow Y \times_X Y$ is a closed immersion and it follows that $W \rightarrow W \times_{X/T} W$ is a closed immersion too, i.e., we see that $W \rightarrow X/T$ is separated. Let

$$p : \mathrm{Spf}(R) \longrightarrow W \times_{X/T} W = (Y \times_X Y)_{/T}$$

be an adic morphism where R is a complete discrete valuation ring with fraction field K . The composition into $Y \times_X Y$ corresponds to a morphism $g : \mathrm{Spec}(R) \rightarrow Y \times_X Y$, see Formal Spaces, Lemma 65.24.3. Since p is an adic morphism, so is the composition $\mathrm{Spf}(R) \rightarrow X$. Thus we see that $g(\mathrm{Spec}(K))$ is a point of

$$(Y \times_X Y) \times_X (X \setminus T) \cong X \setminus T \cong Y \times_X (X \setminus T)$$

(small detail omitted). Hence this lifts to a K -point of Y and we obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow \\ \mathrm{Spec}(R) & \longrightarrow & Y \times_X Y \end{array}$$

Since $Y \rightarrow X$ was assumed separated we find the dotted arrow exists (Cohomology of Spaces, Lemma 51.18.1). Applying the functor completion along T we find that p can be lifted to a morphism into W , i.e., $W \rightarrow W \times_{X/T} W$ is rig-surjective.

Proof of hard direction. Assume $W \rightarrow X/T$ separated and $W \rightarrow W \times_{X/T} W$ rig-surjective. By Cohomology of Spaces, Lemma 51.18.1 and Remark 51.18.3 it suffices to show that given any commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow \\ \mathrm{Spec}(R) & \xrightarrow{g} & Y \times_X Y \end{array}$$

where R is a complete discrete valuation ring with fraction field K , there is at most one dotted arrow making the diagram commute. Let $h : \mathrm{Spec}(R) \rightarrow X$ be the composition of g with the morphism $Y \times_X Y \rightarrow X$. There are three cases: Case I: $h(\mathrm{Spec}(R)) \subset (X \setminus T)$. This case is trivial because $Y \times_X (X \setminus T) = X \setminus T$. Case II: h maps $\mathrm{Spec}(R)$ into T . This case follows from our assumption that $W \rightarrow X/T$ is separated. Namely, if T denotes the reduced induced closed subspace structure on T , then h factors through T and

$$W \times_{X/T} T = Y \times_X T \longrightarrow T$$

is separated by assumption (and for example Formal Spaces, Lemma 65.21.5) which implies we get the lifting property by Cohomology of Spaces, Lemma 51.18.1 applied

to the displayed arrow. Case III: $h(\mathrm{Spec}(K))$ is not in T but h maps the closed point of $\mathrm{Spec}(R)$ into T . In this case the corresponding morphism

$$g_{/T} : \mathrm{Spf}(R) \longrightarrow (Y \times_X Y)_{/T} = W \times_{X_{/T}} W$$

is an adic morphism (detail omitted). Hence our assumption that $W \rightarrow W \times_{X_{/T}} W$ be rig-surjective implies we can lift $g_{/T}$ to a morphism $e : \mathrm{Spf}(R) \rightarrow W = Y_{/T}$ (see Lemma 66.11.11 for why we do not need to extend R). Algebraizing the composition $\mathrm{Spf}(R) \rightarrow Y$ using Formal Spaces, Lemma 65.24.3 we find a morphism $\mathrm{Spec}(R) \rightarrow Y$ lifting g as desired. \square

Lemma 66.12.13. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let $T \subset |X|$ be a closed subset. Let $W \rightarrow X_{/T}$ be an object of the category $\mathcal{C}_{X_{/T}}$ and let $Y \rightarrow X$ be the object corresponding to W via Theorem 66.12.9. Then $Y \rightarrow X$ is proper if and only if the following conditions hold*

- (1) $W \rightarrow X_{/T}$ is proper,
- (2) $W \rightarrow X_{/T}$ is rig-surjective, and
- (3) $\Delta : W \rightarrow W \times_{X_{/T}} W$ is rig-surjective.

Proof. These conditions may be checked after base change to an affine scheme étale over X , resp. a formal affine algebraic space étale over $X_{/T}$, see Morphisms of Spaces, Lemma 49.37.2 as well as Formal Spaces, Lemma 65.22.2. If $U \rightarrow X$ ranges over étale morphisms with U affine, then the formal completions $U_{/T} \rightarrow X_{/T}$ give a family of formal affine coverings as in Formal Spaces, Definition 65.7.1. Thus we may and do assume X is affine. In the proof of both directions we may assume that $Y \rightarrow X$ and $W \rightarrow X_{/T}$ are separated and quasi-compact and that $W \rightarrow W \times_{X_{/T}} W$ is rig-surjective by Lemmas 66.12.10 and 66.12.12.

Proof of the easy direction. Assume $Y \rightarrow X$ is proper. Then $Y_{/T} = Y \times_X X_{/T} \rightarrow X_{/T}$ is proper too. Let

$$p : \mathrm{Spf}(R) \longrightarrow X_{/T}$$

be an adic morphism where R is a complete discrete valuation ring with fraction field K . Then p corresponds to a morphism $g : \mathrm{Spec}(R) \rightarrow X$, see Formal Spaces, Lemma 65.24.3. Since p is an adic morphism, we have $p(\mathrm{Spec}(K)) \notin T$. Since $Y \rightarrow X$ is an isomorphism over $X \setminus T$ we can lift to X and obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & Y \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(R) & \longrightarrow & X \end{array}$$

Since $Y \rightarrow X$ was assumed proper we find the dotted arrow exists. (Cohomology of Spaces, Lemma 51.18.2). Applying the functor completion along T we find that p can be lifted to a morphism into W , i.e., $W \rightarrow X_{/T}$ is rig-surjective.

Proof of hard direction. Assume $W \rightarrow X_{/T}$ proper, $W \rightarrow W \times_{X_{/T}} W$ rig-surjective, and $W \rightarrow X_{/T}$ rig-surjective. By Cohomology of Spaces, Lemma 51.18.2 and

Remark 51.18.3 it suffices to show that given any commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow \\ \text{Spec}(R) & \xrightarrow{g} & X \end{array}$$

where R is a complete discrete valuation ring with fraction field K , there is a dotted arrow making the diagram commute. Let $h : \text{Spec}(R) \rightarrow X$ be the composition of g with the morphism $Y \times_X Y \rightarrow X$. There are three cases: Case I: $h(\text{Spec}(R)) \subset (X \setminus T)$. This case is trivial because $Y \times_X (X \setminus T) = X \setminus T$. Case II: h maps $\text{Spec}(R)$ into T . This case follows from our assumption that $W \rightarrow X_{/T}$ is proper. Namely, if T denotes the reduced induced closed subspace structure on T , then h factors through T and

$$W \times_{X_{/T}} T = Y \times_X T \longrightarrow T$$

is proper by assumption which implies we get the lifting property by Cohomology of Spaces, Lemma 51.18.2 applied to the displayed arrow. Case III: $h(\text{Spec}(K))$ is not in T but h maps the closed point of $\text{Spec}(R)$ into T . In this case the corresponding morphism

$$g_{/T} : \text{Spf}(R) \longrightarrow Y_{/T} = W$$

is an adic morphism (detail omitted). Hence our assumption that $W \rightarrow X_{/T}$ be rig-surjective implies we can lift $g_{/T}$ to a morphism $e : \text{Spf}(R') \rightarrow W = Y_{/T}$ for some extension of complete discrete valuation rings $R \subset R'$. Algebraizing the composition $\text{Spf}(R') \rightarrow Y$ using Formal Spaces, Lemma 65.24.3 we find a morphism $\text{Spec}(R') \rightarrow Y$ lifting g . By the discussion in Cohomology of Spaces, Remark 51.18.3 this is sufficient to conclude that $Y \rightarrow X$ is proper. \square

66.13. Application to modifications

Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. We set $S = \text{Spec}(A)$ and $U = S \setminus \{\mathfrak{m}\}$. In this section we will consider the category

$$(66.13.0.1) \quad \left\{ f : X \longrightarrow S \quad \left| \quad \begin{array}{l} X \text{ is an algebraic space} \\ f \text{ is a proper morphism} \\ f^{-1}(U) \rightarrow U \text{ is an isomorphism} \end{array} \right. \right\}$$

A morphism from X/S to X'/S will be a morphism of algebraic spaces $X \rightarrow X'$ compatible with the structure morphisms over S .

Let $A \rightarrow B$ be a local homomorphism of local Noetherian rings such that $\mathfrak{m}_B = \sqrt{\mathfrak{m}_A B}$. Then base change along the morphism $\text{Spec}(B) \rightarrow \text{Spec}(A)$ gives a functor from the category (66.13.0.1) for A to the category (66.13.0.1) for B .

Lemma 66.13.1. *Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with \mathfrak{m} -adic completion A^\wedge . Then base change defines an equivalence of categories between the category (66.13.0.1) for A with the category (66.13.0.1) for the completion A^\wedge .*

Proof. Set $S = \text{Spec}(A)$ as in (66.13.0.1) and $T = V(\mathfrak{m})$. Similarly, Write $S' = \text{Spec}(A^\wedge)$ and $T' = V(\mathfrak{m}^\wedge)$. The morphism $S' \rightarrow S$ defines an isomorphism $S'_{/T'} \rightarrow S_{/T}$ of formal completions. Let $\mathcal{C}_{S,T}$, $\mathcal{C}_{S_{/T}}$, $\mathcal{C}_{S'_{/T'}}$, and $\mathcal{C}_{S',T'}$ be the corresponding

categories as used in (66.12.3.1). By Theorem 66.12.9 (in fact we only need the affine case treated in Lemma 66.12.8) we see that

$$\mathcal{C}_{S,T} = \mathcal{C}_{S/T} = \mathcal{C}_{S'/T'} = \mathcal{C}_{S',T'}$$

Note that $f : X \rightarrow S$ is an object of (66.13.0.1) if and only if $f : X \rightarrow S$ is an object of $\mathcal{C}_{S,T}$ and f is proper. Hence, to finish the proof we have to show that an object $f : X \rightarrow S$ of $\mathcal{C}_{S,T}$ is proper over S if and only if the base change $f' : X' \rightarrow S'$ is proper over S' . This you can deduce from Lemma 66.12.13 (translating the properness into properties of the formal completion which lives in $\mathcal{C}_{S/T} = \mathcal{C}_{S'/T'}$), or you can deduce it from Descent on Spaces, Lemma 56.10.17. \square

Lemma 66.13.2. *Let $A \rightarrow B$ be a local map of local Noetherian rings such that*

- (1) $A \rightarrow B$ is flat,
- (2) $\mathfrak{m}_B = \mathfrak{m}_A B$, and
- (3) $\kappa(\mathfrak{m}_A) = \kappa(\mathfrak{m}_B)$

(equivalently, $A \rightarrow B$ induces an isomorphism on completions, see More on Algebra, Lemma 15.32.7). Then the base change functor from the category (66.13.0.1) for A to the category (66.13.0.1) for B is an equivalence.

Proof. This follows immediately from Lemma 66.13.1. \square

Lemma 66.13.3. *Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $f : X \rightarrow S$ be an object of (66.13.0.1). Then there exists a U -admissible blowup $S' \rightarrow S$ which dominates X .*

Proof. Special case of More on Morphisms of Spaces, Lemma 58.28.3. \square

Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let A^\wedge be the completion of A . Set $S^\wedge = \text{Spec}(A^\wedge)$, $S = \text{Spec}(A)$ and let $U^\wedge \subset S^\wedge$, $U \subset S$ be the complement of the closed point. Picture

$$\begin{array}{ccc} U^\wedge & \longrightarrow & S^\wedge \\ \downarrow & & \downarrow \\ U & \longrightarrow & S \end{array}$$

This is a cartesian square of schemes.

Lemma 66.13.4. *With assumption and notation as above. If $Y \rightarrow S^\wedge$ is a U^\wedge -admissible blowup, then there exists a U -admissible blowup $X \rightarrow S$ such that $Y = X \times_S S^\wedge$.*

Proof. By definition there exists an ideal $J \subset A^\wedge$ such that $V(J) = \{\mathfrak{m}A^\wedge\}$ and such that Y is the blowup of S^\wedge in the closed subscheme defined by J , see Divisors, Definition 30.20.1. Since A^\wedge is Noetherian this implies $\mathfrak{m}^n A^\wedge \subset J$ for some n . Since $A^\wedge/\mathfrak{m}^n A^\wedge = A/\mathfrak{m}^n$ we find an ideal $\mathfrak{m}^n \subset I \subset A$ such that $J = IA^\wedge$. Let $X \rightarrow S$ be the blowup in I . Since $A \rightarrow A^\wedge$ is flat we conclude that the base change of X is Y by Divisors, Lemma 30.18.3. \square

Resolution of Surfaces

67.1. Introduction

This chapter discusses resolution of singularities of surfaces following Lipman [Lip78] and following the exposition in [Art86].

67.2. A trace map in positive characteristic

In this section p will be a prime number. Let R be an \mathbf{F}_p -algebra. Let M be an R -module and let $D : R \rightarrow M$ be a derivation. Given an $a \in R$ set $A = R[x]/(x^p - a)$. Define an R -linear map

$$\mathrm{Tr}_{x,D} : \Omega_{A/R} \longrightarrow M$$

by the rule

$$x^i dx \longmapsto \begin{cases} 0 & \text{if } 0 \leq i \leq p-2, \\ D(a) & \text{if } i = p-1 \end{cases}$$

This makes sense as $\Omega_{A/R}$ is a free R -module with basis $x^i dx$, $0 \leq i \leq p-1$. The following lemma implies that the trace map is well defined, i.e., independent of the choice of the coordinate x .

Lemma 67.2.1. *Let $\varphi : R[x]/(x^p - a) \rightarrow R[y]/(y^p - b)$ be an R -algebra homomorphism. Then $\mathrm{Tr}_{x,D} = \mathrm{Tr}_{y,D} \circ \varphi$.*

Proof. Say $\varphi(x) = \lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1}$ with $\lambda_i \in R$. The condition that mapping x to $\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1}$ induces an R -algebra homomorphism $R[x]/(x^p - a) \rightarrow R[y]/(y^p - b)$ is equivalent to the condition that

$$a = \lambda_0^p + \lambda_1^p b + \dots + \lambda_{p-1}^p b^{p-1}$$

in the ring R . Consider the polynomial ring

$$R_{univ} = \mathbf{F}_p[b, \lambda_0, \dots, \lambda_{p-1}]$$

with the element $a = \lambda_0^p + \lambda_1^p b + \dots + \lambda_{p-1}^p b^{p-1}$ and with its universal derivation given by

$$D_{univ} = d : R_{univ} \longrightarrow M_{univ} = \Omega_{R_{univ}/\mathbf{F}_p}$$

Consider the universal algebra map $\varphi_{univ} : R_{univ}[x]/(x^p - a) \rightarrow R_{univ}[y]/(y^p - b)$ given by mapping x to $\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1}$. We obtain a canonical maps

$$R_{univ} \longrightarrow R, \quad M_{univ} \longrightarrow M$$

compatible with derivations by sending b, λ_i to b, λ_i and sending $db, d\lambda_i$ to $D(b), D(\lambda_i)$. By construction the maps

$$R_{univ}[x]/(x^p - a) \rightarrow R[x]/(x^p - a), \quad R_{univ}[y]/(y^p - b) \rightarrow R[y]/(y^p - b)$$

are compatible with the trace maps. Hence it suffices to prove the lemma for the map φ_{univ} . We will do this by evaluating $\mathrm{Tr}_{y,D}(\varphi(x)^i d\varphi(x))$ for $i = 0, \dots, p-1$.

The case $0 \leq i \leq p-2$. Expand

$$(\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1})^i (\lambda_1 + 2\lambda_2 y + \dots + (p-1)\lambda_{p-1} y^{p-2})$$

in the ring $R[y]/(y^p - b)$. We have to show that the coefficient of y^{p-1} is zero. For this it suffices to show that the expression above as a polynomial in y has vanishing coefficients in front of the powers y^{pk-1} . Then we write our polynomial as

$$\frac{d}{(i+1)dy} (\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1})^{i+1}$$

and indeed the coefficients of y^{kp-1} are all zero.

The case $i = p-1$. Expand

$$(\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1})^{p-1} (\lambda_1 + 2\lambda_2 y + \dots + (p-1)\lambda_{p-1} y^{p-2})$$

in the ring $R[y]/(y^p - b)$. To finish the proof we have to show that the coefficient of y^{p-1} times $D(b)$ is $D(a)$. Here we use that R is S/pS where $S = \mathbf{Z}[b, \xi_j, \lambda_0, \dots, \lambda_{p-1}, \xi_{i,j}]$. Then the above, as a polynomial in y , is equal to

$$\frac{d}{pdy} (\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1})^p$$

Since $\frac{d}{dy}(y^{pk}) = pk y^{pk-1}$ it suffices to understand the coefficients of y^{pk} in the polynomial $(\lambda_0 + \lambda_1 y + \dots + \lambda_{p-1} y^{p-1})^p$ modulo p . The sum of these terms gives

$$\lambda_0^p + \lambda_1^p y^p + \dots + \lambda_{p-1}^p y^{p(p-1)} \pmod{p}$$

Whence we see that we obtain after applying the operator $\frac{d}{pdy}$ and after reducing modulo $y^p - b$ the value

$$\lambda_1^p + 2\lambda_2^p b + \dots + (p-1)\lambda_{p-1}^p b^{p-2}$$

for the coefficient of y^{p-1} we wanted to compute. Now because $a = \lambda_0^p + \lambda_1^p b + \dots + \lambda_{p-1}^p b^{p-1}$ in R we obtain that

$$D(a) = (\lambda_1^p + 2\lambda_2^p b + \dots + (p-1)\lambda_{p-1}^p b^{p-2})D(b)$$

in R . This proves that the coefficient of y^{p-1} is as desired. \square

Lemma 67.2.2. *Let R be a Noetherian normal domain with fraction field K . Let $a \in K$ be an element such that there exists a derivation $D : R \rightarrow R$ with $D(a) \neq 0$. Then the integral closure of R in $L = K[x]/(x^p - a)$ is finite over R .*

Proof. After replacing x by fx and a by $f^p a$ for some $f \in R$ we may assume $a \in R$. Hence also $D(a) \in R$. We will show by induction on $i \leq p-1$ that if

$$y = a_0 + a_1 x + \dots + a_i x^i, \quad a_j \in K$$

is integral over R , then $D(a)^i a_j \in R$. Thus the integral closure is contained in the finite R -module with basis $D(a)^{-p+1} x^j$, $j = 0, \dots, p-1$. Since R is Noetherian this proves the lemma.

If $i = 0$, then $y = a_0$ is integral over R if and only if $a_0 \in R$ and the statement is true. Suppose the statement holds for some $i < p-1$ and suppose that

$$y = a_0 + a_1 x + \dots + a_{i+1} x^{i+1}, \quad a_j \in K$$

is integral over R . Then

$$y^p = a_0^p + a_1^p a + \dots + a_{i+1}^p a^{i+1}$$

is an element of R (as it is in K and integral over R). Applying D we obtain

$$(a_1^p + 2a_2^p a + \dots + (i+1)a_{i+1}^p a^i)D(a)$$

is in R . Hence it follows that

$$D(a)a_1 + 2D(a)a_2x + \dots + (i+1)D(a)a_{i+1}x^i$$

is integral over R . By induction we find $D(a)^{i+1}a_j \in R$ for $j = 1, \dots, i+1$. (Here we use that $1, \dots, i+1$ are invertible.) Hence $D(a)^{i+1}a_0$ is also in R because it is the difference of y and $\sum_{j>0} D(a)^{i+1}a_jx^j$ which are integral over R (since x is integral over R as $a \in R$). \square

67.3. Modifications

Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. We set $S = \text{Spec}(A)$ and $U = S \setminus \{\mathfrak{m}\}$. In this section we will consider the category

$$(67.3.0.1) \quad \left\{ f : X \longrightarrow S \quad \left| \quad \begin{array}{l} X \text{ is an algebraic space} \\ f \text{ is a proper morphism} \\ f^{-1}(U) \rightarrow U \text{ is an isomorphism} \end{array} \right. \right\}$$

A morphism from X/S to X'/S will be a morphism of algebraic spaces $X \rightarrow X'$ compatible with the structure morphisms over S . In Restricted Power Series, Section 66.13 we have seen that this category only depends on the completion of A and we have proven some elementary properties of objects in this category. In this section we specifically study cases where $\dim(A) \leq 2$ or where the dimension of the closed fibre is at most 1.

Lemma 67.3.1. *Let $(A, \mathfrak{m}, \kappa)$ be a 2-dimensional Noetherian local domain such that $U = \text{Spec}(A) \setminus \{\mathfrak{m}\}$ is a normal scheme. Then any modification $f : X \rightarrow S$ (as in Spaces over Fields, Definition 54.6.1) is a morphism as in (67.3.0.1).*

Proof. Let $f : X \rightarrow S$ be a modification. We have to show that $f^{-1}(U) \rightarrow U$ is an isomorphism. By Spaces over Fields, Lemma 54.6.2 there exists a nonempty open $V \subset S$ such that $f^{-1}(V) \rightarrow V$ is an isomorphism. Since X is integral we see that $f^{-1}(V)$ is dense in X . Note that every closed point u of U has codimension 1, i.e., that $\dim(\mathcal{O}_{U,u}) = 1$. Thus we may apply Spaces over Fields, Lemma 54.4.4 to see that $f^{-1}(U) \rightarrow U$ is finite. In particular $f^{-1}(U)$ is a scheme. Then $f^{-1}(U) \rightarrow U$ is an isomorphism, see Morphisms, Lemma 28.48.16. \square

Lemma 67.3.2. *Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $g : X \rightarrow Y$ be a morphism in the category (67.3.0.1). If the induced morphism $X_\kappa \rightarrow Y_\kappa$ of special fibres is a closed immersion, then g is a closed immersion.*

Proof. This is a special case of More on Morphisms of Spaces, Lemma 58.37.3. \square

Lemma 67.3.3. *Let $(A, \mathfrak{m}, \kappa)$ be a complete Noetherian local ring. Let X be an algebraic space over $\text{Spec}(A)$. If $X \rightarrow \text{Spec}(A)$ is proper and $\dim(X_\kappa) \leq 1$, then X is a scheme projective over A .*

Proof. By Spaces over Fields, Lemma 54.7.5 the algebraic space X_κ is a scheme. Hence X_κ is a proper scheme of dimension ≤ 1 over κ . By Varieties, Lemma 32.23.4 we see that X_κ is H-projective over κ . Let \mathcal{L} be an ample invertible sheaf on X_κ .

We are going to show that \mathcal{L} lifts to a compatible system $\{\mathcal{L}_n\}$ of invertible sheaves on the n th infinitesimal neighbourhoods

$$X_n = X \times_{\text{Spec}(A)} \text{Spec}(A/\mathfrak{m}^n)$$

of $X_\kappa = X_1$. Recall that the étale sites of X_κ and all X_n are canonically equivalent, see More on Morphisms of Spaces, Lemma 58.8.6. In the rest of the proof we do not distinguish between sheaves on X_n and sheaves on X_m or X_κ . Suppose, given a lift \mathcal{L}_n to X_n . We consider the exact sequence

$$1 \rightarrow (1 + \mathfrak{m}^n \mathcal{O}_X / \mathfrak{m}^{n+1} \mathcal{O}_X)^* \rightarrow \mathcal{O}_{X_{n+1}}^* \rightarrow \mathcal{O}_{X_n}^* \rightarrow 1$$

of sheaves on X_{n+1} . We have $(1 + \mathfrak{m}^n \mathcal{O}_X / \mathfrak{m}^{n+1} \mathcal{O}_X)^* \cong \mathfrak{m}^n \mathcal{O}_X / \mathfrak{m}^{n+1} \mathcal{O}_X$ as abelian sheaves on X_{n+1} . The class of \mathcal{L}_n in $H^1(X_n, \mathcal{O}_{X_n}^*)$ (see Cohomology on Sites, Lemma 21.7.1) can be lifted to an element of $H^1(X_{n+1}, \mathcal{O}_{X_{n+1}}^*)$ if and only if the obstruction in $H^2(X_{n+1}, \mathfrak{m}^n \mathcal{O}_X / \mathfrak{m}^{n+1} \mathcal{O}_X)$ is zero. Note that $\mathfrak{m}^n \mathcal{O}_X / \mathfrak{m}^{n+1} \mathcal{O}_X$ is a quasi-coherent \mathcal{O}_{X_κ} -module on X_κ . Hence its étale cohomology agrees with its cohomology on the scheme X_κ , see Descent, Proposition 34.7.10. However, as X_κ is a Noetherian scheme of dimension ≤ 1 this cohomology group vanishes (Cohomology, Proposition 20.21.6).

By Grothendieck’s algebraization theorem (Cohomology of Schemes, Theorem 29.23.4) we find a projective morphism of schemes $Y \rightarrow \text{Spec}(A)$ and a compatible system of isomorphisms $X_n \rightarrow Y_n$. (Here we use the assumption that A is complete.) By More on Morphisms of Spaces, Lemma 58.32.3 we see that $X \cong Y$ and the proof is complete. \square

Lemma 67.3.4. *If $(A, \mathfrak{m}, \kappa)$ is a complete Noetherian local domain of dimension 2, then every modification of $\text{Spec}(A)$ is projective over A .*

Proof. By Lemma 67.3.3 it suffices to show that the special fibre of any modification X of $\text{Spec}(A)$ has dimension ≤ 1 . Let $U \rightarrow X$ be an étale morphism with U affine. Since $X \rightarrow \text{Spec}(A)$ is a modification (Spaces over Fields, Definition 54.6.1) we see that a dense open of U is étale over A . In particular, every generic point η of an irreducible component U' of U maps to the generic point of $\text{Spec}(A)$ and $f.f.(A) \subset \kappa(\eta)$ is finite separable. If $u \in U'$ is a closed point lying over $\mathfrak{m} \in \text{Spec}(A)$, then by the dimension formula we see that

$$\dim(\mathcal{O}_{U',u}) \leq \dim(A) = 2,$$

see Morphisms, Lemma 28.31.1. Since $\eta \notin U'_\kappa$, the dimension of U'_κ can be at most 1 as desired. \square

67.4. Quadratic transformations

In this section we study what happens when we blow up a nonsingular point on a surface. We hesitate to formally define such a morphism as a *quadratic transformation* as on the one hand often other names are used and on the other hand the phrase “quadratic transformation” is sometimes used with a different meaning.

Lemma 67.4.1. *Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f : X \rightarrow S = \text{Spec}(A)$ be the blowing up of A in \mathfrak{m} . There is a closed immersion*

$$r : X \longrightarrow \mathbf{P}_S^1$$

over S such that $\mathcal{O}_X(1) = r^*\mathcal{O}_{\mathbf{P}_S^1}(1)$ and such that $r|_E : E \rightarrow \mathbf{P}_\kappa^1$ is an isomorphism.

Proof. As A is regular of dimension 2 we can write $\mathfrak{m} = (x, y)$. Then x and y placed in degree 1 generate the Rees algebra $\bigoplus_{n \geq 0} \mathfrak{m}^n$ over A . Recall that $X = \text{Proj}(\bigoplus_{n \geq 0} \mathfrak{m}^n)$, see Divisors, Lemma 30.18.2. Thus the surjection

$$A[T_0, T_1] \longrightarrow \bigoplus_{n \geq 0} \mathfrak{m}^n, \quad T_0 \mapsto x, \quad T_1 \mapsto y$$

of graded A -algebras induces a closed immersion $r : X \rightarrow \mathbf{P}_S^1 = \text{Proj}(A[T_0, T_1])$ such that $\mathcal{O}_X(1) = r^*\mathcal{O}_{\mathbf{P}_S^1}(1)$, see Constructions, Lemma 26.11.5. To prove the final statement note that

$$\left(\bigoplus_{n \geq 0} \mathfrak{m}^n \right) \otimes_A \kappa = \bigoplus_{n \geq 0} \mathfrak{m}^n / \mathfrak{m}^{n+1} \cong \kappa[\bar{x}, \bar{y}]$$

a polynomial algebra, see Algebra, Lemma 10.102.1. This proves that the fibre of $X \rightarrow S$ over $\text{Spec}(\kappa)$ is equal to $\text{Proj}(\kappa[\bar{x}, \bar{y}]) = \mathbf{P}_\kappa^1$, see Constructions, Lemma 26.11.6. Recall that E is the closed subscheme of X defined by $\mathfrak{m}\mathcal{O}_X$, i.e., $E = X_\kappa$. By our choice of the morphism r we see that $r|_E$ in fact produces the identification of $E = X_\kappa$ with the special fibre of $\mathbf{P}_S^1 \rightarrow S$. \square

Lemma 67.4.2. *Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f : X \rightarrow S = \text{Spec}(A)$ be the blowing up of A in \mathfrak{m} . Then X is an irreducible regular scheme.*

Proof. Observe that X is integral by Divisors, Lemma 30.18.7 and Algebra, Lemma 10.102.2. To see X is regular it suffices to check that $\mathcal{O}_{X,x}$ is regular for closed points $x \in X$, see Properties, Lemma 27.9.2. Let $x \in X$ be a closed point. Since f is proper x maps to \mathfrak{m} , i.e., x is a point of the exceptional divisor E . Then E is an effective Cartier divisor and $E \cong \mathbf{P}_\kappa^1$. Thus if $f \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$ is a local equation for E , then $\mathcal{O}_{X,x}/(f) \cong \mathcal{O}_{\mathbf{P}_\kappa^1,x}$. Since \mathbf{P}_κ^1 is covered by two affine opens which are the spectrum of a polynomial ring over κ , we see that $\mathcal{O}_{\mathbf{P}_\kappa^1,x}$ is regular by Algebra, Lemma 10.110.1. We conclude by Algebra, Lemma 10.102.7. \square

Lemma 67.4.3. *Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f : X \rightarrow S = \text{Spec}(A)$ be the blowing up of A in \mathfrak{m} . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module.*

- (1) $H^p(X, \mathcal{F}) = 0$ for $p \notin \{0, 1\}$,
- (2) $H^1(X, \mathcal{O}_X(n)) = 0$ for $n \geq -1$,
- (3) $H^1(X, \mathcal{F}) = 0$ if \mathcal{F} or $\mathcal{F}(1)$ is globally generated,
- (4) $H^0(X, \mathcal{O}_X(n)) = \mathfrak{m}^{\max(0,n)}$,
- (5) $\text{length}_A H^1(X, \mathcal{O}_X(n)) = -n(-n-1)/2$ if $n < 0$.

Proof. If $\mathfrak{m} = (x, y)$, then X is covered by the spectra of the affine blowup algebras $A[\frac{\mathfrak{m}}{x}]$ and $A[\frac{\mathfrak{m}}{y}]$ because x and y placed in degree 1 generate the Rees algebra $\bigoplus \mathfrak{m}^n$ over A . See Divisors, Lemma 30.18.2 and Constructions, Lemma 26.8.9. Since X is separated by Constructions, Lemma 26.8.8 we see that cohomology of quasi-coherent sheaves vanishes in degrees ≥ 2 by Cohomology of Schemes, Lemma 29.4.2.

Let $i : E \rightarrow X$ be the exceptional divisor, see Divisors, Definition 30.18.1. Recall that $\mathcal{O}_X(-E) = \mathcal{O}_X(1)$ is f -relatively ample, see Divisors, Lemma 30.18.4. Hence we know that $H^1(X, \mathcal{O}_X(-nE)) = 0$ for some $n > 0$, see Cohomology of Schemes, Lemma 29.15.4. Consider the filtration

$$\mathcal{O}_X(-nE) \subset \mathcal{O}_X(-(n-1)E) \subset \dots \subset \mathcal{O}_X(-E) \subset \mathcal{O}_X \subset \mathcal{O}_X(E)$$

The successive quotients are the sheaves

$$\mathcal{O}_X(-tE)/\mathcal{O}_X(-(t+1)E) = \mathcal{O}_X(t)/\mathcal{I}(t) = i_*\mathcal{O}_E(t)$$

where $\mathcal{I} = \mathcal{O}_X(-E)$ is the ideal sheaf of E . By Lemma 67.4.1 we have $E = \mathbf{P}_\kappa^1$ and $\mathcal{O}_E(1)$ indeed corresponds to the usual Serre twist of the structure sheaf on \mathbf{P}^1 . Hence the cohomology of $\mathcal{O}_E(t)$ vanishes in degree 1 for $t \geq -1$, see Cohomology of Schemes, Lemma 29.8.1. Since this is equal to $H^1(X, i_*\mathcal{O}_E(t))$ (by Cohomology of Schemes, Lemma 29.2.4) we find that $H^1(X, \mathcal{O}_X(-(t+1)E)) \rightarrow H^1(X, \mathcal{O}_X(-tE))$ is surjective for $t \geq -1$. Hence

$$0 = H^1(X, \mathcal{O}_X(-nE)) \longrightarrow H^1(X, \mathcal{O}_X(-tE)) = H^1(X, \mathcal{O}_X(t))$$

is surjective for $t \geq -1$ which proves (2).

Let \mathcal{F} be globally generated. This means there exists a short exact sequence

$$0 \rightarrow \mathcal{G} \rightarrow \bigoplus_{i \in I} \mathcal{O}_X \rightarrow \mathcal{F} \rightarrow 0$$

Note that $H^1(X, \bigoplus_{i \in I} \mathcal{O}_X) = \bigoplus_{i \in I} H^1(X, \mathcal{O}_X)$ by Cohomology, Lemma 20.20.1. By part (2) we have $H^1(X, \mathcal{O}_X) = 0$. If $\mathcal{F}(1)$ is globally generated, then we can find a surjection $\bigoplus_{i \in I} \mathcal{O}_X(-1) \rightarrow \mathcal{F}$ and argue in a similar fashion. In other words, part (3) follows from part (2).

For part (4) we note that for all n large enough we have $\Gamma(X, \mathcal{O}_X(n)) = \mathfrak{m}^n$, see Cohomology of Schemes, Lemma 29.15.3. If $n \geq 0$, then we can use the short exact sequence

$$0 \rightarrow \mathcal{O}_X(n) \rightarrow \mathcal{O}_X(n-1) \rightarrow i_*\mathcal{O}_E(n-1) \rightarrow 0$$

and the vanishing of H^1 for the sheaf on the left to get a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathfrak{m}^{\max(0,n)} & \longrightarrow & \mathfrak{m}^{\max(0,n-1)} & \longrightarrow & \mathfrak{m}^{\max(0,n)}/\mathfrak{m}^{\max(0,n-1)} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \Gamma(X, \mathcal{O}_X(n)) & \longrightarrow & \Gamma(X, \mathcal{O}_X(n-1)) & \longrightarrow & \Gamma(E, \mathcal{O}_E(n-1)) \longrightarrow 0 \end{array}$$

with exact rows. In fact, the rows are exact also for $n < 0$ because in this case the groups on the right are zero. In the proof of Lemma 67.4.1 we have seen that the right vertical arrow is an isomorphism (details omitted). Hence if the left vertical arrow is an isomorphism, so is the middle one. In this way we see that (4) holds by descending induction on n .

Finally, we prove (5) by descending induction on n and the sequences

$$0 \rightarrow \mathcal{O}_X(n) \rightarrow \mathcal{O}_X(n-1) \rightarrow i_*\mathcal{O}_E(n-1) \rightarrow 0$$

Namely, for $n \geq -1$ we already know $H^1(X, \mathcal{O}_X(n)) = 0$. Since

$$H^1(X, i_*\mathcal{O}_E(-2)) = H^1(E, \mathcal{O}_E(-2)) = H^1(\mathbf{P}_\kappa^1, \mathcal{O}(-2)) \cong \kappa$$

by Cohomology of Schemes, Lemma 29.8.1 which has length 1 as an A -module, we conclude from the long exact cohomology sequence that (5) holds for $n = -2$. And so on and so forth. □

Lemma 67.4.4. *Let (A, \mathfrak{m}) be a regular local ring of dimension 2. Let $f : X \rightarrow S = \text{Spec}(A)$ be the blowing up of A in \mathfrak{m} . Let $\mathfrak{m}^n \subset I \subset \mathfrak{m}$ be an ideal. Let $d \geq 0$ be the largest integer such that*

$$I\mathcal{O}_X \subset \mathcal{O}_X(-dE)$$

where E is the exceptional divisor. Set $\mathcal{I}' = I\mathcal{O}_X(dE) \subset \mathcal{O}_X$. Then $d > 0$, the sheaf $\mathcal{O}_X/\mathcal{I}'$ is supported in finitely many closed points x_1, \dots, x_r of X , and

$$\begin{aligned} \text{length}_A(A/I) &> \text{length}_A\Gamma(X, \mathcal{O}_X/\mathcal{I}') \\ &\geq \sum_{i=1, \dots, r} \text{length}_{\mathcal{O}_{X, x_i}}(\mathcal{O}_{X, x_i}/\mathcal{I}'_{x_i}) \end{aligned}$$

Proof. Since $I \subset \mathfrak{m}$ we see that every element of I vanishes on E . Thus we see that $d \geq 1$. On the other hand, since $\mathfrak{m}^n \subset I$ we see that $d \leq n$. Consider the short exact sequence

$$0 \rightarrow I\mathcal{O}_X \rightarrow \mathcal{O}_X \rightarrow \mathcal{O}_X/I\mathcal{O}_X \rightarrow 0$$

Since $I\mathcal{O}_X$ is globally generated, we see that $H^1(X, I\mathcal{O}_X) = 0$ by Lemma 67.4.3. Hence we obtain a surjection $A/I \rightarrow \Gamma(X, \mathcal{O}_X/I\mathcal{O}_X)$. Consider the short exact sequence

$$0 \rightarrow \mathcal{O}_X(-dE)/I\mathcal{O}_X \rightarrow \mathcal{O}_X/I\mathcal{O}_X \rightarrow \mathcal{O}_X/\mathcal{O}_X(-dE) \rightarrow 0$$

By Divisors, Lemma 30.9.24 we see that $\mathcal{O}_X(-dE)/I\mathcal{O}_X$ is supported in finitely many closed points of X . In particular, this coherent sheaf has vanishing higher cohomology groups (detail omitted). Thus in the following diagram

$$\begin{array}{ccccccc} & & & & A/I & & \\ & & & & \downarrow & & \\ 0 & \longrightarrow & \Gamma(X, \mathcal{O}_X(-dE)/I\mathcal{O}_X) & \longrightarrow & \Gamma(X, \mathcal{O}_X/I\mathcal{O}_X) & \longrightarrow & \Gamma(X, \mathcal{O}_X/\mathcal{O}_X(-dE)) \longrightarrow 0 \end{array}$$

the bottom row is exact and the vertical arrow surjective. We have

$$\text{length}_A\Gamma(X, \mathcal{O}_X(-dE)/I\mathcal{O}_X) < \text{length}_A(A/I)$$

since $\Gamma(X, \mathcal{O}_X/\mathcal{O}_X(-dE))$ is nonzero. Namely, the image of $1 \in \Gamma(X, \mathcal{O}_X)$ is nonzero as $d > 0$.

To finish the proof we translate the results above into the statements of the lemma. Since $\mathcal{O}_X(dE)$ is invertible we have

$$\mathcal{O}_X/\mathcal{I}' = \mathcal{O}_X(-dE)/I\mathcal{O}_X \otimes_{\mathcal{O}_X} \mathcal{O}_X(dE).$$

Thus $\mathcal{O}_X/\mathcal{I}'$ and $\mathcal{O}_X(-dE)/I\mathcal{O}_X$ are supported in the same set of finitely many closed points, say $x_1, \dots, x_r \in E \subset X$. Moreover we obtain

$$\Gamma(X, \mathcal{O}_X(-dE)/I\mathcal{O}_X) = \bigoplus \mathcal{O}_X(-dE)_{x_i}/I\mathcal{O}_{X, x_i} \cong \bigoplus \mathcal{O}_{X, x_i}/\mathcal{I}'_{x_i} = \Gamma(X, \mathcal{O}_X/\mathcal{I}')$$

because an invertible module over a local ring is trivial. Thus we obtain the strict inequality. We also get the second because

$$\text{length}_A(\mathcal{O}_{X, x_i}/\mathcal{I}'_{x_i}) \geq \text{length}_{\mathcal{O}_{X, x_i}}(\mathcal{O}_{X, x_i}/\mathcal{I}'_{x_i})$$

as is immediate from the definition of length. \square

67.5. Quadratic transformations of spaces

Using the result above we can prove that blowups in points dominate any modification of a regular 2 dimensional algebraic space.

Let X be a decent algebraic space over some base scheme S . Let $x \in |X|$ be a closed point. By Decent Spaces, Lemma 50.12.5 we can represent x by a closed immersion $i: \text{Spec}(k) \rightarrow X$. Then the *blowing up of X at x* means the blowing up of X in the closed subspace $Z = i(\text{Spec}(k)) \subset X$.

Lemma 67.5.1. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let $T \subset |X|$ be a finite set of closed points x such that (1) X is regular at x and (2) the local ring of X at x has dimension 2. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals such that $\mathcal{O}_X/\mathcal{I}$ is supported on T . Then there exists a sequence*

$$X_n \rightarrow X_{n-1} \rightarrow \dots \rightarrow X_1 \rightarrow X_0 = X$$

where $X_{i+1} \rightarrow X_i$ is the blowing up of X_i at a closed point x_i lying above a point of T such that $\mathcal{I}\mathcal{O}_{X_n}$ is an invertible ideal sheaf.

Proof. Say $T = \{x_1, \dots, x_r\}$. Pick an étale morphism $U \rightarrow X$ where U is a scheme with points $u_i \in U$ lying over x_i . By Decent Spaces, Lemma 50.10.3 the points u_i are closed points. After shrinking U we may assume these are the only points of U mapping to T . The local rings \mathcal{O}_{U,u_i} are regular local of dimension 2, see Properties of Spaces, Definitions 48.23.2 and 48.20.2. Let $I_i \subset \mathcal{O}_{U,u_i}$ be the stalk of $\mathcal{I}|_U$ at u_i . Set

$$n_i = \text{length}_{\mathcal{O}_{U,u_i}}(\mathcal{O}_{U,u_i}/I_i)$$

This is finite as $\mathcal{O}_X/\mathcal{I}$ is supported on T and hence $\mathcal{O}_{U,u_i}/I_i$ has support equal to $\{\mathfrak{m}_{u_i}\}$ (see Algebra, Lemma 10.61.3). We are going to use induction on $\sum n_i$. If $n_i = 0$ for all i , then $\mathcal{I} = \mathcal{O}_X$ and we are done.

Suppose $n_i > 0$. Let $X' \rightarrow X$ be the blowing up of X in x_i (see discussion above the lemma). Since $U \rightarrow X$ is étale and u_i is the unique point of U lying over x we see that $U' = U \times_X X'$ is the blowup of U in u_i , see Divisors on Spaces, Lemma 53.6.3. Since $\text{Spec}(\mathcal{O}_{U,u_i}) \rightarrow U$ is flat we see that $U' \times_U \text{Spec}(\mathcal{O}_{U,u_i})$ is the blowup of the ring \mathcal{O}_{U,u_i} in the maximal ideal. Hence both squares in the commutative diagram

$$\begin{array}{ccccc} \text{Proj}(\bigoplus_{d \geq 0} \mathfrak{m}_{u_i}^d) & \longrightarrow & U' & \longrightarrow & X' \\ \downarrow & & \downarrow & & \downarrow \\ \text{Spec}(\mathcal{O}_{U,u_i}) & \longrightarrow & U & \longrightarrow & X \end{array}$$

are cartesian. Let $E \subset X'$, $E' \subset U'$, $E'' \subset \text{Proj}(\bigoplus_{d \geq 0} \mathfrak{m}_{u_i}^d)$ be the exceptional divisors. Let $d \geq 1$ be the integer found in Lemma 67.4.4 for the ideal $\mathcal{I}_i \subset \mathcal{O}_{U,u_i}$. Since the horizontal arrows in the diagram are flat, since $E'' \rightarrow E$ is surjective, and since E'' is the pullback of E , we see that

$$\mathcal{I}\mathcal{O}_{X'} \subset \mathcal{O}_{X'}(-dE)$$

(some details omitted). Set $\mathcal{I}' = \mathcal{I}\mathcal{O}_{X'}(dE) \subset \mathcal{O}_{X'}$. Then we see that $\mathcal{O}_{X'}/\mathcal{I}'$ is supported in finitely many closed points $T' \subset |X'|$ because this holds over $X \setminus \{x_i\}$ and for the pullback to $\text{Proj}(\bigoplus_{d \geq 0} \mathfrak{m}_{u_i}^d)$. The final assertion of Lemma 67.4.4 tells us that the sum of the lengths of the stalks $\mathcal{O}_{U',u'}/\mathcal{I}'\mathcal{O}_{U',u'}$ for u' lying over u_i is $< n_i$. Hence the sum of the lengths has decreased.

By induction hypothesis, there exists a sequence

$$X'_n \rightarrow \dots \rightarrow X'_1 \rightarrow X'$$

of blowups at closed points lying over T' such that $\mathcal{I}'\mathcal{O}_{X'_n}$ is invertible. Since $\mathcal{I}'\mathcal{O}_{X'}(-dE) = \mathcal{I}\mathcal{O}_{X'}$, we see that $\mathcal{I}\mathcal{O}_{X'_n} = \mathcal{I}'\mathcal{O}_{X'_n}(-d(f')^{-1}E)$ where $f' : X'_n \rightarrow X'$ is the composition. Note that $(f')^{-1}E$ is an effective Cartier divisor by Divisors on Spaces, Lemma 53.6.8. Thus we are done by Divisors on Spaces, Lemma 53.2.7. □

Lemma 67.5.2. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let $T \subset |X|$ be a finite set of closed points x such that (1) X is regular at x and (2) the local ring of X at x has dimension 2. Let $f : Y \rightarrow X$ be a proper morphism of algebraic spaces which is an isomorphism over $U = X \setminus T$. Then there exists a sequence*

$$X_n \rightarrow X_{n-1} \rightarrow \dots \rightarrow X_1 \rightarrow X_0 = X$$

where $X_{i+1} \rightarrow X_i$ is the blowing up of X_i at a closed point x_i lying above a point of T and a factorization $X_n \rightarrow Y \rightarrow X$ of the composition.

Proof. By More on Morphisms of Spaces, Lemma 58.28.3 there exists a U -admissible blowup $X' \rightarrow X$ which dominates $Y \rightarrow X$. Hence we may assume there exists an ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$ such that $\mathcal{O}_X/\mathcal{I}$ is supported on T and such that Y is the blowing up of X in \mathcal{I} . By Lemma 67.5.1 there exists a sequence

$$X_n \rightarrow X_{n-1} \rightarrow \dots \rightarrow X_1 \rightarrow X_0 = X$$

where $X_{i+1} \rightarrow X_i$ is the blowing up of X_i at a closed point x_i lying above a point of T such that $\mathcal{I}\mathcal{O}_{X_n}$ is an invertible ideal sheaf. By the universal property of blowing up (Divisors on Spaces, Lemma 53.6.5) we find the desired factorization. \square

67.6. Examples

Some examples related to the results earlier in this chapter.

Example 67.6.1. Let k be a field. The ring $A = k[x, y, z]/(x^r + y^s + z^t)$ is a UFD for r, s, t pairwise coprime integers. Namely, since $x^r + y^s + z^t$ is irreducible A is a domain. The element z is a prime element, i.e., generates a prime ideal in A . On the other hand, if $r = 1 + ers$ for some e , then

$$A[1/z] \cong k[x', y', 1/z]$$

where $x' = x/z^{es}$, $y' = y/z^{et}$ and $z = (x')^r + (y')^s$. Thus $A[1/z]$ is a localization of a polynomial ring and hence a UFD. It follows from an argument of Nagata that A is a UFD. See Algebra, Lemma 10.116.7. A similar argument can be given if r is not congruent to 1 modulo rs .

Example 67.6.2. The ring $A = \mathbf{C}[[x, y, z]]/(x^r + y^s + z^t)$ is not a UFD when $r < s < t$ are pairwise coprime integers and not equal to 2, 3, 5. For example consider the special case $A = \mathbf{C}[[x, y, z]]/(x^2 + y^5 + z^7)$. Consider the maps

$$\psi_\zeta : \mathbf{C}[[x, y, z]]/(x^2 + y^5 + z^7) \rightarrow \mathbf{C}[[t]]$$

given by

$$x \mapsto t^7, \quad y \mapsto t^3, \quad z \mapsto -\zeta t^2(1+t)^{1/7}$$

where ζ is a 7th root of unity. The kernel \mathfrak{p}_ζ of ψ_ζ is a height one prime, hence if A is a UFD, then it is principal, say given by $f_\zeta \in \mathbf{C}[[x, y, z]]$. Note that $V(x^3 - y^7) = \bigcup V(\mathfrak{p}_\zeta)$ and $A/(x^3 - y^7)$ is reduced away from the closed point. Hence, still assuming A is a UFD, we would obtain

$$\prod_{\zeta} f_\zeta = u(x^3 - y^7) + a(x^2 + y^5 + z^7) \quad \text{in } \mathbf{C}[[x, y, z]]$$

for some unit $u \in \mathbf{C}[[x, y, z]]$ and some element $a \in \mathbf{C}[[x, y, z]]$. After scaling by a constant we may assume $u(0, 0, 0) = 1$. Note that the left hand side vanishes to order 7. Hence $a = -x \bmod \mathfrak{m}^2$. But then we get a term xy^5 on the right hand side which does not occur on the left hand side. A contradiction.

Example 67.6.3. There exists an excellent 2-dimensional Noetherian local ring and a modification $X \rightarrow S = \text{Spec}(A)$ which is not a scheme. We sketch a construction. Let X be a normal surface over \mathbf{C} with a unique singular point $x \in X$. Assume that there exists a resolution $\pi : X' \rightarrow X$ such that the exceptional fibre $C = \pi^{-1}(x)_{\text{red}}$ is a smooth projective curve. Furthermore, assume there exists a point $c \in C$ such that if $\mathcal{O}_C(nc)$ is in the image of $\text{Pic}(X') \rightarrow \text{Pic}(C)$, then $n = 0$. Then we let $X'' \rightarrow X'$ be the blowing up in the nonsingular point c . Let $C' \subset X''$ be the strict transform of C and let $E \subset X''$ be the exceptional fibre. By Artin's results ([Art70]; use for example [Mum61] to see that the normal bundle of C' is negative) we can blow down the curve C' in X'' to obtain an algebraic space X''' .
Picture

We claim that X''' is not a scheme. This provides us with our example because X''' is a scheme if and only if the base change of X''' to $A = \mathcal{O}_{X,x}$ is a scheme (details omitted). If X''' were a scheme, then the image of C' in X''' would have an affine neighbourhood. The complement of this neighbourhood would be an effective Cartier divisor on X''' (because X''' is nonsingular apart from 1 point). This effective Cartier divisor would correspond to an effective Cartier divisor on X'' meeting E and avoiding C' . Taking the image in X' we obtain an effective Cartier divisor meeting C (set theoretically) in c . This is impossible as no multiple of c is the restriction of a Cartier divisor by assumption.

To finish we have to find such a singular surface X . We can just take X to be the affine surface given by

$$x^3 + y^3 + z^3 + x^4 + y^4 + z^4 = 0$$

in $\mathbf{A}_{\mathbf{C}}^3 = \text{Spec}(\mathbf{C}[x, y, z])$ and singular point $(0, 0, 0)$. Then $(0, 0, 0)$ is the only singular point. Blowing up X in the maximal ideal corresponding to $(0, 0, 0)$ we find three charts each isomorphic to the smooth affine surface

$$1 + s^3 + t^3 + x(1 + s^4 + t^4) = 0$$

which is nonsingular with exceptional divisor C given by $x = 0$. The reader will recognize C as an elliptic curve. Finally, the surface X is rational as projection from $(0, 0, 0)$ shows, or because in the equation for the blow up we can solve for x . Finally, the Picard group of a nonsingular rational surface is countable, whereas the Picard group of an elliptic curve over the complex numbers is uncountable. Hence we can find a closed point c as indicated.

Formal Deformation Theory

68.1. Introduction

This chapter develops formal deformation theory in a form applicable later in the stacks project, closely following Rim [GRR72, Exposee VI] and Schlessinger [Sch68]. We strongly encourage the reader new to this topic to read the paper by Schlessinger first, as it is sufficiently general for most applications, and Schlessinger's results are indeed used in most papers that use this kind of formal deformation theory.

Let Λ be a complete Noetherian local ring with residue field k , and let \mathcal{C}_Λ denote the category of Artinian local Λ -algebras with residue field k . Given a functor $F : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ such that $F(k)$ is a one element set, Schlessinger's paper introduced conditions (H1)-(H4) such that:

- (1) F has a "hull" if and only if (H1)-(H3) hold.
- (2) F is prorepresentable if and only (H1)-(H4) hold.

The purpose of this chapter is to generalize these results in two ways exactly as is done in Rim's paper:

- (A) The functor F is replaced by a category \mathcal{F} cofibred in groupoids over \mathcal{C}_Λ , see Section 68.3.
- (B) We let Λ be a Noetherian ring and $\Lambda \rightarrow k$ a finite ring map to a field. The category \mathcal{C}_Λ is the category of Artinian local Λ -algebras A endowed with a given identification $A/\mathfrak{m}_A = k$.

The analogue of the condition that $F(k)$ is a one element set is that $\mathcal{F}(k)$ is the trivial groupoid. If \mathcal{F} satisfies this condition then we say it is a *predeformation category*, but in general we do not make this assumption. Rim's paper [GRR72, Exposee VI] is the original source for the results in this document. We also mention the useful paper [TV10], which discusses deformation theory with groupoids but in less generality than we do here.

An important role is played by the "completion" $\widehat{\mathcal{C}}_\Lambda$ of the category \mathcal{C}_Λ . An object of $\widehat{\mathcal{C}}_\Lambda$ is a Noetherian complete local Λ -algebra R whose residue field is identified with k , see Section 68.4. On the one hand $\mathcal{C}_\Lambda \subset \widehat{\mathcal{C}}_\Lambda$ is a strictly full subcategory and on the other hand $\widehat{\mathcal{C}}_\Lambda$ is a full subcategory of the category of pro-objects of \mathcal{C}_Λ . A functor $\mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ is *prorepresentable* if it is isomorphic to the restriction of a representable functor $\underline{R} = \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(R, -)$ to \mathcal{C}_Λ where $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$.

Categories cofibred in groupoids are dual to categories fibred in groupoids; we introduced them in Section 68.5. A *smooth* morphism of categories cofibred in groupoids over \mathcal{C}_Λ is one that satisfies the infinitesimal lifting criterion for objects, see Section 68.8. This is analogous to the definition of a formally smooth ring map, see

Algebra, Definition 10.133.1 and is exactly dual to the notion in Criteria for Representability, Section 74.6. This is an important notion as we eventually want to prove that certain kinds of categories cofibred in groupoids have a smooth prorepresentable presentation, much like the characterization of algebraic stacks in Algebraic Stacks, Sections 71.16 and 71.17. A *versal formal object* of a category \mathcal{F} cofibred in groupoids over \mathcal{C}_Λ is an object $\xi \in \widehat{\mathcal{F}}(R)$ of the completion such that the associated morphism $\underline{\xi} : \underline{R} \rightarrow \mathcal{F}$ is smooth.

In Section 68.9, we define conditions (S1) and (S2) on \mathcal{F} generalizing Schlessinger’s (H1) and (H2). The analogue of Schlessinger’s (H3)—the condition that \mathcal{F} has finite dimensional tangent space—is not given a name. A key step in the development of the theory is the existence of versal formal objects for predeformation categories satisfying (S1), (S2) and (H3), see Lemma 68.12.4. Schlessinger’s notion of a *hull* for a functor $F : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ is, in our terminology, a versal formal object $\xi \in \widehat{\mathcal{F}}(R)$ such that the induced map of tangent spaces $d\underline{\xi} : T\underline{R} \rightarrow TF$ is an isomorphism. In the literature a hull is often called a “miniversal” object. We do not do so, and here is why. It can happen that a functor has a versal formal object without having a hull. Moreover, we show in Section 68.13 that if a predeformation category has a versal formal object, then it always has a *minimal* one (as defined in Definition 68.13.4) which is unique up to isomorphism, see Lemma 68.13.5. But it can happen that the minimal versal formal object does not induce an isomorphism on tangent spaces! (See Examples 68.14.3 and 68.14.8.)

Keeping in mind the differences pointed out above, Theorem 68.14.5 is the direct generalization of (1) above: it recovers Schlessinger’s result in the case that \mathcal{F} is a functor and it characterizes minimal versal formal objects, in the presence of conditions (S1) and (S2), in terms of the map $d\underline{\xi} : T\underline{R} \rightarrow TF$ on tangent spaces.

In Section 68.15, we define Rim’s condition (RS) on \mathcal{F} generalizing Schlessinger’s (H4). A *deformation category* is defined as a predeformation category satisfying (RS). The analogue to prorepresentable functors are the categories cofibred in groupoids over \mathcal{C}_Λ which have a *presentation by a smooth prorepresentable groupoid in functors* on \mathcal{C}_Λ , see Definitions 68.19.1, 68.20.1, and 68.21.1. This notion of a presentation takes into account the groupoid structure of the fibers of \mathcal{F} . In Theorem 68.24.4 we prove that \mathcal{F} has a presentation by a smooth prorepresentable groupoid in functors if and only if \mathcal{F} has a finite dimensional tangent space and finite dimensional infinitesimal automorphism space. This is the generalization of (2) above: it reduces to Schlessinger’s result in the case that \mathcal{F} is a functor. There is a final Section 68.25 where we discuss how to use minimal versal formal objects to produce a (unique up to isomorphism) minimal presentation by a smooth prorepresentable groupoid in functors.

We also find the following conceptual explanation for Schlessinger’s conditions. If a predeformation category \mathcal{F} satisfies (RS), then the associated functor of isomorphism classes $\overline{\mathcal{F}} : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ satisfies (H1) and (H2) (Lemmas 68.15.6 and 68.9.5). Conversely, if a functor $F : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ arises naturally as the functor of isomorphism classes of a category \mathcal{F} cofibred in groupoids, then it seems to happen in practice that an argument showing F satisfies (H1) and (H2) will also show \mathcal{F} satisfies (RS) (see Artin’s Axioms, Section 75.22 for examples). Moreover, if \mathcal{F} satisfies (RS),

then condition (H4) for $\overline{\mathcal{F}}$ has a simple interpretation in terms of extending automorphisms of objects of \mathcal{F} (Lemma 68.15.7). These observations suggest that (RS) should be regarded as the fundamental deformation theoretic glueing condition.

68.2. Notation and Conventions

A ring is commutative with 1. The maximal ideal of a local ring A is denoted by \mathfrak{m}_A . The set of positive integers is denoted by $\mathbf{N} = \{1, 2, 3, \dots\}$. If U is an object of a category \mathcal{C} , we denote by \underline{U} the functor $\text{Mor}_{\mathcal{C}}(U, -) : \mathcal{C} \rightarrow \text{Sets}$, see Remarks 68.5.2 (12). Warning: this may conflict with the notation in other chapters where sometimes use \underline{U} to denote $h_U(-) = \text{Mor}_{\mathcal{C}}(-, U)$.

Throughout this chapter Λ is a Noetherian ring and $\Lambda \rightarrow k$ is a finite ring map from Λ to a field. The kernel of this map is denoted \mathfrak{m}_Λ and the image $k' \subset k$. It turns out that \mathfrak{m}_Λ is a maximal ideal, $k' = \Lambda/\mathfrak{m}_\Lambda$ is a field, and the extension $k' \subset k$ is finite. See discussion surrounding (68.3.3.1).

68.3. The base category

Motivation. An important application of formal deformation theory is to criteria for representability by algebraic spaces. Suppose given a locally Noetherian base change S and a functor $F : (\text{Sch}/S)_{fppf}^{opp} \rightarrow \text{Sets}$. Let k be a finite type field over S , i.e., we are given a finite type morphism $\text{Spec}(k) \rightarrow S$. One of Artin's criteria is that for any element $x \in F(\text{Spec}(k))$ the predeformation functor associated to the triple (S, k, x) should be prorepresentable. By Morphisms, Lemma 28.17.1 the condition that k is of finite type over S means that there exists an affine open $\text{Spec}(\Lambda) \subset S$ such that k is a finite Λ -algebra. This motivates why we work throughout this chapter with a base category as follows.

Definition 68.3.1. Let Λ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where k is a field. We define \mathcal{C}_Λ to be the category with

- (1) objects are pairs (A, φ) where A is an Artinian local Λ -algebra and where $\varphi : A/\mathfrak{m}_A \rightarrow k$ is a Λ -algebra isomorphism, and
- (2) morphisms $f : (B, \psi) \rightarrow (A, \varphi)$ are local Λ -algebra homomorphisms such that $\varphi \circ (f \bmod \mathfrak{m}) = \psi$.

We say we are in the *classical case* if Λ is a Noetherian complete local ring and k is its residue field.

Note that if $\Lambda \rightarrow k$ is surjective and if A is an Artinian local Λ -algebra, then the identification φ , if it exists, is unique. Moreover, in this case any Λ -algebra map $A \rightarrow B$ is going to be compatible with the identifications. Hence in this case \mathcal{C}_Λ is just the category of local Artinian Λ -algebras whose residue field “is” k . By abuse of notation we also denote objects of \mathcal{C}_Λ simply A in the general case. Moreover, we will often write $A/\mathfrak{m} = k$, i.e., we will pretend all rings in \mathcal{C}_Λ have residue field k (since all ring maps in \mathcal{C}_Λ are compatible with the given identifications this should never cause any problems). Throughout the rest of this chapter the base ring Λ and the field k are fixed. The category \mathcal{C}_Λ will be the base category for the cofibered categories considered below.

Definition 68.3.2. Let $f : B \rightarrow A$ be a ring map in \mathcal{C}_Λ . We say f is a *small extension* if it is surjective and $\text{Ker}(f)$ is a nonzero principal ideal which is annihilated by \mathfrak{m}_B .

By the following lemma we can often reduce arguments involving surjective ring maps in \mathcal{C}_Λ to the case of small extensions.

Lemma 68.3.3. *Let $f : B \rightarrow A$ be a surjective ring map in \mathcal{C}_Λ . Then f can be factored as a composition of small extensions.*

Proof. Let I be the kernel of f . The maximal ideal \mathfrak{m}_B is nilpotent since B is Artinian, say $\mathfrak{m}_B^n = 0$. Hence we get a factorization

$$B = B/I\mathfrak{m}_B^{n-1} \rightarrow B/I\mathfrak{m}_B^{n-2} \rightarrow \dots \rightarrow B/I \cong A$$

of f into a composition of surjective maps whose kernels are annihilated by the maximal ideal. Thus it suffices to prove the lemma when f itself is such a map, i.e. when I is annihilated by \mathfrak{m}_B . In this case I is a k -vector space, which has finite dimension, see Algebra, Lemma 10.51.6. Take a basis x_1, \dots, x_n of I as a k -vector space to get a factorization

$$B \rightarrow B/(x_1) \rightarrow \dots \rightarrow B/(x_1, \dots, x_n) \cong A$$

of f into a composition of small extensions. \square

The next lemma says that we can compute the length of a module over a local Λ -algebra with residue field k in terms of the length over Λ . To explain the notation in the statement, let $k' \subset k$ be the image of our fixed finite ring map $\Lambda \rightarrow k$. Note that k/k' is a finite extension of rings. Hence k' is a field and k'/k is a finite extension, see Algebra, Lemma 10.35.16. Moreover, as $\Lambda \rightarrow k'$ is surjective we see that its kernel is a maximal ideal \mathfrak{m}_Λ . Thus

$$(68.3.3.1) \quad [k : k'] = [k : \Lambda/\mathfrak{m}_\Lambda] < \infty$$

and in the classical case we have $k = k'$. The notation $k' = \Lambda/\mathfrak{m}_\Lambda$ will be fixed throughout this chapter.

Lemma 68.3.4. *Let A be a local Λ -algebra with residue field k . Let M be an A -module. Then $[k : k']\text{length}_A(M) = \text{length}_\Lambda(M)$. In the classical case we have $\text{length}_A(M) = \text{length}_\Lambda(M)$.*

Proof. If M is a simple A -module then $M \cong k$ as an A -module, see Algebra, Lemma 10.50.10. In this case $\text{length}_A(M) = 1$ and $\text{length}_\Lambda(M) = [k' : k]$, see Algebra, Lemma 10.50.6. If $\text{length}_A(M)$ is finite, then the result follows on choosing a filtration of M by A -submodules with simple quotients using additivity, see Algebra, Lemma 10.50.3. If $\text{length}_A(M)$ is infinite, the result follows from the obvious inequality $\text{length}_A(M) \leq \text{length}_\Lambda(M)$. \square

Lemma 68.3.5. *Let $A \rightarrow B$ be a ring map in \mathcal{C}_Λ . The following are equivalent*

- (1) f is surjective,
- (2) $\mathfrak{m}_A/\mathfrak{m}_A^2 \rightarrow \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective, and
- (3) $\mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2) \rightarrow \mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective.

Proof. For any ring map $f : A \rightarrow B$ in \mathcal{C}_Λ we have $f(\mathfrak{m}_A) \subset \mathfrak{m}_B$ for example because $\mathfrak{m}_A, \mathfrak{m}_B$ is the set of nilpotent elements of A, B . Suppose f is surjective. Let $y \in \mathfrak{m}_B$. Choose $x \in A$ with $f(x) = y$. Since f induces an isomorphism $A/\mathfrak{m}_A \rightarrow B/\mathfrak{m}_B$ we see that $x \in \mathfrak{m}_A$. Hence the induced map $\mathfrak{m}_A/\mathfrak{m}_A^2 \rightarrow \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective. In this way we see that (1) implies (2).

It is clear that (2) implies (3). The map $A \rightarrow B$ gives rise to a canonical commutative diagram

$$\begin{array}{ccccccc} \mathfrak{m}_A/\mathfrak{m}_A^2 \otimes_{k'} k & \longrightarrow & \mathfrak{m}_A/\mathfrak{m}_A^2 & \longrightarrow & \mathfrak{m}_A/(\mathfrak{m}_A A + \mathfrak{m}_A^2) & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \mathfrak{m}_A/\mathfrak{m}_A^2 \otimes_{k'} k & \longrightarrow & \mathfrak{m}_B/\mathfrak{m}_B^2 & \longrightarrow & \mathfrak{m}_B/(\mathfrak{m}_A B + \mathfrak{m}_B^2) & \longrightarrow & 0 \end{array}$$

with exact rows. Hence if (3) holds, then so does (2).

Assume (2). To show that $A \rightarrow B$ is surjective it suffices by Nakayama's lemma (Algebra, Lemma 10.19.1) to show that $A/\mathfrak{m}_A \rightarrow B/\mathfrak{m}_A B$ is surjective. (Note that \mathfrak{m}_A is a nilpotent ideal.) As $k = A/\mathfrak{m}_A = B/\mathfrak{m}_B$ it suffices to show that $\mathfrak{m}_A B \rightarrow \mathfrak{m}_B$ is surjective. Applying Nakayama's lemma once more we see that it suffices to see that $\mathfrak{m}_A B/\mathfrak{m}_A \mathfrak{m}_B \rightarrow \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective which is what we assumed. \square

If $A \rightarrow B$ is a ring map in \mathcal{C}_Λ , then the map $\mathfrak{m}_A/(\mathfrak{m}_A A + \mathfrak{m}_A^2) \rightarrow \mathfrak{m}_B/(\mathfrak{m}_A B + \mathfrak{m}_B^2)$ is the map on relative cotangent spaces. Here is a formal definition.

Definition 68.3.6. Let $R \rightarrow S$ be a local homomorphism of local rings. The *relative cotangent space*¹ of R over S is the S/\mathfrak{m}_S -vector space $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$.

If $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ are two ring maps, then the fiber product $A_1 \times_A A_2$ is the subring of $A_1 \times A_2$ consisting of elements whose two projections to A are equal. Throughout this chapter we will be considering conditions involving such a fiber product when f_1 and f_2 are in \mathcal{C}_Λ . It isn't always the case that the fibre product is an object of \mathcal{C}_Λ .

Example 68.3.7. Let p be a prime number and let $n \in \mathbf{N}$. Let $\Lambda = \mathbf{F}_p(t_1, t_2, \dots, t_n)$ and let $k = \mathbf{F}_p(x_1, \dots, x_n)$ with map $\Lambda \rightarrow k$ given by $t_i \mapsto x_i^p$. Let $A = k[\epsilon] = k[x]/(x^2)$. Then A is an object of \mathcal{C}_Λ . Suppose that $D : k \rightarrow k$ is a derivation of k over Λ , for example $D = \partial/\partial x_i$. Then the map

$$f_D : k \longrightarrow k[\epsilon], \quad a \mapsto a + D(a)\epsilon$$

is a morphism of \mathcal{C}_Λ . Set $A_1 = A_2 = k$ and set $f_1 = f_{\partial/\partial x_1}$ and $f_2(a) = a$. Then $A_1 \times_A A_2 = \{a \in k \mid \partial/\partial x_1(a) = 0\}$ which does not surject onto k . Hence the fibre product isn't an object of \mathcal{C}_Λ .

It turns out that this problem can only occur if the residue field extension $k' \subset k$ (68.3.3.1) is inseparable and neither f_1 nor f_2 is surjective.

Lemma 68.3.8. *Let $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ be ring maps in \mathcal{C}_Λ . Then:*

- (1) *If f_1 or f_2 is surjective, then $A_1 \times_A A_2$ is in \mathcal{C}_Λ .*
- (2) *If f_2 is a small extension, then so is $A_1 \times_A A_2 \rightarrow A_1$.*
- (3) *If the field extension $k' \subset k$ is separable, then $A_1 \times_A A_2$ is in \mathcal{C}_Λ .*

Proof. The ring $A_1 \times_A A_2$ is a Λ -algebra via the map $\Lambda \rightarrow A_1 \times_A A_2$ induced by the maps $\Lambda \rightarrow A_1$ and $\Lambda \rightarrow A_2$. It is a local ring with unique maximal ideal

$$\mathfrak{m}_{A_1} \times_{\mathfrak{m}_A} \mathfrak{m}_{A_2} = \text{Ker}(A_1 \times_A A_2 \longrightarrow k)$$

¹Caution: We will see later that in our general setting the tangent space of an object $A \in \mathcal{C}_\Lambda$ over Λ should not be defined simply as the k -linear dual of the relative cotangent space. In fact, the correct definition of the relative cotangent space is $\Omega_{S/R} \otimes_S S/\mathfrak{m}_S$.

A ring is Artinian if and only if it has finite length as a module over itself, see Algebra, Lemma 10.51.6. Since A_1 and A_2 are Artinian, Lemma 68.3.4 implies $\text{length}_\Lambda(A_1)$ and $\text{length}_\Lambda(A_2)$, and hence $\text{length}_\Lambda(A_1 \times A_2)$, are all finite. As $A_1 \times_A A_2 \subset A_1 \times A_2$ is a Λ -submodule, this implies $\text{length}_{A_1 \times_A A_2}(A_1 \times_A A_2) \leq \text{length}_\Lambda(A_1 \times_A A_2)$ is finite. So $A_1 \times_A A_2$ is Artinian. Thus the only thing that is keeping $A_1 \times_A A_2$ from being an object of \mathcal{C}_Λ is the possibility that its residue field maps to a proper subfield of k via the map $A_1 \times_A A_2 \rightarrow A \rightarrow A/\mathfrak{m}_A = k$ above.

Proof of (1). If f_2 is surjective, then the projection $A_1 \times_A A_2 \rightarrow A_1$ is surjective. Hence the composition $A_1 \times_A A_2 \rightarrow A_1 \rightarrow A_1/\mathfrak{m}_{A_1} = k$ is surjective and we conclude that $A_1 \times_A A_2$ is an object of \mathcal{C}_Λ .

Proof of (2). If f_2 is a small extension then $A_2 \rightarrow A$ and $A_1 \times_A A_2 \rightarrow A_1$ are both surjective with the same kernel. Hence the kernel of $A_1 \times_A A_2 \rightarrow A_1$ is a 1-dimensional k -vector space and we see that $A_1 \times_A A_2 \rightarrow A_1$ is a small extension.

Proof of (3). Choose $\bar{x} \in k$ such that $k = k'(\bar{x})$ (see Fields, Lemma 9.18.1). Let $P'(T) \in k'[T]$ be the minimal polynomial of \bar{x} over k' . Since k/k' is separable we see that $dP/dT(\bar{x}) \neq 0$. Choose a monic $P \in \Lambda[T]$ which maps to P' under the surjective map $\Lambda[T] \rightarrow k'[T]$. Because A, A_1, A_2 are henselian, see Algebra, Lemma 10.145.11, we can find $x, x_1, x_2 \in A, A_1, A_2$ with $P(x) = 0, P(x_1) = 0, P(x_2) = 0$ and such that the image of x, x_1, x_2 in k is \bar{x} . Then $(x_1, x_2) \in A_1 \times_A A_2$ because x_1, x_2 map to $x \in A$ by uniqueness, see Algebra, Lemma 10.145.2. Hence the residue field of $A_1 \times_A A_2$ contains a generator of k over k' and we win. \square

Next we define essential surjections in \mathcal{C}_Λ . A necessary and sufficient condition for a surjection in \mathcal{C}_Λ to be essential is given in Lemma 68.3.12.

Definition 68.3.9. Let $f : B \rightarrow A$ be a ring map in \mathcal{C}_Λ . We say f is an *essential surjection* if it has the following properties:

- (1) f is surjective.
- (2) If $g : C \rightarrow B$ is a ring map in \mathcal{C}_Λ such that $f \circ g$ is surjective, then g is surjective.

Using Lemma 68.3.5, we can characterize essential surjections in \mathcal{C}_Λ as follows.

Lemma 68.3.10. *Let $f : B \rightarrow A$ be a ring map in \mathcal{C}_Λ . The following are equivalent*

- (1) f is an essential surjection,
- (2) the map $B/\mathfrak{m}_B^2 \rightarrow A/\mathfrak{m}_A^2$ is an essential surjection, and
- (3) the map $B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \rightarrow A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is an essential surjection.

Proof. Assume (3). Let $C \rightarrow B$ be a ring map in \mathcal{C}_Λ such that $C \rightarrow A$ is surjective. Then $C \rightarrow A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is surjective too. We conclude that $C \rightarrow B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective by our assumption. Hence $C \rightarrow B$ is surjective by applying Lemma 68.3.5 (2 times).

Assume (1). Let $C \rightarrow B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ be a morphism of \mathcal{C}_Λ such that $C \rightarrow A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is surjective. Set $C' = C \times_{B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)} B$ which is an object of \mathcal{C}_Λ by Lemma 68.3.8. Note that $C' \rightarrow A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is still surjective, hence $C' \rightarrow A$ is surjective by Lemma 68.3.5. Thus $C' \rightarrow B$ is surjective by our assumption. This implies that $C' \rightarrow B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective, which implies by the construction of C' that $C \rightarrow B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective.

In the first paragraph we proved (3) \Rightarrow (1) and in the second paragraph we proved (1) \Rightarrow (3). The equivalence of (2) and (3) is a special case of the equivalence of (1) and (3), hence we are done. \square

To analyze essential surjections in \mathcal{C}_Λ a bit more we introduce some notation. Suppose that A is an object of \mathcal{C}_Λ . There is a canonical exact sequence

$$(68.3.10.1) \quad \mathfrak{m}_A/\mathfrak{m}_A^2 \xrightarrow{d_A} \Omega_{A/\Lambda} \otimes_A k \rightarrow \Omega_{k/\Lambda} \rightarrow 0$$

see Algebra, Lemma 10.127.9. Note that $\Omega_{k/\Lambda} = \Omega_{k/k'}$ with k' as in (68.3.3.1). Let $H_1(L_{k/\Lambda})$ be the first homology module of the naive cotangent complex of k over Λ , see Algebra, Definition 10.129.1. Then we can extend (68.3.10.1) to the exact sequence

$$(68.3.10.2) \quad H_1(L_{k/\Lambda}) \rightarrow \mathfrak{m}_A/\mathfrak{m}_A^2 \xrightarrow{d_A} \Omega_{A/\Lambda} \otimes_A k \rightarrow \Omega_{k/\Lambda} \rightarrow 0,$$

see Algebra, Lemma 10.129.4. If $B \rightarrow A$ is a ring map in \mathcal{C}_Λ then we obtain a commutative diagram

$$(68.3.10.3) \quad \begin{array}{ccccccc} H_1(L_{k/\Lambda}) & \longrightarrow & \mathfrak{m}_B/\mathfrak{m}_B^2 & \xrightarrow{d_B} & \Omega_{B/\Lambda} \otimes_B k & \longrightarrow & \Omega_{k/\Lambda} \longrightarrow 0 \\ \parallel & & \downarrow & & \downarrow & & \parallel \\ H_1(L_{k/\Lambda}) & \longrightarrow & \mathfrak{m}_A/\mathfrak{m}_A^2 & \xrightarrow{d_A} & \Omega_{A/\Lambda} \otimes_A k & \longrightarrow & \Omega_{k/\Lambda} \longrightarrow 0 \end{array}$$

with exact rows.

Lemma 68.3.11. *There is a canonical map*

$$\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \longrightarrow H_1(L_{k/\Lambda}).$$

If $k' \subset k$ is separable (for example if the characteristic of k is zero), then this map induces an isomorphism $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k = H_1(L_{k/\Lambda})$. If $k = k'$ (for example in the classical case), then $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 = H_1(L_{k/\Lambda})$. The composition

$$\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \longrightarrow H_1(L_{k/\Lambda}) \longrightarrow \mathfrak{m}_A/\mathfrak{m}_A^2$$

comes from the canonical map $\mathfrak{m}_\Lambda \rightarrow \mathfrak{m}_A$.

Proof. Note that $H_1(L_{k'/\Lambda}) = \mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2$ as $\Lambda \rightarrow k'$ is surjective with kernel \mathfrak{m}_Λ . The map arises from functoriality of the naive cotangent complex. If $k' \subset k$ is separable, then $k' \rightarrow k$ is an étale ring map, see Algebra, Lemma 10.138.4. Thus its naive cotangent complex has trivial homology groups, see Algebra, Definition 10.138.1. Then Algebra, Lemma 10.129.4 applied to the ring maps $\Lambda \rightarrow k' \rightarrow k$ implies that $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k = H_1(L_{k/\Lambda})$. We omit the proof of the final statement. \square

Lemma 68.3.12. *Let $f : B \rightarrow A$ be a ring map in \mathcal{C}_Λ . Notation as in (68.3.10.3).*

- (1) *The equivalent conditions of Lemma 68.3.10 characterizing when f is surjective are also equivalent to*
 - (a) *$\text{Im}(d_B) \rightarrow \text{Im}(d_A)$ is surjective, and*
 - (b) *the map $\Omega_{B/\Lambda} \otimes_B k \rightarrow \Omega_{A/\Lambda} \otimes_A k$ is surjective.*
- (2) *The following are equivalent*
 - (a) *f is an essential surjection,*
 - (b) *the map $\text{Im}(d_B) \rightarrow \text{Im}(d_A)$ is an isomorphism, and*
 - (c) *the map $\Omega_{B/\Lambda} \otimes_B k \rightarrow \Omega_{A/\Lambda} \otimes_A k$ is an isomorphism.*

- (3) If k/k' is separable, then f is an essential surjection if and only if the map $\mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \rightarrow \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is an isomorphism.
- (4) If f is a small extension, then f is not essential if and only if f has a section $s : A \rightarrow B$ in \mathcal{C}_Λ with $f \circ s = id_A$.

Proof. Proof of (1). It follows from (68.3.10.3) that (1)(a) and (1)(b) are equivalent. Also, if $A \rightarrow B$ is surjective, then (1)(a) and (1)(b) hold. Assume (1)(a). Since the kernel of d_A is the image of $H_1(L_{k/\Lambda})$ which also maps to $\mathfrak{m}_B/\mathfrak{m}_B^2$ we conclude that $\mathfrak{m}_B/\mathfrak{m}_B^2 \rightarrow \mathfrak{m}_A/\mathfrak{m}_A^2$ is surjective. Hence $B \rightarrow A$ is surjective by Lemma 68.3.5. This finishes the proof of (1).

Proof of (2). The equivalence of (2)(b) and (2)(c) is immediate from (68.3.10.3).

Assume (2)(b). Let $g : C \rightarrow B$ be a ring map in \mathcal{C}_Λ such that $f \circ g$ is surjective. We conclude that $\mathfrak{m}_C/\mathfrak{m}_C^2 \rightarrow \mathfrak{m}_A/\mathfrak{m}_A^2$ is surjective by Lemma 68.3.5. Hence $\text{Im}(d_C) \rightarrow \text{Im}(d_A)$ is surjective and by the assumption we see that $\text{Im}(d_C) \rightarrow \text{Im}(d_B)$ is surjective. It follows that $C \rightarrow B$ is surjective by (1).

Assume (2)(a). Then f is surjective and we see that $\Omega_{B/\Lambda} \otimes_B k \rightarrow \Omega_{A/\Lambda} \otimes_A k$ is surjective. Let K be the kernel. Note that $K = d_B(\text{Ker}(\mathfrak{m}_B/\mathfrak{m}_B^2 \rightarrow \mathfrak{m}_A/\mathfrak{m}_A^2))$ by (68.3.10.3). Choose a splitting

$$\Omega_{B/\Lambda} \otimes_B k = \Omega_{A/\Lambda} \otimes_A k \oplus K$$

of k -vector space. The map $d : B \rightarrow \Omega_{B/\Lambda}$ induces via the projection onto K a map $D : B \rightarrow K$. Set $C = \{b \in B \mid D(b) = 0\}$. The Leibniz rule shows that this is a Λ -subalgebra of B . Let $\bar{x} \in k$. Choose $x \in B$ mapping to \bar{x} . If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_B$ such that $D(y) = D(x)$. Hence $x - y \in C$ is an element which maps to \bar{x} . Thus $C \rightarrow k$ is surjective and C is an object of \mathcal{C}_Λ . Similarly, pick $\omega \in \text{Im}(d_A)$. We can find $x \in \mathfrak{m}_B$ such that $d_B(x)$ maps to ω by (1). If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_B$ which maps to zero in $\mathfrak{m}_A/\mathfrak{m}_A^2$ such that $D(y) = D(x)$. Hence $z = x - y$ is an element of \mathfrak{m}_C whose image $d_C(z) \in \Omega_{C/k} \otimes_C k$ maps to ω . Hence $\text{Im}(d_C) \rightarrow \text{Im}(d_A)$ is surjective. We conclude that $C \rightarrow A$ is surjective by (1). Hence $C \rightarrow B$ is surjective by assumption. Hence $D = 0$, i.e., $K = 0$, i.e., (2)(c) holds. This finishes the proof of (2).

Proof of (3). If k'/k is separable, then $H_1(L_{k/\Lambda}) = \mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k$, see Lemma 68.3.11. Hence $\text{Im}(d_A) = \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ and similarly for B . Thus (3) follows from (2).

Proof of (4). A section s of f is not surjective (by definition a small extension has nontrivial kernel), hence f is not essentially surjective. Conversely, assume f is a small surjection but not an essential surjection. Choose a ring map $C \rightarrow B$ in \mathcal{C}_Λ which is not surjective, such that $C \rightarrow A$ is surjective. Let $C' \subset B$ be the image of $C \rightarrow B$. Then $C' \neq B$ but C' surjects onto A . Since $f : B \rightarrow A$ is a small extension, $\text{length}_C(B) = \text{length}_C(A) + 1$. Thus $\text{length}_C(C') \leq \text{length}_C(A)$ since C' is a proper subring of B . But $C' \rightarrow A$ is surjective, so in fact we must have $\text{length}_C(C') = \text{length}_C(A)$ and $C' \rightarrow A$ is an isomorphism which gives us our section. \square

Example 68.3.13. Let $\Lambda = k[[x]]$ be the power series ring in 1 variable over k . Set $A = k$ and $B = \Lambda/(x^2)$. Then $B \rightarrow A$ is an essential surjection by Lemma 68.3.12

because it is a small extension and the map $B \rightarrow A$ does not have a right inverse (in the category \mathcal{C}_Λ). But the map

$$k \cong \mathfrak{m}_B/\mathfrak{m}_B^2 \longrightarrow \mathfrak{m}_A/\mathfrak{m}_A^2 = 0$$

is not an isomorphism. Thus in Lemma 68.3.12 (3) it is necessary to consider the map of relative cotangent spaces $\mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \rightarrow \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$.

68.4. The completed base category

The following “completion” of the category \mathcal{C}_Λ will serve as the base category of the completion of a category cofibered in groupoids over \mathcal{C}_Λ (Section 68.7).

Definition 68.4.1. Let Λ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where k is a field. We define $\widehat{\mathcal{C}}_\Lambda$ to be the category with

- (1) objects are pairs (R, φ) where R is a Noetherian complete local Λ -algebra and where $\varphi : R/\mathfrak{m}_R \rightarrow k$ is a Λ -algebra isomorphism, and
- (2) morphisms $f : (S, \psi) \rightarrow (R, \varphi)$ are local Λ -algebra homomorphisms such that $\varphi \circ (f \bmod \mathfrak{m}) = \psi$.

As in the discussion following Definition 68.3.1 we will usually denote an object of $\widehat{\mathcal{C}}_\Lambda$ simply R , with the identification $R/\mathfrak{m}_R = k$ understood. In this section we discuss some basic properties of objects and morphisms of the category $\widehat{\mathcal{C}}_\Lambda$ paralleling our discussion of the category \mathcal{C}_Λ in the previous section.

Our first observation is that any object $A \in \mathcal{C}_\Lambda$ is an object of $\widehat{\mathcal{C}}_\Lambda$ as an Artinian local ring is always Noetherian and complete with respect to its maximal ideal (which is after all a nilpotent ideal). Moreover, it is clear from the definitions that $\mathcal{C}_\Lambda \subset \widehat{\mathcal{C}}_\Lambda$ is the strictly full subcategory consisting of all Artinian rings. As it turns out, conversely every object of $\widehat{\mathcal{C}}_\Lambda$ is a limit of objects of \mathcal{C}_Λ .

Suppose that R is an object of $\widehat{\mathcal{C}}_\Lambda$. Consider the rings $R_n = R/\mathfrak{m}_R^n$ for $n \in \mathbf{N}$. These are Noetherian local rings with a unique nilpotent prime ideal, hence Artinian, see Algebra, Proposition 10.59.6. The ring maps

$$\dots \rightarrow R_{n+1} \rightarrow R_n \rightarrow \dots \rightarrow R_2 \rightarrow R_1 = k$$

are all surjective. Completeness of R by definition means that $R = \lim R_n$. If $f : R \rightarrow S$ is a ring map in $\widehat{\mathcal{C}}_\Lambda$ then we obtain a system of ring maps $f_n : R_n \rightarrow S_n$ whose limit is the given map.

Lemma 68.4.2. *Let $f : R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. The following are equivalent*

- (1) f is surjective,
- (2) the map $\mathfrak{m}_R/\mathfrak{m}_R^2 \rightarrow \mathfrak{m}_S/\mathfrak{m}_S^2$ is surjective, and
- (3) the map $\mathfrak{m}_R/(\mathfrak{m}_\Lambda R + \mathfrak{m}_R^2) \rightarrow \mathfrak{m}_S/(\mathfrak{m}_\Lambda S + \mathfrak{m}_S^2)$ is surjective.

Proof. Note that for $n \geq 2$ we have the equality of relative cotangent spaces

$$\mathfrak{m}_R/(\mathfrak{m}_\Lambda R + \mathfrak{m}_R^2) = \mathfrak{m}_{R_n}/(\mathfrak{m}_\Lambda R_n + \mathfrak{m}_{R_n}^2)$$

and similarly for S . Hence by Lemma 68.3.5 we see that $R_n \rightarrow S_n$ is surjective for all n . Now let K_n be the kernel of $R_n \rightarrow S_n$. Then the sequences

$$0 \rightarrow K_n \rightarrow R_n \rightarrow S_n \rightarrow 0$$

form an exact sequence of directed inverse systems. The system (K_n) is Mittag-Leffler since each K_n is Artinian. Hence by Algebra, Lemma 10.83.4 taking limits preserves exactness. So $\lim R_n \rightarrow \lim S_n$ is surjective, i.e., f is surjective. \square

Lemma 68.4.3. *The category $\widehat{\mathcal{C}}_\Lambda$ admits pushouts.*

Proof. Let $R \rightarrow S_1$ and $R \rightarrow S_2$ be morphisms of $\widehat{\mathcal{C}}_\Lambda$. Consider the ring $C = S_1 \otimes_R S_2$. This ring has a finitely generated maximal ideal $\mathfrak{m} = \mathfrak{m}_{S_1} \otimes S_2 + S_1 \otimes \mathfrak{m}_{S_2}$ with residue field k . Set C^\wedge equal to the completion of C with respect to \mathfrak{m} . Then C^\wedge is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^\wedge = \mathfrak{m}C^\wedge$ whose residue field is identified with k , see Algebra, Lemma 10.93.9. Hence C^\wedge is an object of $\widehat{\mathcal{C}}_\Lambda$. Then $S_1 \rightarrow C^\wedge$ and $S_2 \rightarrow C^\wedge$ turn C^\wedge into a pushout over R in $\widehat{\mathcal{C}}_\Lambda$ (details omitted). \square

We will not need the following lemma.

Lemma 68.4.4. *The category $\widehat{\mathcal{C}}_\Lambda$ admits coproducts of pairs of objects.*

Proof. Let R and S be objects of $\widehat{\mathcal{C}}_\Lambda$. Consider the ring $C = R \otimes_\Lambda S$. There is a canonical surjective map $C \rightarrow R \otimes_\Lambda S \rightarrow k \otimes_\Lambda k \rightarrow k$ where the last map is the multiplication map. The kernel of $C \rightarrow k$ is a maximal ideal \mathfrak{m} . Note that \mathfrak{m} is generated by $\mathfrak{m}_R C$, $\mathfrak{m}_S C$ and finitely many elements of C which map to generators of the kernel of $k \otimes_\Lambda k \rightarrow k$. Hence \mathfrak{m} is a finitely generated ideal. Set C^\wedge equal to the completion of C with respect to \mathfrak{m} . Then C^\wedge is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^\wedge = \mathfrak{m}C^\wedge$ with residue field k , see Algebra, Lemma 10.93.9. Hence C^\wedge is an object of $\widehat{\mathcal{C}}_\Lambda$. Then $R \rightarrow C^\wedge$ and $S \rightarrow C^\wedge$ turn C^\wedge into a coproduct in $\widehat{\mathcal{C}}_\Lambda$ (details omitted). \square

An empty coproduct in a category is an initial object of the category. In the classical case $\widehat{\mathcal{C}}_\Lambda$ has an initial object, namely Λ itself. More generally, if $k' = k$, then the completion Λ^\wedge of Λ with respect to \mathfrak{m}_Λ is an initial object. More generally still, if $k' \subset k$ is separable, then $\widehat{\mathcal{C}}_\Lambda$ has an initial object too. Namely, choose a monic polynomial $P \in \Lambda[T]$ such that $k \cong k'[T]/(P')$ where $p' \in k'[T]$ is the image of P . Then $R = \Lambda^\wedge[T]/(P)$ is an initial object, see proof of Lemma 68.3.8.

If R is an initial object as above, then we have $\mathcal{C}_\Lambda = \mathcal{C}_R$ and $\widehat{\mathcal{C}}_\Lambda = \widehat{\mathcal{C}}_R$ which effectively brings the whole discussion in this chapter back to the classical case. But, if $k' \subset k$ is inseparable, then an initial object does not exist.

Lemma 68.4.5. *Let S be an object of $\widehat{\mathcal{C}}_\Lambda$. Then $\dim_k \text{Der}_\Lambda(S, k) < \infty$.*

Proof. Let $x_1, \dots, x_n \in \mathfrak{m}_S$ map to a k -basis for the relative cotangent space $\mathfrak{m}_S/(\mathfrak{m}_\Lambda S + \mathfrak{m}_S^2)$. Choose $y_1, \dots, y_m \in S$ whose images in k generate k over k' . We claim that $\dim_k \text{Der}_\Lambda(S, k) \leq n+m$. To see this it suffices to prove that if $D(x_i) = 0$ and $D(y_j) = 0$, then $D = 0$. Let $a \in S$. We can find a polynomial $P = \sum \lambda_J y^J$ with $\lambda_J \in \Lambda$ whose image in k is the same as the image of a in k . Then we see that $D(a - P) = D(a) - D(P) = D(a)$ by our assumption that $D(y_j) = 0$ for all j . Thus we may assume $a \in \mathfrak{m}_S$. Write $a = \sum a_i x_i$ with $a_i \in S$. By the Leibniz rule

$$D(a) = \sum x_i D(a_i) + \sum a_i D(x_i) = \sum x_i D(a_i)$$

as we assumed $D(x_i) = 0$. We have $\sum x_i D(a_i) = 0$ as multiplication by x_i is zero on k . \square

Lemma 68.4.6. *Let $f : R \rightarrow S$ be a morphism of $\widehat{\mathcal{C}}_\Lambda$. If $\text{Der}_\Lambda(S, k) \rightarrow \text{Der}_\Lambda(R, k)$ is injective, then f is surjective.*

Proof. If f is not surjective, then $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$ is nonzero by Lemma 68.4.2. Then also $Q = S/(f(R) + \mathfrak{m}_R S + \mathfrak{m}_S^2)$ is nonzero. Note that Q is a $k = R/\mathfrak{m}_R$ -vector space via f . We turn Q into an S -module via $S \rightarrow k$. The quotient map $D : S \rightarrow Q$ is an R -derivation: if $a_1, a_2 \in S$, we can write $a_1 = f(b_1) + a'_1$ and $a_2 = f(b_2) + a'_2$ for some $b_1, b_2 \in R$ and $a'_1, a'_2 \in \mathfrak{m}_S$. Then b_i and a_i have the same image in k for $i = 1, 2$ and

$$\begin{aligned} a_1 a_2 &= (f(b_1) + a'_1)(f(b_2) + a'_2) \\ &= f(b_1)a'_2 + f(b_2)a'_1 \\ &= f(b_1)(f(b_2) + a'_2) + f(b_2)(f(b_1) + a'_1) \\ &= f(b_1)a_2 + f(b_2)a_1 \end{aligned}$$

in Q which proves the Leibniz rule. Hence $D : S \rightarrow Q$ is a Λ -derivation which is zero on composing with $R \rightarrow S$. Since $Q \neq 0$ there also exist derivations $D : S \rightarrow k$ which are zero on composing with $R \rightarrow S$, i.e., $\text{Der}_\Lambda(S, k) \rightarrow \text{Der}_\Lambda(R, k)$ is not injective. \square

Lemma 68.4.7. *Let R be an object of $\widehat{\mathcal{C}}_\Lambda$. Let (J_n) be a decreasing sequence of ideals such that $\mathfrak{m}_R^n \subset J_n$. Set $J = \bigcap J_n$. Then the sequence (J_n/J) defines the $\mathfrak{m}_{R/J}$ -adic topology on R/J .*

Proof. It is clear that $\mathfrak{m}_{R/J}^n \subset J_n/J$. Thus it suffices to show that for every n there exists an N such that $J_N/J \subset \mathfrak{m}_{R/J}^n$. This is equivalent to $J_N \subset \mathfrak{m}_R^n + J$. For each n the ring R/\mathfrak{m}_R^n is Artinian, hence there exists a N_n such that

$$J_{N_n} + \mathfrak{m}_R^n = J_{N_n+1} + \mathfrak{m}_R^n = \dots$$

Set $E_n = (J_{N_n} + \mathfrak{m}_R^n)/\mathfrak{m}_R^n$. Set $E = \lim E_n \subset \lim R/\mathfrak{m}_R^n = R$. Note that $E \subset J$ as for any $f \in E$ and any m we have $f \in J_m + \mathfrak{m}_R^m$ for all $n \gg 0$, so $f \in J_m$ by Artin-Rees, see Algebra, Lemma 10.49.4. Since the transition maps $E_n \rightarrow E_{n-1}$ are all surjective, we see that J surjects onto E_n . Hence for $N = N_n$ works. \square

Lemma 68.4.8. *Let $\dots \rightarrow A_3 \rightarrow A_2 \rightarrow A_1$ be a sequence of surjective ring maps in \mathcal{C}_Λ . If $\dim_k(\mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2)$ is bounded, then $S = \lim A_n$ is an object in $\widehat{\mathcal{C}}_\Lambda$ and the ideals $I_n = \text{Ker}(S \rightarrow A_n)$ define the \mathfrak{m}_S -adic topology on S .*

Proof. We will use freely that the maps $S \rightarrow A_n$ are surjective for all n . Note that the maps $\mathfrak{m}_{A_{n+1}}/\mathfrak{m}_{A_{n+1}}^2 \rightarrow \mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2$ are surjective, see Lemma 68.4.2. Hence for n sufficiently large the dimension $\dim_k(\mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2)$ stabilizes to an integer, say r . Thus we can find $x_1, \dots, x_r \in \mathfrak{m}_S$ whose images in A_n generate \mathfrak{m}_{A_n} . Moreover, pick $y_1, \dots, y_t \in S$ whose images in k generate k over Λ . Then we get a ring map $P = \Lambda[z_1, \dots, z_{r+t}] \rightarrow S$, $z_i \mapsto x_i$ and $z_{r+j} \mapsto y_j$ such that the composition $P \rightarrow S \rightarrow A_n$ is surjective for all n . Let $\mathfrak{m} \subset P$ be the kernel of $P \rightarrow k$. Let $R = P^\wedge$ be the \mathfrak{m} -adic completion of P ; this is an object of $\widehat{\mathcal{C}}_\Lambda$. Since we still have the compatible system of (surjective) maps $R \rightarrow A_n$ we get a map $R \rightarrow S$. Set $J_n = \text{Ker}(R \rightarrow A_n)$. Set $J = \bigcap J_n$. By Lemma 68.4.7 we see that $R/J = \lim R/J_n = \lim A_n = S$ and that the ideals $J_n/J = I_n$ define the \mathfrak{m} -adic topology. (Note that for each n we have $\mathfrak{m}_R^{N_n} \subset J_n$ for some N_n and not necessarily $N_n = n$, so a renumbering of the ideals J_n may be necessary before applying the lemma.) \square

Lemma 68.4.9. *Let $R', R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. Suppose that $R = R' \oplus I$ for some ideal I of R . Let $x_1, \dots, x_r \in I$ map to a basis of $I/\mathfrak{m}_R I$. Set $S = R'[[X_1, \dots, X_r]]$ and consider the R' -algebra map $S \rightarrow R$ mapping X_i to x_i . Assume that for every $n \gg 0$ the map $S/\mathfrak{m}_S^n \rightarrow R/\mathfrak{m}_R^n$ has a left inverse in \mathcal{C}_Λ . Then $S \rightarrow R$ is an isomorphism.*

Proof. As $R = R' \oplus I$ we have

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_{R'}^2 \oplus I/\mathfrak{m}_R I$$

and similarly

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_{R'}^2 \oplus \bigoplus kX_i$$

Hence for $n > 1$ the map $S/\mathfrak{m}_S^n \rightarrow R/\mathfrak{m}_R^n$ induces an isomorphism on cotangent spaces. Thus a left inverse $h_n : R/\mathfrak{m}_R^n \rightarrow S/\mathfrak{m}_S^n$ is surjective by Lemma 68.4.2. Since h_n is injective as a left inverse it is an isomorphism. Thus the canonical surjections $S/\mathfrak{m}_S^n \rightarrow R/\mathfrak{m}_R^n$ are all isomorphisms and we win. \square

68.5. Categories cofibered in groupoids

In developing the theory we work with categories *cofibered* in groupoids. We assume as known the definition and basic properties of categories *fibered* in groupoids, see Categories, Section 4.33.

Definition 68.5.1. Let \mathcal{C} be a category. A *category cofibered in groupoids over \mathcal{C}* is a category \mathcal{F} equipped with a functor $p : \mathcal{F} \rightarrow \mathcal{C}$ such that \mathcal{F}^{opp} is a category fibered in groupoids over \mathcal{C}^{opp} via $p^{opp} : \mathcal{F}^{opp} \rightarrow \mathcal{C}^{opp}$.

Explicitly, $p : \mathcal{F} \rightarrow \mathcal{C}$ is cofibered in groupoids if the following two conditions hold:

- (1) For every morphism $f : U \rightarrow V$ in \mathcal{C} and every object x lying over U , there is a morphism $x \rightarrow y$ of \mathcal{F} lying over f .
- (2) For every pair of morphisms $a : x \rightarrow y$ and $b : x \rightarrow z$ of \mathcal{F} and any morphism $f : p(y) \rightarrow p(z)$ such that $p(b) = f \circ p(a)$, there exists a unique morphism $c : y \rightarrow z$ of \mathcal{F} lying over f such that $b = c \circ a$.

Remarks 68.5.2. Everything about categories fibered in groupoids translates directly to the cofibered setting. The following remarks are meant to fix notation. Let \mathcal{C} be a category.

- (1) We often omit the functor $p : \mathcal{F} \rightarrow \mathcal{C}$ from the notation.
- (2) The fiber category over an object U in \mathcal{C} is denoted by $\mathcal{F}(U)$. Its objects are those of \mathcal{F} lying over U and its morphisms are those of \mathcal{F} lying over id_U . If x, y are objects of $\mathcal{F}(U)$, we sometimes write $\text{Mor}_U(x, y)$ for $\text{Mor}_{\mathcal{F}(U)}(x, y)$.
- (3) The fibre categories $\mathcal{F}(U)$ are groupoids, see Categories, Lemma 4.33.2. Hence the morphisms in $\mathcal{F}(U)$ are all isomorphisms. We sometimes write $\text{Aut}_U(x)$ for $\text{Mor}_{\mathcal{F}(U)}(x, x)$.
- (4) Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C} , let $f : U \rightarrow V$ be a morphism in \mathcal{C} , and let $x \in \text{Ob}(\mathcal{F}(U))$. A *pushforward* of x along f is a morphism $x \rightarrow y$ of \mathcal{F} lying over f . A pushforward is unique up to unique isomorphism (see the discussion following Categories, Definition 4.31.1). We sometimes write $x \rightarrow f_*x$ for “the” pushforward of x along f .

- (5) A *choice of pushforwards for \mathcal{F}* is the choice of a pushforward of x along f for every pair (x, f) as above. We can make such a choice of pushforwards for \mathcal{F} by the axiom of choice.
- (6) Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C} . Given a choice of pushforwards for \mathcal{F} , there is an associated pseudo-functor $\mathcal{C} \rightarrow \text{Groupoids}$. We will never use this construction so we give no details.
- (7) A morphism of categories cofibered in groupoids over \mathcal{C} is a functor commuting with the projections to \mathcal{C} . If \mathcal{F} and \mathcal{F}' are categories cofibered in groupoids over \mathcal{C} , we denote the morphisms from \mathcal{F} to \mathcal{F}' by $\text{Mor}_{\mathcal{C}}(\mathcal{F}, \mathcal{F}')$.
- (8) Categories cofibered in groupoids form a $(2, 1)$ -category $\text{Cof}(\mathcal{C})$. Its 1-morphisms are the morphisms described in (7). If $p : \mathcal{F} \rightarrow \mathcal{C}$ and $p' : \mathcal{F}' \rightarrow \mathcal{C}$ are categories cofibered in groupoids and $\varphi, \psi : \mathcal{F} \rightarrow \mathcal{F}'$ are 1-morphisms, then a 2-morphism $t : \varphi \rightarrow \psi$ is a morphism of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{F})$.
- (9) Let $F : \mathcal{C} \rightarrow \text{Groupoids}$ be a functor. There is a category cofibered in groupoids $\mathcal{F} \rightarrow \mathcal{C}$ associated to F as follows. An object of \mathcal{F} is a pair (U, x) where $U \in \text{Ob}(\mathcal{C})$ and $x \in \text{Ob}(F(U))$. A morphism $(U, x) \rightarrow (V, y)$ is a pair (f, a) where $f \in \text{Mor}_{\mathcal{C}}(U, V)$ and $a \in \text{Mor}_{F(V)}(F(f)(x), y)$. The functor $\mathcal{F} \rightarrow \mathcal{C}$ sends (U, x) to U . See Categories, Section 4.35.
- (10) Let \mathcal{F} be cofibered in groupoids over \mathcal{C} . For $U \in \text{Ob}(\mathcal{C})$ set $\overline{\mathcal{F}}(U)$ equal to the set of isomorphism classes of the category $\overline{\mathcal{F}}(U)$. If $f : U \rightarrow V$ is a morphism of \mathcal{C} , then we obtain a map of sets $\overline{\mathcal{F}}(U) \rightarrow \overline{\mathcal{F}}(V)$ by mapping the isomorphism class of x to the isomorphism class of a pushforward f_*x of x see (4). Then $\overline{\mathcal{F}} : \mathcal{C} \rightarrow \text{Sets}$ is a functor. Similarly, if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of cofibered categories, we denote by $\overline{\varphi} : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ the associated morphism of functors.
- (11) Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a functor. We can think of a set as a discrete category, i.e., as a groupoid with only identity morphisms. Then the construction (9) associates to F a category cofibered in sets. This defines a fully faithful embedding of the category of functors $\mathcal{C} \rightarrow \text{Sets}$ to the category of categories cofibered in groupoids over \mathcal{C} . We identify the category of functors with its image under this embedding. Hence if $F : \mathcal{C} \rightarrow \text{Sets}$ is a functor, we denote the associated category cofibered in sets also by F ; and if $\varphi : F \rightarrow G$ is a morphism of functors, we denote still by φ the corresponding morphism of categories cofibered in sets, and vice-versa. See Categories, Section 4.36.
- (12) Let U be an object of \mathcal{C} . We write \underline{U} for the functor $\text{Mor}_{\mathcal{C}}(U, -) : \mathcal{C} \rightarrow \text{Sets}$. This defines a fully faithful embedding of \mathcal{C}^{opp} into the category of functors $\mathcal{C} \rightarrow \text{Sets}$. Hence, if $f : U \rightarrow V$ is a morphism, we are justified in denoting still by f the induced morphism $\underline{V} \rightarrow \underline{U}$, and vice-versa.
- (13) Fiber products of categories cofibered in groupoids: If $\mathcal{F} \rightarrow \mathcal{H}$ and $\mathcal{G} \rightarrow \mathcal{H}$ are morphisms of categories cofibered in groupoids over \mathcal{C}_{Λ} , then a construction of their 2-fiber product is given by the construction for their 2-fiber product as categories over \mathcal{C}_{Λ} , as described in Categories, Lemma 4.30.3.
- (14) Restricting the base category: Let $p : \mathcal{F} \rightarrow \mathcal{C}$ be a category cofibered in groupoids, and let \mathcal{C}' be a full subcategory of \mathcal{C} . The restriction $\mathcal{F}|_{\mathcal{C}'}$ is the

full subcategory of \mathcal{F} whose objects lie over objects of \mathcal{C}' . It is a category cofibered in groupoids via the functor $p|_{\mathcal{C}'} : \mathcal{F}|_{\mathcal{C}'} \rightarrow \mathcal{C}'$.

68.6. Prorepresentable functors and predeformation categories

Our basic goal is to understand categories cofibered in groupoids over \mathcal{C}_Λ and $\widehat{\mathcal{C}}_\Lambda$. Since \mathcal{C}_Λ is a full subcategory of $\widehat{\mathcal{C}}_\Lambda$ we can restrict categories cofibered in groupoids over $\widehat{\mathcal{C}}_\Lambda$ to \mathcal{C}_Λ , see Remarks 68.5.2 (14). In particular we can do this with functors, in particular with representable functors. The functors on \mathcal{C}_Λ one obtains in this way are called prorepresentable functors.

Definition 68.6.1. Let $F : \mathcal{C}_\Lambda \rightarrow Sets$ be a functor. We say F is *prorepresentable* if there exists an isomorphism $F \cong \underline{R}|_{\mathcal{C}_\Lambda}$ of functors for some $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$.

Note that if $F : \mathcal{C}_\Lambda \rightarrow Sets$ is prorepresentable by $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$, then

$$F(k) = \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(R, k) = \{*\}$$

is a singleton. The categories cofibered in groupoids over \mathcal{C}_Λ that arise in deformation theory will often satisfy an analogous condition.

Definition 68.6.2. A *predeformation category* \mathcal{F} is a category cofibered in groupoids over \mathcal{C}_Λ such that $\mathcal{F}(k)$ is equivalent to a category with a single object and a single morphism, i.e., $\mathcal{F}(k)$ contains at least one object and there is a unique morphism between any two objects. A *morphism of predeformation categories* is a morphism of categories cofibered in groupoids over \mathcal{C}_Λ .

A feature of a predeformation category is the following. Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then every object of \mathcal{F} comes equipped with a unique morphism to x_0 . Namely, if x is an object of \mathcal{F} over A , then we can choose a pushforward $x \rightarrow q_*x$ where $q : A \rightarrow k$ is the quotient map. There is a unique isomorphism $q_*x \rightarrow x_0$ and the composition $x \rightarrow q_*x \rightarrow x_0$ is the desired morphism.

Remark 68.6.3. We say that a functor $F : \mathcal{C}_\Lambda \rightarrow Sets$ is a *predeformation functor* if the associated cofibered set is a predeformation category, i.e. if $F(k)$ is a one element set. Thus if \mathcal{F} is a predeformation category, then $\overline{\mathcal{F}}$ is a predeformation functor.

Remark 68.6.4. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibered in groupoids, and let $x \in \text{Ob}(\mathcal{F}(k))$. We denote by \mathcal{F}_x the category of objects over x . An object of \mathcal{F}_x is an arrow $y \rightarrow x$. A morphism $(y \rightarrow x) \rightarrow (z \rightarrow x)$ in \mathcal{F}_x is a commutative diagram

There is a forgetful functor $\mathcal{F}_x \rightarrow \mathcal{F}$. We define the functor $p_x : \mathcal{F}_x \rightarrow \mathcal{C}_\Lambda$ as the composition $\mathcal{F}_x \rightarrow \mathcal{F} \xrightarrow{p} \mathcal{C}_\Lambda$. Then $p_x : \mathcal{F}_x \rightarrow \mathcal{C}_\Lambda$ is a predeformation category (proof omitted). In this way we can pass from an arbitrary category cofibered in groupoids over \mathcal{C}_Λ to a predeformation category at any $x \in \text{Ob}(\mathcal{F}(k))$.

68.7. Formal objects and completion categories

In this section we discuss how to go between categories cofibred in groupoids over \mathcal{C}_Λ to categories cofibred in groupoids over $\widehat{\mathcal{C}}_\Lambda$ and vice versa.

Definition 68.7.1. Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . The category $\widehat{\mathcal{F}}$ of formal objects of \mathcal{F} is the category with the following objects and morphisms.

- (1) A formal object $\xi = (R, \xi_n, f_n)$ of $\widehat{\mathcal{F}}$ consists of an object R of $\widehat{\mathcal{C}}_\Lambda$, and a collection indexed by $n \in \mathbf{N}$ of objects ξ_n of $\mathcal{F}(R/\mathfrak{m}_R^n)$ and morphisms $f_n : \xi_{n+1} \rightarrow \xi_n$ lying over the projection $R/\mathfrak{m}_R^{n+1} \rightarrow R/\mathfrak{m}_R^n$.
- (2) Let $\xi = (R, \xi_n, f_n)$ and $\eta = (S, \eta_n, g_n)$ be formal objects of $\widehat{\mathcal{F}}$. A morphism $a : \xi \rightarrow \eta$ of formal objects consists of a map $a_0 : R \rightarrow S$ in $\widehat{\mathcal{C}}_\Lambda$ and a collection $a_n : \xi_n \rightarrow \eta_n$ of morphisms of \mathcal{F} lying over $R/\mathfrak{m}_R^n \rightarrow S/\mathfrak{m}_S^n$, such that for every n the diagram

$$\begin{array}{ccc} \xi_{n+1} & \xrightarrow{f_n} & \xi_n \\ a_{n+1} \downarrow & & \downarrow a_n \\ \eta_{n+1} & \xrightarrow{g_n} & \eta_n \end{array}$$

commutes.

The category of formal objects comes with a functor $\widehat{p} : \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_\Lambda$ which sends an object (R, ξ_n, f_n) to R and a morphism $(R, \xi_n, f_n) \rightarrow (S, \eta_n, g_n)$ to the map $R \rightarrow S$.

Lemma 68.7.2. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibred in groupoids. Then $\widehat{p} : \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_\Lambda$ is a category cofibred in groupoids.

Proof. Let $R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. Let (R, ξ_n, f_n) be an object of $\widehat{\mathcal{F}}$. For each n choose a pushforward $\xi_n \rightarrow \eta_n$ of ξ_n along $R/\mathfrak{m}_R^n \rightarrow S/\mathfrak{m}_S^n$. For each n there exists a unique morphism $g_n : \eta_{n+1} \rightarrow \eta_n$ in \mathcal{F} lying over $S/\mathfrak{m}_S^{n+1} \rightarrow S/\mathfrak{m}_S^n$ such that

$$\begin{array}{ccc} \xi_{n+1} & \xrightarrow{f_n} & \xi_n \\ \downarrow & & \downarrow \\ \eta_{n+1} & \xrightarrow{g_n} & \eta_n \end{array}$$

commutes (by the first axiom of a category cofibred in groupoids). Hence we obtain a morphism $(R, \xi_n, f_n) \rightarrow (S, \eta_n, g_n)$ lying over $R \rightarrow S$, i.e., the first axiom of a category cofibred in groupoids holds for $\widehat{\mathcal{F}}$. To see the second axiom suppose that we have morphisms $a : (R, \xi_n, f_n) \rightarrow (S, \eta_n, g_n)$ and $b : (R, \xi_n, f_n) \rightarrow (T, \theta_n, h_n)$ in $\widehat{\mathcal{F}}$ and a morphism $c_0 : S \rightarrow T$ in $\widehat{\mathcal{C}}_\Lambda$ such that $c_0 \circ a_0 = b_0$. By the second axiom of a category cofibred in groupoids for \mathcal{F} we obtain unique maps $c_n : \eta_n \rightarrow \theta_n$ lying over $S/\mathfrak{m}_S^n \rightarrow T/\mathfrak{m}_T^n$ such that $c_n \circ a_n = b_n$. Setting $c = (c_n)_{n \geq 0}$ gives the desired morphism $c : (S, \eta_n, g_n) \rightarrow (T, \theta_n, h_n)$ in $\widehat{\mathcal{F}}$ (we omit the verification that $h_n \circ c_{n+1} = c_n \circ g_n$). \square

Definition 68.7.3. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibred in groupoids. The category cofibred in groupoids $\widehat{p} : \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_\Lambda$ is called the *completion of \mathcal{F}* .

If \mathcal{F} is a category cofibered in groupoids over \mathcal{C}_Λ , we have defined $\widehat{\mathcal{F}}(R)$ for $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ in terms of the filtration of R by powers of its maximal ideal. But suppose $\mathcal{I} = (I_n)$ is a filtration of R by ideals inducing the \mathfrak{m}_R -adic topology. We define $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ to be the category with the following objects and morphisms:

- (1) An object is a collection $(\xi_n, f_n)_{n \in \mathbf{N}}$ of objects ξ_n of $\mathcal{F}(R/I_n)$ and morphisms $f_n : \xi_{n+1} \rightarrow \xi_n$ lying over the projections $R/I_{n+1} \rightarrow R/I_n$.
- (2) A morphism $a : (\xi_n, f_n) \rightarrow (\eta_n, g_n)$ consists of a collection $a_n : \xi_n \rightarrow \eta_n$ of morphisms in $\mathcal{F}(R/I_n)$, such that for every n the diagram

$$\begin{array}{ccc} \xi_{n+1} & \xrightarrow{f_n} & \xi_n \\ a_{n+1} \downarrow & & \downarrow a_n \\ \eta_{n+1} & \xrightarrow{g_n} & \eta_n \end{array}$$

commutes.

Lemma 68.7.4. *In the situation above, $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ is equivalent to the category $\widehat{\mathcal{F}}(R)$.*

Proof. An equivalence $\widehat{\mathcal{F}}_{\mathcal{I}}(R) \rightarrow \widehat{\mathcal{F}}(R)$ can be defined as follows. For each n , let $m(n)$ be the least m that $I_m \subset \mathfrak{m}_R^n$. Given an object (ξ_n, f_n) of $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$, let η_n be the pushforward of $\xi_{m(n)}$ along $R/I_{m(n)} \rightarrow R/\mathfrak{m}_R^n$. Let $g_n : \eta_{n+1} \rightarrow \eta_n$ be the unique morphism of \mathcal{F} lying over $R/\mathfrak{m}_R^{n+1} \rightarrow R/\mathfrak{m}_R^n$ such that

$$\begin{array}{ccc} \xi_{m(n+1)} & \xrightarrow{f_{m(n)} \circ \dots \circ f_{m(n+1)-1}} & \xi_{m(n)} \\ \downarrow & & \downarrow \\ \eta_{n+1} & \xrightarrow{g_n} & \eta_n \end{array}$$

commutes (existence and uniqueness is guaranteed by the axioms of a cofibered category). The functor $\widehat{\mathcal{F}}_{\mathcal{I}}(R) \rightarrow \widehat{\mathcal{F}}(R)$ sends (ξ_n, f_n) to (R, η_n, g_n) . We omit the verification that this is indeed an equivalence of categories. \square

Remark 68.7.5. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibered in groupoids. Suppose that for each $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ we are given a filtration \mathcal{I}_R of R by ideals. If \mathcal{I}_R induces the \mathfrak{m}_R -adic topology on R for all R , then one can define a category $\widehat{\mathcal{F}}_{\mathcal{I}}$ by mimicking the definition of $\widehat{\mathcal{F}}$. This category comes equipped with a morphism $\widehat{p}_{\mathcal{I}} : \widehat{\mathcal{F}}_{\mathcal{I}} \rightarrow \widehat{\mathcal{C}}_\Lambda$ making it into a category cofibered in groupoids such that $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ is isomorphic to $\widehat{\mathcal{F}}_{\mathcal{I}_R}(R)$ as defined above. The categories cofibered in groupoids $\widehat{\mathcal{F}}_{\mathcal{I}}$ and $\widehat{\mathcal{F}}$ are equivalent, by using over an object $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ the equivalence of Lemma 68.7.4.

Remark 68.7.6. Let $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a functor. Identifying functors with cofibered sets, the completion of F is the functor $\widehat{F} : \widehat{\mathcal{C}}_\Lambda \rightarrow \text{Sets}$ given by $\widehat{F}(S) = \lim F(S/\mathfrak{m}_S^n)$. This agrees with the definition in Schlessinger’s paper [Sch68].

Remark 68.7.7. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . We claim that there is a canonical equivalence

$$\text{can} : \widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \longrightarrow \mathcal{F}.$$

Namely, let $A \in \text{Ob}(\mathcal{C}_\Lambda)$ and let (A, ξ_n, f_n) be an object of $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda}(A)$. Since A is Artinian there is a minimal $m \in \mathbf{N}$ such that $\mathfrak{m}_A^m = 0$. Then can sends (A, ξ_n, f_n)

to ξ_m . This functor is an equivalence of categories cofibered in groupoids by Categories, Lemma 4.33.8 because it is an equivalence on all fibre categories by Lemma 68.7.4 and the fact that the \mathfrak{m}_A -adic topology on a local Artinian ring A comes from the zero ideal. We will frequently identify \mathcal{F} with a full subcategory of $\widehat{\mathcal{F}}$ via a quasi-inverse to the functor *can*.

Remark 68.7.8. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over \mathcal{C}_Λ . Then there is an induced morphism $\widehat{\varphi} : \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{G}}$ of categories cofibered in groupoids over $\widehat{\mathcal{C}}_\Lambda$. It sends an object $\xi = (R, \xi_n, f_n)$ of $\widehat{\mathcal{F}}$ to $(R, \varphi(\xi_n), \varphi(f_n))$, and it sends a morphism $(a_0 : R \rightarrow S, a_n : \xi_n \rightarrow \eta_n)$ between objects ξ and η of $\widehat{\mathcal{F}}$ to $(a_0 : R \rightarrow S, \varphi(a_n) : \varphi(\xi_n) \rightarrow \varphi(\eta_n))$. Finally, if $t : \varphi \rightarrow \varphi'$ is a 2-morphism between 1-morphisms $\varphi, \varphi' : \mathcal{F} \rightarrow \mathcal{G}$ of categories cofibered in groupoids, then we obtain a 2-morphism $\widehat{t} : \widehat{\varphi} \rightarrow \widehat{\varphi}'$. Namely, for $\xi = (R, \xi_n, f_n)$ as above we set $\widehat{t}_\xi = (t_{\varphi(\xi_n)})$. Hence completion defines a functor between 2-categories

$$\widehat{} : \text{Cof}(\mathcal{C}_\Lambda) \longrightarrow \text{Cof}(\widehat{\mathcal{C}}_\Lambda)$$

from the 2-category of categories cofibered in groupoids over \mathcal{C}_Λ to the 2-category of categories cofibered in groupoids over $\widehat{\mathcal{C}}_\Lambda$.

Remark 68.7.9. We claim the completion functor of Remark 68.7.8 and the restriction functor $|_{\mathcal{C}_\Lambda} : \text{Cof}(\widehat{\mathcal{C}}_\Lambda) \rightarrow \text{Cof}(\mathcal{C}_\Lambda)$ of Remarks 68.5.2 (14) are “2-adjoint” in the following precise sense. Let $\mathcal{F} \in \text{Ob}(\text{Cof}(\mathcal{C}_\Lambda))$ and let $\mathcal{G} \in \text{Ob}(\text{Cof}(\widehat{\mathcal{C}}_\Lambda))$. Then there is an equivalence of categories

$$\Phi : \text{Mor}_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \longrightarrow \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}})$$

To describe this equivalence, we define canonical morphisms $\mathcal{G} \rightarrow \widehat{\mathcal{G}}|_{\mathcal{C}_\Lambda}$ and $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ as follows

- (1) Let $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ and let ξ be an object of the fiber category $\mathcal{G}(R)$. Choose a pushforward $\xi \rightarrow \xi_n$ of ξ to R/\mathfrak{m}_R^n for each $n \in \mathbf{N}$, and let $f_n : \xi_{n+1} \rightarrow \xi_n$ be the induced morphism. Then $\mathcal{G} \rightarrow \widehat{\mathcal{G}}|_{\mathcal{C}_\Lambda}$ sends ξ to (R, ξ_n, f_n) .
- (2) This is the equivalence *can* : $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ of Remark 68.7.7.

Having said this, the equivalence $\Phi : \text{Mor}_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \rightarrow \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}})$ sends a morphism $\varphi : \mathcal{G}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ to

$$\mathcal{G} \rightarrow \widehat{\mathcal{G}}|_{\mathcal{C}_\Lambda} \xrightarrow{\widehat{\varphi}} \widehat{\mathcal{F}}$$

There is a quasi-inverse $\Psi : \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}}) \rightarrow \text{Mor}_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F})$ to Φ which sends $\psi : \mathcal{G} \rightarrow \widehat{\mathcal{F}}$ to

$$\mathcal{G}|_{\mathcal{C}_\Lambda} \xrightarrow{\psi|_{\mathcal{C}_\Lambda}} \widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}.$$

We omit the verification that Φ and Ψ are quasi-inverse. We also do not address functoriality of Φ (because it would lead into 3-category territory which we want to avoid at all cost).

Remark 68.7.10. For a category \mathcal{C} we denote by $\text{CofSet}(\mathcal{C})$ the category of cofibered sets over \mathcal{C} . It is a 1-category isomorphic the category of functors $\mathcal{C} \rightarrow \text{Sets}$. See Remarks 68.5.2 (11). The completion and restriction functors restrict to functors $\widehat{} : \text{CofSet}(\mathcal{C}_\Lambda) \rightarrow \text{CofSet}(\widehat{\mathcal{C}}_\Lambda)$ and $|_{\mathcal{C}_\Lambda} : \text{CofSet}(\widehat{\mathcal{C}}_\Lambda) \rightarrow \text{CofSet}(\mathcal{C}_\Lambda)$ which we denote by the same symbols. As functors on the categories of cofibered sets,

completion and restriction are adjoints in the usual 1-categorical sense: the same construction as in Remark 68.7.9 defines a functorial bijection

$$\text{Mor}_{\mathcal{C}_\Lambda}(G|_{\mathcal{C}_\Lambda}, F) \longrightarrow \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(G, \widehat{F})$$

for $F \in \text{Ob}(\text{CofSet}(\mathcal{C}_\Lambda))$ and $G \in \text{Ob}(\text{CofSet}(\widehat{\mathcal{C}}_\Lambda))$. Again the map $\widehat{F}|_{\mathcal{C}_\Lambda} \rightarrow F$ is an isomorphism.

Remark 68.7.11. Let $G : \widehat{\mathcal{C}}_\Lambda \rightarrow \text{Sets}$ be a functor that commutes with limits. Then the map $G \rightarrow \widehat{G|_{\mathcal{C}_\Lambda}}$ described in Remark 68.7.9 is an isomorphism. Indeed, if S is an object of $\widehat{\mathcal{C}}_\Lambda$, then we have canonical bijections

$$\widehat{G|_{\mathcal{C}_\Lambda}}(S) = \lim_n G(S/\mathfrak{m}_S^n) = G(\lim_n S/\mathfrak{m}_S^n) = G(S).$$

In particular, if R is an object of $\widehat{\mathcal{C}}_\Lambda$ then $\underline{R} = \widehat{R|_{\mathcal{C}_\Lambda}}$ because the representable functor \underline{R} commutes with limits by definition of limits.

Remark 68.7.12. Let R be an object of $\widehat{\mathcal{C}}_\Lambda$. It defines a functor $\underline{R} : \widehat{\mathcal{C}}_\Lambda \rightarrow \text{Sets}$ as described in Remarks 68.5.2 (12). As usual we identify this functor with the associated cofibered set. If \mathcal{F} is a cofibered category over \mathcal{C}_Λ , then there is an equivalence of categories

$$(68.7.12.1) \quad \text{Mor}_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \longrightarrow \widehat{\mathcal{F}}(R).$$

It is given by the composition

$$\text{Mor}_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \xrightarrow{\Phi} \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\sim} \widehat{\mathcal{F}}(R)$$

where Φ is as in Remark 68.7.9 and the second equivalence comes from the 2-Yoneda lemma (the cofibered analogue of Categories, Lemma 4.39.1). Explicitly, the equivalence sends a morphism $\varphi : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ to the formal object $(R, \varphi(R \rightarrow R/\mathfrak{m}_R^n), \varphi(f_n))$ in $\widehat{\mathcal{F}}(R)$, where $f_n : R/\mathfrak{m}_R^{n+1} \rightarrow R/\mathfrak{m}_R^n$ is the projection.

Assume a choice of pushforwards for \mathcal{F} has been made. Given any $\xi \in \text{Ob}(\widehat{\mathcal{F}}(R))$ we construct an explicit $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ which maps to ξ under (68.7.12.1). Namely, say $\xi = (R, \xi_n, f_n)$. An object α in $\underline{R}|_{\mathcal{C}_\Lambda}$ is the same thing as a morphism $\alpha : R \rightarrow A$ of $\widehat{\mathcal{C}}_\Lambda$ with A Artinian. Let $m \in \mathbb{N}$ be minimal such that $\mathfrak{m}_A^m = 0$. Then α factors through a unique $\alpha_m : R/\mathfrak{m}_R^m \rightarrow A$ and we can set $\underline{\xi}(\alpha) = \alpha_{m,*}\xi_m$. We omit the description of $\underline{\xi}$ on morphisms and we omit the proof that $\underline{\xi}$ maps to ξ via (68.7.12.1).

Assume a choice of pushforwards for $\widehat{\mathcal{F}}$ has been made. In this case the proof of Categories, Lemma 4.39.1 gives an explicit quasi-inverse

$$\iota : \widehat{\mathcal{F}}(R) \longrightarrow \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}})$$

to the 2-Yoneda equivalence which takes ξ to the morphism $\iota(\xi) : \underline{R} \rightarrow \widehat{\mathcal{F}}$ sending $f \in \underline{R}(S) = \text{Mor}_{\mathcal{C}_\Lambda}(R, S)$ to $f_*\xi$. A quasi-inverse to (68.7.12.1) is then

$$\widehat{\mathcal{F}}(R) \xrightarrow{\iota} \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\Psi} \text{Mor}_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F})$$

where Ψ is as in Remark 68.7.9. Given $\xi \in \text{Ob}(\widehat{\mathcal{F}}(R))$ we have $\Psi(\iota(\xi)) \cong \xi$ where ξ is as in the previous paragraph, because both are mapped to ξ under the equivalence of categories (68.7.12.1). Using $\underline{R} = \widehat{R|_{\mathcal{C}_\Lambda}}$ (see Remark 68.7.11) and unwinding the definitions of Φ and Ψ we conclude that $\iota(\xi)$ is isomorphic to the completion of $\underline{\xi}$.

Remark 68.7.13. Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . Let $\xi = (R, \xi_i, f_n)$ and $\eta = (S, \eta_n, g_n)$ be formal objects of \mathcal{F} . Let $a = (a_n) : \xi \rightarrow \eta$ be a morphism of formal objects, i.e., a morphism of $\widehat{\mathcal{F}}$. Let $f = \widehat{p}(a) = a_0 : R \rightarrow S$ be the projection of a in $\widehat{\mathcal{C}}_\Lambda$. Then we obtain a 2-commutative diagram

$$\begin{array}{ccc} \underline{R}|_{\mathcal{C}_\Lambda} & \xleftarrow{f} & \underline{S}|_{\mathcal{C}_\Lambda} \\ & \searrow \underline{\xi} & \swarrow \underline{\eta} \\ & \mathcal{F} & \end{array}$$

where $\underline{\xi}$ and $\underline{\eta}$ are the morphisms constructed in Remark 68.7.12. To see this let $\alpha : S \rightarrow A$ be an object of $\underline{S}|_{\mathcal{C}_\Lambda}$ (see loc. cit.). Let $m \in \mathbb{N}$ be minimal such that $\mathfrak{m}_A^m = 0$. We get a commutative diagram

$$\begin{array}{ccccc} R & \longrightarrow & R/\mathfrak{m}_R^m & & \\ \downarrow f & & \downarrow f_m & \searrow \beta_m & \\ S & \longrightarrow & S/\mathfrak{m}_S^m & \xrightarrow{\alpha_m} & A \end{array}$$

such that the bottom arrows compose to give α . Then $\underline{\eta}(\alpha) = \alpha_{m,*}\eta_m$ and $\underline{\xi}(\alpha \circ f) = \beta_{m,*}\xi_m$. The morphism $a_m : \xi_m \rightarrow \eta_m$ lies over f_m hence we obtain a canonical morphism

$$\underline{\xi}(\alpha \circ f) = \beta_{m,*}\xi_m \longrightarrow \underline{\eta}(\alpha) = \alpha_{m,*}\eta_m$$

lying over id_A such that

$$\begin{array}{ccc} \xi_m & \longrightarrow & \beta_{m,*}\xi_m \\ \downarrow a_m & & \downarrow \\ \eta_m & \longrightarrow & \alpha_{m,*}\eta_m \end{array}$$

commutes by the axioms of a category cofibred in groupoids. This defines a transformation of functors $\underline{\xi} \circ f \rightarrow \underline{\eta}$ which witnesses the 2-commutativity of the first diagram of this remark.

Remark 68.7.14. According to Remark 68.7.12, giving a formal object ξ of \mathcal{F} is equivalent to giving a prorepresentable functor $U : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ and a morphism $U \rightarrow \mathcal{F}$.

68.8. Smooth morphisms

In this section we discuss smooth morphisms of categories cofibred in groupoids over \mathcal{C}_Λ .

Definition 68.8.1. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibred in groupoids over \mathcal{C}_Λ . We say φ is *smooth* if it satisfies the following condition: Let $B \rightarrow A$ be a surjective ring map in \mathcal{C}_Λ . Let $y \in \text{Ob}(\mathcal{G}(B)), x \in \text{Ob}(\mathcal{F}(A))$, and $y \rightarrow \varphi(x)$ be a morphism lying over $B \rightarrow A$. Then there exists $x' \in \text{Ob}(\mathcal{F}(B))$, a morphism $x' \rightarrow x$ lying over $B \rightarrow A$, and a morphism $\varphi(x') \rightarrow y$ lying over

$\text{id} : B \rightarrow B$, such that the diagram

$$\begin{array}{ccc} \varphi(x') & \longrightarrow & y \\ & \searrow & \downarrow \\ & & \varphi(x) \end{array}$$

commutes.

Lemma 68.8.2. *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over \mathcal{C}_Λ . Then φ is smooth if the condition in Definition 68.8.1 is assumed to hold only for small extensions $B \rightarrow A$.*

Proof. Let $B \rightarrow A$ be a surjective ring map in \mathcal{C}_Λ . Let $y \in \text{Ob}(\mathcal{G}(B))$, $x \in \text{Ob}(\mathcal{F}(A))$, and $y \rightarrow \varphi(x)$ be a morphism lying over $B \rightarrow A$. By Lemma 68.3.3 we can factor $B \rightarrow A$ into small extensions $B = B_n \rightarrow B_{n-1} \rightarrow \dots \rightarrow B_0 = A$. We argue by induction on n . If $n = 1$ the result is true by assumption. If $n > 1$, then denote $f : B = B_n \rightarrow B_{n-1}$ and denote $g : B_{n-1} \rightarrow B_0 = A$. Choose a pushforward $y \rightarrow f_*y$ of y along f , so that the morphism $y \rightarrow \varphi(x)$ factors as $y \rightarrow f_*y \rightarrow \varphi(x)$. By the induction hypothesis we can find $x_{n-1} \rightarrow x$ lying over $g : B_{n-1} \rightarrow A$ and $a : \varphi(x_{n-1}) \rightarrow f_*y$ lying over $\text{id} : B_{n-1} \rightarrow B_{n-1}$ such that

$$\begin{array}{ccc} \varphi(x_{n-1}) & \xrightarrow{a} & f_*y \\ & \searrow & \downarrow \\ & & \varphi(x) \end{array}$$

commutes. We can apply the assumption to the composition $y \rightarrow \varphi(x_{n-1})$ of $y \rightarrow f_*y$ with $a^{-1} : f_*y \rightarrow \varphi(x_{n-1})$. We obtain $x_n \rightarrow x_{n-1}$ lying over $B_n \rightarrow B_{n-1}$ and $\varphi(x_n) \rightarrow y$ lying over $\text{id} : B_n \rightarrow B_n$ so that the diagram

$$\begin{array}{ccc} \varphi(x_n) & \longrightarrow & y \\ \downarrow & & \downarrow \\ \varphi(x_{n-1}) & \xrightarrow{a} & f_*y \\ & \searrow & \downarrow \\ & & \varphi(x) \end{array}$$

commutes. Then the composition $x_n \rightarrow x_{n-1} \rightarrow x$ and $\varphi(x_n) \rightarrow y$ are the morphisms required by the definition of smoothness. \square

Remark 68.8.3. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over \mathcal{C}_Λ . Let $B \rightarrow A$ be a ring map in \mathcal{C}_Λ . Choices of pushforwards along $B \rightarrow A$ for objects in the fiber categories $\mathcal{F}(B)$ and $\mathcal{G}(B)$ determine functors $\mathcal{F}(B) \rightarrow \mathcal{F}(A)$ and $\mathcal{G}(B) \rightarrow \mathcal{G}(A)$ fitting into a 2-commutative diagram

$$\begin{array}{ccc} \mathcal{F}(B) & \xrightarrow{\varphi} & \mathcal{G}(B) \\ \downarrow & & \downarrow \\ \mathcal{F}(A) & \xrightarrow{\varphi} & \mathcal{G}(A). \end{array}$$

Hence there is an induced functor $\mathcal{F}(B) \rightarrow \mathcal{F}(A) \times_{\mathcal{G}(A)} \mathcal{G}(B)$. Unwinding the definitions shows that $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is smooth if and only if this induced functor is essentially surjective whenever $B \rightarrow A$ is surjective (or equivalently, by Lemma 68.8.2, whenever $B \rightarrow A$ is a small extension).

Remark 68.8.4. The characterization of smooth morphisms in Remark 68.8.3 is analogous to Schlessinger's notion of a smooth morphism of functors, cf. [Sch68, Definition 2.2.]. In fact, when \mathcal{F} and \mathcal{G} are cofibered in sets then our notion is equivalent to Schlessinger's. Namely, in this case let $F, G : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be the corresponding functors, see Remarks 68.5.2 (11). Then $F \rightarrow G$ is smooth if and only if for every surjection of rings $B \rightarrow A$ in \mathcal{C}_Λ the map $F(B) \rightarrow F(A) \times_{G(A)} G(B)$ is surjective.

Remark 68.8.5. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Then the morphism $\mathcal{F} \rightarrow \overline{\mathcal{F}}$ is smooth.

If $R \rightarrow S$ is a ring map $\widehat{\mathcal{C}}_\Lambda$, then there is an induced morphism $\underline{S} \rightarrow \underline{R}$ between the functors $\underline{S}, \underline{R} : \widehat{\mathcal{C}}_\Lambda \rightarrow \text{Sets}$. In this situation, smoothness of the restriction $\underline{S}|_{\mathcal{C}_\Lambda} \rightarrow \underline{R}|_{\mathcal{C}_\Lambda}$ is a familiar notion:

Lemma 68.8.6. *Let $R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. Then the induced morphism $\underline{S}|_{\mathcal{C}_\Lambda} \rightarrow \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth if and only if S is a power series ring over R .*

Proof. Assume S is a power series ring over R . Say $S = R[[x_1, \dots, x_n]]$. Smoothness of $\underline{S}|_{\mathcal{C}_\Lambda} \rightarrow \underline{R}|_{\mathcal{C}_\Lambda}$ means the following (see Remark 68.8.4): Given a surjective ring map $B \rightarrow A$ in \mathcal{C}_Λ , a ring map $R \rightarrow B$, a ring map $S \rightarrow A$ such that the solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & B \end{array}$$

is commutative then a dotted arrow exists making the diagram commute. (Note the similarity with Algebra, Definition 10.133.1.) To construct the dotted arrow choose elements $b_i \in B$ whose images in A are equal to the images of x_i in A . Note that $b_i \in \mathfrak{m}_B$ as x_i maps to an element of \mathfrak{m}_A . Hence there is a unique R -algebra map $R[[x_1, \dots, x_n]] \rightarrow B$ which maps x_i to b_i and which can serve as our dotted arrow.

Conversely, assume $\underline{S}|_{\mathcal{C}_\Lambda} \rightarrow \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. Let $x_1, \dots, x_n \in S$ be elements whose images form a basis in the relative cotangent space $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$ of S over R . Set $T = R[[X_1, \dots, X_n]]$. Note that both

$$S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \cong R/\mathfrak{m}_R[x_1, \dots, x_n]/(x_i x_j)$$

and

$$T/(\mathfrak{m}_R T + \mathfrak{m}_T^2) \cong R/\mathfrak{m}_R[X_1, \dots, X_n]/(X_i X_j).$$

Let $S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \rightarrow T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ be the local R -algebra isomorphism given by mapping the class of x_i to the class of X_i . Let $f_1 : S \rightarrow T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ be the composition $S \rightarrow S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \rightarrow T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$. The assumption that $\underline{S}|_{\mathcal{C}_\Lambda} \rightarrow \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth means we can lift f_1 to a map $f_2 : S \rightarrow T/\mathfrak{m}_T^2$, then to a map $f_3 : S \rightarrow T/\mathfrak{m}_T^3$, and so on, for all $n \geq 1$. Thus we get an induced map $f : S \rightarrow T = \lim T/\mathfrak{m}_T^n$ of local R -algebras. By our choice of f_1 , the map f

induces an isomorphism $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \rightarrow \mathfrak{m}_T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ of relative cotangent spaces. Hence f is surjective by Lemma 68.4.2 (where we think of f as a map in $\widehat{\mathcal{C}}_R$). Choose preimages $y_i \in S$ of $X_i \in T$ under f . As T is a power series ring over R there exists a local R -algebra homomorphism $s : T \rightarrow S$ mapping X_i to y_i . By construction $f \circ s = \text{id}$. Then s is injective. But s induces an isomorphism on relative cotangent spaces since f does, so it is also surjective by Lemma 68.4.2 again. Hence s and f are isomorphisms. \square

Smooth morphisms satisfy the following functorial properties.

Lemma 68.8.7. *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\psi : \mathcal{G} \rightarrow \mathcal{H}$ be morphisms of categories cofibered in groupoids over \mathcal{C}_Λ .*

- (1) *If φ and ψ are smooth, then $\psi \circ \varphi$ is smooth.*
- (2) *If φ is essentially surjective and $\psi \circ \varphi$ is smooth, then ψ is smooth.*
- (3) *If $\mathcal{G}' \rightarrow \mathcal{G}$ is a morphism of categories cofibered in groupoids and φ is smooth, then $\mathcal{F} \times_{\mathcal{G}} \mathcal{G}' \rightarrow \mathcal{G}'$ is smooth.*

Proof. Statements (1) and (2) follow immediately from the definitions. Proof of (3) omitted. Hints: use the formulation of smoothness given in Remark 68.8.3 and use that $\mathcal{F} \times_{\mathcal{G}} \mathcal{G}'$ is the 2-fibre product, see Remarks 68.5.2 (13). \square

Lemma 68.8.8. *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a smooth morphism of categories cofibered in groupoids over \mathcal{C}_Λ . Assume $\varphi : \mathcal{F}(k) \rightarrow \mathcal{G}(k)$ is essentially surjective. Then $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\widehat{\varphi} : \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{G}}$ are essentially surjective.*

Proof. Let y be an object of \mathcal{G} lying over $A \in \text{Ob}(\mathcal{C}_\Lambda)$. Let $y \rightarrow y_0$ be a pushforward of y along $A \rightarrow k$. By the assumption on essential surjectivity of $\varphi : \mathcal{F}(k) \rightarrow \mathcal{G}(k)$ there exist an object x_0 of \mathcal{F} lying over k and an isomorphism $y_0 \rightarrow \varphi(x_0)$. Smoothness of φ implies there exists an object x of \mathcal{F} over A whose image $\varphi(x)$ is isomorphic to y . Thus $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is essentially surjective.

Let $\eta = (R, \eta_n, g_n)$ be an object of $\widehat{\mathcal{G}}$. We construct an object ξ of $\widehat{\mathcal{F}}$ with an isomorphism $\eta \rightarrow \varphi(\xi)$. By the assumption on essential surjectivity of $\varphi : \mathcal{F}(k) \rightarrow \mathcal{G}(k)$, there exists a morphism $\eta_1 \rightarrow \varphi(\xi_1)$ in $\mathcal{G}(k)$ for some $\xi_1 \in \text{Ob}(\mathcal{F}(k))$. The morphism $\eta_2 \xrightarrow{g_1} \eta_1 \rightarrow \varphi(\xi_1)$ lies over the surjective ring map $R/\mathfrak{m}_R^2 \rightarrow k$, hence by smoothness of φ there exists $\xi_2 \in \text{Ob}(\mathcal{F}(R/\mathfrak{m}_R^2))$, a morphism $f_1 : \xi_2 \rightarrow \xi_1$ lying over $R/\mathfrak{m}_R^2 \rightarrow k$, and a morphism $\eta_2 \rightarrow \varphi(\xi_2)$ such that

$$\begin{array}{ccc} \varphi(\xi_2) & \xrightarrow{\varphi(f_1)} & \varphi(\xi_1) \\ \uparrow & & \uparrow \\ \eta_2 & \xrightarrow{g_1} & \eta_1 \end{array}$$

commutes. Continuing in this way we construct an object $\xi = (R, \xi_n, f_n)$ of $\widehat{\mathcal{F}}$ and a morphism $\eta \rightarrow \varphi(\xi) = (R, \varphi(\xi_n), \varphi(f_n))$ in $\widehat{\mathcal{G}}(R)$. \square

Remark 68.8.9. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibered in groupoids. We can consider \mathcal{C}_Λ as the trivial category cofibered in groupoids over \mathcal{C}_Λ , and then p is a morphism of categories cofibered in groupoids over \mathcal{C}_Λ . We say \mathcal{F} is *smooth* if its structure morphism p is smooth. This is the “absolute” notion of smoothness for a category cofibered in groupoids over \mathcal{C}_Λ .

Example 68.8.10. Let $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. When is $\underline{R}|_{\mathcal{C}_\Lambda}$ smooth? In the classical case this means that R is a power series ring over Λ , see Lemma 68.8.6. (Strictly speaking this uses that $\underline{\Lambda}|_{\mathcal{C}_\Lambda} = \mathcal{C}_\Lambda$ because Λ is an initial object of $\widehat{\mathcal{C}}_\Lambda$ in the classical case.) In the general case we can construct examples as follows. Pick an integer $n \geq 0$ and a maximal ideal $\mathfrak{m} \subset \Lambda[x_1, \dots, x_n]$ lying over \mathfrak{m}_Λ so that

$$k' = \Lambda/\mathfrak{m}_\Lambda \longrightarrow \Lambda[x_1, \dots, x_n]/\mathfrak{m}$$

is isomorphic to $k' \rightarrow k$. Fix such an identification $k = \Lambda[x_1, \dots, x_n]/\mathfrak{m}$. Set $R = \Lambda[x_1, \dots, x_n]^\wedge$ equal to the \mathfrak{m} -adic completion of $\Lambda[x_1, \dots, x_n]$. Then R is an object of $\widehat{\mathcal{C}}_\Lambda$. Namely, it is a complete local Noetherian ring (see Algebra, Lemma 10.93.10) and its residue field is identified with k . We claim that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. To see this we have to show: Given a surjection $B \rightarrow A$ in \mathcal{C}_Λ and a map $R \rightarrow A$ there exists a lift of this map to B . This is clear as we can first lift the composition $\Lambda[x_1, \dots, x_n] \rightarrow R \rightarrow A$ to a map $\Lambda[x_1, \dots, x_n] \rightarrow B$ and then observe that this latter map factors through the completion R as B is complete (being Artinian). In fact, it turns out that whenever $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth, then R is isomorphic to a completion of a smooth algebra over Λ , but we won't use this.

Example 68.8.11. Here is a more explicit example of an R as in Example 68.8.10. Let p be a prime number and let $n \in \mathbf{N}$. Let $\Lambda = \mathbf{F}_p(t_1, t_2, \dots, t_n)$ and let $k = \mathbf{F}_p(x_1, \dots, x_n)$ with map $\Lambda \rightarrow k$ given by $t_i \mapsto x_i^p$. Then we can take

$$R = \Lambda[x_1, \dots, x_n]^\wedge_{(x_1^p - t_1, \dots, x_n^p - t_n)}$$

We cannot do “better” in this example, i.e., we cannot approximate \mathcal{C}_Λ by a smaller smooth object of $\widehat{\mathcal{C}}_\Lambda$ (one can argue that the dimension of R has to be at least n since the map $\Omega_{R/\Lambda} \otimes_R k \rightarrow \Omega_{k/\Lambda}$ is surjective). We will discuss this phenomenon later in more detail.

Remark 68.8.12. Suppose \mathcal{F} is a predeformation category admitting a smooth morphism $\varphi : \mathcal{U} \rightarrow \mathcal{F}$ from a predeformation category \mathcal{U} . Then by Lemma 68.8.8 φ is essentially surjective, so by Lemma 68.8.7 $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ is smooth if and only if the composition $\mathcal{U} \xrightarrow{\varphi} \mathcal{F} \xrightarrow{p} \mathcal{C}_\Lambda$ is smooth, i.e. \mathcal{F} is smooth if and only if \mathcal{U} is smooth.

Later we are interested in producing smooth morphisms from prorepresentable functors to predeformation categories \mathcal{F} . By the discussion in Remark 68.7.12 these morphisms correspond to certain formal objects of \mathcal{F} . More precisely, these are the so-called versal formal objects of \mathcal{F} .

Definition 68.8.13. Let \mathcal{F} be a category cofibered in groupoids. Let ξ be a formal object of \mathcal{F} lying over $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. We say ξ is *versal* if the corresponding morphism $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ of Remark 68.7.12 is smooth.

Remark 68.8.14. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ , and let ξ be a formal object of \mathcal{F} . It follows from the definition of smoothness that versality of ξ is equivalent to the following condition: If

$$\begin{array}{ccc} & & y \\ & & \downarrow \\ \xi & \longrightarrow & x \end{array}$$

is a diagram in $\widehat{\mathcal{F}}$ such that $y \rightarrow x$ lies over a surjective map $B \rightarrow A$ of Artinian rings (we may assume it is a small extension), then there exists a morphism $\xi \rightarrow y$ such that

commutes. In particular, the condition that ξ be versal does not depend on the choices of pushforwards made in the construction of $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ in Remark 68.7.12.

Lemma 68.8.15. *Let \mathcal{F} be a predeformation category. Let ξ be a versal formal object of \mathcal{F} . For any formal object η of $\widehat{\mathcal{F}}$, there exists a morphism $\xi \rightarrow \eta$.*

Proof. By assumption the morphism $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ is smooth. Then $\iota(\xi) : \underline{R} \rightarrow \widehat{\mathcal{F}}$ is the completion of $\underline{\xi}$, see Remark 68.7.12. By Lemma 68.8.8 there exists an object f of \underline{R} such that $\iota(\xi)(f) = \eta$. Then f is a ring map $f : R \rightarrow S$ in $\widehat{\mathcal{C}}_\Lambda$. And $\iota(\xi)(f) = \eta$ means that $f_*\xi \cong \eta$ which means exactly that there is a morphism $\xi \rightarrow \eta$ lying over f . \square

68.9. Schlessinger’s conditions

In the following we often consider fibre products $A_1 \times_A A_2$ of rings in the category \mathcal{C}_Λ . We have seen in Example 68.3.7 that such a fibre product may not always be an object of \mathcal{C}_Λ . However, in virtually all cases below one of the two maps $A_i \rightarrow A$ is surjective and $A_1 \times_A A_2$ will be an object of \mathcal{C}_Λ by Lemma 68.3.8. We will use this result without further mention.

We denote by $k[\epsilon]$ the ring of dual numbers over k . More generally, for a k -vector space V , we denote by $k[V]$ the k -algebra whose underlying vector space is $k \oplus V$ and whose multiplication is given by $(a, v) \cdot (a', v') = (aa', av' + a'v)$. When $V = k$, $k[V]$ is the ring of dual numbers over k . For any finite dimensional k -vector space V the ring $k[V]$ is in \mathcal{C}_Λ .

Definition 68.9.1. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . We define conditions (S1) and (S2) on \mathcal{F} as follows:

(S1) Every diagram in \mathcal{F}

in \mathcal{C}_Λ with $A_2 \rightarrow A$ surjective can be completed to a commutative diagram

(S2) The condition of (S1) holds for diagrams in \mathcal{F} lying over a diagram in \mathcal{C}_Λ of the form

$$\begin{array}{ccc} & & k[\epsilon] \\ & & \downarrow \\ A & \longrightarrow & k. \end{array}$$

Moreover, if we have two commutative diagrams in \mathcal{F}

$$\begin{array}{ccc} y & \xrightarrow{c} & x_\epsilon \\ \downarrow a & & \downarrow e \\ x & \xrightarrow{d} & x_0 \end{array} \quad \text{and} \quad \begin{array}{ccc} y' & \xrightarrow{c'} & x_\epsilon \\ \downarrow a' & & \downarrow e \\ x & \xrightarrow{d} & x_0 \end{array} \quad \text{lying over} \quad \begin{array}{ccc} A \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\ \downarrow & & \downarrow \\ A & \longrightarrow & k \end{array}$$

then there exists a morphism $b : y \rightarrow y'$ in $\mathcal{F}(A \times_k k[\epsilon])$ such that $a = a' \circ b$.

We can partly explain the meaning of conditions (S1) and (S2) in terms of fibre categories. Suppose that $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ are ring maps in \mathcal{C}_Λ with f_2 surjective. Denote $p_i : A_1 \times_A A_2 \rightarrow A_i$ the projection maps. Assume a choice of pushforwards for \mathcal{F} has been made. Then the commutative diagram of rings translates into a 2-commutative diagram

$$\begin{array}{ccc} \mathcal{F}(A_1 \times_A A_2) & \xrightarrow{p_{2,*}} & \mathcal{F}(A_2) \\ p_{1,*} \downarrow & & \downarrow f_{2,*} \\ \mathcal{F}(A_1) & \xrightarrow{f_{1,*}} & \mathcal{F}(A) \end{array}$$

of fibre categories whence a functor

$$(68.9.1.1) \quad \mathcal{F}(A_1 \times_A A_2) \rightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$$

into the 2-fibre product of categories. Condition (S1) requires that this functor be essentially surjective. The first part of condition (S2) requires that this functor be a essentially surjective if f_2 equals the map $k[\epsilon] \rightarrow k$. Moreover in this case, the second part of (S2) implies that two objects which become isomorphic in the target are isomorphic in the source (but it is *not* equivalent to this statement). The advantage of stating the conditions as in the definition is that no choices have to be made.

Lemma 68.9.2. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Then \mathcal{F} satisfies (S1) if the condition of (S1) is assumed to hold only when $A_2 \rightarrow A$ is a small extension.*

Proof. Proof omitted. Hints: apply Lemma 68.3.3 and use induction similar to the proof of Lemma 68.8.2. □

Remark 68.9.3. When \mathcal{F} is cofibered in sets, conditions (S1) and (S2) are exactly conditions (H1) and (H2) from Schlessinger's paper [Sch68]. Namely, for a functor $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$, conditions (S1) and (S2) state:

- (S1) If $A_1 \rightarrow A$ and $A_2 \rightarrow A$ are maps in \mathcal{C}_Λ with $A_2 \rightarrow A$ surjective, then the induced map $F(A_1 \times_A A_2) \rightarrow F(A_1) \times_{F(A)} F(A_2)$ is surjective.
- (S2) If $A \rightarrow k$ is a map in \mathcal{C}_Λ , then the induced map $F(A \times_k k[\epsilon]) \rightarrow F(A) \times_{F(k)} F(k[\epsilon])$ is bijective.

The injectivity of the map $F(A \times_k k[\epsilon]) \rightarrow F(A) \times_{F(k)} F(k[\epsilon])$ comes from the second part of condition (S2) and the fact that morphisms are identities.

Lemma 68.9.4. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . If \mathcal{F} satisfies (S2), then the condition of (S2) also holds when $k[\epsilon]$ is replaced by $k[V]$ for any finite dimensional k -vector space V .*

Proof. In the case that \mathcal{F} is cofibred in sets, i.e., corresponds to a functor $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ this follows from the description of (S2) for F in Remark 68.9.3 and the fact that $k[V] \cong k[\epsilon] \times_k \dots \times_k k[\epsilon]$ with $\dim_k V$ factors. The case of functors is what we will use in the rest of this chapter.

We prove the general case by induction on $\dim(V)$. If $\dim(V) = 1$, then $k[V] \cong k[\epsilon]$ and the result holds by assumption. If $\dim(V) > 1$ we write $V = V' \oplus k\epsilon$. Pick a diagram

$$\begin{array}{ccc}
 & x_V & \\
 & \downarrow & \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 & k[V] & \\
 & \downarrow & \\
 A & \longrightarrow & k
 \end{array}$$

Choose a morphism $x_V \rightarrow x_{V'}$ lying over $k[V] \rightarrow k[V']$ and a morphism $x_V \rightarrow x_\epsilon$ lying over $k[V] \rightarrow k[\epsilon]$. Note that the morphism $x_V \rightarrow x_0$ factors as $x_V \rightarrow x_{V'} \rightarrow x_0$ and as $x_V \rightarrow x_\epsilon \rightarrow x_0$. By induction hypothesis we can find a diagram

$$\begin{array}{ccc}
 y' & \longrightarrow & x_{V'} \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[V'] & \longrightarrow & k[V'] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

This gives us a commutative diagram

$$\begin{array}{ccc}
 & x_\epsilon & \\
 & \downarrow & \\
 y' & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 & k[\epsilon] & \\
 & \downarrow & \\
 A \times_k k[V'] & \longrightarrow & k
 \end{array}$$

Hence by (S2) we get a commutative diagram

$$\begin{array}{ccc}
 y & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow \\
 y' & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 (A \times_k k[V']) \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\
 \downarrow & & \downarrow \\
 A \times_k k[V'] & \longrightarrow & k
 \end{array}$$

Note that $(A \times_k k[V']) \times_k k[\epsilon] = A \times_k k[V' \oplus k\epsilon] = A \times_k k[V]$. We claim that y fits into the correct commutative diagram. To see this we let $y \rightarrow y_V$ be a morphism lying over $A \times_k k[V] \rightarrow k[V]$. We can factor the morphisms $y \rightarrow y' \rightarrow x_{V'}$ and $y \rightarrow x_\epsilon$ through the morphism $y \rightarrow y_V$ (by the axioms of categories cofibred in groupoids). Hence we see that both y_V and x_V fit into commutative diagrams

$$\begin{array}{ccc}
 y_V & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow \\
 x_{V'} & \longrightarrow & x_0
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 x_V & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow \\
 x_{V'} & \longrightarrow & x_0
 \end{array}$$

and hence by the second part of (S2) there exists an isomorphism $y_V \rightarrow x_V$ compatible with $y_V \rightarrow x_{V'}$ and $x_V \rightarrow x_{V'}$ and in particular compatible with the maps to x_0 . The composition $y \rightarrow y_V \rightarrow x_V$ then fits into the required commutative diagram

$$\begin{array}{ccc}
 y & \longrightarrow & x_V \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[V] & \longrightarrow & k[V] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

In this way we see that the first part of (S2) holds with $k[\epsilon]$ replaced by $k[V]$.

To prove the second part suppose given two commutative diagrams

$$\begin{array}{ccc}
 y & \longrightarrow & x_V \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 y' & \longrightarrow & x_V \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[V] & \longrightarrow & k[V] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

We will use the morphisms $x_V \rightarrow x_{V'} \rightarrow x_0$ and $x_V \rightarrow x_\epsilon \rightarrow x_0$ introduced in the first paragraph of the proof. Choose morphisms $y \rightarrow y_{V'}$ and $y' \rightarrow y'_{V'}$ lying over $A \times_k k[V] \rightarrow A \times_k k[V']$. The axioms of a cofibered category imply we can find commutative diagrams

$$\begin{array}{ccc}
 y_{V'} & \longrightarrow & x_{V'} \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 y'_{V'} & \longrightarrow & x_{V'} \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[V'] & \longrightarrow & k[V'] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

By induction hypothesis we obtain an isomorphism $b : y_{V'} \rightarrow y'_{V'}$, compatible with the morphisms $y_{V'} \rightarrow x$ and $y'_{V'} \rightarrow x$, in particular compatible with the morphisms to x_0 . Then we have commutative diagrams

$$\begin{array}{ccc}
 y & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow \\
 y'_{V'} & \longrightarrow & x_0
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 y' & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow \\
 y'_{V'} & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

where the morphism $y \rightarrow y'_{V'}$ is the composition $y \rightarrow y_{V'} \xrightarrow{b} y'_{V'}$, and where the morphisms $y \rightarrow x_\epsilon$ and $y' \rightarrow x_\epsilon$ are the compositions of the maps $y \rightarrow x_V$ and $y' \rightarrow x_V$ with the morphism $x_V \rightarrow x_\epsilon$. Then the second part of (S2) guarantees the existence of an isomorphism $y \rightarrow y'$ compatible with the maps to $y'_{V'}$, in particular compatible with the maps to x (because b was compatible with the maps to x). \square

Lemma 68.9.5. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ .*

- (1) *If \mathcal{F} satisfies (S1), then so does $\overline{\mathcal{F}}$.*
- (2) *If \mathcal{F} satisfies (S2), then so does $\overline{\mathcal{F}}$ provided at least one of the following conditions is satisfied*
 - (a) *\mathcal{F} is a predeformation category,*
 - (b) *the category $\mathcal{F}(k)$ is a set or a setoid, or*
 - (c) *for any morphism $x_\epsilon \rightarrow x_0$ of \mathcal{F} lying over $k[\epsilon] \rightarrow k$ the pushforward map $\text{Aut}_{k[\epsilon]}(x_\epsilon) \rightarrow \text{Aut}_k(x_0)$ is surjective.*

Proof. Assume \mathcal{F} has (S1). Suppose we have ring maps $f_i : A_i \rightarrow A$ in \mathcal{C}_Λ with f_2 surjective. Let $x_i \in \mathcal{F}(A_i)$ such that the pushforwards $f_{1,*}(x_1)$ and $f_{2,*}(x_2)$ are isomorphic. Then we can denote x an object of \mathcal{F} over A isomorphic to both of these and we obtain a diagram as in (S1). Hence we find an object y of \mathcal{F} over $A_1 \times_A A_2$ whose pushforward to A_1 , resp. A_2 is isomorphic to x_1 , resp. x_2 . In this way we see that (S1) holds for $\overline{\mathcal{F}}$.

Assume \mathcal{F} has (S2). The first part of (S2) for $\overline{\mathcal{F}}$ follows as in the argument above. The second part of (S2) for $\overline{\mathcal{F}}$ signifies that the map

$$\overline{\mathcal{F}}(A \times_k k[\epsilon]) \rightarrow \overline{\mathcal{F}}(A) \times_{\overline{\mathcal{F}}(k)} \overline{\mathcal{F}}(k[\epsilon])$$

is injective for any ring A in \mathcal{C}_Λ . Suppose that $y, y' \in \mathcal{F}(A \times_k k[\epsilon])$. Using the axioms of cofibred categories we can choose commutative diagrams

$$\begin{array}{ccc} y & \xrightarrow{c} & x_\epsilon \\ a \downarrow & & \downarrow e \\ x & \xrightarrow{d} & x_0 \end{array} \quad \text{and} \quad \begin{array}{ccc} y' & \xrightarrow{c'} & x'_\epsilon \\ a' \downarrow & & \downarrow e' \\ x' & \xrightarrow{d'} & x'_0 \end{array} \quad \text{lying over} \quad \begin{array}{ccc} A \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\ \downarrow & & \downarrow \\ A & \longrightarrow & k \end{array}$$

Assume that there exist isomorphisms $\alpha : x \rightarrow x'$ in $\mathcal{F}(A)$ and $\beta : x_\epsilon \rightarrow x'_\epsilon$ in $\mathcal{F}(k[\epsilon])$. This also means there exists an isomorphism $\gamma : x_0 \rightarrow x'_0$ compatible with α . To prove (S2) for $\overline{\mathcal{F}}$ we have to show that there exists an isomorphism $y \rightarrow y'$ in $\mathcal{F}(A \times_k k[\epsilon])$. By (S2) for \mathcal{F} such a morphism will exist if we can choose the isomorphisms α and β and γ such that

$$\begin{array}{ccccc} x & \longrightarrow & x_0 & \longleftarrow & x_\epsilon \\ \downarrow \alpha & & \downarrow \gamma & & \downarrow \beta \\ x' & \longrightarrow & x'_0 & \longleftarrow & x'_\epsilon \end{array}$$

is commutative (because then we can replace x by x' and x_ϵ by x'_ϵ in the previous displayed diagram). The left hand square commutes by our choice of γ . We can factor $e' \circ \beta$ as $\gamma' \circ e$ for some second map $\gamma' : x_0 \rightarrow x'_0$. Now the question is whether we can arrange it so that $\gamma = \gamma'$? This is clear if $\mathcal{F}(k)$ is a set, or a setoid. Moreover, if $\text{Aut}_{k[\epsilon]}(x_\epsilon) \rightarrow \text{Aut}_k(x_0)$ is surjective, then we can adjust the choice of β by precomposing with an automorphism of x_ϵ whose image is $\gamma^{-1} \circ \gamma'$ to make things work. \square

Lemma 68.9.6. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Let \mathcal{F}_{x_0} be the category cofibred in groupoids over \mathcal{C}_Λ constructed in Remark 68.6.4.*

- (1) *If \mathcal{F} satisfies (S1), then so does \mathcal{F}_{x_0} .*
- (2) *If \mathcal{F} satisfies (S2), then so does \mathcal{F}_{x_0} .*

Proof. Any diagram as in Definition 68.9.1 in \mathcal{F}_{x_0} gives rise to a diagram in \mathcal{F} and the output of condition (S1) or (S2) for this diagram in \mathcal{F} can be viewed as an output for \mathcal{F}_{x_0} as well. \square

Lemma 68.9.7. *Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be a category cofibered in groupoids. Consider a diagram of \mathcal{F}*

$$\begin{array}{ccc}
 y & \longrightarrow & x_\epsilon \\
 a \downarrow & & \downarrow e \\
 x & \xrightarrow{d} & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k.
 \end{array}$$

in \mathcal{C}_Λ . Assume \mathcal{F} satisfies (S2). Then there exists a morphism $s : x \rightarrow y$ with $a \circ s = id_x$ if and only if there exists a morphism $s_\epsilon : x \rightarrow x_\epsilon$ with $e \circ s_\epsilon = d$.

Proof. The “only if” direction is clear. Conversely, assume there exists a morphism $s_\epsilon : x \rightarrow x_\epsilon$ with $e \circ s_\epsilon = d$. Note that $p(s_\epsilon) : A \rightarrow k[\epsilon]$ is a ring map compatible with the map $A \rightarrow k$. Hence we obtain

$$\sigma = (id_A, p(s_\epsilon)) : A \rightarrow A \times_k k[\epsilon].$$

Choose a pushforward $x \rightarrow \sigma_*x$. By construction we can factor s_ϵ as $x \rightarrow \sigma_*x \rightarrow x_\epsilon$. Moreover, as σ is a section of $A \times_k k[\epsilon] \rightarrow A$, we get a morphism $\sigma_*x \rightarrow x$ such that $x \rightarrow \sigma_*x \rightarrow x$ is id_x . Because $e \circ s_\epsilon = d$ we find that the diagram

$$\begin{array}{ccc}
 \sigma_*x & \longrightarrow & x_\epsilon \\
 \downarrow & & \downarrow e \\
 x & \xrightarrow{d} & x_0
 \end{array}$$

is commutative. Hence by (S2) we obtain a morphism $\sigma_*x \rightarrow y$ such that $\sigma_*x \rightarrow y \rightarrow x$ is the given map $\sigma_*x \rightarrow x$. The solution to the problem is now to take $a : x \rightarrow y$ equal to the composition $x \rightarrow \sigma_*x \rightarrow y$. \square

Lemma 68.9.8. *Consider a commutative diagram in a predeformation category \mathcal{F}*

$$\begin{array}{ccc}
 y & \longrightarrow & x_2 \\
 \downarrow & & \downarrow a_2 \\
 x_1 & \xrightarrow{a_1} & x
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A_1 \times_A A_2 & \longrightarrow & A_2 \\
 \downarrow & & \downarrow f_2 \\
 A_1 & \xrightarrow{f_1} & A
 \end{array}$$

in \mathcal{C}_Λ where $f_2 : A_2 \rightarrow A$ is a small extension. Assume there is a map $h : A_1 \rightarrow A_2$ such that $f_2 = f_1 \circ h$. Let $I = Ker(f_2)$. Consider the ring map

$$g : A_1 \times_A A_2 \longrightarrow k[I] = k \oplus I, \quad (u, v) \mapsto \bar{u} \oplus (v - h(u))$$

*Choose a pushforward $y \rightarrow g_*y$. Assume \mathcal{F} satisfies (S2). If there exists a morphism $x_1 \rightarrow g_*y$, then there exists a morphism $b : x_1 \rightarrow x_2$ such that $a_1 = a_2 \circ b$.*

Proof. Note that $id_{A_1} \times g : A_1 \times_A A_2 \rightarrow A_1 \times_k k[I]$ is an isomorphism and that $k[I] \cong k[\epsilon]$. Hence we have a diagram

$$\begin{array}{ccc}
 y & \longrightarrow & g_*y \\
 \downarrow & & \downarrow \\
 x_1 & \longrightarrow & x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A_1 \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\
 \downarrow & & \downarrow \\
 A_1 & \longrightarrow & k.
 \end{array}$$

where x_0 is an object of \mathcal{F} lying over k (every object of \mathcal{F} has a unique morphism to x_0 , see discussion following Definition 68.6.2). If we have a morphism $x_1 \rightarrow g_*y$ then Lemma 68.9.7 provides us with a section $s : x_1 \rightarrow y$ of the map $y \rightarrow x_1$. Composing this with the map $y \rightarrow x_2$ we obtain $b : x_1 \rightarrow x_2$ which has the

property that $a_1 = a_2 \circ b$ because the diagram of the lemma commutes and because s is a section. □

68.10. Tangent spaces of functors

Let R be a ring. We write Mod_R for the category of R -modules and Mod_R^{fg} for the category of finitely generated R -modules.

Definition 68.10.1. Let $L : \text{Mod}_R^{fg} \rightarrow \text{Mod}_R$, resp. $L : \text{Mod}_R \rightarrow \text{Mod}_R$ be a functor. We say that L is R -linear if for every pair of objects M, N of Mod_R^{fg} , resp. Mod_R the map

$$L : \text{Hom}_R(M, N) \longrightarrow \text{Hom}_R(L(M), L(N))$$

is a map of R -modules.

Remark 68.10.2. One can define the notion of an R -linearity for any functor between categories enriched over Mod_R . We made the definition specifically for functors $L : \text{Mod}_R^{fg} \rightarrow \text{Mod}_R$ and $L : \text{Mod}_R \rightarrow \text{Mod}_R$ because these are the cases that we have needed so far.

Remark 68.10.3. If $L : \text{Mod}_R^{fg} \rightarrow \text{Mod}_R$ is an R -linear functor, then L preserves finite products and sends the zero module to the zero module, see Homology, Lemma 12.3.7. On the other hand, if a functor $\text{Mod}_R^{fg} \rightarrow \text{Sets}$ preserves finite products and sends the zero module to a one element set, then it has a unique lift to a R -linear functor, see Lemma 68.10.4.

Lemma 68.10.4. Let $L : \text{Mod}_R^{fg} \rightarrow \text{Sets}$, resp. $L : \text{Mod}_R \rightarrow \text{Sets}$ be a functor. Suppose $L(0)$ is a one element set and L preserves finite products. Then there exists a unique R -linear functor $\tilde{L} : \text{Mod}_R^{fg} \rightarrow \text{Mod}_R$, resp. $\tilde{L} : \text{Mod}_R^{fg} \rightarrow \text{Mod}_R$, such that

commutes.

Proof. We only prove this in case $L : \text{Mod}_R^{fg} \rightarrow \text{Sets}$. Let M be a finitely generated R -module. We define $\tilde{L}(M)$ to be the set $L(M)$ with the following R -module structure.

Multiplication: If $r \in R$, multiplication by r on $L(M)$ is defined to be the map $L(M) \rightarrow L(M)$ induced by the multiplication map $r \cdot : M \rightarrow M$.

Addition: The sum map $M \times M \rightarrow M : (m_1, m_2) \mapsto m_1 + m_2$ induces a map $L(M \times M) \rightarrow L(M)$. By assumption $L(M \times M)$ is canonically isomorphic to $L(M) \times L(M)$. Addition on $L(M)$ is defined by the map $L(M) \times L(M) \cong L(M \times M) \rightarrow L(M)$.

Zero: There is a unique map $0 \rightarrow M$. The zero element of $L(M)$ is the image of $L(0) \rightarrow L(M)$.

We omit the verification that this defines an R -module $\tilde{L}(M)$, the unique such that is R -linearly functorial in M . □

Lemma 68.10.5. *Let $L_1, L_2 : \text{Mod}_R^{fg} \rightarrow \text{Sets}$ be functors that take 0 to a one element set and preserve finite products. Let $t : L_1 \rightarrow L_2$ be a morphism of functors. Then t induces a morphism $\tilde{t} : \tilde{L}_1 \rightarrow \tilde{L}_2$ between the functors guaranteed by Lemma 68.10.4, which is given simply by $\tilde{t}_M = t_M : \tilde{L}_1(M) \rightarrow \tilde{L}_2(M)$ for each $M \in \text{Ob}(\text{Mod}_R^{fg})$. In other words, $t_M : \tilde{L}_1(M) \rightarrow \tilde{L}_2(M)$ is a map of R -modules.*

Proof. Omitted. \square

In the case $R = K$ is a field, a K -linear functor $L : \text{Mod}_K^{fg} \rightarrow \text{Mod}_K$ is determined by its value $L(K)$.

Lemma 68.10.6. *Let K be a field. Let $L : \text{Mod}_K^{fg} \rightarrow \text{Mod}_K$ be a K -linear functor. Then L is isomorphic to the functor $L(K) \otimes_K - : \text{Mod}_K^{fg} \rightarrow \text{Mod}_K$.*

Proof. For $V \in \text{Ob}(\text{Mod}_K^{fg})$, the isomorphism $L(K) \otimes_K V \rightarrow L(V)$ is given on pure tensors by $x \otimes v \mapsto L(f_v)(x)$, where $f_v : K \rightarrow V$ is the K -linear map sending $1 \mapsto v$. When $V = K$, this is the isomorphism $L(K) \otimes_K K \rightarrow L(K)$ given by multiplication by K . For general V , it is an isomorphism by the case $V = K$ and the fact that L commutes with finite products (Remark 68.10.3). \square

For a ring R and an R -module M , let $R[M]$ be the R -algebra whose underlying R -module is $R \oplus M$ and whose multiplication is given by $(r, m) \cdot (r', m') = (rr', rm' + r'm)$. When $M = R$ this is the ring of dual numbers over R , which we denote by $R[\epsilon]$.

Now let S be a ring and assume R is an S -algebra. Then the assignment $M \mapsto R[M]$ determines a functor $\text{Mod}_R \rightarrow S\text{-Alg}/R$, where $S\text{-Alg}/R$ denotes the category of S -algebras over R . Note that $S\text{-Alg}/R$ admits finite products: if $A_1 \rightarrow R$ and $A_2 \rightarrow R$ are two objects, then $A_1 \times_R A_2$ is a product.

Lemma 68.10.7. *Let R be an S -algebra. Then the functor $\text{Mod}_R \rightarrow S\text{-Alg}/R$ described above preserves finite products.*

Proof. This is merely the statement that if M and N are R -modules, then the map $R[M \times N] \rightarrow R[M] \times_R R[N]$ is an isomorphism in $S\text{-Alg}/R$. \square

Lemma 68.10.8. *Let R be an S -algebra, and let \mathcal{C} be a strictly full subcategory of $S\text{-Alg}/R$ containing $R[M]$ for all $M \in \text{Ob}(\text{Mod}_R^{fg})$. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Suppose that $F(R)$ is a one element set and that for any $M, N \in \text{Ob}(\text{Mod}_R^{fg})$, the induced map*

$$F(R[M] \times_R R[N]) \rightarrow F(R[M]) \times F(R[N])$$

is a bijection. Then $F(R[M])$ has a natural R -module structure for any $M \in \text{Ob}(\text{Mod}_R^{fg})$.

Proof. Note that $R \cong R[0]$ and $R[M] \times_R R[N] \cong R[M \times N]$ hence R and $R[M] \times_R R[N]$ are objects of \mathcal{C} by our assumptions on \mathcal{C} . Thus the conditions on F make sense. The functor $\text{Mod}_R \rightarrow S\text{-Alg}/R$ of Lemma 68.10.7 restricts to a functor $\text{Mod}_R^{fg} \rightarrow \mathcal{C}$ by the assumption on \mathcal{C} . Let L be the composition $\text{Mod}_R^{fg} \rightarrow \mathcal{C} \rightarrow \text{Sets}$, i.e., $L(M) = F(R[M])$. Then L preserves finite products by Lemma 68.10.7 and the assumption on F . Hence Lemma 68.10.4 shows that $L(M) = F(R[M])$ has a natural R -module structure for any $M \in \text{Ob}(\text{Mod}_R^{fg})$. \square

Definition 68.10.9. Let \mathcal{C} be a category as in Lemma 68.10.8. Let $F : \mathcal{C} \rightarrow \mathit{Sets}$ be a functor such that $F(R)$ is a one element set. The *tangent space* TF of F is $F(R[\epsilon])$.

When $F : \mathcal{C} \rightarrow \mathit{Sets}$ satisfies the hypotheses of Lemma 68.10.8, the tangent space TF has a natural R -module structure.

Example 68.10.10. Since \mathcal{C}_Λ contains all $k[V]$ for finite dimensional vector spaces V we see that Definition 68.10.9 applies with $S = \Lambda$, $R = k$, $\mathcal{C} = \mathcal{C}_\Lambda$, and $F : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ a predeformation functor. The tangent space is $TF = F(k[\epsilon])$.

Example 68.10.11. Let us work out the tangent space of Example 68.10.10 when $F : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$ is a prorepresentable functor, say $F = \underline{S}|_{\mathcal{C}_\Lambda}$ for $S \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. Then F commutes with arbitrary limits and thus satisfies the hypotheses of Lemma 68.10.8. We compute

$$TF = F(k[\epsilon]) = \text{Mor}_{\mathcal{C}_\Lambda}(S, k[\epsilon]) = \text{Der}_\Lambda(S, k)$$

and more generally for a finite dimensional k -vector space V we have

$$F(k[V]) = \text{Mor}_{\mathcal{C}_\Lambda}(S, k[V]) = \text{Der}_\Lambda(S, V).$$

Explicitly, a Λ -algebra map $f : S \rightarrow k[V]$ compatible with the augmentations $q : S \rightarrow k$ and $k[V] \rightarrow k$ corresponds to the derivation D defined by $s \mapsto f(s) - q(s)$. Conversely, a Λ -derivation $D : S \rightarrow V$ corresponds to $f : S \rightarrow k[V]$ in \mathcal{C}_Λ defined by the rule $f(s) = q(s) + D(s)$. Since these identifications are functorial we see that the k -vector spaces structures on TF and $\text{Der}_\Lambda(S, k)$ correspond (see Lemma 68.10.5). It follows that $\dim_k TF$ is finite by Lemma 68.4.5.

Example 68.10.12. The computation of Example 68.10.11 simplifies in the classical case. Namely, in this case the tangent space of the functor $F = \underline{S}|_{\mathcal{C}_\Lambda}$ is simply the relative cotangent space of S over Λ , in a formula $TF = T_{S/\Lambda}$. In fact, this works more generally when the field extension $k' \subset k$ is separable. See Exercises, Exercise 83.28.2.

Lemma 68.10.13. Let $F, G : \mathcal{C} \rightarrow \mathit{Sets}$ be functors satisfying the hypotheses of Lemma 68.10.8. Let $t : F \rightarrow G$ be a morphism of functors. For any $M \in \text{Ob}(\text{Mod}_R^{fg})$, the map $t_{R[M]} : F(R[M]) \rightarrow G(R[M])$ is a map of R -modules, where $F(R[M])$ and $G(R[M])$ are given the R -module structure from Lemma 68.10.8. In particular, $t_{R[\epsilon]} : TF \rightarrow TG$ is a map of R -modules.

Proof. Follows from Lemma 68.10.5. □

Example 68.10.14. Suppose that $f : R \rightarrow S$ is a ring map in $\widehat{\mathcal{C}}_\Lambda$. Set $F = \underline{R}|_{\mathcal{C}_\Lambda}$ and $G = \underline{S}|_{\mathcal{C}_\Lambda}$. The ring map f induces a transformation of functors $G \rightarrow F$. By Lemma 68.10.13 we get a k -linear map $TG \rightarrow TF$. This is the map

$$TG = \text{Der}_\Lambda(S, k) \longrightarrow \text{Der}_\Lambda(R, k) = TF$$

as follows from the canonical identifications $F(k[V]) = \text{Der}_\Lambda(R, V)$ and $G(k[V]) = \text{Der}_\Lambda(S, V)$ of Example 68.10.11 and the rule for computing the map on tangent spaces.

Lemma 68.10.15. Let $F : \mathcal{C} \rightarrow \mathit{Sets}$ be a functor satisfying the hypotheses of Lemma 68.10.8. Assume $R = K$ is a field. Then $F(K[V]) \cong TF \otimes_K V$ for any finite dimensional K -vector space V .

Proof. Follows from Lemma 68.10.6. □

68.11. Tangent spaces of predefination categories

We will define tangent spaces of predefination functors using the general Definition 68.10.9. We have spelled this out in Example 68.10.10. It applies to predefination categories by looking at the associated functor of isomorphism classes.

Definition 68.11.1. Let \mathcal{F} be a predefination category. The *tangent space* $T\mathcal{F}$ of \mathcal{F} is the set $\overline{\mathcal{F}}(k[\epsilon])$ of isomorphism classes of objects in the fiber category $\mathcal{F}(k[\epsilon])$.

Thus $T\mathcal{F}$ is nothing but the tangent space of the associated functor $\overline{\mathcal{F}} : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$. It has a natural vector space structure when \mathcal{F} satisfies (S2), or, in fact, as long as $\overline{\mathcal{F}}$ does.

Lemma 68.11.2. *Let \mathcal{F} be a predefination category such that $\overline{\mathcal{F}}$ satisfies (S2). Then $T\mathcal{F}$ has a natural k -vector space structure. For any finite dimensional vector space V we have $\overline{\mathcal{F}}(k[V]) = T\mathcal{F} \otimes_k V$ functorially in V .*

Proof. Let us write $F = \overline{\mathcal{F}} : \mathcal{C}_\Lambda \rightarrow \mathit{Sets}$. This is a predefination functor and F satisfies (S2). By Lemma 68.9.4 (and the translation of Remark 68.9.3) we see that

$$F(A \times_k k[V]) \longrightarrow F(A) \times F(k[V])$$

is a bijection for every finite dimensional vector space V and every $A \in \text{Ob}(\mathcal{C}_\Lambda)$. In particular, if $A = k[W]$ then we see that $F(k[W] \times_k k[V]) = F(k[W]) \times F(k[V])$. In other words, the hypotheses of Lemma 68.10.8 hold and we see that $T\mathcal{F} = T\mathcal{F}$ has a natural k -vector space structure. The final assertion follows from Lemma 68.10.15. \square

A morphism of predefination categories induces a map on tangent spaces.

Definition 68.11.3. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism predefination categories. The *differential* $d\varphi : T\mathcal{F} \rightarrow T\mathcal{G}$ of φ is the map obtained by evaluating the morphism of functors $\overline{\varphi} : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ at $A = k[\epsilon]$.

Lemma 68.11.4. *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism predefination categories. Assume $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ both satisfy (S2). Then $d\varphi : T\mathcal{F} \rightarrow T\mathcal{G}$ is k -linear.*

Proof. In the proof of Lemma 68.11.2 we have seen that $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ satisfy the hypotheses of Lemma 68.10.8. Hence the lemma follows from Lemma 68.10.13. \square

Remark 68.11.5. We can globalize the notions of tangent space and differential to arbitrary categories cofibered in groupoids as follows. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ , and let $x \in \text{Ob}(\mathcal{F}(k))$. As in Remark 68.6.4, we get a predefination category \mathcal{F}_x . We define the *tangent space* $T_x\mathcal{F}$ of \mathcal{F} at x to be the tangent space $T\mathcal{F}_x$ of \mathcal{F}_x . Similarly, if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of categories cofibered in groupoids over \mathcal{C}_Λ and $x \in \text{Ob}(\mathcal{F}(k))$, then there is an induced morphism $\varphi_x : \mathcal{F}_x \rightarrow \mathcal{G}_{\varphi(x)}$. We define the *differential* $d_x\varphi : T_x\mathcal{F} \rightarrow T_{\varphi(x)}\mathcal{G}$ of φ at x to be the map $d\varphi_x : T\mathcal{F}_x \rightarrow T\mathcal{G}_{\varphi(x)}$. If both \mathcal{F} and \mathcal{G} satisfy (S2) then all of these tangent spaces have a natural k -vector space structure and all the differentials $d_x\varphi : T_x\mathcal{F} \rightarrow T_{\varphi(x)}\mathcal{G}$ are k -linear (use Lemmas 68.9.6 and 68.11.4).

The following observations are uninteresting in the classical case or when $k' \subset k$ is a separable field extension, because then $\text{Der}_\Lambda(k, k)$ and $\text{Der}_\Lambda(V, k)$ are zero. There is a canonical identification

$$\text{Mor}_{\mathcal{C}_\Lambda}(k, k[\epsilon]) = \text{Der}_\Lambda(k, k).$$

Namely, for $D \in \text{Der}_\Lambda(k, k)$ let $f_D : k \rightarrow k[\epsilon]$ be the map $a \mapsto a + D(a)\epsilon$. More generally, given a finite dimensional vector space V over k we have

$$\text{Mor}_{\mathcal{C}_\Lambda}(k, k[V]) = \text{Der}_\Lambda(k, V)$$

and we will use the same notation f_D for the map associated to the derivation D . We also have

$$\text{Mor}_{\mathcal{C}_\Lambda}(k[W], k[V]) = \text{Hom}_k(V, W) \oplus \text{Der}_\Lambda(k, V)$$

where (φ, D) corresponds to the map $f_{\varphi, D} : a + w \mapsto a + \varphi(w) + D(a)$. We will sometimes write $f_{1, D} : a + v \rightarrow a + v + D(a)$ for the automorphism of $k[V]$ determined by the derivation $D : k \rightarrow V$. Note that $f_{1, D} \circ f_{1, D'} = f_{1, D+D'}$.

Let \mathcal{F} be a predeformation category over \mathcal{C}_Λ . Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. By the above there is a canonical map

$$\gamma_V : \text{Der}_\Lambda(k, V) \longrightarrow \overline{\mathcal{F}}(k[V])$$

defined by $D \mapsto f_{D,*}(x_0)$. Moreover, there is an action

$$a_V : \text{Der}_\Lambda(k, V) \times \overline{\mathcal{F}}(k[V]) \longrightarrow \overline{\mathcal{F}}(k[V])$$

defined by $(D, x) \mapsto f_{1, D,*}(x)$. These two maps are compatible, i.e., $f_{1, D,*}f_{D',*}x_0 = f_{D+D',*}x_0$ as follows from a computation of the compositions of these maps. Note that the maps γ_V and a_V are independent of the choice of x_0 as there is a unique x_0 up to isomorphism.

Lemma 68.11.6. *Let \mathcal{F} be a predeformation category over \mathcal{C}_Λ . If $\overline{\mathcal{F}}$ has (S2) then the maps γ_V are k -linear and we have $a_V(D, x) = x + \gamma_V(D)$.*

Proof. In the proof of Lemma 68.11.2 we have seen that the functor $V \mapsto \overline{\mathcal{F}}(k[V])$ transforms 0 to a singleton and products to products. The same is true of the functor $V \mapsto \text{Der}_\Lambda(k, V)$. Hence γ_V is linear by Lemma 68.10.5. Let $D : k \rightarrow V$ be a Λ -derivation. Set $D_1 : k \rightarrow V^{\oplus 2}$ equal to $a \mapsto (D(a), 0)$. Then

$$\begin{array}{ccc} k[V \times V] & \xrightarrow{+} & k[V] \\ \downarrow f_{1, D_1} & & \downarrow f_{1, D} \\ k[V \times V] & \xrightarrow{+} & k[V] \end{array}$$

commutes. Unwinding the definitions and using that $\overline{F}(V \times V) = \overline{F}(V) \times \overline{F}(V)$ this means that $a_D(x_1) + x_2 = a_D(x_1 + x_2)$ for all $x_1, x_2 \in \overline{F}(V)$. Thus it suffices to show that $a_V(D, 0) = 0 + \gamma_V(D)$ where $0 \in \overline{F}(V)$ is the zero vector. By definition this is the element $f_{0,*}(x_0)$. Since $f_D = f_{1, D} \circ f_0$ the desired result follows. \square

A special case of the constructions above are the map

$$(68.11.6.1) \quad \gamma : \text{Der}_\Lambda(k, k) \longrightarrow T\mathcal{F}$$

and the action

$$(68.11.6.2) \quad a : \text{Der}_\Lambda(k, k) \times T\mathcal{F} \longrightarrow T\mathcal{F}$$

defined for any predeformation category \mathcal{F} . Note that if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of predeformation categories, then we get commutative diagrams

$$\begin{array}{ccc} \text{Der}_\Lambda(k, k) & \xrightarrow{\gamma} & T\mathcal{F} \\ & \searrow \gamma & \downarrow d\varphi \\ & & T\mathcal{G} \end{array} \quad \text{and} \quad \begin{array}{ccc} \text{Der}_\Lambda(k, k) \times T\mathcal{F} & \xrightarrow{a} & T\mathcal{F} \\ \downarrow 1 \times d\varphi & & \downarrow d\varphi \\ \text{Der}_\Lambda(k, k) \times T\mathcal{G} & \xrightarrow{a} & T\mathcal{G} \end{array}$$

68.12. Versal formal objects

The existence of a versal formal object forces \mathcal{F} to have property (S1).

Lemma 68.12.1. *Let \mathcal{F} be a predeformation category. Assume \mathcal{F} has a versal formal object. Then \mathcal{F} satisfies (S1).*

Proof. Let ξ be a versal formal object of \mathcal{F} . Let

$$\begin{array}{ccc} & & x_2 \\ & & \downarrow \\ x_1 & \longrightarrow & x \end{array}$$

be a diagram in \mathcal{F} such that $x_2 \rightarrow x$ lies over a surjective ring map. Since the natural morphism $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \xrightarrow{\sim} \mathcal{F}$ is an equivalence (see Remark 68.7.7), we can consider this diagram also as a diagram in $\widehat{\mathcal{F}}$. By Lemma 68.8.15 there exists a morphism $\xi \rightarrow x_1$, so by Remark 68.8.14 we also get a morphism $\xi \rightarrow x_2$ making the diagram

$$\begin{array}{ccc} \xi & \longrightarrow & x_2 \\ \downarrow & & \downarrow \\ x_1 & \longrightarrow & x \end{array}$$

commute. If $x_1 \rightarrow x$ and $x_2 \rightarrow x$ lie above ring maps $A_1 \rightarrow A$ and $A_2 \rightarrow A$ then taking the pushforward of ξ to $A_1 \times_A A_2$ gives an object y as required by (S1). \square

In the case that our cofibred category satisfies (S1) and (S2) we can characterize the versal formal objects as follows.

Lemma 68.12.2. *Let \mathcal{F} be a predeformation category satisfying (S1) and (S2). Let ξ be a formal object of \mathcal{F} corresponding to $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$, see Remark 68.7.12. Then ξ is versal if and only if the following two conditions hold:*

- (1) *the map $d\underline{\xi} : T\underline{R}|_{\mathcal{C}_\Lambda} \rightarrow T\mathcal{F}$ on tangent spaces is surjective, and*
- (2) *given a diagram in $\widehat{\mathcal{F}}$*

$$\begin{array}{ccc} & y & \\ & \downarrow & \\ \xi & \longrightarrow & x \end{array} \quad \text{lying over} \quad \begin{array}{ccc} & B & \\ & \downarrow f & \\ R & \longrightarrow & A \end{array}$$

in $\widehat{\mathcal{C}}_\Lambda$ with $B \rightarrow A$ a small extension of Artinian rings, then there exists a ring map $R \rightarrow B$ such that

$$\begin{array}{ccc} & & B \\ & \nearrow & \downarrow f \\ R & \longrightarrow & A \end{array}$$

commutes.

Proof. If ξ is versal then (1) holds by Lemma 68.8.8 and (2) holds by Remark 68.8.14. Assume (1) and (2) hold. By Remark 68.8.14 we must show that given a diagram in $\widehat{\mathcal{F}}$ as in (2), there exists $\xi \rightarrow y$ such that

$$\begin{array}{ccc} & & y \\ & \nearrow & \downarrow \\ \xi & \longrightarrow & x \end{array}$$

commutes. Let $b : R \rightarrow B$ be the map guaranteed by (2). Denote $y' = b_*\xi$ and choose a factorization $\xi \rightarrow y' \rightarrow x$ lying over $R \rightarrow B \rightarrow A$ of the given morphism $\xi \rightarrow x$. By (S1) we obtain a commutative diagram

$$\begin{array}{ccc} z \longrightarrow y & & B \times_A B \longrightarrow B \\ \downarrow & \text{lying over} & \downarrow \quad \downarrow f \\ y' \longrightarrow x & & B \xrightarrow{f} A \end{array}$$

Set $I = \text{Ker}(k)$. Let $\bar{g} : B \times_A B \rightarrow k[I]$ be the ring map $(u, v) \mapsto \bar{u} \oplus (v - u)$, cf. Lemma 68.9.8. By (1) there exists a morphism $\xi \rightarrow \bar{g}_*z$ which lies over a ring map $i : R \rightarrow k[\epsilon]$. Choose an Artinian quotient $b_1 : R \rightarrow B_1$ such that both $b : R \rightarrow B$ and $i : R \rightarrow k[\epsilon]$ factor through $R \rightarrow B_1$, i.e., giving $h : B_1 \rightarrow B$ and $i' : B_1 \rightarrow k[\epsilon]$. Choose a pushforward $y_1 = b_{1,*}\xi$, a factorization $\xi \rightarrow y_1 \rightarrow y'$ lying over $R \rightarrow B_1 \rightarrow B$ of $\xi \rightarrow y'$, and a factorization $\xi \rightarrow y_1 \rightarrow \bar{g}_*z$ lying over $R \rightarrow B_1 \rightarrow k[\epsilon]$ of $\xi \rightarrow \bar{g}_*z$. Applying (S1) once more we obtain

$$\begin{array}{ccc} z_1 \longrightarrow z \longrightarrow y & & B_1 \times_A B \longrightarrow B \times_A B \longrightarrow B \\ \downarrow & \text{lying over} & \downarrow & \downarrow & \downarrow f \\ y_1 \longrightarrow y' \longrightarrow x & & B_1 \longrightarrow B \longrightarrow A \end{array}$$

Note that the map $g : B_1 \times_A B \rightarrow k[I]$ of Lemma 68.9.8 (defined using h) is the composition of $B_1 \times_A B \rightarrow B \times_A B$ and the map \bar{g} above. By construction there exists a morphism $y_1 \rightarrow g_*z_1 \cong \bar{g}_*z$! Hence Lemma 68.9.8 applies (to the outer rectangles in the diagrams above) to give a morphism $y_1 \rightarrow y$ and precomposing with $\xi \rightarrow y_1$ gives the desired morphism $\xi \rightarrow y$. \square

If \mathcal{F} has property (S1) then the “largest quotient where a lift exists” exists. Here is a precise statement.

Lemma 68.12.3. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ which has (S1). Let $B \rightarrow A$ be a surjection in \mathcal{C}_Λ with kernel I annihilated by \mathfrak{m}_B . Let $x \in \mathcal{F}(A)$. The set of ideals*

$$\mathcal{J} = \{J \subset I \mid \text{there exists an } y \rightarrow x \text{ lying over } B/J \rightarrow A\}$$

has a smallest element.

Proof. Note that \mathcal{J} is nonempty as $I \in \mathcal{J}$. Also, if $J \in \mathcal{J}$ and $J \subset J' \subset I$ then $J' \in \mathcal{J}$ because we can pushforward the object y to an object y' over B/J' . Let J and K be elements of the displayed set. We claim that $J \cap K \in \mathcal{J}$ which will prove the lemma. Since I is a k -vector space we can find an ideal $J \subset J' \subset I$ such that $J \cap K = J' \cap K$ and such that $J' + K = I$. By the above we may replace J by J' and assume that $J + K = I$. In this case

$$A/(J \cap K) = A/J \times_{A/I} A/K.$$

Hence the existence of an element $z \in \mathcal{F}(A/(J \cap K))$ mapping to x follows, via (S1), from the existence of the elements we have assumed exist over A/J and A/K . \square

We will improve on the following result later.

Lemma 68.12.4. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . Assume the following conditions hold:*

- (1) \mathcal{F} is a predeformation category.
- (2) \mathcal{F} satisfies (S1).
- (3) \mathcal{F} satisfies (S2).
- (4) $\dim_k T\mathcal{F}$ is finite.

Then \mathcal{F} has a versal formal object.

Proof. Assume (1), (2), (3), and (4) hold. Choose an object $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth, see Example 68.8.10. Let $r = \dim_k T\mathcal{F}$ and put $S = R[[X_1, \dots, X_r]]$.

We are going to inductively construct for $n \geq 2$ pairs $(J_n, f_{n-1} : \xi_n \rightarrow \xi_{n-1})$ where $J_n \subset S$ is an decreasing sequence of ideals and $f_{n-1} : \xi_n \rightarrow \xi_{n-1}$ is a morphism of \mathcal{F} lying over the projection $S/J_n \rightarrow S/J_{n-1}$.

Step 1. Let $J_1 = \mathfrak{m}_S$. Let ξ_1 be the unique (up to unique isomorphism) object of \mathcal{F} over $k = S/J_1 = S/\mathfrak{m}_S$.

Step 2. Let $J_2 = \mathfrak{m}_S^2 + \mathfrak{m}_R S$. Then $S/J_2 = k[V]$ with $V = kX_1 \oplus \dots \oplus kX_r$. By (S2) for $\overline{\mathcal{F}}$ we get a bijection

$$\overline{\mathcal{F}}(S/J_2) \longrightarrow T\mathcal{F} \otimes_k V,$$

see Lemmas 68.9.5 and 68.11.2. Choose a basis $\theta_1, \dots, \theta_r$ for $T\mathcal{F}$ and set $\xi_2 = \sum \theta_i \otimes X_i \in \text{Ob}(\mathcal{F}(S/J_2))$. The point of this choice is that

$$d\xi_2 : \text{Mor}_{\mathcal{C}_\Lambda}(S/J_2, k[\epsilon]) \longrightarrow T\mathcal{F}$$

is surjective. Let $f_1 : \xi_2 \rightarrow \xi_1$ be the unique morphism.

Induction step. Assume $(J_n, f_{n-1} : \xi_n \rightarrow \xi_{n-1})$ has been constructed for some $n \geq 2$. There is a minimal element J_{n+1} of the set of ideals $J \subset S$ satisfying: (a) $\mathfrak{m}_S J_n \subset J \subset J_n$ and (b) there exists a morphism $\xi_{n+1} \rightarrow \xi_n$ lying over $S/J \rightarrow S/J_n$, see Lemma 68.12.3. Let $f_n : \xi_{n+1} \rightarrow \xi_n$ be any morphism of \mathcal{F} lying over $S/J_{n+1} \rightarrow S/J_n$.

Set $J = \bigcap J_n$. Set $\overline{S} = S/J$. Set $\overline{J}_n = J_n/J$. By Lemma 68.4.7 the sequence of ideals (\overline{J}_n) induces the $\mathfrak{m}_{\overline{S}}$ -adic topology on \overline{S} . Since (ξ_n, f_n) is an object of $\widehat{\mathcal{F}}_{\mathcal{I}}(\overline{S})$, where \mathcal{I} is the filtration (\overline{J}_n) of \overline{S} , we see that (ξ_n, f_n) induces an object ξ of $\widehat{\mathcal{F}}(\overline{S})$. see Lemma 68.7.4.

We prove ξ is versal. For versality it suffices to check conditions (1) and (2) of Lemma 68.12.2. Condition (1) follows from our choice of ξ_2 in Step 2 above. Suppose given a diagram in $\widehat{\mathcal{F}}$

$$\begin{array}{ccc} & y & B \\ & \downarrow & \downarrow f \\ \eta \longrightarrow & x & \bar{S} \longrightarrow A \end{array} \quad \text{lying over}$$

in $\widehat{\mathcal{C}}_\Lambda$ with $f : B \rightarrow A$ a small extension of Artinian rings. We have to show there is a map $\bar{S} \rightarrow B$ fitting into the diagram on the right. Choose n such that $\bar{S} \rightarrow A$ factors through $\bar{S} \rightarrow S/J_n$. This is possible as the sequence (J_n) induces the $\mathfrak{m}_{\bar{S}}$ -adic topology as we saw above. The pushforward of ξ along $\bar{S} \rightarrow S/J_n$ is ξ_n . We may factor $\xi \rightarrow x$ as $\xi \rightarrow \xi_n \rightarrow x$ hence we get a diagram in \mathcal{F}

$$\begin{array}{ccc} & y & B \\ & \downarrow & \downarrow f \\ \xi_n \longrightarrow & x & S/J_n \longrightarrow A \end{array} \quad \text{lying over}$$

To check condition (2) of Lemma 68.12.2 it suffices to complete the diagram

$$\begin{array}{ccc} S/J_{n+1} & \dashrightarrow & B \\ \downarrow & & \downarrow f \\ S/J_n & \longrightarrow & A \end{array}$$

or equivalently, to complete the diagram

$$\begin{array}{ccc} & S/J_n \times_A B & \\ & \nearrow & \downarrow p_1 \\ S/J_{n+1} & \longrightarrow & S/J_n \end{array}$$

If p_1 has a section we are done. If not, by Lemma 68.3.8 (2) p_1 is a small extension, so by Lemma 68.3.12 (4) p_1 is an essential surjection. Recall that $S = R[[X_1, \dots, X_r]]$ and that we chose R such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. Hence there exists a map $h : R \rightarrow B$ lifting the map $R \rightarrow S \rightarrow S/J_n \rightarrow A$. By the universal property of a power series ring there is an R -algebra map $h : S = R[[X_1, \dots, X_r]] \rightarrow B$ lifting the given map $S \rightarrow S/J_n \rightarrow A$. This induces a map $g : S \rightarrow S/J_n \times_A B$ making the solid square in the diagram

$$\begin{array}{ccc} S & \xrightarrow{g} & S/J_n \times_A B \\ \downarrow & \nearrow & \downarrow p_1 \\ S/J_{n+1} & \longrightarrow & S/J_n \end{array}$$

commute. Then g is a surjection since p_1 is an essential surjection. We claim the ideal $K = \text{Ker}(g)$ of S satisfies conditions (a) and (b) of the construction of J_{n+1} in the induction step above. Namely, $K \subset J_n$ is clear and $\mathfrak{m}_S J_n \subset K$ as p_1 is a

small extension; this proves (a). By (S1) applied to

$$\begin{array}{ccc} & & y \\ & & \downarrow \\ \xi_n & \longrightarrow & x, \end{array}$$

there exists a lifting of ξ_n to $S/K \cong S/J_n \times_A B$, so (b) holds. Since J_{n+1} was the minimal ideal with properties (a) and (b) this implies $J_{n+1} \subset K$. Thus the desired map $S/J_{n+1} \rightarrow S/K \cong S/J_n \times_A B$ exists. \square

68.13. Minimal versal formal objects

We do a little bit of work to try and understand (non)uniqueness of versal formal objects. It turns out that if a predeformation category has a versal formal object, then it has a minimal versal formal object and any two such are isomorphic. Moreover, all versal formal objects are “more or less” the same up to replacing the base ring by a power series extension.

Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ . For every object x of \mathcal{F} lying over $A \in \text{Ob}(\mathcal{C}_\Lambda)$ consider the category \mathcal{S}_x with objects

$$\text{Ob}(\mathcal{S}_x) = \{x' \rightarrow x \mid x' \rightarrow x \text{ lies over } A' \subset A\}$$

and morphisms are morphisms over x . For every $y \rightarrow x$ in \mathcal{F} lying over $f : B \rightarrow A$ in \mathcal{C}_Λ there is a functor $f_* : \mathcal{S}_y \rightarrow \mathcal{S}_x$ defined as follows: Given $y' \rightarrow y$ lying over $B' \subset B$ set $A' = f(B')$ and let $y' \rightarrow x'$ be over $B' \rightarrow f(B')$ be the pushforward of y' . By the axioms of a category cofibred in groupoids we obtain a unique morphism $x' \rightarrow x$ lying over $f(B') \rightarrow A$ such that

$$\begin{array}{ccc} y' & \longrightarrow & x' \\ \downarrow & & \downarrow \\ y & \longrightarrow & x \end{array}$$

commutes. Then $x' \rightarrow x$ is an object of \mathcal{S}_x . We say an object $x' \rightarrow x$ of \mathcal{S}_x is *minimal* if any morphism $(x'_1 \rightarrow x) \rightarrow (x' \rightarrow x)$ in \mathcal{S}_x is an isomorphism, i.e., x' and x'_1 are defined over the same subring of A . Since A has finite length as a Λ -module we see that minimal objects always exist.

Lemma 68.13.1. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ which has (S1).*

- (1) *For $y \rightarrow x$ in \mathcal{F} a minimal object in \mathcal{S}_y maps to a minimal object of \mathcal{S}_x .*
- (2) *For $y \rightarrow x$ in \mathcal{F} lying over a surjection $f : B \rightarrow A$ in \mathcal{C}_Λ every minimal object of \mathcal{S}_x is the image of a minimal object of \mathcal{S}_y .*

Proof. Proof of (1). Say $y \rightarrow x$ lies over $f : B \rightarrow A$. Let $y' \rightarrow y$ lying over $B' \subset B$ be a minimal object of \mathcal{S}_y . Let

$$\begin{array}{ccc} y' & \longrightarrow & x' \\ \downarrow & & \downarrow \\ y & \longrightarrow & x \end{array} \quad \text{lying over} \quad \begin{array}{ccc} B' & \longrightarrow & f(B') \\ \downarrow & & \downarrow \\ B & \longrightarrow & A \end{array}$$

be as in the construction of f_* above. Suppose that $(x'' \rightarrow x) \rightarrow (x' \rightarrow x)$ is a morphism of \mathcal{S}_x with $x'' \rightarrow x'$ lying over $A'' \subset f(B')$. By (S1) there exists

$y'' \rightarrow y'$ lying over $B' \times_{f(B')} A'' \rightarrow B'$. Since $y' \rightarrow y$ is minimal we conclude that $B' \times_{f(B')} A'' \rightarrow B'$ is an isomorphism, which implies that $A'' = f(B')$, i.e., $x' \rightarrow x$ is minimal.

Proof of (2). Suppose $f : B \rightarrow A$ is surjective and $y \rightarrow x$ lies over f . Let $x' \rightarrow x$ be a minimal object of \mathcal{S}_x lying over $A' \subset A$. By (S1) there exists $y' \rightarrow y$ lying over $B' = f^{-1}(A') = B \times_A A' \rightarrow B$ whose image in \mathcal{S}_x is $x' \rightarrow x$. So $f_*(y' \rightarrow y) = x' \rightarrow x$. Choose a morphism $(y'' \rightarrow y) \rightarrow (y' \rightarrow y)$ in \mathcal{S}_y with $y'' \rightarrow y$ a minimal object (this is possible by the remark on lengths above the lemma). Then $f_*(y'' \rightarrow y)$ is an object of \mathcal{S}_x which maps to $x' \rightarrow x$ (by functoriality of f_*) hence is isomorphic to $x' \rightarrow x$ by minimality of $x' \rightarrow x$. \square

Lemma 68.13.2. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ which has (S1). Let ξ be a versal formal object of \mathcal{F} lying over R . There exists a morphism $\xi' \rightarrow \xi$ lying over $R' \subset R$ with the following minimality properties*

- (1) for every $f : R \rightarrow A$ with $A \in \text{Ob}(\mathcal{C}_\Lambda)$ the pushforwards

$$\begin{array}{ccc}
 \xi' & \longrightarrow & x' \\
 \downarrow & & \downarrow \\
 \xi & \longrightarrow & x
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 R' & \longrightarrow & f(R') \\
 \downarrow & & \downarrow \\
 R & \longrightarrow & A
 \end{array}$$

produce a minimal object $x' \rightarrow x$ of \mathcal{S}_x , and

- (2) for any morphism of formal objects $\xi'' \rightarrow \xi'$ the corresponding morphism $R'' \rightarrow R'$ is surjective.

Proof. Write $\xi = (R, \xi_n, f_n)$. Set $R'_1 = k$ and $\xi'_1 = \xi_1$. Suppose that we have constructed minimal objects $\xi'_m \rightarrow \xi_m$ of \mathcal{S}_{ξ_m} lying over $R'_m \subset R/\mathfrak{m}_R^m$ for $m \leq n-1$ and morphisms $f'_m : \xi'_{m+1} \rightarrow \xi'_m$ compatible with f_m for $m \leq n-1$. By Lemma 68.13.1 (2) there exists a minimal object $\xi'_{n+1} \rightarrow \xi_{n+1}$ lying over $R'_{n+1} \subset R/\mathfrak{m}_R^{n+1}$ whose image is $\xi'_n \rightarrow \xi_n$ over $R'_n \subset R/\mathfrak{m}_R^n$. This produces the commutative diagram

$$\begin{array}{ccc}
 \xi'_{n+1} & \xrightarrow{f'_n} & \xi'_n \\
 \downarrow & & \downarrow \\
 \xi_{n+1} & \xrightarrow{f_n} & \xi_n
 \end{array}$$

by construction. Moreover the ring map $R'_{n+1} \rightarrow R'_n$ is surjective. Set $R' = \varinjlim_n R'_n$. Then $R' \rightarrow R$ is injective.

However, it isn't a priori clear that R' is Noetherian. To prove this we use that ξ is versal. Namely, versality implies that there exists a morphism $\xi \rightarrow \xi'_n$ in $\widehat{\mathcal{F}}$, see Lemma 68.8.15. The corresponding map $R \rightarrow R'_n$ has to be surjective (as $\xi'_n \rightarrow \xi_n$ is minimal in \mathcal{S}_{ξ_n}). Thus the dimensions of the cotangent spaces are bounded and Lemma 68.4.8 implies R' is Noetherian, i.e., an object of $\widehat{\mathcal{C}}_\Lambda$. By Lemma 68.7.4 (plus the result on filtrations of Lemma 68.4.8) the sequence of elements ξ'_n defines a formal object ξ' over R' and we have a map $\xi' \rightarrow \xi$.

By construction (1) holds for $R \rightarrow R/\mathfrak{m}_R^n$ for each n . Since each $R \rightarrow A$ as in (1) factors through $R \rightarrow R/\mathfrak{m}_R^n \rightarrow A$ we see that (1) for $x' \rightarrow x$ over $f(R) \subset A$ follows from the minimality of $\xi'_n \rightarrow \xi_n$ over $R'_n \rightarrow R/\mathfrak{m}_R^n$ by Lemma 68.13.1 (1).

If $R'' \rightarrow R'$ as in (2) is not surjective, then $R'' \rightarrow R' \rightarrow R'_n$ would not be surjective for some n and $\xi'_n \rightarrow \xi_n$ wouldn't be minimal, a contradiction. This contradiction proves (2). \square

Lemma 68.13.3. *Let \mathcal{F} be a category cofibred in groupoids over \mathcal{C}_Λ which has (S1). Let ξ be a versal formal object of \mathcal{F} lying over R . Let $\xi' \rightarrow \xi$ be a morphism of formal objects lying over $R' \subset R$ as constructed in Lemma 68.13.2. Then*

$$R \cong R'[[x_1, \dots, x_r]]$$

is a power series ring over R' . Moreover, ξ' is a versal formal object too.

Proof. By Lemma 68.8.15 there exists a morphism $\xi \rightarrow \xi'$. By Lemma 68.13.2 the corresponding map $f : R \rightarrow R'$ induces a surjection $f|_{R'} : R' \rightarrow R'$. This is an isomorphism by Algebra, Lemma 10.30.8. Hence $I = \text{Ker}(f)$ is an ideal of R such that $R = R' \oplus I$. Let $x_1, \dots, x_n \in I$ be elements which form a basis for $I/\mathfrak{m}_R I$. Consider the map $S = R'[[X_1, \dots, X_r]] \rightarrow R$ mapping X_i to x_i . For every $n \geq 1$ we get a surjection of Artinian R' -algebras $B = S/\mathfrak{m}_S^n \rightarrow R/\mathfrak{m}_R^n = A$. Denote $y \in \text{Ob}(\mathcal{F}(B))$, resp. $x \in \text{Ob}(\mathcal{F}(A))$ the pushforward of ξ' along $R' \rightarrow S \rightarrow B$, resp. $R' \rightarrow S \rightarrow A$. Note that x is also the pushforward of ξ along $R \rightarrow A$ as ξ is the pushforward of ξ' along $R' \rightarrow R$. Thus we have a solid diagram

Because ξ is versal, using Remark 68.8.14 we obtain the dotted arrows fitting into these diagrams. In particular, the maps $S/\mathfrak{m}_S^n \rightarrow R/\mathfrak{m}_R^n$ have sections $h_n : R/\mathfrak{m}_R^n \rightarrow S/\mathfrak{m}_S^n$. It follows from Lemma 68.4.9 that $S \rightarrow R$ is an isomorphism.

As ξ is a pushforward of ξ' along $R' \rightarrow R$ we obtain from Remark 68.7.13 a commutative diagram

Since $R' \rightarrow R$ has a left inverse (namely $R \rightarrow R/I = R'$) we see that $R|_{\mathcal{C}_\Lambda} \rightarrow R'|_{\mathcal{C}_\Lambda}$ is essentially surjective. Hence by Lemma 68.8.7 we see that $\underline{\xi'}$ is smooth, i.e., ξ' is a versal formal object. \square

Motivated by the preceding lemmas we make the following definition.

Definition 68.13.4. Let \mathcal{F} be a predeformation category. We say a versal formal object ξ of \mathcal{F} is *minimal*² if for any morphism of formal objects $\xi' \rightarrow \xi$ the underlying map on rings is surjective. Sometimes a minimal versal formal object is called *miniversal*.

²This may be nonstandard terminology. Many authors tie this notion in with properties of tangent spaces. We will make the link in Section 68.14.

The work in this section shows this definition is reasonable. First of all, the existence of a versal formal object implies that \mathcal{F} has (S1). Then the preceding lemmas show there exists a minimal versal formal object. Finally, any two minimal versal formal objects are isomorphic. Here is a summary of our results (with detailed proofs).

Lemma 68.13.5. *Let \mathcal{F} be a predeformation category which has a versal formal object. Then*

- (1) \mathcal{F} has a minimal versal formal object,
- (2) minimal versal objects are unique up to isomorphism, and
- (3) any versal object is the pushforward of a minimal versal object along a power series ring extension.

Proof. Suppose \mathcal{F} has a versal formal object ξ over R . Then it satisfies (S1), see Lemma 68.12.1. Let $\xi' \rightarrow \xi$ over $R' \subset R$ be any of the morphisms constructed in Lemma 68.13.2. By Lemma 68.13.3 we see that ξ' is versal, hence it is a minimal versal formal object (by construction). This proves (1). Also, $R \cong R'[[x_1, \dots, x_n]]$ which proves (3).

Suppose that ξ_i/R_i are two minimal versal formal objects. By Lemma 68.8.15 there exist morphisms $\xi_1 \rightarrow \xi_2$ and $\xi_2 \rightarrow \xi_1$. The corresponding ring maps $f : R_1 \rightarrow R_2$ and $g : R_2 \rightarrow R_1$ are surjective by minimality. Hence the compositions $g \circ f : R_1 \rightarrow R_1$ and $f \circ g : R_2 \rightarrow R_2$ are isomorphisms by Algebra, Lemma 10.30.8. Thus f and g are isomorphisms whence the maps $\xi_1 \rightarrow \xi_2$ and $\xi_2 \rightarrow \xi_1$ are isomorphisms (because $\widehat{\mathcal{F}}$ is cofibred in groupoids by Lemma 68.7.2). This proves (2) and finishes the proof of the lemma. \square

68.14. Miniversal formal objects and tangent spaces

The general notion of minimality introduced in Definition 68.13.4 can sometimes be deduced from the behaviour on tangent spaces. Let ξ be a formal object of the predeformation category \mathcal{F} and let $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ be the corresponding morphism. Then we can consider the following the condition

$$(68.14.0.1) \quad d\underline{\xi} : \text{Der}_\Lambda(R, k) \rightarrow T\mathcal{F} \text{ is bijective}$$

and the condition

$$(68.14.0.2) \quad d\underline{\xi} : \text{Der}_\Lambda(R, k) \rightarrow T\mathcal{F} \text{ is bijective on } \text{Der}_\Lambda(k, k)\text{-orbits.}$$

Here we are using the identification $T\underline{R}|_{\mathcal{C}_\Lambda} = \text{Der}_\Lambda(R, k)$ of Example 68.10.11 and the action (68.11.6.2) of derivations on the tangent spaces. If $k' \subset k$ is separable, then $\text{Der}_\Lambda(k, k) = 0$ and the two conditions are equivalent. It turns out that, in the presence of condition (S2) a versal formal object is minimal if and only if $\underline{\xi}$ satisfies (68.14.0.2). Moreover, if $\underline{\xi}$ satisfies (68.14.0.1), then \mathcal{F} satisfies (S2).

Lemma 68.14.1. *Let \mathcal{F} be a predeformation category. Let ξ be a versal formal object of \mathcal{F} such that (68.14.0.2) holds. Then ξ is a minimal versal formal object. In particular, such ξ are unique up to isomorphism.*

Proof. If ξ is not minimal, then there exists a morphism $\xi' \rightarrow \xi$ lying over $R' \rightarrow R$ such that $R = R'[[x_1, \dots, x_n]]$ with $n > 0$, see Lemma 68.13.5. Thus $d\underline{\xi}$ factors as

$$\text{Der}_\Lambda(R, k) \rightarrow \text{Der}_\Lambda(R', k) \rightarrow T\mathcal{F}$$

and we see that (68.14.0.2) cannot hold because $D : f \mapsto \partial/\partial x_1(f) \bmod \mathfrak{m}_R$ is an element of the kernel of the first arrow which is not in the image of $\text{Der}_\Lambda(k, k) \rightarrow \text{Der}_\Lambda(R, k)$. \square

Lemma 68.14.2. *Let \mathcal{F} be a predeformation category. Let ξ be a versal formal object of \mathcal{F} such that (68.14.0.1) holds. Then*

- (1) \mathcal{F} satisfies (S1).
- (2) \mathcal{F} satisfies (S2).
- (3) $\dim_k T\mathcal{F}$ is finite.

Proof. Condition (S1) holds by Lemma 68.12.1. The first part of (S2) holds since (S1) holds. Let

$$\begin{array}{ccc}
 y \xrightarrow{c} x_\epsilon & & y' \xrightarrow{c'} x_\epsilon \\
 a \downarrow & & a' \downarrow \\
 x \xrightarrow{d} x_0 & \text{and} & x \xrightarrow{d} x_0
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 A \times_k k[\epsilon] & \longrightarrow & k[\epsilon] \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & k
 \end{array}$$

be diagrams as in the second part of (S2). As above we can find morphisms $b : \xi \rightarrow y$ and $b' : \xi \rightarrow y'$ such that

$$\begin{array}{ccc}
 \xi & \xrightarrow{b'} & y' \\
 b \downarrow & & \downarrow a' \\
 y & \xrightarrow{a} & x
 \end{array}$$

commutes. Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ denote the structure morphism. Say $\widehat{p}(\xi) = R$, i.e., ξ lies over $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. We see that the pushforward of ξ via $p(c) \circ p(b)$ is x_ϵ and that the pushforward of ξ via $p(c') \circ p(b')$ is x_ϵ . Since ξ satisfies (68.14.0.1), we see that $p(c) \circ p(b) = p(c') \circ p(b')$ as maps $R \rightarrow k[\epsilon]$. Hence $p(b) = p(b')$ as maps from $R \rightarrow A \times_k k[\epsilon]$. Thus we see that y and y' are isomorphic to the pushforward of ξ along this map and we get a unique morphism $y \rightarrow y'$ over $A \times_k k[\epsilon]$ compatible with b and b' as desired.

Finally, by Example 68.10.11 we see $\dim_k T\mathcal{F} = \dim_k T\underline{R}|_{\mathcal{C}_\Lambda}$ is finite. \square

Example 68.14.3. There exist predeformation categories which have a versal formal object satisfying (68.14.0.2) but which do not satisfy (S2). A quick example is to take $F = k[\epsilon]/G$ where $G \subset \text{Aut}_{\mathcal{C}_\Lambda}(k[\epsilon])$ is a finite nontrivial subgroup. Namely, the map $k[\epsilon] \rightarrow F$ is smooth, but the tangent space of F does not have a natural k -vector space structure (as it is a quotient of a k -vector space by a finite group).

Lemma 68.14.4. *Let \mathcal{F} be a predeformation category satisfying (S2) which has a versal formal object. Then its minimal versal formal object satisfies (68.14.0.2).*

Proof. Let ξ be a minimal versal formal object for \mathcal{F} , see Lemma 68.13.5. Say ξ lies over $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. In order to parse (68.14.0.2) we point out that $T\mathcal{F}$ has a natural k -vector space structure (see Lemma 68.11.2), that $d\xi : \text{Der}_\Lambda(R, k) \rightarrow T\mathcal{F}$ is linear (see Lemma 68.11.4), and that the action of $\text{Der}_\Lambda(k, k)$ is given by addition

(see Lemma 68.11.6). Consider the diagram

$$\begin{array}{ccccc}
 & & \text{Hom}_k(\mathfrak{m}_R/\mathfrak{m}_R^2, k) & & \\
 & & \uparrow & & \\
 K & \longrightarrow & \text{Der}_\Lambda(R, k) & \xrightarrow{d\xi} & T\mathcal{F} \\
 & & \uparrow & \nearrow & \\
 & & \text{Der}_\Lambda(k, k) & &
 \end{array}$$

The vector space K is the kernel of $d\xi$. Note that the middle column is exact in the middle as it is dual to the sequence (68.3.10.1). If (68.14.0.2) fails, then we can find a nonzero element $D \in K$ which does not map to zero in $\text{Hom}_k(\mathfrak{m}_R/\mathfrak{m}_R^2, k)$. This means there exists an $t \in \mathfrak{m}_R$ such that $D(t) = 1$. Set $R' = \{a \in R \mid D(a) = 0\}$. As D is a derivation this is a subring of R . Since $D(t) = 1$ we see that $R' \rightarrow k$ is surjective (compare with the proof of Lemma 68.3.12). Note that $\mathfrak{m}_{R'} = \text{Ker}(D : \mathfrak{m}_R \rightarrow k)$ is an ideal of R and $\mathfrak{m}_R^2 \subset \mathfrak{m}_{R'}$. Hence

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_R^2 + k\bar{t}$$

which implies that the map

$$R'/\mathfrak{m}_R^2 \times_k k[\epsilon] \rightarrow R/\mathfrak{m}_R^2$$

sending ϵ to \bar{t} is an isomorphism. In particular there is a map $R/\mathfrak{m}_R^2 \rightarrow R'/\mathfrak{m}_R^2$.

Let $\xi \rightarrow y$ be a morphism lying over $R \rightarrow R/\mathfrak{m}_R^2$. Let $y \rightarrow x$ be a morphism lying over $R/\mathfrak{m}_R^2 \rightarrow R'/\mathfrak{m}_R^2$. Let $y \rightarrow x_\epsilon$ be a morphism lying over $R/\mathfrak{m}_R^2 \rightarrow k[\epsilon]$. Let x_0 be the unique (up to unique isomorphism) object of \mathcal{F} over k . By the axioms of a category cofibred in groupoids we obtain a commutative diagram

$$\begin{array}{ccc}
 y \longrightarrow x_\epsilon & & R'/\mathfrak{m}_R^2 \times_k k[\epsilon] \longrightarrow k[\epsilon] \\
 \downarrow & \text{lying over} & \downarrow \\
 x \longrightarrow x_0 & & R'/\mathfrak{m}_R^2 \longrightarrow k
 \end{array}$$

Because $D \in K$ we see that x_ϵ is isomorphic to $0 \in \mathcal{F}(k[\epsilon])$, i.e., x_ϵ is the pushforward of x_0 via $k \rightarrow k[\epsilon], a \mapsto a$. Hence by Lemma 68.9.7 we see that there exists a morphism $x \rightarrow y$. Since $\text{length}_\Lambda(R'/\mathfrak{m}_R^2) < \text{length}_\Lambda(R/\mathfrak{m}_R^2)$ the corresponding ring map $R'/\mathfrak{m}_R^2 \rightarrow R/\mathfrak{m}_R^2$ is not surjective. This contradicts the minimality of ξ/R , see part (1) of Lemma 68.13.2. This contradiction shows that such a D cannot exist, hence we win. \square

Theorem 68.14.5. *Let \mathcal{F} be a predeformation category. Consider the following conditions*

- (1) \mathcal{F} has a minimal versal formal object satisfying (68.14.0.1),
- (2) \mathcal{F} has a minimal versal formal object satisfying (68.14.0.2),
- (3) the following conditions hold:
 - (a) \mathcal{F} satisfies (S1).
 - (b) \mathcal{F} satisfies (S2).
 - (c) $\dim_k T\mathcal{F}$ is finite.

We always have

$$(1) \Rightarrow (3) \Rightarrow (2).$$

If $k' \subset k$ is separable, then all three are equivalent.

Proof. Lemma 68.14.2 shows that $(1) \Rightarrow (3)$. Lemmas 68.12.4 and 68.14.4 show that $(3) \Rightarrow (2)$. If $k' \subset k$ is separable then $\text{Der}_\Lambda(k, k) = 0$ and we see that (68.14.0.1) = (68.14.0.2), i.e., (1) is the same as (2).

An alternative proof of $(3) \Rightarrow (1)$ in the classical case is to add a few words to the proof of Lemma 68.12.4 to see that one can right away construct a versal object which satisfies (68.14.0.1) in this case. This avoids the use of Lemma 68.12.4 in the classical case. Details omitted. \square

Remark 68.14.6. When \mathcal{F} is a predeformation functor, the condition $\dim_k T\mathcal{F} < \infty$ is precisely condition (H3) from Schlessinger’s paper. In the classical case (or the case where $k' \subset k$ is separable), Theorem 68.14.5 recovers Schlessinger’s theorem on the existence of “hulls”. In our terminology a *hull* is a versal formal object ξ for a predeformation functor such that $d\xi$ is an isomorphism.

Remark 68.14.7. Let \mathcal{F} be a predeformation category satisfying (S1), (S2), and $\dim_k T\mathcal{F} < \infty$. Then $\overline{\mathcal{F}}$ also satisfies (S1), (S2), and $\dim_k T\overline{\mathcal{F}} < \infty$, see Lemma 68.9.5. Thus, if $k' \subset k$ is separable, then $\overline{\mathcal{F}}$ has a hull (see Remark 68.14.6). In fact, if ξ is a minimal versal object for \mathcal{F} lying over R , then the composition

$$\underline{R}|_{\mathcal{C}_\Lambda} \longrightarrow \mathcal{F} \longrightarrow \overline{\mathcal{F}}$$

is smooth and identifies tangent spaces, i.e., the image $\overline{\xi}$ of ξ in $\overline{\mathcal{F}}$ is a hull. This follows from the fact that $\mathcal{F} \rightarrow \overline{\mathcal{F}}$ identifies tangent spaces.

Example 68.14.8. In Example 68.8.10 we constructed objects $R \in \widehat{\mathcal{C}}_\Lambda$ such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. We can reformulate this as follows. Let $\mathcal{F} = \mathcal{C}_\Lambda$ considered as cofibred in groupoids via the identity functor. In other words, \mathcal{F} is the category cofibred in sets corresponding to the functor $F : A \mapsto \{*\}$ (this is the final object in the category of functors $\mathcal{C}_\Lambda \rightarrow \text{Sets}$). The condition that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth means exactly that $\underline{R}|_{\mathcal{C}_\Lambda} \rightarrow F$ is smooth, i.e., that $\xi = *$ is a formal versal object of \mathcal{F} over R . Hence \mathcal{F} has a versal formal object. In fact, it is easy to see that \mathcal{F} satisfies condition (3) of Theorem 68.14.5. The theorem implies that (2) holds. This means we can find a minimal versal formal object $* \in \widehat{\mathcal{F}}(S)$ over some $S \in \widehat{\mathcal{C}}_\Lambda$ such that $d* : \text{Der}_\Lambda(S, k) \rightarrow 0$ is bijective on $\text{Der}_\Lambda(k, k)$ -orbits. Clearly this means that the injection $\text{Der}_\Lambda(k, k) \rightarrow \text{Der}_\Lambda(S, k)$ is also surjective. In other words, the exact sequence (68.3.10.2) turns into a pair of isomorphisms

$$H_1(L_{k/\Lambda}) = \mathfrak{m}_S/\mathfrak{m}_S^2 \quad \text{and} \quad \Omega_{S/\Lambda} \otimes_S k = \Omega_{k/\Lambda}.$$

(The first arrow is injective because of the formal smoothness of S over Λ ; details omitted.) Of course the existence of such a ring S can be proved directly by judiciously slicing the ring R constructed in Example 68.8.10.

68.15. Rim-Schlessinger conditions and deformation categories

There is a very natural property of categories fibred in groupoids over \mathcal{C}_Λ which is easy to check in practice and which implies Schlessinger’s properties (S1) and (S2) we have introduced earlier.

Definition 68.15.1. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . We say that \mathcal{F} satisfies *condition (RS)* if for every diagram in \mathcal{F}

$$\begin{array}{ccc} & x_2 & \\ & \downarrow & \\ x_1 & \longrightarrow & x \end{array} \quad \text{lying over} \quad \begin{array}{ccc} & A_2 & \\ & \downarrow & \\ A_1 & \longrightarrow & A \end{array}$$

in \mathcal{C}_Λ with $A_2 \rightarrow A$ surjective, there exists a fiber product $x_1 \times_x x_2$ in \mathcal{F} such that the diagram

$$\begin{array}{ccc} x_1 \times_x x_2 & \longrightarrow & x_2 \\ \downarrow & & \downarrow \\ x_1 & \longrightarrow & x \end{array} \quad \text{lies over} \quad \begin{array}{ccc} A_1 \times_A A_2 & \longrightarrow & A_2 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A. \end{array}$$

Lemma 68.15.2. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Given a commutative diagram in \mathcal{F}

$$\begin{array}{ccc} y & \longrightarrow & x_2 \\ \downarrow & & \downarrow \\ x_1 & \longrightarrow & x \end{array} \quad \text{lying over} \quad \begin{array}{ccc} A_1 \times_A A_2 & \longrightarrow & A_2 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A. \end{array}$$

with $A_2 \rightarrow A$ surjective, then it is a fiber square.

Proof. Since \mathcal{F} satisfies (RS), there exists a fiber product diagram

$$\begin{array}{ccc} x_1 \times_x x_2 & \longrightarrow & x_2 \\ \downarrow & & \downarrow \\ x_1 & \longrightarrow & x \end{array} \quad \text{lying over} \quad \begin{array}{ccc} A_1 \times_A A_2 & \longrightarrow & A_2 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A. \end{array}$$

The induced map $y \rightarrow x_1 \times_x x_2$ lies over $\text{id} : A_1 \times_A A_1 \rightarrow A_1 \times_A A_1$, hence it is an isomorphism. \square

Lemma 68.15.3. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Then \mathcal{F} satisfies (RS) if the condition in Definition 68.15.1 is assumed to hold only when $A_2 \rightarrow A$ is a small extension.

Proof. Apply Lemma 68.3.3. The proof is similar to that of Lemma 68.8.2. \square

Lemma 68.15.4. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . The following are equivalent

- (1) \mathcal{F} satisfies (RS),
- (2) the functor $\mathcal{F}(A_1 \times_A A_2) \rightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ see (68.9.1.1) is an equivalence of categories whenever $A_2 \rightarrow A$ is surjective, and
- (3) same as in (2) whenever $A_2 \rightarrow A$ is a small extension.

Proof. Assume (1). By Lemma 68.15.2 we see that every object of $\mathcal{F}(A_1 \times_A A_2)$ is of the form $x_1 \times_x x_2$. Moreover

$$\text{Mor}_{A_1 \times_A A_2}(x_1 \times_x x_2, y_1 \times_y y_2) = \text{Mor}_{A_1}(x_1, y_1) \times_{\text{Mor}_A(x, y)} \text{Mor}_{A_2}(x_2, y_2).$$

Hence we see that $\mathcal{F}(A_1 \times_A A_2)$ is a 2-fibre product of $\mathcal{F}(A_1)$ with $\mathcal{F}(A_2)$ over $\mathcal{F}(A)$ by Categories, Remark 4.29.5. In other words, we see that (2) holds.

The implication (2) \Rightarrow (3) is immediate.

Assume (3). Let $q_1 : A_1 \rightarrow A$ and $q_2 : A_2 \rightarrow A$ be given with q_2 a small extension. We will use the description of the 2-fibre product $\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ from Categories, Remark 4.29.5. Hence let $y \in \mathcal{F}(A_1 \times_A A_2)$ correspond to $(x_1, x_2, x, a_1 : x_1 \rightarrow x, a_2 : x_2 \rightarrow x)$. Let z be an object of \mathcal{F} lying over C . Then

$$\begin{aligned} \text{Mor}_{\mathcal{F}}(z, y) &= \{(f, \alpha) \mid f : C \rightarrow A_1 \times_A A_2, \alpha : f_* z \rightarrow y\} \\ &= \{(f_1, f_2, \alpha_1, \alpha_2) \mid f_i : C \rightarrow A_i, \alpha_i : f_{i,*} z \rightarrow x_i, \\ &\quad q_1 \circ f_1 = q_2 \circ f_2, q_{1,*} \alpha_1 = q_{2,*} \alpha_2\} \\ &= \text{Mor}_{\mathcal{F}}(z, x_1) \times_{\text{Mor}_{\mathcal{F}}(z, x)} \text{Mor}_{\mathcal{F}}(z, x_2) \end{aligned}$$

whence y is a fibre product of x_1 and x_2 over x . Thus we see that \mathcal{F} satisfies (RS) in case $A_2 \rightarrow A$ is a small extension. Hence (RS) holds by Lemma 68.15.3. \square

Remark 68.15.5. When \mathcal{F} is cofibered in sets, condition (RS) is exactly condition (H4) from Schlessinger’s paper [Sch68, Theorem 2.11]. Namely, for a functor $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$, condition (RS) states: If $A_1 \rightarrow A$ and $A_2 \rightarrow A$ are maps in \mathcal{C}_Λ with $A_2 \rightarrow A$ surjective, then the induced map $F(A_1 \times_A A_2) \rightarrow F(A_1) \times_{F(A)} F(A_2)$ is bijective.

Lemma 68.15.6. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . The condition (RS) for \mathcal{F} implies both (S1) and (S2) for \mathcal{F} .*

Proof. Using the reformulation of Lemma 68.15.4 and the explanation of (S1) following Definition 68.9.1 it is immediate that (RS) implies (S1). This proves the first part of (S2). The second part of (S2) follows because Lemma 68.15.2 tells us that $y = x_1 \times_{d, x_0, e} x_2 = y'$ if y, y' are as in the second part of the definition of (S2) in Definition 68.9.1. (In fact the morphism $y \rightarrow y'$ is compatible with both a, a' and c, c' !) \square

The following lemma is the analogue of Lemma 68.9.5. Recall that if \mathcal{F} is a category cofibered in groupoids over \mathcal{C}_Λ and x is an object of \mathcal{F} lying over A , then we denote $\text{Aut}_A(x) = \text{Mor}_A(x, x) = \text{Mor}_{\mathcal{F}(A)}(x, x)$. If $x' \rightarrow x$ is a morphism of \mathcal{F} lying over $A' \rightarrow A$ then there is a well defined map of groups $\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x)$.

Lemma 68.15.7. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). The following conditions are equivalent:*

- (1) $\overline{\mathcal{F}}$ satisfies (RS).
- (2) Let $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ be ring maps in \mathcal{C}_Λ with f_2 surjective. The induced map of sets of isomorphism classes

$$\overline{\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)} \rightarrow \overline{\mathcal{F}(A_1)} \times_{\overline{\mathcal{F}(A)}} \overline{\mathcal{F}(A_2)}$$

is injective.

- (3) For every morphism $x' \rightarrow x$ in \mathcal{F} lying over a surjective ring map $A' \rightarrow A$, the map $\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x)$ is surjective.
- (4) For every morphism $x' \rightarrow x$ in \mathcal{F} lying over a small extension $A' \rightarrow A$, the map $\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x)$ is surjective.

Proof. We prove that (1) is equivalent to (2) and (2) is equivalent to (3). The equivalence of (3) and (4) follows from Lemma 68.3.3.

Let $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ be ring maps in \mathcal{C}_Λ with f_2 surjective. By Remark 68.15.5 we see $\overline{\mathcal{F}}$ satisfies (RS) if and only if the map

$$\overline{\mathcal{F}}(A_1 \times_A A_2) \rightarrow \overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$$

is bijective for any such f_1, f_2 . This map is at least surjective since that is the condition of (S1) and $\overline{\mathcal{F}}$ satisfies (S1) by Lemmas 68.15.6 and 68.9.5. Moreover, this map factors as

$$\overline{\mathcal{F}}(A_1 \times_A A_2) \longrightarrow \overline{\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)} \longrightarrow \overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2),$$

where the first map is a bijection since

$$\mathcal{F}(A_1 \times_A A_2) \longrightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$$

is an equivalence by (RS) for \mathcal{F} . Hence (1) is equivalent to (2).

Assume (2) holds. Let $x' \rightarrow x$ be a morphism in \mathcal{F} lying over a surjective ring map $f : A' \rightarrow A$. Let $a \in \text{Aut}_A(x)$. The objects

$$(x', x', a : x \rightarrow x), (x', x', \text{id} : x \rightarrow x)$$

of $\mathcal{F}(A') \times_{\mathcal{F}(A)} \mathcal{F}(A')$ have the same image in $\overline{\mathcal{F}}(A') \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A')$. By (2) there exists maps $b_1, b_2 : x' \rightarrow x'$ such that

$$\begin{array}{ccc} x & \xrightarrow{a} & x \\ f_* b_1 \downarrow & & \downarrow f_* b_2 \\ x & \xrightarrow{\text{id}} & x \end{array}$$

commutes. Hence $b_2^{-1} \circ b_1 \in \text{Aut}_{A'}(x')$ has image $a \in \text{Aut}_A(x)$. Hence (3) holds.

Assume (3) holds. Suppose

$$(x_1, x_2, a : (f_1)_* x_1 \rightarrow (f_2)_* x_2), (x'_1, x'_2, a' : (f_1)_* x'_1 \rightarrow (f_2)_* x'_2)$$

are objects of $\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ with the same image in $\overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$. Then there are morphisms $b_1 : x_1 \rightarrow x'_1$ in $\mathcal{F}(A_1)$ and $b_2 : x_2 \rightarrow x'_2$ in $\mathcal{F}(A_2)$. By (3) we can modify b_2 by an automorphism of x_2 over A_2 so that the diagram

$$\begin{array}{ccc} (f_1)_* x_1 & \xrightarrow{a} & (f_2)_* x_2 \\ (f_1)_* b_1 \downarrow & & \downarrow (f_2)_* b_2 \\ (f_1)_* x'_1 & \xrightarrow{a'} & (f_2)_* x'_2 \end{array}$$

commutes. This proves $(x_1, x_2, a) \cong (x'_1, x'_2, a')$ in $\overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$. Hence (2) holds. □

Finally we define the notion of a deformation category.

Definition 68.15.8. A *deformation category* is a predeformation category \mathcal{F} satisfying (RS). A morphism of deformation categories is a morphism of categories over \mathcal{C}_Λ .

Remark 68.15.9. We say that a functor $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ is a *deformation functor* if the associated cofibered set is a deformation category, i.e. if $F(k)$ is a one element set and F satisfies (RS). If \mathcal{F} is a deformation category, then $\overline{\mathcal{F}}$ is a predeformation functor but not necessarily a deformation functor, as Lemma 68.15.7 shows.

Example 68.15.10. A prorepresentable functor F is a deformation functor. Namely, suppose $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$ and $F(A) = \text{Mor}_{\widehat{\mathcal{C}}_\Lambda}(R, A)$. There is a unique morphism $R \rightarrow k$, so $F(k)$ is a one element set. Since

$$\text{Hom}_\Lambda(R, A_1 \times_A A_2) = \text{Hom}_\Lambda(R, A_1) \times_{\text{Hom}_\Lambda(R, A)} \text{Hom}_\Lambda(R, A_2)$$

the same is true for maps in $\widehat{\mathcal{C}}_\Lambda$ and we see that F has (RS).

The following is one of our typical remarks on passing from a category cofibered in groupoids to the predeformation category at a point over k : it says that this process preserves (RS).

Lemma 68.15.11. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Let \mathcal{F}_{x_0} be the category cofibered in groupoids over \mathcal{C}_Λ constructed in Remark 68.6.4. If \mathcal{F} satisfies (RS), then so does \mathcal{F}_{x_0} . In particular, \mathcal{F}_{x_0} is a deformation category.*

Proof. Any diagram as in Definition 68.15.1 in \mathcal{F}_{x_0} gives rise to a diagram in \mathcal{F} and the output of (RS) for this diagram in \mathcal{F} can be viewed as an output for \mathcal{F}_{x_0} as well. □

The following lemma is the analogue of the fact that 2-fibre products of algebraic stacks are algebraic stacks.

Lemma 68.15.12. *Let*

$$\begin{array}{ccc} \mathcal{H} \times_{\mathcal{F}} \mathcal{G} & \longrightarrow & \mathcal{G} \\ \downarrow & & \downarrow g \\ \mathcal{H} & \xrightarrow{f} & \mathcal{F} \end{array}$$

be 2-fibre product of categories cofibered in groupoids over \mathcal{C}_Λ . If $\mathcal{F}, \mathcal{G}, \mathcal{H}$ all satisfy (RS), then $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ satisfies (RS).

Proof. If A is an object of \mathcal{C}_Λ , then an object of the fiber category of $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ over A is a triple (u, v, a) where $u \in \mathcal{H}(A)$, $v \in \mathcal{G}(A)$, and $a : f(u) \rightarrow g(v)$ is a morphism in $\mathcal{F}(A)$. Consider a diagram in $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$

$$\begin{array}{ccc} (u_2, v_2, a_2) & & A_2 \\ \downarrow & \text{lying over} & \downarrow \\ (u_1, v_1, a_1) \longrightarrow (u, v, a) & & A_1 \longrightarrow A \end{array}$$

in \mathcal{C}_Λ with $A_2 \rightarrow A$ surjective. Since \mathcal{H} and \mathcal{G} satisfy (RS), there are fiber products $u_1 \times_u u_2$ and $v_1 \times_v v_2$ lying over $A_1 \times_A A_2$. Since \mathcal{F} satisfies (RS), Lemma 68.15.2 shows

$$\begin{array}{ccc} f(u_1 \times_u u_2) \longrightarrow f(u_2) & & g(v_1 \times_v v_2) \longrightarrow g(v_2) \\ \downarrow & & \downarrow \\ f(u_1) \longrightarrow f(u) & \text{and} & g(v_1) \longrightarrow g(v) \end{array}$$

are both fiber squares in \mathcal{F} . Thus we can view $a_1 \times_a a_2$ as a morphism from $f(u_1 \times_u u_2)$ to $g(v_1 \times_v v_2)$ over $A_1 \times_A A_2$. It follows that

$$\begin{array}{ccc} (u_1 \times_u u_2, v_1 \times_v v_2, a_1 \times_a a_2) & \longrightarrow & (u_2, v_2, a_2) \\ \downarrow & & \downarrow \\ (u_1, v_1, a_1) & \longrightarrow & (u, v, a) \end{array}$$

is a fiber square in $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ as desired. □

68.16. Lifts of objects

The content of this section is that the tangent space has a principal homogeneous action on the set of lifts along a small surjection in the case of a deformation category.

Definition 68.16.1. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $f : A' \rightarrow A$ be a map in \mathcal{C}_Λ . Let $x \in \mathcal{F}(A)$. The category $Lift(x, f)$ of lifts of x along f is the category with the following objects and morphisms.

- (1) Objects: A *lift of x along f* is a morphism $x' \rightarrow x$ lying over f .
- (2) Morphisms: A *morphism of lifts* from $a_1 : x'_1 \rightarrow x$ to $a_2 : x'_2 \rightarrow x$ is a morphism $b : x'_1 \rightarrow x'_2$ in $\mathcal{F}(A')$ such that $a_2 = a_1 \circ b$.

The set $Lift(x, f)$ of lifts of x along f is the set of isomorphism classes of $Lift(x, f)$.

Remark 68.16.2. When the map $f : A' \rightarrow A$ is clear from the context, we may write $Lift(x, A')$ and $Lift(x, A')$ in place of $Lift(x, f)$ and $Lift(x, f)$.

Remark 68.16.3. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Let V be a finite dimensional vector space. Then $Lift(x_0, k[V])$ is the set of isomorphism classes of $\mathcal{F}_{x_0}(k[V])$ where \mathcal{F}_{x_0} is the predeformation category of objects in \mathcal{F} lying over x_0 , see Remark 68.6.4. Hence if \mathcal{F} satisfies (S2), then so does \mathcal{F}_{x_0} (see Lemma 68.9.6) and by Lemma 68.11.2 we see that

$$Lift(x_0, k[V]) = T\mathcal{F}_{x_0} \otimes_k V$$

as k -vector spaces.

Remark 68.16.4. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let

$$\begin{array}{ccc} A_1 \times_A A_2 & \longrightarrow & A_2 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A \end{array}$$

be a fibre square in \mathcal{C}_Λ such that either $A_1 \rightarrow A$ or $A_2 \rightarrow A$ is surjective. Let $x \in \text{Ob}(\mathcal{F}(A))$. Given lifts $x_1 \rightarrow x$ and $x_2 \rightarrow x$ of x to A_1 and A_2 , we get by (RS) a lift $x_1 \times_x x_2 \rightarrow x$ of x to $A_1 \times_A A_2$. Conversely, by Lemma 68.15.2 any lift of x to $A_1 \times_A A_2$ is of this form. Hence a bijection

$$Lift(x, A_1) \times Lift(x, A_2) \longrightarrow Lift(x, A_1 \times_A A_2).$$

Similarly, if $x_1 \rightarrow x$ is a fixed lifting of x to A_1 , then there is a bijection

$$Lift(x_1, A_1 \times_A A_2) \longrightarrow Lift(x, A_2).$$

Now let

$$\begin{array}{ccccc}
 A'_1 \times_A A_2 & \longrightarrow & A_1 \times_A A_2 & \longrightarrow & A_2 \\
 \downarrow & & \downarrow & & \downarrow \\
 A'_1 & \longrightarrow & A_1 & \longrightarrow & A
 \end{array}$$

be a composition of fibre squares in \mathcal{C}_Λ with both $A'_1 \rightarrow A_1$ and $A_1 \rightarrow A$ surjective. Let $x_1 \rightarrow x$ be a morphism lying over $A_1 \rightarrow A$. Then by the above we have bijections

$$\begin{aligned}
 \text{Lift}(x_1, A'_1 \times_A A_2) &= \text{Lift}(x_1, A'_1) \times \text{Lift}(x_1, A_1 \times_A A_2) \\
 &= \text{Lift}(x_1, A'_1) \times \text{Lift}(x, A_2).
 \end{aligned}$$

Lemma 68.16.5. *Let \mathcal{F} be a deformation category. Let $A' \rightarrow A$ be a surjective ring map in \mathcal{C}_Λ whose kernel I is annihilated by $\mathfrak{m}_{A'}$. Let $x \in \text{Ob}(\mathcal{F}(A))$. If $\text{Lift}(x, A')$ is nonempty, then there is a free and transitive action of $T\mathcal{F} \otimes_k I$ on $\text{Lift}(x, A')$.*

Proof. Consider the ring map $g : A' \times_A A' \rightarrow k[I]$ defined by the rule $g(a_1, a_2) = \overline{a_1} \oplus a_2 - a_1$ (compare with Lemma 68.9.8). There is an isomorphism

$$A' \times_A A' \xrightarrow{\sim} A' \times_k k[I]$$

given by $(a_1, a_2) \mapsto (a_1, g(a_1, a_2))$. This isomorphism commutes with the projections to A' on the first factor, and hence with the projections of $A' \times_A A'$ and $A' \times_k k[I]$ to A . Thus there is a bijection

$$(68.16.5.1) \quad \text{Lift}(x, A' \times_A A') \longrightarrow \text{Lift}(x, A' \times_k k[I])$$

By Remark 68.16.4 there is a bijection

$$(68.16.5.2) \quad \text{Lift}(x, A') \times \text{Lift}(x, A') \longrightarrow \text{Lift}(x, A' \times_A A')$$

There is a commutative diagram

$$\begin{array}{ccccc}
 A' \times_k k[I] & \longrightarrow & A \times_k k[I] & \longrightarrow & k[I] \\
 \downarrow & & \downarrow & & \downarrow \\
 A' & \longrightarrow & A & \longrightarrow & k.
 \end{array}$$

Thus if we choose a pushforward $x \rightarrow x_0$ of x along $A \rightarrow k$, we obtain by the end of Remark 68.16.4 a bijection

$$(68.16.5.3) \quad \text{Lift}(x, A' \times_k k[I]) \longrightarrow \text{Lift}(x, A') \times \text{Lift}(x_0, k[I])$$

Composing (68.16.5.2), (68.16.5.1), and (68.16.5.3) we get a bijection

$$\Phi : \text{Lift}(x, A') \times \text{Lift}(x, A') \longrightarrow \text{Lift}(x, A') \times \text{Lift}(x_0, k[I]).$$

This bijection commutes with the projections on the first factors. By Remark 68.16.3 we see that $\text{Lift}(x_0, k[I]) = T\mathcal{F} \otimes_k I$. If pr_2 is the second projection of $\text{Lift}(x, A') \times \text{Lift}(x, A')$, then we get a map

$$a = \text{pr}_2 \circ \Phi^{-1} : \text{Lift}(x, A') \times (T\mathcal{F} \otimes_k I) \longrightarrow \text{Lift}(x, A').$$

Unwinding all the above we see that $a(x' \rightarrow x, \theta)$ is the unique lift $x'' \rightarrow x$ such that $g_*(x', x'') = \theta$ in $\text{Lift}(x_0, k[I]) = T\mathcal{F} \otimes_k I$. To see this is an action of $T\mathcal{F} \otimes_k I$ on $\text{Lift}(x, A')$ we have to show the following: if x', x'', x''' are lifts of x and $g_*(x', x'') =$

θ , $g_*(x'', x''') = \theta'$, then $g_*(x', x''') = \theta + \theta'$. This follows from the commutative diagram

$$\begin{array}{ccc}
 A' \times_A A' \times_A A' & \xrightarrow{(a_1, a_2, a_3) \mapsto (g(a_1, a_2), g(a_2, a_3))} & k[I] \times_k k[I] = k[I \times I] \\
 & \searrow_{(a_1, a_2, a_3) \mapsto g(a_1, a_3)} & \downarrow + \\
 & & k[I]
 \end{array}$$

The action is free and transitive because Φ is bijective. □

Remark 68.16.6. The action of Lemma 68.16.5 is functorial. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of deformation categories. Let $A' \rightarrow A$ be a surjective ring map whose kernel I is annihilated by $\mathfrak{m}_{A'}$. Let $x \in \text{Ob}(\mathcal{F}(A))$. In this situation φ induces the vertical arrows in the following commutative diagram

$$\begin{array}{ccc}
 \text{Lift}(x, A') \times (T\mathcal{F} \otimes_k I) & \longrightarrow & \text{Lift}(x, A') \\
 (\varphi, d\varphi \otimes \text{id}_I) \downarrow & & \downarrow \varphi \\
 \text{Lift}(\varphi(x), A') \times (T\mathcal{G} \otimes_k I) & \longrightarrow & \text{Lift}(\varphi(x), A')
 \end{array}$$

The commutativity follows as each of the maps (68.16.5.2), (68.16.5.1), and (68.16.5.3) of the proof of Lemma 68.16.5 gives rise to a similar commutative diagram.

68.17. Schlessinger’s theorem on prorepresentable functors

We deduce Schlessinger’s theorem characterizing prorepresentable functors on \mathcal{C}_Λ .

Lemma 68.17.1. *Let $F, G : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be deformation functors. Let $\varphi : F \rightarrow G$ be a smooth morphism which induces an isomorphism $d\varphi : TF \rightarrow TG$ of tangent spaces. Then φ is an isomorphism.*

Proof. We prove $F(A) \rightarrow G(A)$ is a bijection for all $A \in \text{Ob}(\mathcal{C}_\Lambda)$ by induction on $\text{length}_A(A)$. For $A = k$ the statement follows from the assumption that F and G are deformation functors. Suppose that the statement holds for rings of length less than n and let A' be a ring of length n . Choose a small extension $f : A' \rightarrow A$. We have a commutative diagram

$$\begin{array}{ccc}
 F(A') & \longrightarrow & G(A') \\
 F(f) \downarrow & & \downarrow G(f) \\
 F(A) & \xrightarrow{\sim} & G(A)
 \end{array}$$

where the map $F(A) \rightarrow G(A)$ is a bijection. By smoothness of $F \rightarrow G$, $F(A') \rightarrow G(A')$ is surjective (Lemma 68.8.8). Thus we can check bijectivity by checking it on fibers $F(f)^{-1}(x) \rightarrow G(f)^{-1}(\varphi(x))$ for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty. These fibers are precisely $\text{Lift}(x, A')$ and $\text{Lift}(\varphi(x), A')$ and by assumption we have an isomorphism $d\varphi \otimes \text{id} : TF \otimes_k \text{Ker}(f) \rightarrow TG \otimes_k \text{Ker}(f)$. Thus, by Lemma 68.16.5 and Remark 68.16.6, for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty the map $F(f)^{-1}(x) \rightarrow G(f)^{-1}(\varphi(x))$ is a map of sets commuting with free transitive actions by $TF \otimes_k \text{Ker}(f)$. Hence it is bijective. □

Note that in case $k' \subset k$ is separable condition (c) in the theorem below is empty.

Theorem 68.17.2. *Let $F : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a functor. Then F is prorepresentable if and only if (a) F is a deformation functor, (b) $\dim_k TF$ is finite, and (c) $\gamma : \text{Der}_\Lambda(k, k) \rightarrow TF$ is injective.*

Proof. Assume F is prorepresentable by $R \in \widehat{\mathcal{C}}_\Lambda$. We see F is a deformation functor by Example 68.15.10. We see $\dim_k TF$ is finite by Example 68.10.11. Finally, $\text{Der}_\Lambda(k, k) \rightarrow TF$ is identified with $\text{Der}_\Lambda(k, k) \rightarrow \text{Der}_\Lambda(R, k)$ by Example 68.10.14 which is injective because $R \rightarrow k$ is surjective.

Conversely, assume (a), (b), and (c) hold. By Lemma 68.15.6 we see that (S1) and (S2) hold. Hence by Theorem 68.14.5 there exists a minimal versal formal object ξ of F such that (68.14.0.2) holds. Say ξ lies over R . The map

$$d\xi : \text{Der}_\Lambda(R, k) \rightarrow TF$$

is bijective on $\text{Der}_\Lambda(k, k)$ -orbits. Since the action of $\text{Der}_\Lambda(k, k)$ on the left hand side is free by (c) and Lemma 68.11.6 we see that the map is bijective. Thus we see that ξ is an isomorphism by Lemma 68.17.1. \square

68.18. Infinitesimal automorphisms

Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Given a morphism $x' \rightarrow x$ in \mathcal{F} lying over $A' \rightarrow A$, there is an induced homomorphism

$$\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x).$$

Lemma 68.15.7 says that the cokernel of this homomorphism determines whether condition (RS) on \mathcal{F} passes to $\overline{\mathcal{F}}$. In this section we study the kernel of this homomorphism. We will see that it also gives a measure of how far \mathcal{F} is from $\overline{\mathcal{F}}$.

Definition 68.18.1. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $x' \rightarrow x$ be a morphism in \mathcal{F} lying over $A' \rightarrow A$. The *group of infinitesimal automorphisms of x' over x* is the kernel of $\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x)$. Notation $\text{Inf}(x'/x) = \text{Ker}(\text{Aut}_{A'}(x') \rightarrow \text{Aut}_A(x))$.

Definition 68.18.2. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Assume a choice of pushforward $x_0 \rightarrow x'_0$ of x_0 along the map $k \rightarrow k[\epsilon], a \mapsto a$ has been made. Then there is a unique map $x'_0 \rightarrow x_0$ such that $x_0 \rightarrow x'_0 \rightarrow x_0$ is the identity on x_0 . The *group of infinitesimal automorphisms of x_0* is $\text{Inf}_{x_0}(\mathcal{F}) := \text{Inf}(x'_0/x_0)$.

Remark 68.18.3. Up to isomorphism, $\text{Inf}_{x_0}(\mathcal{F})$ does not depend on the choice of pushforward $x_0 \rightarrow x'_0$. Moreover, if $y_0 \in \mathcal{F}(k)$ and $x_0 \cong y_0$ in $\mathcal{F}(k)$, then $\text{Inf}_{x_0}(\mathcal{F}) \cong \text{Inf}_{y_0}(\mathcal{F})$.

Remark 68.18.4. When \mathcal{F} is a predeformation category, $\text{Aut}_k(x_0)$ is trivial and hence $\text{Inf}_{x_0}(\mathcal{F}) = \text{Aut}_{k[\epsilon]}(x'_0)$.

We will see that $\text{Inf}_{x_0}(\mathcal{F})$ has a natural k -vector space structure when \mathcal{F} satisfies (RS). At the same time, we will see that if \mathcal{F} satisfies (RS), then the infinitesimal automorphisms $\text{Inf}(x'/x)$ of a morphism $x' \rightarrow x$ lying over a small extension are governed by $\text{Inf}_{x_0}(\mathcal{F})$, where x_0 is a pushforward of x to $\mathcal{F}(k)$. In order to do this, we introduce the automorphism functor for any object $x \in \text{Ob}(\mathcal{F})$ as follows.

Definition 68.18.5. Let $p : \mathcal{F} \rightarrow \mathcal{C}$ be a category cofibered in groupoids over an arbitrary base category \mathcal{C} . Assume a choice of pushforwards has been made. Let $x \in \text{Ob}(\mathcal{F})$ and let $U = p(x)$. Let U/\mathcal{C} denote the category of objects under U . The *automorphism functor of x* is the functor $\text{Aut}(x) : U/\mathcal{C} \rightarrow \text{Sets}$ sending an object $f : U \rightarrow V$ to $\text{Aut}_V(f_*x)$ and sending a morphism

$$\begin{array}{ccc} V' & \xrightarrow{\quad} & V \\ & \swarrow f' & \nearrow f \\ & U & \end{array}$$

to the homomorphism $\text{Aut}_{V'}(f'_*x) \rightarrow \text{Aut}_V(f_*x)$ coming from the unique morphism $f'_*x \rightarrow f_*x$ lying over $V' \rightarrow V$ and compatible with $x \rightarrow f'_*x$ and $x \rightarrow f_*x$.

We will be concerned with the automorphism functors of objects in a category cofibered in groupoids \mathcal{F} over \mathcal{C}_Λ . If $A \in \text{Ob}(\mathcal{C}_\Lambda)$, then the category A/\mathcal{C}_Λ is nothing but the category \mathcal{C}_A , i.e. the category defined in Section 68.3 where we take $\Lambda = A$ and $k = A/\mathfrak{m}_A$. Hence the automorphism functor of an object $x \in \text{Ob}(\mathcal{F}(A))$ is a functor $\text{Aut}(x) : \mathcal{C}_A \rightarrow \text{Sets}$.

The following lemma could be deduced from Lemma 68.15.12 by thinking about the “inertia” of a category cofibered in groupoids, see for example Stacks, Section 8.7 and Categories, Section 4.32. However, it is easier to see it directly.

Lemma 68.18.6. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x \in \text{Ob}(\mathcal{F}(A))$. Then $\text{Aut}(x) : \mathcal{C}_A \rightarrow \text{Sets}$ satisfies (RS).*

Proof. It follows that $\text{Aut}(x)$ satisfies (RS) from the fully faithfulness of the functor $\mathcal{F}(A_1 \times_A A_2) \rightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ in Lemma 68.15.4. \square

Lemma 68.18.7. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x \in \text{Ob}(\mathcal{F}(A))$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$.*

- (1) $T_{\text{id}_{x_0}} \text{Aut}(x)$ has a natural k -vector space structure such that addition agrees with composition in $T_{\text{id}_{x_0}} \text{Aut}(x)$. In particular, composition in $T_{\text{id}_{x_0}} \text{Aut}(x)$ is commutative.
- (2) There is a canonical isomorphism $T_{\text{id}_{x_0}} \text{Aut}(x) \rightarrow T_{\text{id}_{x_0}} \text{Aut}(x_0)$ of k -vector spaces.

Proof. We apply Remark 68.6.4 to the functor $\text{Aut}(x) : \mathcal{C}_A \rightarrow \text{Sets}$ and the element $\text{id}_{x_0} \in \text{Aut}(x)(k)$ to get a predeformation functor $F = \text{Aut}(x)_{\text{id}_{x_0}}$. By Lemmas 68.18.6 and 68.15.11 F is a deformation functor. By definition $T_{\text{id}_{x_0}} \text{Aut}(x) = TF = F(k[\epsilon])$ which has a natural k -vector space structure specified by Lemma 68.10.8.

Addition is defined as the composition

$$F(k[\epsilon]) \times F(k[\epsilon]) \longrightarrow F(k[\epsilon] \times_k k[\epsilon]) \longrightarrow F(k[\epsilon])$$

where the first map is the inverse of the bijection guaranteed by (RS) and the second is induced by the k -algebra map $k[\epsilon] \times_k k[\epsilon] \rightarrow k[\epsilon]$ which maps $(\epsilon, 0)$ and $(0, \epsilon)$ to ϵ . If $A \rightarrow B$ is a ring map in \mathcal{C}_Λ , then $F(A) \rightarrow F(B)$ is a homomorphism where $F(A) = \text{Aut}(x)_{\text{id}_{x_0}}(A)$ and $F(B) = \text{Aut}(x)_{\text{id}_{x_0}}(B)$ are groups under composition. We conclude that $+$: $F(k[\epsilon]) \times F(k[\epsilon]) \rightarrow F(k[\epsilon])$ is a homomorphism where $F(k[\epsilon])$ is regarded as a group under composition. With $\text{id} \in F(k[\epsilon])$ the unit element we see

that $+(v, \text{id}) = +(\text{id}, v) = v$ for any $v \in F(k[\epsilon])$ because (id, v) is the pushforward of v along the ring map $k[\epsilon] \rightarrow k[\epsilon] \times_k k[\epsilon]$ with $\epsilon \mapsto (\epsilon, 0)$. In general, given a group G with multiplication \circ and $+$: $G \times G \rightarrow G$ is a homomorphism such that $+(g, 1) = +(1, g) = g$, where 1 is the identity of G , then $+$ = \circ . This shows addition in the k -vector space structure on $F(k[\epsilon])$ agrees with composition.

Finally, (2) is a matter of unwinding the definitions. Namely $T_{\text{id}_{x_0}} \text{Aut}(x)$ is the set of automorphisms α of the pushforward of x along $A \rightarrow k \rightarrow k[\epsilon]$ which are trivial modulo ϵ . On the other hand $T_{\text{id}_{x_0}} \text{Aut}(x_0)$ is the set of automorphisms of the pushforward of x_0 along $k \rightarrow k[\epsilon]$ which are trivial modulo ϵ . Since x_0 is the pushforward of x along $A \rightarrow k$ the result is clear. \square

Remark 68.18.8. We point out some basic relationships between infinitesimal automorphism groups, liftings, and tangent spaces to automorphism functors. Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $x' \rightarrow x$ be a morphism lying over a ring map $A' \rightarrow A$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. Then from the definitions we have an equality

$$\text{Inf}(x'/x) = \text{Lift}(\text{id}_x, A')$$

where the liftings are of id_x as an object of $\text{Aut}(x')$. If $x_0 \in \text{Ob}(\mathcal{F}(k))$ and x'_0 is the pushforward to $\mathcal{F}(k[\epsilon])$, then applying this to $x'_0 \rightarrow x_0$ we get

$$\text{Inf}_{x_0}(\mathcal{F}) = \text{Lift}(\text{id}_{x_0}, k[\epsilon]) = T_{\text{id}_{x_0}} \text{Aut}(x_0),$$

the last equality following directly from the definitions.

Lemma 68.18.9. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then $\text{Inf}_{x_0}(\mathcal{F})$ is equal as a set to $T_{\text{id}_{x_0}} \text{Aut}(x_0)$, and so has a natural k -vector space structure such that addition agrees with composition of automorphisms.*

Proof. The equality of sets is as in the end of Remark 68.18.8 and the statement about the vector space structure follows from Lemma 68.18.7. \square

Lemma 68.18.10. *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then φ induces a k -linear map $\text{Inf}_{x_0}(\mathcal{F}) \rightarrow \text{Inf}_{\varphi(x_0)}(\mathcal{G})$.*

Proof. It is clear that φ induces a morphism from $\text{Aut}(x_0) \rightarrow \text{Aut}(\varphi(x_0))$ which maps the identity to the identity. Hence this follows from the result for tangent spaces, see Lemma 68.11.4. \square

Lemma 68.18.11. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x' \rightarrow x$ be a morphism lying over a surjective ring map $A' \rightarrow A$ with kernel I annihilated by $\mathfrak{m}_{A'}$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. Then $\text{Inf}(x'/x)$ has a free and transitive action by $T_{\text{id}_{x_0}} \text{Aut}(x') \otimes_k I = \text{Inf}_{x_0}(\mathcal{F}) \otimes_k I$.*

Proof. This is just the analogue of Lemma 68.16.5 in the setting of automorphism sheaves. To be precise, we apply Remark 68.6.4 to the functor $\text{Aut}(x') : \mathcal{C}_{A'} \rightarrow \text{Sets}$ and the element $\text{id}_{x_0} \in \text{Aut}(x)(k)$ to get a predeformation functor $F = \text{Aut}(x')_{\text{id}_{x_0}}$. By Lemmas 68.18.6 and 68.15.11 F is a deformation functor. Hence Lemma 68.16.5 gives a free and transitive action of $TF \otimes_k I$ on $\text{Lift}(\text{id}_x, A')$, because as $\text{Lift}(\text{id}_x, A')$ is a group it is always nonempty. Note that we have equalities of vector spaces

$$TF = T_{\text{id}_{x_0}} \text{Aut}(x') \otimes_k I = \text{Inf}_{x_0}(\mathcal{F}) \otimes_k I$$

by Lemma 68.18.7. The equality $\text{Inf}(x'/x) = \text{Lift}(\text{id}_x, A')$ of Remark 68.18.8 finishes the proof. \square

Lemma 68.18.12. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x' \rightarrow x$ be a morphism in \mathcal{F} lying over a surjective ring map. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. If $\text{Inf}_{x_0}(\mathcal{F}) = 0$ then $\text{Inf}(x'/x) = 0$.*

Proof. Follows from Lemmas 68.3.3 and 68.18.11. \square

Lemma 68.18.13. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ satisfying (RS). Let $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then $\text{Inf}_{x_0}(\mathcal{F}) = 0$ if and only if the natural morphism $\mathcal{F}_{x_0} \rightarrow \overline{\mathcal{F}_{x_0}}$ of categories cofibered in groupoids is an equivalence.*

Proof. The morphism $\mathcal{F}_{x_0} \rightarrow \overline{\mathcal{F}_{x_0}}$ is an equivalence if and only if \mathcal{F}_{x_0} is fibered in setoids, cf. Categories, Section 4.37 (a setoid is by definition a groupoid in which the only automorphism of any object is the identity). We prove that $\text{Inf}_{x_0}(\mathcal{F}) = 0$ if and only if this condition holds for \mathcal{F}_{x_0} . Obviously if \mathcal{F}_{x_0} is fibered in setoids then $\text{Inf}_{x_0}(\mathcal{F}) = 0$. Conversely assume $\text{Inf}_{x_0}(\mathcal{F}) = 0$. Let A be an object of \mathcal{C}_Λ . Then by Lemma 68.18.12, $\text{Inf}(x/x_0) = 0$ for any object $x \rightarrow x_0$ of $\mathcal{F}_{x_0}(A)$. Since by definition $\text{Inf}(x/x_0)$ equals the group of automorphisms of $x \rightarrow x_0$ in $\mathcal{F}_{x_0}(A)$, this proves $\mathcal{F}_{x_0}(A)$ is a setoid. \square

Lemma 68.18.14. *Let $f : \mathcal{H} \rightarrow \mathcal{F}$ and $g : \mathcal{G} \rightarrow \mathcal{F}$ be 1-morphisms of deformation categories. Then*

- (1) $\mathcal{W} = \mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ is a deformation category
- (2) let $w_0 \in \text{Ob}(\mathcal{W}(k))$ and let x_0, y_0, z_0 be the image of w_0 in $\mathcal{F}, \mathcal{H}, \mathcal{G}$. Then we have a 6-term exact sequence of vector spaces

$$0 \rightarrow \text{Inf}_{w_0}(\mathcal{W}) \rightarrow \text{Inf}_{y_0}(\mathcal{H}) \oplus \text{Inf}_{z_0}(\mathcal{G}) \rightarrow \text{Inf}_{x_0}(\mathcal{F}) \rightarrow T\mathcal{W} \rightarrow T\mathcal{H} \oplus T\mathcal{G} \rightarrow T\mathcal{F}$$

Proof. Part (1) follows from Lemma 68.15.12 and the fact that $\mathcal{W}(k)$ is the fibre product of two setoids with a unique isomorphism class over a setoid with a unique isomorphism class.

Part (2). We apply Lemmas 68.11.4 and 68.18.10 to get all the linear maps except for the “boundary map” $\delta : \text{Inf}_{x_0}(\mathcal{F}) \rightarrow T\mathcal{W}$. We will insert suitable signs later.

Construction of δ . Choose a pushforward $w_0 \rightarrow w'_0$ along $k \rightarrow k[\epsilon]$. Denote x'_0, y'_0, z'_0 the images of w'_0 in $\mathcal{F}, \mathcal{H}, \mathcal{G}$. In particular we obtain isomorphisms $b' : f(y'_0) \rightarrow x'_0$ and $c' : x'_0 \rightarrow g(z'_0)$. Denote $b : f(y_0) \rightarrow x_0$ and $c : x_0 \rightarrow g(z_0)$ the pushforwards along $k[\epsilon] \rightarrow k$. Observe that this means $w'_0 = (k[\epsilon], y'_0, z'_0, c' \circ b')$ and $w_0 = (k, y_0, z_0, c \circ b)$ in terms of the explicit form of the fibre product of categories, see Remarks 68.5.2 (13). Given $\alpha : x'_0 \rightarrow x_0$ we set $\delta(\alpha) = (k[\epsilon], y'_0, z'_0, c' \circ \alpha \circ b')$ which is indeed an object of \mathcal{W} over $k[\epsilon]$ and comes with a morphism $(k[\epsilon], y'_0, z'_0, c' \circ \alpha \circ b') \rightarrow w_0$ over $k[\epsilon] \rightarrow k$ as α pushes forward to the identity over k . More generally, for any k -vector space V we can define a map

$$\text{Lift}(\text{id}_{x_0}, k[V]) \longrightarrow \text{Lift}(w_0, k[V])$$

using exactly the same formulae. This construction is functorial in the vector space V (details omitted). Hence δ is k -linear by an application of Lemma 68.10.5.

Having constructed these maps it is straightforward to show the sequence is exact. Injectivity of the first map comes from the fact that $f \times g : \mathcal{W} \rightarrow \mathcal{F} \times \mathcal{G}$ is faithful. If $(\beta, \gamma) \in \text{Inf}_{y_0}(\mathcal{H}) \oplus \text{Inf}_{z_0}(\mathcal{G})$ map to the same element of $\text{Inf}_{x_0}(\mathcal{F})$ then (β, γ) defines

an automorphism of $w'_0 = (k[\epsilon], y'_0, z'_0, c' \circ b')$ whence exactness at the second spot. If α as above gives the trivial deformation $(k[\epsilon], y'_0, z'_0, c' \circ \alpha \circ b')$ of w_0 , then the isomorphism $w'_0 = (k[\epsilon], y'_0, z'_0, c' \circ b') \rightarrow (k[\epsilon], y'_0, z'_0, c' \circ \alpha \circ b')$ produces a pair (β, γ) which is a preimage of α . If $w = (k[\epsilon], y, z, \phi)$ is a deformation of w_0 such that $y'_0 \cong y$ and $z \cong z'_0$ then the map

$$f(y'_0) \rightarrow f(y) \xrightarrow{\phi} g(z) \rightarrow g(z'_0)$$

is an α which maps to w under δ . Finally, if y and z are deformations of y_0 and z_0 and there exists an isomorphism $\phi : f(y) \rightarrow g(z)$ of deformations of $f(y_0) = x_0 = g(z_0)$ then we get a preimage $w = (k[\epsilon], y, z, \phi)$ of (x, y) in $T\mathcal{W}$. This finishes the proof. \square

68.19. Groupoids in functors on an arbitrary category

We begin with generalities on groupoids in functors on an arbitrary category. In the next section we will pass to the category \mathcal{C}_Λ . For clarity we shall sometimes refer to an ordinary groupoid, i.e., a category whose morphisms are all isomorphisms, as a groupoid category.

Definition 68.19.1. Let \mathcal{C} be a category. The *category of groupoids in functors on \mathcal{C}* is the category with the following objects and morphisms.

- (1) Objects: A *groupoid in functors on \mathcal{C}* is a quintuple (U, R, s, t, c) where $U, R : \mathcal{C} \rightarrow \mathbf{Sets}$ are functors and $s, t : R \rightarrow U$ and $c : R \times_{s, U, t} R \rightarrow R$ are morphisms with the following property: For any object T of \mathcal{C} , the quintuple

$$(U(T), R(T), s, t, c)$$

is a groupoid category.

- (2) Morphisms: A *morphism* $(U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of *groupoids in functors on \mathcal{C}* consists of morphisms $U \rightarrow U'$ and $R \rightarrow R'$ with the following property: For any object T of \mathcal{C} , the induced maps $U(T) \rightarrow U'(T)$ and $R(T) \rightarrow R'(T)$ define a functor between groupoid categories

$$(U(T), R(T), s, t, c) \rightarrow (U'(T), R'(T), s', t', c').$$

Remark 68.19.2. A groupoid in functors on \mathcal{C} amounts to the data of a functor $\mathcal{C} \rightarrow \mathbf{Groupoids}$, and a morphism of groupoids in functors on \mathcal{C} amounts to a morphism of the corresponding functors $\mathcal{C} \rightarrow \mathbf{Groupoids}$ (where *Groupoids* is regarded as a 1-category). However, for our purposes it is more convenient to use the terminology of groupoids in functors. In fact, thinking of a groupoid in functors as the corresponding functor $\mathcal{C} \rightarrow \mathbf{Groupoids}$, or equivalently as the category cofibered in groupoids associated to that functor, can lead to confusion (Remark 68.21.2).

Remark 68.19.3. Let (U, R, s, t, c) be a groupoid in functors on a category \mathcal{C} . There are unique morphisms $e : U \rightarrow R$ and $i : R \rightarrow R$ such that for every object T of \mathcal{C} , $e : U(T) \rightarrow R(T)$ sends $x \in U(T)$ to the identity morphism on x and $i : R(T) \rightarrow R(T)$ sends $a \in U(T)$ to the inverse of a in the groupoid category $(U(T), R(T), s, t, c)$. We will sometimes refer to s, t, c, e , and i as “source”, “target”, “composition”, “identity”, and “inverse”.

Definition 68.19.4. Let \mathcal{C} be a category. A groupoid in functors on \mathcal{C} is *representable* if it is isomorphic to one of the form $(\underline{U}, \underline{R}, s, t, c)$ where U and R are objects of \mathcal{C} and the pushout $R \amalg_{s, U, t} R$ exists.

Remark 68.19.5. Hence a representable groupoid in functors on \mathcal{C} is given by objects U and R of \mathcal{C} and morphisms $s, t : U \rightarrow R$ and $c : R \rightarrow R \amalg_{s,U,t} R$ such that $(\underline{U}, \underline{R}, s, t, c)$ satisfies the condition of Definition 68.19.1. The reason for requiring the existence of the pushout $R \amalg_{s,U,t} R$ is so that the composition morphism c is defined at the level of morphisms in \mathcal{C} . This requirement will always be satisfied below when we consider representable groupoids in functors on $\widehat{\mathcal{C}}_\Lambda$, since by Lemma 68.4.3 the category $\widehat{\mathcal{C}}_\Lambda$ admits pushouts.

Remark 68.19.6. We will say “let $(\underline{U}, \underline{R}, s, t, c)$ be a groupoid in functors on \mathcal{C} ” to mean that we have a representable groupoid in functors. Thus this means that U and R are objects of \mathcal{C} , there are morphisms $s, t : U \rightarrow R$, the pushout $R \amalg_{s,U,t} R$ exists, there is a morphism $c : R \rightarrow R \amalg_{s,U,t} R$, and $(\underline{U}, \underline{R}, s, t, c)$ is a groupoid in functors on \mathcal{C} .

We introduce notation for restriction of groupoids in functors. This will be relevant below in situations where we restrict from $\widehat{\mathcal{C}}_\Lambda$ to \mathcal{C}_Λ .

Definition 68.19.7. Let (U, R, s, t, c) be a groupoid in functors on a category \mathcal{C} . Let \mathcal{C}' be a subcategory of \mathcal{C} . The *restriction* $(U, R, s, t, c)|_{\mathcal{C}'}$ of (U, R, s, t, c) to \mathcal{C}' is the groupoid in functors on \mathcal{C}' given by $(U|_{\mathcal{C}'}, R|_{\mathcal{C}'}, s|_{\mathcal{C}'}, t|_{\mathcal{C}'}, c|_{\mathcal{C}'})$.

Remark 68.19.8. In the situation of Definition 68.19.7, we often denote $s|_{\mathcal{C}'}, t|_{\mathcal{C}'}, c|_{\mathcal{C}'}$ simply by s, t, c .

Definition 68.19.9. Let (U, R, s, t, c) be a groupoid in functors on a category \mathcal{C} .

- (1) The assignment $T \mapsto (U(T), R(T), s, t, c)$ determines a functor $\mathcal{C} \rightarrow \text{Groupoids}$. The *quotient category cofibered in groupoids* $[U/R] \rightarrow \mathcal{C}$ is the category cofibered in groupoids over \mathcal{C} associated to this functor (as in Remarks 68.5.2 (9)).
- (2) The *quotient morphism* $U \rightarrow [U/R]$ is the morphism of categories cofibered in groupoids over \mathcal{C} defined by the rules
 - (a) $x \in U(T)$ maps to the object $(T, x) \in \text{Ob}([U/R](T))$, and
 - (b) $x \in U(T)$ and $f : T \rightarrow T'$ give rise to the morphism $(f, \text{id}_{U(f)(x)}) : (T, x) \rightarrow (T', U(f)(x))$ lying over $f : T \rightarrow T'$.

68.20. Groupoids in functors on the base category

In this section we discuss groupoids in functors on \mathcal{C}_Λ . Our eventual goal is to show that prorepresentable groupoids in functors on \mathcal{C}_Λ serve as “presentations” for well-behaved deformation categories in the same way that smooth groupoids in algebraic spaces serve as presentations for algebraic stacks, cf. Algebraic Stacks, Section 71.16.

Definition 68.20.1. A groupoid in functors on \mathcal{C}_Λ is *prorepresentable* if it is isomorphic to $(\underline{R}_0, \underline{R}_1, s, t, c)|_{\mathcal{C}_\Lambda}$ for some representable groupoid in functors $(\underline{R}_0, \underline{R}_1, s, t, c)$ on the category $\widehat{\mathcal{C}}_\Lambda$.

Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ . Taking completions, we get a quintuple $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$. By Remark 68.7.10 completion as a functor on $\text{CofSet}(\mathcal{C}_\Lambda)$ is a right adjoint, so it commutes with limits. In particular, there is a canonical isomorphism

$$R \widehat{\times}_{s,U,t} R \longrightarrow \widehat{R} \times_{\widehat{s}, \widehat{U}, \widehat{t}} \widehat{R},$$

so \widehat{c} can be regarded as a functor $\widehat{R} \times_{\widehat{s}, \widehat{U}, \widehat{t}} \widehat{R} \rightarrow \widehat{R}$. Then $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$ is a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$, with identity and inverse morphisms being the completions of those of (U, R, s, t, c) .

Definition 68.20.2. Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ . The *completion* $(U, R, s, t, c)^\wedge$ of (U, R, s, t, c) is the groupoid in functors $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$ on $\widehat{\mathcal{C}}_\Lambda$ described above.

Remark 68.20.3. Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ . Then there is a canonical isomorphism $(U, R, s, t, c)^\wedge|_{\mathcal{C}_\Lambda} \cong (U, R, s, t, c)$, see Remark 68.7.7. On the other hand, let (U, R, s, t, c) be a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$ such that $U, R : \widehat{\mathcal{C}}_\Lambda \rightarrow \text{Sets}$ both commute with limits, e.g. if U, R are representable. Then there is a canonical isomorphism $((U, R, s, t, c)|_{\mathcal{C}_\Lambda})^\wedge \cong (U, R, s, t, c)$. This follows from Remark 68.7.11.

Lemma 68.20.4. Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ .

- (1) (U, R, s, t, c) is prorepresentable if and only if its completion is representable as a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$.
- (2) (U, R, s, t, c) is prorepresentable if and only if U and R are prorepresentable.

Proof. Part (1) follows from Remark 68.20.3. For (2), the “only if” direction is clear from the definition of a prorepresentable groupoid in functors. Conversely, assume U and R are prorepresentable, say $U \cong \underline{R}_0|_{\mathcal{C}_\Lambda}$ and $R \cong \underline{R}_1|_{\mathcal{C}_\Lambda}$ for objects R_0 and R_1 of $\widehat{\mathcal{C}}_\Lambda$. Since $\underline{R}_0 \cong \widehat{\underline{R}_0|_{\mathcal{C}_\Lambda}}$ and $\underline{R}_1 \cong \widehat{\underline{R}_1|_{\mathcal{C}_\Lambda}}$ by Remark 68.7.11 we see that the completion $(U, R, s, t, c)^\wedge$ is a groupoid in functors of the form $(\underline{R}_0, \underline{R}_1, \widehat{s}, \widehat{t}, \widehat{c})$. By Lemma 68.4.3 the pushout $\underline{R}_1 \times_{\widehat{s}, \underline{R}_1, \widehat{t}} \underline{R}_1$ exists. Hence $(\underline{R}_0, \underline{R}_1, \widehat{s}, \widehat{t}, \widehat{c})$ is a representable groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$. Finally, the restriction $(\underline{R}_0, \underline{R}_1, s, t, c)|_{\mathcal{C}_\Lambda}$ gives back (U, R, s, t, c) by Remark 68.20.3 hence (U, R, s, t, c) is prorepresentable by definition. \square

68.21. Smooth groupoids in functors on the base category

The notion of smoothness for groupoids in functors on \mathcal{C}_Λ is defined as follows.

Definition 68.21.1. Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ . We say (U, R, s, t, c) is *smooth* if $s, t : R \rightarrow U$ are smooth.

Remark 68.21.2. We note that this terminology is potentially confusing: if (U, R, s, t, c) is a smooth groupoid in functors, then the quotient $[U/R]$ need not be a smooth category cofibred in groupoids as defined in Remark 68.8.9. However smoothness of (U, R, s, t, c) does imply (in fact is equivalent to) smoothness of the quotient morphism $U \rightarrow [U/R]$ as we shall see in Lemma 68.21.4.

Remark 68.21.3. Let $(\underline{R}_0, \underline{R}_1, s, t, c)|_{\mathcal{C}_\Lambda}$ be a prorepresentable groupoid in functors on \mathcal{C}_Λ . Then $(\underline{R}_0, \underline{R}_1, s, t, c)|_{\mathcal{C}_\Lambda}$ is smooth if and only if \underline{R}_1 is a power series over \underline{R}_0 via both s and t . This follows from Lemma 68.8.6.

Lemma 68.21.4. Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C}_Λ . The following are equivalent:

- (1) The groupoid in functors (U, R, s, t, c) is smooth.
- (2) The morphism $s : R \rightarrow U$ is smooth.

- (3) *The morphism $t : R \rightarrow U$ is smooth.*
- (4) *The quotient morphism $U \rightarrow [U/R]$ is smooth.*

Proof. Statement (2) is equivalent to (3) since the inverse $i : R \rightarrow R$ of (U, R, s, t, c) is an isomorphism and $t = s \circ i$. By definition (1) is equivalent to (2) and (3) together, hence it is equivalent to either of them individually.

Finally we prove (2) is equivalent to (4). Unwinding the definitions:

- (2) Smoothness of $s : R \rightarrow U$ amounts to the following condition: If $f : B \rightarrow A$ is a surjective ring map in \mathcal{C}_Λ , $a \in R(A)$, and $y \in U(B)$ such that $s(a) = U(f)(y)$, then there exists $a' \in R(B)$ such that $R(f)(a') = a$ and $s(a') = y$.
- (4) Smoothness of $U \rightarrow [U/R]$ amounts to the following condition: If $f : B \rightarrow A$ is a surjective ring map in \mathcal{C}_Λ and $(f, a) : (B, y) \rightarrow (A, x)$ is a morphism of $[U/R]$, then there exists $x' \in U(B)$ and $b \in R(B)$ with $s(b) = x'$, $t(b) = y$ such that $c(a, R(f)(b)) = e(x)$. Here $e : U \rightarrow R$ denotes the identity and the notation (f, a) is as in Remarks 68.5.2 (9); in particular $a \in R(A)$ with $s(a) = U(f)(y)$ and $t(a) = x$.

If (4) holds and f, a, y as in (2) are given, let $x = t(a)$ so that we have a morphism $(f, a) : (B, y) \rightarrow (A, x)$. Then (4) produces x' and b , and $a' = i(b)$ satisfies the requirements of (2). Conversely, assume (2) holds and let $(f, a) : (B, y) \rightarrow (A, x)$ as in (4) be given. Then (2) produces $a' \in R(B)$, and $x' = t(a')$ and $b = i(a')$ satisfy the requirements of (4). □

68.22. Deformation categories as quotients of groupoids in functors

We discuss conditions on a groupoid in functors on \mathcal{C}_Λ which guarantee that the quotient is a deformation category, and we calculate the tangent and infinitesimal automorphism spaces of such a quotient.

Lemma 68.22.1. *Let (U, R, s, t, c) be a smooth groupoid in functors on \mathcal{C}_Λ . Assume U and R satisfy (RS). Then $[U/R]$ satisfies (RS).*

Proof. Let

$$\begin{array}{ccc} & (A_2, x_2) & \\ & \downarrow (f_2, a_2) & \\ (A_1, x_1) & \xrightarrow{(f_1, a_1)} & (A, x) \end{array}$$

be a diagram in $[U/R]$ such that $f_2 : A_2 \rightarrow A$ is surjective. The notation is as in Remarks 68.5.2 (9). Hence $f_1 : A_1 \rightarrow A, f_2 : A_2 \rightarrow A$ are maps in \mathcal{C}_Λ , $x \in U(A)$, $x_1 \in U(A_1)$, $x_2 \in U(A_2)$, and $a_1, a_2 \in R(A)$ with $s(a_1) = U(f_1)(x_1)$, $t(a_1) = x$ and $s(a_2) = U(f_2)(x_2)$, $t(a_2) = x$. We construct a fiber product lying over $A_1 \times_A A_2$ for this diagram in $[U/R]$ as follows.

Let $a = c(i(a_1), a_2)$, where $i : R \rightarrow R$ is the inverse morphism. Then $a \in R(A)$, $x_2 \in U(A_2)$ and $s(a) = U(f_2)(x_2)$. Hence an element $(a, x_2) \in R(A) \times_{s, U(A), U(f_2)} U(A_2)$. By smoothness of $s : R \rightarrow U$ there is an element $\tilde{a} \in R(A_2)$ with $R(f_2)(\tilde{a}) = a$ and $s(\tilde{a}) = x_2$. In particular $U(f_2)(t(\tilde{a})) = t(a) = U(f_1)(x_1)$. Thus x_1 and $t(\tilde{a})$ define an element

$$(x_1, t(\tilde{a})) \in U(A_1) \times_{U(A)} U(A_2).$$

By the assumption that U satisfies (RS), we have an identification $U(A_1) \times_{U(A)} U(A_2) = U(A_1 \times_A A_2)$. Let us denote $x_1 \times t(\tilde{a}) \in U(A_1 \times_A A_2)$ the element corresponding to $(x_1, t(\tilde{a})) \in U(A_1) \times_{U(A)} U(A_2)$. Let p_1, p_2 be the projections of $A_1 \times_A A_2$. We claim

$$\begin{CD} (A_1 \times_A A_2, x_1 \times t(\tilde{a})) @>(p_2, i(\tilde{a}))>> (A_2, x_2) \\ @V(p_1, e(x_1))VV @VV(f_2, a_2)V \\ (A_1, x_1) @>(f_1, a_1)>> (A, x) \end{CD}$$

is a fiber square in $[U/R]$. (Note $e : U \rightarrow R$ denotes the identity.)

The diagram is commutative because $c(a_2, R(f_2)(i(\tilde{a}))) = c(a_2, i(a)) = a_1$. To check it is a fiber square, let

$$\begin{CD} (B, z) @>(g_2, b_2)>> (A_2, x_2) \\ @V(g_1, b_1)VV @VV(f_2, a_2)V \\ (A_1, x_1) @>(f_1, a_1)>> (A, x) \end{CD}$$

be a commutative diagram in $[U/R]$. We will show there is a unique morphism $(g, b) : (B, z) \rightarrow (A_1 \times_A A_2, x_1 \times t(\tilde{a}))$ compatible with the morphisms to (A_1, x_1) and (A_2, x_2) . We must take $g = (g_1, g_2) : B \rightarrow A_1 \times_A A_2$. Since by assumption R satisfies (RS), we have an identification $R(A_1 \times_A A_2) = R(A_1) \times_{R(A)} R(A_2)$. Hence we can write $b = (b'_1, b'_2)$ for some $b'_1 \in R(A_1)$, $b'_2 \in R(A_2)$ which agree in $R(A)$. Then $((g_1, g_2), (b'_1, b'_2)) : (B, z) \rightarrow (A_1 \times_A A_2, x_1 \times t(\tilde{a}))$ will commute with the projections if and only if $b'_1 = b_1$ and $b'_2 = c(\tilde{a}, b_2)$ proving unicity and existence. \square

Lemma 68.22.2. *Let (U, R, s, t, c) be a smooth groupoid in functors on \mathcal{C}_Λ . Assume U and R are deformation functors. Then:*

- (1) *The quotient $[U/R]$ is a deformation category.*
- (2) *The tangent space of $[U/R]$ is*

$$T[U/R] = \text{Coker}(ds - dt : TR \rightarrow TU).$$

- (3) *Let x_0 be the unique object of $[U/R](k)$. The space of infinitesimal automorphisms of $[U/R]$ is*

$$\text{Inf}_{x_0}([U/R]) = \text{Ker}(ds \oplus dt : TR \rightarrow TU \oplus TU).$$

Proof. Since U and R are deformation functors $[U/R]$ is a predeformation category. Since (RS) holds for deformation functors by definition we see that (RS) holds for $[U/R]$ by Lemma 68.22.1. Hence $[U/R]$ is a deformation category. Statements (2) and (3) follow directly from the definitions. \square

68.23. Presentations of categories cofibered in groupoids

A presentation is defined as follows.

Definition 68.23.1. Let \mathcal{F} be a category cofibered in groupoids over a category \mathcal{C} . Let (U, R, s, t, c) be a groupoid in functors on \mathcal{C} . A *presentation of \mathcal{F} by (U, R, s, t, c)* is an equivalence $\varphi : [U/R] \rightarrow \mathcal{F}$ of categories cofibered in groupoids over \mathcal{C} .

The following two general lemmas will be used to get presentations.

Lemma 68.23.2. *Let \mathcal{F} be category cofibered in groupoids over a category \mathcal{C} . Let $U : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Let $f : U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids over \mathcal{C} . Define R, s, t, c as follows:*

- (1) $R : \mathcal{C} \rightarrow \text{Sets}$ is the functor $U \times_{f, \mathcal{F}, f} U$.
- (2) $t, s : R \rightarrow U$ are the first and second projections, respectively.
- (3) $c : R \times_{s, U, t} R \rightarrow R$ is the morphism given by projection onto the first and last factors of $U \times_{f, \mathcal{F}, f} U \times_{f, \mathcal{F}, f} U$ under the canonical isomorphism $R \times_{s, U, t} R \rightarrow U \times_{f, \mathcal{F}, f} U \times_{f, \mathcal{F}, f} U$.

Then (U, R, s, t, c) is a groupoid in functors on \mathcal{C} .

Proof. Omitted. □

Lemma 68.23.3. *Let \mathcal{F} be category cofibered in groupoids over a category \mathcal{C} . Let $U : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Let $f : U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids over \mathcal{C} . Let (U, R, s, t, c) be the groupoid in functors on \mathcal{C} constructed from $f : U \rightarrow \mathcal{F}$ in Lemma 68.23.2. Then there is a natural morphism $[f] : [U/R] \rightarrow \mathcal{F}$ such that:*

- (1) $[f] : [U/R] \rightarrow \mathcal{F}$ is fully faithful.
- (2) $[f] : [U/R] \rightarrow \mathcal{F}$ is an equivalence if and only if $f : U \rightarrow \mathcal{F}$ is essentially surjective.

Proof. Omitted. □

68.24. Presentations of deformation categories

According to the next lemma, a smooth morphism from a predeformation functor to a predeformation category \mathcal{F} gives rise to a presentation of \mathcal{F} by a smooth groupoid in functors.

Lemma 68.24.1. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Let $U : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a functor. Let $f : U \rightarrow \mathcal{F}$ be a smooth morphism of categories cofibered in groupoids. Then:*

- (1) *If (U, R, s, t, c) is the groupoid in functors on \mathcal{C}_Λ constructed from $f : U \rightarrow \mathcal{F}$ in Lemma 68.23.2, then (U, R, s, t, c) is smooth.*
- (2) *If $f : U(k) \rightarrow \mathcal{F}(k)$ is essentially surjective, then the morphism $[f] : [U/R] \rightarrow \mathcal{F}$ of Lemma 68.23.3 is an equivalence.*

Proof. From the construction of Lemma 68.23.2 we have a commutative diagram

$$\begin{array}{ccc} R = U \times_{f, \mathcal{F}, f} U & \xrightarrow{s} & U \\ t \downarrow & & \downarrow f \\ U & \xrightarrow{f} & \mathcal{F} \end{array}$$

where t, s are the first and second projections. So t, s are smooth by Lemma 68.8.7. Hence (1) holds.

If the assumption of (2) holds, then by Lemma 68.8.8 the morphism $f : U \rightarrow \mathcal{F}$ is essentially surjective. Hence by Lemma 68.23.3 the morphism $[f] : [U/R] \rightarrow \mathcal{F}$ is an equivalence. □

Lemma 68.24.2. *Let \mathcal{F} be a deformation category. Let $U : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a deformation functor. Let $f : U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let u_0 be the unique element of $U(k)$. Then $U \times_{f, \mathcal{F}, f} U$ is a deformation functor with tangent space fitting into an exact sequence of k -vector spaces*

$$0 \rightarrow \text{Inf}_{f(u_0)}(\mathcal{F}) \rightarrow T(U \times_{f, \mathcal{F}, f} U) \rightarrow TU \oplus TU$$

Proof. Follows from Lemma 68.18.14 and the fact that $\text{Inf}_{u_0}(U) = (0)$. \square

Lemma 68.24.3. *Let \mathcal{F} be a deformation category. Let $U : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a prorepresentable functor. Let $f : U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let (U, R, s, t, c) be the groupoid in functors on \mathcal{C}_Λ constructed from $f : U \rightarrow \mathcal{F}$ in Lemma 68.23.2. Assume $\dim_k \text{Inf}_{x_0}(\mathcal{F})$ is finite for $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then (U, R, s, t, c) is prorepresentable.*

Proof. Note that U is a deformation functor by Example 68.15.10. By Lemma 68.24.2 we see that $R = U \times_{f, \mathcal{F}, f} U$ is a deformation functor whose tangent space $TR = T(U \times_{f, \mathcal{F}, f} U)$ sits in an exact sequence $0 \rightarrow \text{Inf}_{x_0}(\mathcal{F}) \rightarrow TR \rightarrow TU \oplus TU$. Since we have assumed the first space has finite dimension and since TU has finite dimension by Example 68.10.11 we see that $\dim TR < \infty$. The map $\gamma : \text{Der}_\Lambda(k, k) \rightarrow TR$ see (68.11.6.1) is injective because its composition with $TR \rightarrow TU$ is injective by Theorem 68.17.2 for the prorepresentable functor U . Thus R is prorepresentable by Theorem 68.17.2. It follows from Lemma 68.20.4 that (U, R, s, t, c) is prorepresentable. \square

Theorem 68.24.4. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Then \mathcal{F} admits a presentation by a smooth prorepresentable groupoid in functors on \mathcal{C}_Λ if and only if the following conditions hold:*

- (1) \mathcal{F} is a deformation category.
- (2) $\dim_k T\mathcal{F}$ is finite.
- (3) $\dim_k \text{Inf}_{x_0}(\mathcal{F})$ is finite for some $x_0 \in \text{Ob}(\mathcal{F}(k))$.

Proof. Recall that a prorepresentable functor is a deformation functor, see Example 68.15.10. Thus if \mathcal{F} is equivalent to a smooth prorepresentable groupoid in functors, then conditions (1), (2), and (3) follow from Lemma 68.22.2 (1), (2), and (3).

Conversely, assume conditions (1), (2), and (3) hold. Condition (1) implies that (S1) and (S2) are satisfied, see Lemma 68.15.6. By Lemma 68.12.4 there exists a versal formal object ξ . Setting $U = \underline{R}|_{\mathcal{C}_\Lambda}$ the associated map $\underline{\xi} : U \rightarrow \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let (U, R, s, t, c) be the groupoid in functors constructed in Lemma 68.23.2 from the map $\underline{\xi}$. By Lemma 68.24.1 we see that (U, R, s, t, c) is a smooth groupoid in functors and that $[U/R] \rightarrow \mathcal{F}$ is an equivalence. By Lemma 68.24.3 we see that (U, R, s, t, c) is prorepresentable. Hence $[U/R] \rightarrow \mathcal{F}$ is the desired presentation of \mathcal{F} . \square

68.25. Remarks regarding minimality

The main theorem of this chapter is Theorem 68.24.4 above. It describes completely those categories cofibered in groupoids over \mathcal{C}_Λ which have a presentation by a smooth prorepresentable groupoid in functors. In this section we briefly discuss how the minimality discussed in Sections 68.13 and 68.14 can be used to obtain a “minimal” smooth prorepresentable presentation.

Definition 68.25.1. Let (U, R, s, t, c) be a smooth prorepresentable groupoid in functors on \mathcal{C}_Λ .

- (1) We say (U, R, s, t, c) is *normalized* if the groupoid $(U(k[\epsilon]), R(k[\epsilon]), s, t, c)$ is totally disconnected, i.e., there are no morphisms between distinct objects.
- (2) We say (U, R, s, t, c) is *minimal* if the $U \rightarrow [U/R]$ is given by a minimal versal formal object of $[U/R]$.

The difference between the two notions is related to the difference between conditions (68.14.0.1) and (68.14.0.2) and disappears when $k' \subset k$ is separable. Also a normalized smooth prorepresentable groupoid in functors is minimal as the following lemma shows. Here is a precise statement.

Lemma 68.25.2. *Let (U, R, s, t, c) be a smooth prorepresentable groupoid in functors on \mathcal{C}_Λ .*

- (1) *(U, R, s, t, c) is normalized if and only if the morphism $U \rightarrow [U/R]$ induces an isomorphism on tangent spaces, and*
- (2) *(U, R, s, t, c) is minimal if and only if the kernel of $TU \rightarrow T[U/R]$ is contained in the image of $Der_\Lambda(k, k) \rightarrow TU$.*

Proof. Part (1) follows immediately from the definitions. To see part (2) set $\mathcal{F} = [U/R]$. Since \mathcal{F} has a presentation it is a deformation category, see Theorem 68.24.4. In particular it satisfies (RS), (S1), and (S2), see Lemma 68.15.6. Recall that minimal versal formal objects are unique up to isomorphism, see Lemma 68.13.5. By Theorem 68.14.5 a minimal versal object induces a map $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \rightarrow \mathcal{F}$ satisfying (68.14.0.2). Since $U \cong \underline{R}|_{\mathcal{C}_\Lambda}$ over \mathcal{F} we see that $TU \rightarrow T\mathcal{F} = T[U/R]$ satisfies the property as stated in the lemma. \square

The quotient of a minimal prorepresentable groupoid in functors on \mathcal{C}_Λ does not admit autoequivalences which are not automorphisms. To prove this, we first note the following lemma.

Lemma 68.25.3. *Let $U : \mathcal{C}_\Lambda \rightarrow \text{Sets}$ be a prorepresentable functor. Let $\varphi : U \rightarrow U$ be a morphism such that $d\varphi : TU \rightarrow TU$ is an isomorphism. Then φ is an isomorphism.*

Proof. If $U \cong \underline{R}|_{\mathcal{C}_\Lambda}$ for some $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$, then completing φ gives a morphism $\underline{R} \rightarrow \underline{R}$. If $f : R \rightarrow R$ is the corresponding morphism in $\widehat{\mathcal{C}}_\Lambda$, then f induces an isomorphism $Der_\Lambda(R, k) \rightarrow Der_\Lambda(R, k)$, see Example 68.10.14. In particular f is a surjection by Lemma 68.4.6. As a surjective endomorphism of a Noetherian ring is an isomorphism (see Algebra, Lemma 10.30.8) we conclude f , hence $\underline{R} \rightarrow \underline{R}$, hence $\varphi : U \rightarrow U$ is an isomorphism. \square

Lemma 68.25.4. *Let (U, R, s, t, c) be a minimal smooth prorepresentable groupoid in functors on \mathcal{C}_Λ . If $\varphi : [U/R] \rightarrow [U/R]$ is an equivalence of categories cofibered in groupoids, then φ is an isomorphism.*

Proof. A morphism $\varphi : [U/R] \rightarrow [U/R]$ is the same thing as a morphism $\varphi : (U, R, s, t, c) \rightarrow (U, R, s, t, c)$ of groupoids in functors over \mathcal{C}_Λ as defined in Definition 68.19.1. Denote $\phi : U \rightarrow U$ and $\psi : R \rightarrow R$ the corresponding morphisms. Because

the diagram

$$\begin{array}{ccc}
 & \text{Der}_\Lambda(k, k) & \\
 \swarrow \gamma & & \searrow \gamma \\
 TU & \xrightarrow{d\phi} & TU \\
 \downarrow & & \downarrow \\
 T[U/R] & \xrightarrow{d\varphi} & T[U/R]
 \end{array}$$

is commutative, since $d\varphi$ is bijective, and since we have the characterization of minimality in Lemma 68.25.2 we conclude that $d\phi$ is injective (hence bijective by dimension reasons). Thus $\phi : U \rightarrow U$ is an isomorphism by Lemma 68.25.3. We can use a similar argument, using the exact sequence

$$0 \rightarrow \text{Inf}_{x_0}([U/R]) \rightarrow TR \rightarrow TU \oplus TU$$

of Lemma 68.24.2 to prove that $\psi : R \rightarrow R$ is an isomorphism. But is also a consequence of the fact that $R = U \times_{[U/R]} U$ and that φ and ϕ are isomorphisms. \square

Lemma 68.25.5. *Let (U, R, s, t, c) and (U', R', s', t', c') be minimal smooth prorepresentable groupoids in functors on \mathcal{C}_Λ . If $\varphi : [U/R] \rightarrow [U'/R']$ is an equivalence of categories cofibered in groupoids, then φ is an isomorphism.*

Proof. Let $\psi : [U'/R'] \rightarrow [U/R]$ be a quasi-inverse to φ . Then $\psi \circ \varphi$ and $\varphi \circ \psi$ are isomorphisms by Lemma 68.25.4, hence φ and ψ are isomorphisms. \square

The following lemma summarizes some of the things we have seen earlier in this chapter.

Lemma 68.25.6. *Let \mathcal{F} be a deformation category such that $\dim_k T\mathcal{F} < \infty$ and $\dim_k \text{Inf}_{x_0}(\mathcal{F}) < \infty$ for some $x_0 \in \text{Ob}(\mathcal{F}(k))$. Then there exists a minimal versal formal object ξ of \mathcal{F} . Say ξ lies over $R \in \text{Ob}(\widehat{\mathcal{C}}_\Lambda)$. Let $U = \underline{R}|_{\mathcal{C}_\Lambda}$. Let $f = \underline{\xi} : U \rightarrow \mathcal{F}$ be the associated morphism. Let (U, R, s, t, c) be the groupoid in functors on \mathcal{C}_Λ constructed from $f : U \rightarrow \mathcal{F}$ in Lemma 68.23.2. Then (U, R, s, t, c) is a minimal smooth prorepresentable groupoid in functors on \mathcal{C}_Λ and there is an equivalence $[U/R] \rightarrow \mathcal{F}$.*

Proof. As \mathcal{F} is a deformation category it satisfies (S1) and (S2), see Lemma 68.15.6. By Lemma 68.12.4 there exists a versal formal object. By Lemma 68.13.5 there exists a minimal versal formal object ξ/R as in the statement of the lemma. Setting $U = \underline{R}|_{\mathcal{C}_\Lambda}$ the associated map $\underline{\xi} : U \rightarrow \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let (U, R, s, t, c) be the groupoid in functors constructed in Lemma 68.23.2 from the map $\underline{\xi}$. By Lemma 68.24.1 we see that (U, R, s, t, c) is a smooth groupoid in functors and that $[U/R] \rightarrow \mathcal{F}$ is an equivalence. By Lemma 68.24.3 we see that (U, R, s, t, c) is prorepresentable. Finally, (U, R, s, t, c) is minimal because $U \rightarrow [U/R] = \mathcal{F}$ corresponds to the minimal versal formal object ξ . \square

Presentations by minimal prorepresentable groupoids in functors satisfy the following uniqueness property.

Lemma 68.25.7. *Let \mathcal{F} be category cofibered in groupoids over \mathcal{C}_Λ . Assume there exist presentations of \mathcal{F} by minimal smooth prorepresentable groupoids in functors*

(U, R, s, t, c) and (U', R', s', t', c') . Then (U, R, s, t, c) and (U', R', s', t', c') are isomorphic.

Proof. Follows from Lemma 68.25.5 and the observation that a morphism $[U/R] \rightarrow [U'/R']$ is the same thing as a morphism of groupoids in functors (by our explicit construction of $[U/R]$ in Definition 68.19.9). \square

In summary we have proved the following theorem.

Theorem 68.25.8. *Let \mathcal{F} be a category cofibered in groupoids over \mathcal{C}_Λ . Consider the following conditions*

- (1) \mathcal{F} admits a presentation by a normalized smooth prorepresentable groupoid in functors on \mathcal{C}_Λ ,
- (2) \mathcal{F} admits a presentation by a smooth prorepresentable groupoid in functors on \mathcal{C}_Λ ,
- (3) \mathcal{F} admits a presentation by a minimal smooth prorepresentable groupoid in functors on \mathcal{C}_Λ , and
- (4) \mathcal{F} satisfies the following conditions
 - (a) \mathcal{F} is a deformation category.
 - (b) $\dim_k T\mathcal{F}$ is finite.
 - (c) $\dim_k \text{Inf}_{x_0}(\mathcal{F})$ is finite for some $x_0 \in \text{Ob}(\mathcal{F}(k))$.

Then (2), (3), (4) are equivalent and are implied by (1). If $k' \subset k$ is separable, then (1), (2), (3), (4) are all equivalent. Furthermore, the minimal smooth prorepresentable groupoids in functors which provide a presentation of \mathcal{F} are unique up to isomorphism.

Proof. We see that (1) implies (3) and is equivalent to (3) if $k' \subset k$ is separable from Lemma 68.25.2. It is clear that (3) implies (2). We see that (2) implies (4) by Theorem 68.24.4. We see that (4) implies (3) by Lemma 68.25.6. This proves all the implications. The final uniqueness statement follows from Lemma 68.25.7. \square

68.26. Change of residue field

In this section we quickly discuss what happens if we replace the residue field k by a finite extension. Let Λ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where k is a field. Throughout this whole chapter we have used \mathcal{C}_Λ to denote the category of Artinian local Λ -algebras whose residue field is identified with k , see Definition 68.3.1. However, since in this section we will discuss what happen when we change k we will instead use the notation $\mathcal{C}_{\Lambda, k}$ to indicate the dependence on k .

Situation 68.26.1. Let Λ be a Noetherian ring and let $\Lambda \rightarrow k \rightarrow l$ be a finite ring maps where k and l are fields. Thus $k \subset l$ is a finite extensions of fields. A typical object of $\mathcal{C}_{\Lambda, l}$ will be denoted B and a typical object of $\mathcal{C}_{\Lambda, k}$ will be denoted A . We define

$$(68.26.1.1) \quad \mathcal{C}_{\Lambda, l} \longrightarrow \mathcal{C}_{\Lambda, k}, \quad B \longmapsto B \times_l k$$

Given a category cofibered in groupoids $p : \mathcal{F} \rightarrow \mathcal{C}_{\Lambda, k}$ we obtain an associated category cofibered in groupoids

$$p_{l/k} : \mathcal{F}_{l/k} \longrightarrow \mathcal{C}_{\Lambda, l}$$

by setting $\mathcal{F}_{l/k}(B) = \mathcal{F}(B \times_l k)$.

The functor (68.26.1.1) makes sense: because $B \times_l k \subset B$ we have

$$\begin{aligned} [k : k'] \operatorname{length}_{B \times_l k}(B \times_l k) &= \operatorname{length}_\Lambda(B \times_l k) \\ &\leq \operatorname{length}_\Lambda(B) \\ &= [l : k'] \operatorname{length}_B(B) < \infty \end{aligned}$$

(see Lemma 68.3.4) hence $B \times_l k$ is Artinian (see Algebra, Lemma 10.51.6). Thus $B \times_l k$ is an Artinian local ring with residue field k . Note that (68.26.1.1) commutes with fibre products

$$(B_1 \times_B B_2) \times_l k = (B_1 \times_l k) \times_{(B \times_l k)} (B_2 \times_l k)$$

and transforms surjective ring maps into surjective ring maps. We use the “expensive” notation $\mathcal{F}_{l/k}$ to prevent confusion with the construction of Remark 68.6.4. Here are some elementary observations.

Lemma 68.26.2. *With notation and assumptions as in Situation 68.26.1.*

- (1) We have $\overline{\mathcal{F}_{l/k}} = (\overline{\mathcal{F}})_{l/k}$.
- (2) If \mathcal{F} is a predeformation category, then $\mathcal{F}_{l/k}$ is a predeformation category.
- (3) If \mathcal{F} satisfies (S1), then $\mathcal{F}_{l/k}$ satisfies (S1).
- (4) If \mathcal{F} satisfies (S2), then $\mathcal{F}_{l/k}$ satisfies (S2).
- (5) If \mathcal{F} satisfies (RS), then $\mathcal{F}_{l/k}$ satisfies (RS).

Proof. Part (1) is immediate from the definitions.

Since $\mathcal{F}_{l/k}(l) = \mathcal{F}(k)$ part (2) follows from the definition, see Definition 68.6.2.

Part (3) follows as the functor (68.26.1.1) commutes with fibre products and transforms surjective maps into surjective maps, see Definition 68.9.1.

Part (4). To see this consider a diagram

$$\begin{array}{ccc} & & l[\epsilon] \\ & & \downarrow \\ B & \longrightarrow & l \end{array}$$

in $\mathcal{C}_{\Lambda, l}$ as in Definition 68.9.1. Applying the functor (68.26.1.1) we obtain

$$\begin{array}{ccc} & & k[l\epsilon] \\ & & \downarrow \\ B \times_l k & \longrightarrow & k \end{array}$$

where $l\epsilon$ denotes the finite dimensional k -vector space $l\epsilon \subset l[\epsilon]$. According to Lemma 68.9.4 the condition of (S2) for \mathcal{F} also holds for this diagram. Hence (S2) holds for $\mathcal{F}_{l/k}$.

Part (5) follows from the characterization of (RS) in Lemma 68.15.4 part (2) and the fact that (68.26.1.1) commutes with fibre products. □

The following lemma applies in particular when \mathcal{F} satisfies (S2) and is a predeformation category, see Lemma 68.9.5.

Lemma 68.26.3. *With notation and assumptions as in Situation 68.26.1. Assume \mathcal{F} is a predeformation category and $\overline{\mathcal{F}}$ satisfies (S2). Then there is a canonical l -vector space isomorphism*

$$T\mathcal{F} \otimes_k l \longrightarrow T\mathcal{F}_{l/k}$$

of tangent spaces.

Proof. By Lemma 68.26.2 we may replace \mathcal{F} by $\overline{\mathcal{F}}$. Moreover we see that $T\mathcal{F}$, resp. $T\mathcal{F}_{l/k}$ has a canonical k -vector space structure, resp. l -vector space structure, see Lemma 68.11.2. Then

$$T\mathcal{F}_{l/k} = \mathcal{F}_{l/k}(l[\epsilon]) = \mathcal{F}(k[l\epsilon]) = T\mathcal{F} \otimes_k l$$

the last equality by Lemma 68.11.2. More generally, given a finite dimensional l -vector space V we have

$$\mathcal{F}_{l/k}(l[V]) = \mathcal{F}(k[V_k]) = T\mathcal{F} \otimes_k V_k$$

where V_k denotes V seen as a k -vector space. We conclude that the functors $V \mapsto \mathcal{F}_{l/k}(l[V])$ and $V \mapsto T\mathcal{F} \otimes_k V_k$ are canonically identified as functors to the category of sets. By Lemma 68.10.4 we see there is at most one way to turn either functor into an l -linear functor. Hence the isomorphisms are compatible with the l -vector space structures and we win. \square

Lemma 68.26.4. *With notation and assumptions as in Situation 68.26.1. Assume \mathcal{F} is a deformation category. Let $x_0 \in \text{Ob}(\mathcal{F}(k))$ and denote $x_{l,0}$ the corresponding object of $\mathcal{F}_{l/k}$ over l . Then there is a canonical l -vector space isomorphism*

$$\text{Inf}_{x_0}(\mathcal{F}) \otimes_k l \longrightarrow \text{Inf}_{x_{l,0}}(\mathcal{F}_{l/k})$$

of infinitesimal automorphism spaces.

Proof. Recall that the vector space structure on $\text{Inf}_{x_0}(\mathcal{F})$ comes from identifying it with the tangent space of the functor $\text{Aut}(x_0)$ which is defined on the category $\mathcal{C}_{k,k}$ of Artinian local k -algebras with residue field k . Similarly, $\text{Inf}_{x_{l,0}}(\mathcal{F}_{l/k})$ is the tangent space of $\text{Aut}(x_{l,0})$ which is defined on the category $\mathcal{C}_{l,l}$ of Artinian local l -algebras with residue field l . Unwinding the definitions we see that $\text{Aut}(x_{l,0})$ is the restriction of $\text{Aut}(x_0)_{l/k}$ (which lives on $\mathcal{C}_{k,l}$) to $\mathcal{C}_{l,l}$. Since there is no difference between the tangent space of $\text{Aut}(x_0)_{l/k}$ seen as a functor on $\mathcal{C}_{k,l}$ or $\mathcal{C}_{l,l}$, the lemma follows from Lemma 68.26.3 and the fact that $\text{Aut}(x_0)$ satisfies (RS) by Lemma 68.18.6 (whence we have (S2) by Lemma 68.15.6). \square

Lemma 68.26.5. *With notation and assumptions as in Situation 68.26.1. If $\mathcal{F} \rightarrow \mathcal{G}$ is a smooth morphism of categories cofibred in groupoids over $\mathcal{C}_{\Lambda,k}$, then $\mathcal{F}_{l/k} \rightarrow \mathcal{G}_{l/k}$ is a smooth morphism of categories cofibred in groupoids over $\mathcal{C}_{\Lambda,l}$.*

Proof. This follows immediately from the definitions and the fact that (68.26.1.1) preserves surjections. \square

There are many more things you can say about the relationship between \mathcal{F} and $\mathcal{F}_{l/k}$ (in particular about the relationship between versal deformations) and we will add these here as needed.

Deformation Theory

69.1. Introduction

The goal of this chapter is to give a (relatively) gentle introduction to deformation theory of modules, morphisms, etc. In this chapter we deal with those results that can be proven using the naive cotangent complex. In the chapter on the cotangent complex we will extend these results a little bit. The advanced reader may wish to consult the treatise by Illusie on this subject, see [Ill72].

69.2. Deformations of rings and the naive cotangent complex

In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a surjective ring map $A' \rightarrow A$ whose kernel is an ideal I of square zero. Moreover we assume given a ring map $A \rightarrow B$, a B -module N , and an A -module map $c : I \rightarrow N$. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

$$(69.2.0.1) \quad \begin{array}{ccccccccc} 0 & \longrightarrow & N & \longrightarrow & ? & \longrightarrow & B & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ & & c & & & & & & \\ 0 & \longrightarrow & I & \longrightarrow & A' & \longrightarrow & A & \longrightarrow & 0 \end{array}$$

and moreover how unique the solution is (if it exists). More precisely, we look for a surjection of A' -algebras $B' \rightarrow B$ whose kernel is identified with N such that $A' \rightarrow B'$ induces the given map c . We will say B' is a *solution* to (69.2.0.1).

Lemma 69.2.1. *Given a commutative diagram*

$$\begin{array}{ccccccccc} 0 & \longrightarrow & N_2 & \longrightarrow & B'_2 & \longrightarrow & B_2 & \longrightarrow & 0 \\ & & \nearrow & & \uparrow & & \nearrow & & \\ & & & & c_2 & & & & \\ 0 & \longrightarrow & I_2 & \longrightarrow & A'_2 & \longrightarrow & A_2 & \longrightarrow & 0 \\ & & \nearrow & & \nearrow & & \nearrow & & \\ 0 & \longrightarrow & N_1 & \longrightarrow & B'_1 & \longrightarrow & B_1 & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ & & c_1 & & & & & & \\ 0 & \longrightarrow & I_1 & \longrightarrow & A'_1 & \longrightarrow & A_1 & \longrightarrow & 0 \end{array}$$

with front and back solutions to (69.2.0.1) we have

- (1) *There exist a canonical element in $\text{Ext}_{B_1}^1(NL_{B_1/A_1}, N_2)$ whose vanishing is a necessary and sufficient condition for the existence of a ring map $B'_1 \rightarrow B'_2$ fitting into the diagram.*

- (2) If there exists a map $B'_1 \rightarrow B'_2$ fitting into the diagram the set of all such maps is a principal homogeneous space under $\text{Hom}_{B_1}(\Omega_{B_1/A_1}, N_2)$.

Proof. Let $E = B_1$ viewed as a set. Consider the surjection $A_1[E] \rightarrow B_1$ with kernel J used to define the naive cotangent complex by the formula

$$NL_{B_1/A_1} = (J/J^2 \rightarrow \Omega_{A_1[E]/A_1} \otimes_{A_1[E]} B_1)$$

in Algebra, Section 10.129. Since $\Omega_{A_1[E]/A_1} \otimes B_1$ is a free B_1 -module we have

$$\text{Ext}_{B_1}^1(NL_{B_1/A_1}, N_2) = \frac{\text{Hom}_{B_1}(J/J^2, N_2)}{\text{Hom}_{B_1}(\Omega_{A_1[E]/A_1} \otimes B_1, N_2)}$$

We will construct an obstruction in the module on the right. Let $J' = \text{Ker}(A'_1[E] \rightarrow B_1)$. Note that there is a surjection $J' \rightarrow J$ whose kernel is $I_1 A_1[E]$. For every $e \in E$ denote $x_e \in A_1[E]$ the corresponding variable. Choose a lift $y_e \in B'_1$ of the image of x_e in B_1 and a lift $z_e \in B'_2$ of the image of x_e in B_2 . These choices determine A'_1 -algebra maps

$$A'_1[E] \rightarrow B'_1 \quad \text{and} \quad A'_1[E] \rightarrow B'_2$$

The first of these gives a map $J' \rightarrow N_1$, $f' \mapsto f'(y_e)$ and the second gives a map $J' \rightarrow N_2$, $f' \mapsto f'(z_e)$. A calculation shows that these maps annihilate $(J')^2$. Because the left square of the diagram (involving c_1 and c_2) commutes we see that these maps agree on $I_1 A_1[E]$ as maps into N_2 . Observe that B'_1 is the pushout of $J' \rightarrow A'_1[B_1]$ and $J' \rightarrow N_1$. Thus, if the maps $J' \rightarrow N_1 \rightarrow N_2$ and $J' \rightarrow N_2$ agree, then we obtain a map $B'_1 \rightarrow B'_2$ fitting into the diagram. Thus we let the obstruction be the class of the map

$$J/J^2 \rightarrow N_2, \quad f \mapsto f'(z_e) - \nu(f'(y_e))$$

where $\nu : N_1 \rightarrow N_2$ is the given map and where $f' \in J'$ is a lift of f . This is well defined by our remarks above. Note that we have the freedom to modify our choices of z_e into $z_e + \delta_{2,e}$ and y_e into $y_e + \delta_{1,e}$ for some $\delta_{i,e} \in N_i$. This will modify the map above into

$$f \mapsto f'(z_e + \delta_{2,e}) - \nu(f'(y_e + \delta_{1,e})) = f'(z_e) - \nu(f'(z_e)) + \sum (\delta_{2,e} - \nu(\delta_{1,e})) \frac{\partial f}{\partial x_e}$$

This means exactly that we are modifying the map $J/J^2 \rightarrow N_2$ by the composition $J/J^2 \rightarrow \Omega_{A_1[E]/A_1} \otimes B_1 \rightarrow N_2$ where the second map sends dx_e to $\delta_{2,e} - \nu(\delta_{1,e})$. Thus our obstruction is well defined and is zero if and only if a lift exists.

Part (2) comes from the observation that given two maps $\varphi, \psi : B'_1 \rightarrow B'_2$ fitting into the diagram, then $\varphi - \psi$ factors through a map $D : B_1 \rightarrow N_2$ which is an A_1 -derivation:

$$\begin{aligned} D(fg) &= \varphi(f'g') - \psi(f'g') \\ &= \varphi(f')\varphi(g') - \psi(f')\psi(g') \\ &= (\varphi(f') - \psi(f'))\varphi(g') + \psi(f')(\varphi(g') - \psi(g')) \\ &= gD(f) + fD(g) \end{aligned}$$

Thus D corresponds to a unique B_1 -linear map $\Omega_{B_1/A_1} \rightarrow N_2$. Conversely, given such a linear map we get a derivation D and given a ring map $\psi : B'_1 \rightarrow B'_2$ fitting into the diagram the map $\psi + D$ is another ring map fitting into the diagram. \square

The naive cotangent complex isn't good enough to contain all information regarding obstructions to finding solutions to (69.2.0.1). However, if the ring map is a local complete intersection, then the obstruction vanishes. This is a kind of lifting result; observe that for syntomic ring maps we have proved a rather strong lifting result in Smoothing Ring Maps, Proposition 16.4.2.

Lemma 69.2.2. *If $A \rightarrow B$ is a local complete intersection ring map, then there exists a solution to (69.2.0.1).*

Proof. Write $B = A[x_1, \dots, x_n]/J$. Let $J' \subset A'[x_1, \dots, x_n]$ be the inverse image of J . Denote $I[x_1, \dots, x_n]$ the kernel of $A'[x_1, \dots, x_n] \rightarrow A[x_1, \dots, x_n]$. By More on Algebra, Lemma 15.22.5 we have $I[x_1, \dots, x_n] \cap (J')^2 = J'I[x_1, \dots, x_n] = JI[x_1, \dots, x_n]$. Hence we obtain a short exact sequence

$$0 \rightarrow I \otimes_A B \rightarrow J'/(J')^2 \rightarrow J/J^2 \rightarrow 0$$

Since J/J^2 is projective (More on Algebra, Lemma 15.22.3) we can choose a splitting of this sequence

$$J'/(J')^2 = I \otimes_A B \oplus J/J^2$$

Let $(J')^2 \subset J'' \subset J'$ be the elements which map to the second summand in the decomposition above. Then

$$0 \rightarrow I \otimes_A B \rightarrow A'[x_1, \dots, x_n]/J'' \rightarrow B \rightarrow 0$$

is a solution to (69.2.0.1) with $N = I \otimes_A B$. The general case is obtained by doing a pushout along the given map $I \otimes_A B \rightarrow N$. \square

Lemma 69.2.3. *If there exists a solution to (69.2.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_B^1(NL_{B/A}, N)$.*

Proof. We observe right away that given two solutions B'_1 and B'_2 to (69.2.0.1) we obtain by Lemma 69.2.1 an obstruction element $o(B'_1, B'_2) \in \text{Ext}_B^1(NL_{B/A}, N)$ to the existence of a map $B'_1 \rightarrow B'_2$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution B' and an element $\xi \in \text{Ext}_B^1(NL_{B/A}, N)$ we can find a second solution B'_ξ such that $o(B', B'_\xi) = \xi$.

Let $E = B$ viewed as a set. Consider the surjection $A[E] \rightarrow B$ with kernel J used to define the naive cotangent complex by the formula

$$NL_{B/A} = (J/J^2 \rightarrow \Omega_{A[E]/A} \otimes_{A[E]} B)$$

in Algebra, Section 10.129. Since $\Omega_{A[E]/A} \otimes B$ is a free B -module we have

$$\text{Ext}_B^1(NL_{B/A}, N) = \frac{\text{Hom}_B(J/J^2, N)}{\text{Hom}_B(\Omega_{A[E]/A} \otimes B, N)}$$

Thus we may represent ξ as the class of a morphism $\delta : J/J^2 \rightarrow N$.

For every $e \in E$ denote $x_e \in A[E]$ the corresponding variable. Choose a lift $y_e \in B'$ of the image of x_e in B . These choices determine an A' -algebra map $\varphi : A'[E] \rightarrow B'$. Let $J' = \text{Ker}(A'[E] \rightarrow B)$. Observe that φ induces a map $\varphi|_{J'} : J' \rightarrow N$ and that

B' is the pushout, as in the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & N & \longrightarrow & B' & \longrightarrow & B \longrightarrow 0 \\ & & \uparrow \varphi|_{J'} & & \uparrow & & \uparrow = \\ 0 & \longrightarrow & J' & \longrightarrow & A'[E] & \longrightarrow & B \longrightarrow 0 \end{array}$$

Let $\psi : J' \rightarrow N$ be the sum of the map $\varphi|_{J'}$ and the composition

$$J' \rightarrow J'/(J')^2 \rightarrow J/J^2 \xrightarrow{\delta} N.$$

Then the pushout along ψ is an other ring extension B'_ξ fitting into a diagram as above. A calculation shows that $o(B', B'_\xi) = \xi$ as desired. \square

Lemma 69.2.4. *Let A be a ring and let I be an A -module.*

- (1) *The set of extensions of rings $0 \rightarrow I \rightarrow A' \rightarrow A \rightarrow 0$ where I is an ideal of square zero is canonically bijective to $\text{Ext}_A^1(NL_{A/\mathbf{Z}}, I)$.*
- (2) *Given a ring map $A \rightarrow B$, a B -module N , an A -module map $c : I \rightarrow N$, and given extensions of rings with square zero kernels:*
 - (a) $0 \rightarrow I \rightarrow A' \rightarrow A \rightarrow 0$ corresponding to $\alpha \in \text{Ext}_A^1(NL_{A/\mathbf{Z}}, I)$, and
 - (b) $0 \rightarrow N \rightarrow B' \rightarrow B \rightarrow 0$ corresponding to $\beta \in \text{Ext}_B^1(NL_{B/\mathbf{Z}}, N)$*then there is a map $A' \rightarrow B'$ fitting into a diagram (69.2.0.1) if and only if β and α map to the same element of $\text{Ext}_A^1(NL_{A/\mathbf{Z}}, N)$.*

Proof. To prove this we apply the previous results where we work over $0 \rightarrow 0 \rightarrow \mathbf{Z} \rightarrow \mathbf{Z} \rightarrow 0$, in other words, we work over the extension of \mathbf{Z} by 0. Part (1) follows from Lemma 69.2.3 and the fact that there exists a solution, namely $I \oplus A$. Part (2) follows from Lemma 69.2.1 and a compatibility between the constructions in the proofs of Lemmas 69.2.3 and 69.2.1 whose statement and proof we omit. \square

69.3. Thickenings of ringed spaces

In the following few sections we will use the following notions:

- (1) A sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X'}$ on a ringed space $(X', \mathcal{O}_{X'})$ is *locally nilpotent* if any local section of \mathcal{I} is locally nilpotent. Compare with Algebra, Item 29.
- (2) A *thickening* of ringed spaces is a morphism $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ of ringed spaces such that
 - (a) i induces a homeomorphism $X \rightarrow X'$,
 - (b) the map $i^\# : \mathcal{O}_{X'} \rightarrow i_*\mathcal{O}_X$ is surjective, and
 - (c) the kernel of $i^\#$ is a locally nilpotent sheaf of ideals.
- (3) A *first order thickening* of ringed spaces is a thickening $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ of ringed spaces such that $\text{Ker}(i^\#)$ has square zero.
- (4) It is clear how to define *morphisms of thickenings*, *morphisms of thickenings over a base ringed space*, etc.

If $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ is a thickening of ringed spaces then we identify the underlying topological spaces and think of \mathcal{O}_X , $\mathcal{O}_{X'}$, and $\mathcal{I} = \text{Ker}(i^\#)$ as sheaves on $X = X'$. We obtain a short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$$

of $\mathcal{O}_{X'}$ -modules. By Modules, Lemma 17.13.4 the category of \mathcal{O}_X -modules is equivalent to the category of $\mathcal{O}_{X'}$ -modules annihilated by \mathcal{I} . In particular, if i is a first order thickening, then \mathcal{I} is a \mathcal{O}_X -module.

Situation 69.3.1. A morphism of thickenings (f, f') is given by a commutative diagram

$$(69.3.1.1) \quad \begin{array}{ccc} (X, \mathcal{O}_X) & \xrightarrow{i} & (X', \mathcal{O}_{X'}) \\ f \downarrow & & \downarrow f' \\ (S, \mathcal{O}_S) & \xrightarrow{t} & (S', \mathcal{O}_{S'}) \end{array}$$

of ringed spaces whose horizontal arrows are thickenings. In this situation we set $\mathcal{I} = \text{Ker}(i^\sharp) \subset \mathcal{O}_{X'}$ and $\mathcal{J} = \text{Ker}(t^\sharp) \subset \mathcal{O}_{S'}$. As $f = f'$ on underlying topological spaces we will identify the (topological) pullback functors f^{-1} and $(f')^{-1}$. Observe that $(f')^\sharp : f^{-1}\mathcal{O}_{S'} \rightarrow \mathcal{O}_{X'}$ induces in particular a map $f^{-1}\mathcal{J} \rightarrow \mathcal{I}$ and therefore a map of $\mathcal{O}_{X'}$ -modules

$$(f')^*\mathcal{J} \rightarrow \mathcal{I}$$

If i and t are first order thickenings, then $(f')^*\mathcal{J} = f^*\mathcal{J}$ and the map above becomes a map $f^*\mathcal{J} \rightarrow \mathcal{I}$.

Definition 69.3.2. In Situation 69.3.1 we say that (f, f') is a *strict morphism of thickenings* if the map $(f')^*\mathcal{J} \rightarrow \mathcal{I}$ is surjective.

The following lemma in particular shows that a morphism $(f, f') : (X \subset X') \rightarrow (S \subset S')$ of thickenings of schemes is strict if and only if $X = S \times_{S'} X'$.

Lemma 69.3.3. *In Situation 69.3.1 the morphism (f, f') is a strict morphism of thickenings if and only if (69.3.1.1) is cartesian in the category of ringed spaces.*

Proof. Omitted. □

69.4. Modules on first order thickenings of ringed spaces

In this section we discuss some preliminaries to the deformation theory of modules. Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. We will freely use the notation introduced in Section 69.3, in particular we will identify the underlying topological spaces. In this section we consider short exact sequences

$$(69.4.0.1) \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

of $\mathcal{O}_{X'}$ -modules, where \mathcal{F}, \mathcal{K} are \mathcal{O}_X -modules and \mathcal{F}' is an $\mathcal{O}_{X'}$ -module. In this situation we have a canonical \mathcal{O}_X -module map

$$c_{\mathcal{F}'} : \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}$$

where $\mathcal{I} = \text{Ker}(i^\sharp)$. Namely, given local sections f of \mathcal{I} and s of \mathcal{F} we set $c_{\mathcal{F}'}(f \otimes s) = fs'$ where s' is a local section of \mathcal{F}' lifting s .

Lemma 69.4.1. *Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Assume given extensions*

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

as in (69.4.0.1) and maps $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\psi : \mathcal{K} \rightarrow \mathcal{L}$.

- (1) If there exists an $\mathcal{O}_{X'}$ -module map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ , then the diagram

$$\begin{array}{ccc} \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_{\mathcal{F}'}} & \mathcal{K} \\ 1 \otimes \varphi \downarrow & & \downarrow \psi \\ \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{G} & \xrightarrow{c_{\mathcal{G}'}} & \mathcal{L} \end{array}$$

is commutative.

- (2) The set of $\mathcal{O}_{X'}$ -module maps $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ is, if nonempty, a principal homogeneous space under $\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{L})$.

Proof. Part (1) is immediate from the description of the maps. For (2), if φ' and φ'' are two maps $\mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ , then $\varphi' - \varphi''$ factors as

$$\mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{L} \rightarrow \mathcal{G}'$$

The map in the middle comes from a unique element of $\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{L})$ by Modules, Lemma 17.13.4. Conversely, given an element α of this group we can add the composition (as displayed above with α in the middle) to φ' . Some details omitted. \square

Lemma 69.4.2. Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Assume given extensions

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

as in (69.4.0.1) and maps $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\psi : \mathcal{K} \rightarrow \mathcal{L}$. Assume the diagram

$$\begin{array}{ccc} \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_{\mathcal{F}'}} & \mathcal{K} \\ 1 \otimes \varphi \downarrow & & \downarrow \psi \\ \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{G} & \xrightarrow{c_{\mathcal{G}'}} & \mathcal{L} \end{array}$$

is commutative. Then there exists an element

$$o(\varphi, \psi) \in \mathrm{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{L})$$

whose vanishing is a necessary and sufficient condition for the existence of a map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ .

Proof. We can construct explicitly an extension

$$0 \rightarrow \mathcal{L} \rightarrow \mathcal{H} \rightarrow \mathcal{F} \rightarrow 0$$

by taking \mathcal{H} to be the cohomology of the complex

$$\mathcal{K} \xrightarrow{1, -\psi} \mathcal{F}' \oplus \mathcal{G}' \xrightarrow{\varphi, 1} \mathcal{G}$$

in the middle (with obvious notation). A calculation with local sections using the assumption that the diagram of the lemma commutes shows that \mathcal{H} is annihilated by \mathcal{I} . Hence \mathcal{H} defines a class in

$$\mathrm{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{L}) \subset \mathrm{Ext}_{\mathcal{O}_{X'}}^1(\mathcal{F}, \mathcal{L})$$

Finally, the class of \mathcal{H} is the difference of the pushout of the extension \mathcal{F}' via ψ and the pullback of the extension \mathcal{G}' via φ (calculations omitted). Thus the vanishing

of the class of \mathcal{H} is equivalent to the existence of a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} & \longrightarrow & 0 \\ & & \downarrow \psi & & \downarrow \varphi' & & \downarrow \varphi & & \\ 0 & \longrightarrow & \mathcal{L} & \longrightarrow & \mathcal{G}' & \longrightarrow & \mathcal{G} & \longrightarrow & 0 \end{array}$$

as desired. □

Lemma 69.4.3. *Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Assume given \mathcal{O}_X -modules \mathcal{F}, \mathcal{K} and an \mathcal{O}_X -linear map $c : \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}$. If there exists a sequence (69.4.0.1) with $c_{\mathcal{F}'} = c$ then the set of isomorphism classes of these extensions is principal homogeneous under $\text{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{K})$.*

Proof. Assume given extensions

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}'_1 \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F} \rightarrow 0$$

with $c_{\mathcal{F}'_1} = c_{\mathcal{F}'_2} = c$. Then the difference (in the extension group, see Homology, Section 12.6) is an extension

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0$$

where \mathcal{E} is annihilated by \mathcal{I} (local computation omitted). Hence the sequence is an extension of \mathcal{O}_X -modules, see Modules, Lemma 17.13.4. Conversely, given such an extension \mathcal{E} we can add the extension \mathcal{E} to the $\mathcal{O}_{X'}$ -extension \mathcal{F}' without affecting the map $c_{\mathcal{F}'}$. Some details omitted. □

Lemma 69.4.4. *Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Assume given \mathcal{O}_X -modules \mathcal{F}, \mathcal{K} and an \mathcal{O}_X -linear map $c : \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}$. Then there exists an element*

$$o(\mathcal{F}, \mathcal{K}, c) \in \text{Ext}_{\mathcal{O}_X}^2(\mathcal{F}, \mathcal{K})$$

whose vanishing is a necessary and sufficient condition for the existence of a sequence (69.4.0.1) with $c_{\mathcal{F}'} = c$.

Proof. We first show that if \mathcal{K} is an injective \mathcal{O}_X -module, then there does exist a sequence (69.4.0.1) with $c_{\mathcal{F}'} = c$. To do this, choose a flat $\mathcal{O}_{X'}$ -module \mathcal{H}' and a surjection $\mathcal{H}' \rightarrow \mathcal{F}$ (Modules, Lemma 17.16.6). Let $\mathcal{J} \subset \mathcal{H}'$ be the kernel. Since \mathcal{H}' is flat we have

$$\mathcal{I} \otimes_{\mathcal{O}_{X'}} \mathcal{H}' = \mathcal{I}\mathcal{H}' \subset \mathcal{J} \subset \mathcal{H}'$$

Observe that the map

$$\mathcal{I}\mathcal{H}' = \mathcal{I} \otimes_{\mathcal{O}_{X'}} \mathcal{H}' \longrightarrow \mathcal{I} \otimes_{\mathcal{O}_{X'}} \mathcal{F} = \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$$

annihilates $\mathcal{I}\mathcal{J}$. Namely, if f is a local section of \mathcal{I} and s is a local section of \mathcal{H} , then fs is mapped to $f \otimes \bar{s}$ where \bar{s} is the image of s in \mathcal{F} . Thus we obtain

$$\begin{array}{ccc} \mathcal{I}\mathcal{H}' / \mathcal{I}\mathcal{J} & \longrightarrow & \mathcal{J} / \mathcal{I}\mathcal{J} \\ \downarrow & & \downarrow \gamma \\ \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c} & \mathcal{K} \end{array}$$

a diagram of \mathcal{O}_X -modules. If \mathcal{K} is injective as an \mathcal{O}_X -module, then we obtain the dotted arrow. Denote $\gamma' : \mathcal{J} \rightarrow \mathcal{K}$ the composition of γ with $\mathcal{J} \rightarrow \mathcal{J}/\mathcal{I}\mathcal{J}$. A local calculation shows the pushout

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{J} & \longrightarrow & \mathcal{H}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow \gamma' & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

is a solution to the problem posed by the lemma.

General case. Choose an embedding $\mathcal{K} \subset \mathcal{K}'$ with \mathcal{K}' an injective \mathcal{O}_X -module. Let \mathcal{Q} be the quotient, so that we have an exact sequence

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{K}' \rightarrow \mathcal{Q} \rightarrow 0$$

Denote $c' : \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}'$ be the composition. By the paragraph above there exists a sequence

$$0 \rightarrow \mathcal{K}' \rightarrow \mathcal{E}' \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.4.0.1) with $c_{\mathcal{E}'} = c'$. Note that c' composed with the map $\mathcal{K}' \rightarrow \mathcal{Q}$ is zero, hence the pushout of \mathcal{E}' by $\mathcal{K}' \rightarrow \mathcal{Q}$ is an extension

$$0 \rightarrow \mathcal{Q} \rightarrow \mathcal{D}' \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.4.0.1) with $c_{\mathcal{D}'} = 0$. This means exactly that \mathcal{D}' is annihilated by \mathcal{I} , in other words, the \mathcal{D}' is an extension of \mathcal{O}_X -modules, i.e., defines an element

$$o(\mathcal{F}, \mathcal{K}, c) \in \text{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{Q}) = \text{Ext}_{\mathcal{O}_X}^2(\mathcal{F}, \mathcal{K})$$

(the equality holds by the long exact cohomology sequence associated to the exact sequence above and the vanishing of higher ext groups into the injective module \mathcal{K}'). If $o(\mathcal{F}, \mathcal{K}, c) = 0$, then we can choose a splitting $s : \mathcal{F} \rightarrow \mathcal{D}'$ and we can set

$$\mathcal{F}' = \text{Ker}(\mathcal{E}' \rightarrow \mathcal{D}'/s(\mathcal{F}))$$

so that we obtain the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{K}' & \longrightarrow & \mathcal{E}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

with exact rows which shows that $c_{\mathcal{F}'} = c$. Conversely, if \mathcal{F}' exists, then the pushout of \mathcal{F}' by the map $\mathcal{K} \rightarrow \mathcal{K}'$ is isomorphic to \mathcal{E}' by Lemma 69.4.3 and the vanishing of higher ext groups into the injective module \mathcal{K}' . This gives a diagram as above, which implies that \mathcal{D}' is split as an extension, i.e., the class $o(\mathcal{F}, \mathcal{K}, c)$ is zero. \square

Remark 69.4.5. Let (X, \mathcal{O}_X) be a ringed space. A first order thickening $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ is said to be *trivial* if there exists a morphism of ringed spaces $\pi : (X', \mathcal{O}_{X'}) \rightarrow (X, \mathcal{O}_X)$ which is a left inverse to i . The choice of such a morphism π is called a *trivialization* of the first order thickening. Given π we obtain a splitting

$$(69.4.5.1) \quad \mathcal{O}_{X'} = \mathcal{O}_X \oplus \mathcal{I}$$

as sheaves of algebras on X by using π^\sharp to split the surjection $\mathcal{O}_{X'} \rightarrow \mathcal{O}_X$. Conversely, such a splitting determines a morphism π . The category of trivialized first order thickenings of (X, \mathcal{O}_X) is equivalent to the category of \mathcal{O}_X -modules.

Remark 69.4.6. Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a trivial first order thickening of ringed spaces and let $\pi : (X', \mathcal{O}_{X'}) \rightarrow (X, \mathcal{O}_X)$ be a trivialization. Then given any triple $(\mathcal{F}, \mathcal{K}, c)$ consisting of a pair of \mathcal{O}_X -modules and a map $c : \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}$ we may set

$$\mathcal{F}'_{c, \text{triv}} = \mathcal{F} \oplus \mathcal{K}$$

and use the splitting (69.4.5.1) associated to π and the map c to define the $\mathcal{O}_{X'}$ -module structure and obtain an extension (69.4.0.1). We will call $\mathcal{F}'_{c, \text{triv}}$ the *trivial extension* of \mathcal{F} by \mathcal{K} corresponding to c and the trivialization π . Given any extension \mathcal{F}' as in (69.4.0.1) we can use $\pi^\sharp : \mathcal{O}_X \rightarrow \mathcal{O}_{X'}$ to think of \mathcal{F}' as an \mathcal{O}_X -module extension, hence a class $\xi_{\mathcal{F}'}$ in $\text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K})$. Lemma 69.4.3 assures that $\mathcal{F}' \mapsto \xi_{\mathcal{F}'}$ induces a bijection

$$\left\{ \begin{array}{l} \text{isomorphism classes of extensions} \\ \mathcal{F}' \text{ as in (69.4.0.1) with } c = c_{\mathcal{F}'} \end{array} \right\} \rightarrow \text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K})$$

Moreover, the trivial extension $\mathcal{F}'_{c, \text{triv}}$ maps to the zero class.

Remark 69.4.7. Let (X, \mathcal{O}_X) be a ringed space. Let $(X, \mathcal{O}_X) \rightarrow (X'_i, \mathcal{O}_{X'_i})$, $i = 1, 2$ be first order thickenings with ideal sheaves \mathcal{I}_i . Let $h : (X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_2, \mathcal{O}_{X'_2})$ be a morphism of first order thickenings of (X, \mathcal{O}_X) . Picture

$$\begin{array}{ccc} & (X, \mathcal{O}_X) & \\ & \swarrow & \searrow \\ (X'_1, \mathcal{O}_{X'_1}) & \xrightarrow{h} & (X'_2, \mathcal{O}_{X'_2}) \end{array}$$

Observe that $h^\sharp : \mathcal{O}_{X'_2} \rightarrow \mathcal{O}_{X'_1}$ in particular induces an \mathcal{O}_X -module map $\mathcal{I}_2 \rightarrow \mathcal{I}_1$. Let \mathcal{F} be an \mathcal{O}_X -module. Let (\mathcal{K}_i, c_i) , $i = 1, 2$ be a pair consisting of an \mathcal{O}_X -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume furthermore given a map of \mathcal{O}_X -modules $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ such that

$$\begin{array}{ccc} \mathcal{I}_2 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\ \downarrow & & \downarrow \\ \mathcal{I}_1 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1 \end{array}$$

is commutative. Then there is a canonical functoriality

$$\left\{ \begin{array}{l} \mathcal{F}'_2 \text{ as in (69.4.0.1) with} \\ c_2 = c_{\mathcal{F}'_2} \text{ and } \mathcal{K} = \mathcal{K}_2 \end{array} \right\} \rightarrow \left\{ \begin{array}{l} \mathcal{F}'_1 \text{ as in (69.4.0.1) with} \\ c_1 = c_{\mathcal{F}'_1} \text{ and } \mathcal{K} = \mathcal{K}_1 \end{array} \right\}$$

Namely, thinking of all sheaves $\mathcal{O}_X, \mathcal{O}_{X'_i}, \mathcal{F}, \mathcal{K}_i$, etc as sheaves on X , we set given \mathcal{F}'_2 the sheaf \mathcal{F}'_1 equal to the pushout, i.e., fitting into the following diagram of extensions

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{K}_2 & \longrightarrow & \mathcal{F}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{K}_1 & \longrightarrow & \mathcal{F}'_1 & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

We omit the construction of the $\mathcal{O}_{X'_1}$ -module structure on the pushout (this uses the commutativity of the diagram involving c_1 and c_2).

Remark 69.4.8. Let (X, \mathcal{O}_X) , $(X, \mathcal{O}_X) \rightarrow (X'_i, \mathcal{O}_{X'_i})$, \mathcal{I}_i , and $h : (X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_2, \mathcal{O}_{X'_2})$ be as in Remark 69.4.7. Assume that we are given given trivializations $\pi_i : X'_i \rightarrow X$ such that $\pi_1 = h \circ \pi_2$. In other words, assume h is a morphism of trivialized first order thickening of (X, \mathcal{O}_X) . Let (\mathcal{K}_i, c_i) , $i = 1, 2$ be a pair consisting of an \mathcal{O}_X -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume furthermore given a map of \mathcal{O}_X -modules $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ such that

$$\begin{array}{ccc} \mathcal{I}_2 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\ \downarrow & & \downarrow \\ \mathcal{I}_1 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1 \end{array}$$

is commutative. In this situation the construction of Remark 69.4.6 induces a commutative diagram

$$\begin{array}{ccc} \{\mathcal{F}'_2 \text{ as in (69.4.0.1) with } c_2 = c_{\mathcal{F}'_2} \text{ and } \mathcal{K} = \mathcal{K}_2\} & \longrightarrow & \text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_2) \\ \downarrow & & \downarrow \\ \{\mathcal{F}'_1 \text{ as in (69.4.0.1) with } c_1 = c_{\mathcal{F}'_1} \text{ and } \mathcal{K} = \mathcal{K}_1\} & \longrightarrow & \text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_1) \end{array}$$

where the vertical map on the right is given by functoriality of Ext and the map $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ and the vertical map on the left is the one from Remark 69.4.7.

Remark 69.4.9. Let (X, \mathcal{O}_X) be a ringed space. We define a sequence of morphisms of first order thickenings

$$(X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_2, \mathcal{O}_{X'_2}) \rightarrow (X'_3, \mathcal{O}_{X'_3})$$

of (X, \mathcal{O}_X) to be a *complex* if the corresponding maps between the ideal sheaves \mathcal{I}_i give a complex of \mathcal{O}_X -modules $\mathcal{I}_3 \rightarrow \mathcal{I}_2 \rightarrow \mathcal{I}_1$ (i.e., the composition is zero). In this case the composition $(X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_3, \mathcal{O}_{X'_3})$ factors through $(X, \mathcal{O}_X) \rightarrow (X'_3, \mathcal{O}_{X'_3})$, i.e., the first order thickening $(X'_1, \mathcal{O}_{X'_1})$ of (X, \mathcal{O}_X) is trivial and comes with a canonical trivialization $\pi : (X'_1, \mathcal{O}_{X'_1}) \rightarrow (X, \mathcal{O}_X)$.

We say a sequence of morphisms of first order thickenings

$$(X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_2, \mathcal{O}_{X'_2}) \rightarrow (X'_3, \mathcal{O}_{X'_3})$$

of (X, \mathcal{O}_X) is a *short exact sequence* if the corresponding maps between ideal sheaves is a short exact sequence

$$0 \rightarrow \mathcal{I}_3 \rightarrow \mathcal{I}_2 \rightarrow \mathcal{I}_1 \rightarrow 0$$

of \mathcal{O}_X -modules.

Remark 69.4.10. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module. Let

$$(X'_1, \mathcal{O}_{X'_1}) \rightarrow (X'_2, \mathcal{O}_{X'_2}) \rightarrow (X'_3, \mathcal{O}_{X'_3})$$

be a complex first order thickenings of (X, \mathcal{O}_X) , see Remark 69.4.9. Let (\mathcal{K}_i, c_i) , $i = 1, 2, 3$ be pairs consisting of an \mathcal{O}_X -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume given a short exact sequence of \mathcal{O}_X -modules

$$0 \rightarrow \mathcal{K}_3 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{K}_1 \rightarrow 0$$

such that

$$\begin{array}{ccc}
 \mathcal{I}_2 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\
 \downarrow & & \downarrow \\
 \mathcal{I}_1 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 \mathcal{I}_3 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_3} & \mathcal{K}_3 \\
 \downarrow & & \downarrow \\
 \mathcal{I}_2 \otimes_{\mathcal{O}_X} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2
 \end{array}$$

are commutative. Finally, assume given an extension

$$0 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.4.0.1) with $\mathcal{K} = \mathcal{K}_2$ of $\mathcal{O}_{X'_2}$ -modules with $c_{\mathcal{F}'_2} = c_2$. In this situation we can apply the functoriality of Remark 69.4.7 to obtain an extension \mathcal{F}'_1 on X'_1 (we'll describe \mathcal{F}'_1 in this special case below). By Remark 69.4.6 using the canonical splitting $\pi : (X'_1, \mathcal{O}_{X'_1}) \rightarrow (X, \mathcal{O}_X)$ of Remark 69.4.9 we obtain $\xi_{\mathcal{F}'_1} \in \text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_1)$. Finally, we have the obstruction

$$o(\mathcal{F}, \mathcal{K}_3, c_3) \in \text{Ext}^2_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_3)$$

see Lemma 69.4.4. In this situation we **claim** that the canonical map

$$\partial : \text{Ext}^1_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_1) \longrightarrow \text{Ext}^2_{\mathcal{O}_X}(\mathcal{F}, \mathcal{K}_3)$$

coming from the short exact sequence $0 \rightarrow \mathcal{K}_3 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{K}_1 \rightarrow 0$ sends $\xi_{\mathcal{F}'_1}$ to the obstruction class $o(\mathcal{F}, \mathcal{K}_3, c_3)$.

To prove this claim choose an embedding $j : \mathcal{K}_3 \rightarrow \mathcal{K}$ where \mathcal{K} is an injective \mathcal{O}_X -module. We can lift j to a map $j' : \mathcal{K}_2 \rightarrow \mathcal{K}$. Set $\mathcal{E}'_2 = j'_* \mathcal{F}'_2$ equal to the pushout of \mathcal{F}'_2 by j' so that $c_{\mathcal{E}'_2} = j' \circ c_2$. Picture:

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \mathcal{K}_2 & \longrightarrow & \mathcal{F}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\
 & & \downarrow j' & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{E}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0
 \end{array}$$

Set $\mathcal{E}'_3 = \mathcal{E}'_2$ but viewed as an $\mathcal{O}_{X'_3}$ -module via $\mathcal{O}_{X'_3} \rightarrow \mathcal{O}_{X'_2}$. Then $c_{\mathcal{E}'_3} = j \circ c_3$. The proof of Lemma 69.4.4 constructs $o(\mathcal{F}, \mathcal{K}_3, c_3)$ as the boundary of the class of the extension of \mathcal{O}_X -modules

$$0 \rightarrow \mathcal{K}/\mathcal{K}_3 \rightarrow \mathcal{E}'_3/\mathcal{K}_3 \rightarrow \mathcal{F} \rightarrow 0$$

On the other hand, note that $\mathcal{F}'_1 = \mathcal{F}'_2/\mathcal{K}_3$ hence the class $\xi_{\mathcal{F}'_1}$ is the class of the extension

$$0 \rightarrow \mathcal{K}_2/\mathcal{K}_3 \rightarrow \mathcal{F}'_2/\mathcal{K}_3 \rightarrow \mathcal{F} \rightarrow 0$$

seen as a sequence of \mathcal{O}_X -modules using $\pi^\#$ where $\pi : (X'_1, \mathcal{O}_{X'_1}) \rightarrow (X, \mathcal{O}_X)$ is the canonical splitting. Thus finally, the claim follows from the fact that we have a commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \mathcal{K}_2/\mathcal{K}_3 & \longrightarrow & \mathcal{F}'_2/\mathcal{K}_3 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \mathcal{K}/\mathcal{K}_3 & \longrightarrow & \mathcal{E}'_3/\mathcal{K}_3 & \longrightarrow & \mathcal{F} \longrightarrow 0
 \end{array}$$

which is \mathcal{O}_X -linear (with the \mathcal{O}_X -module structures given above).

69.5. Infinitesimal deformations of modules on ringed spaces

Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. We freely use the notation introduced in Section 69.3. Let \mathcal{F}' be an $\mathcal{O}_{X'}$ -module and set $\mathcal{F} = i^*\mathcal{F}'$. In this situation we have a short exact sequence

$$0 \rightarrow \mathcal{I}\mathcal{F}' \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

of $\mathcal{O}_{X'}$ -modules. Since $\mathcal{I}^2 = 0$ the $\mathcal{O}_{X'}$ -module structure on $\mathcal{I}\mathcal{F}'$ comes from a unique \mathcal{O}_X -module structure. Thus the sequence above is an extension as in (69.4.0.1). As a special case, if $\mathcal{F}' = \mathcal{O}_{X'}$ we have $i^*\mathcal{O}_{X'} = \mathcal{O}_X$ and $\mathcal{I}\mathcal{O}_{X'} = \mathcal{I}$ and we recover the sequence of structure sheaves

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$$

Lemma 69.5.1. *Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Let \mathcal{F}' , \mathcal{G}' be $\mathcal{O}_{X'}$ -modules. Set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -linear map. The set of lifts of φ to an $\mathcal{O}_{X'}$ -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ is, if nonempty, a principal homogeneous space under $\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{I}\mathcal{G}')$.*

Proof. This is a special case of Lemma 69.4.1 but we also give a direct proof. We have short exact sequences of modules

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{I}\mathcal{G}' \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

and similarly for \mathcal{F}' . Since \mathcal{I} has square zero the $\mathcal{O}_{X'}$ -module structure on \mathcal{I} and $\mathcal{I}\mathcal{G}'$ comes from a unique \mathcal{O}_X -module structure. It follows that

$$\mathrm{Hom}_{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{I}\mathcal{G}') \quad \text{and} \quad \mathrm{Hom}_{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{G}') = \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$$

The lemma now follows from the exact sequence

$$0 \rightarrow \mathrm{Hom}_{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{I}\mathcal{G}') \rightarrow \mathrm{Hom}_{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{G}') \rightarrow \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$$

see Homology, Lemma 12.5.8. □

Lemma 69.5.2. *Let (f, f') be a morphism of first order thickenings of ringed spaces as in Situation 69.3.1. Let \mathcal{F}' be an $\mathcal{O}_{X'}$ -module and set $\mathcal{F} = i^*\mathcal{F}'$. Assume that \mathcal{F} is flat over S and that (f, f') is a strict morphism of thickenings (Definition 69.3.2). Then the following are equivalent*

- (1) \mathcal{F}' is flat over S' , and
- (2) the canonical map $f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$ is an isomorphism.

Moreover, in this case the maps

$$f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$$

are isomorphisms.

Proof. The map $f^*\mathcal{J} \rightarrow \mathcal{I}$ is surjective as (f, f') is a strict morphism of thickenings. Hence the final statement is a consequence of (2).

Proof of the equivalence of (1) and (2). We may check these conditions at stalks. Let $x \in X \subset X'$ be a point with image $s = f(x) \in S \subset S'$. Set $A' = \mathcal{O}_{S',s}$, $B' = \mathcal{O}_{X',x}$, $A = \mathcal{O}_{S,s}$, and $B = \mathcal{O}_{X,x}$. Then $A = A'/J$ and $B = B'/I$ for some square zero ideals. Since (f, f') is a strict morphism of thickenings we have $I = JB'$. Let $M' = \mathcal{F}'_x$ and $M = \mathcal{F}_x$. Then M' is a B' -module and M is a B -module. Since

$\mathcal{F} = i^*\mathcal{F}'$ we see that the kernel of the surjection $M' \rightarrow M$ is $IM' = JM'$. Thus we have a short exact sequence

$$0 \rightarrow JM' \rightarrow M' \rightarrow M \rightarrow 0$$

Using Sheaves, Lemma 6.26.4 and Modules, Lemma 17.15.1 to identify stalks of pullbacks and tensor products we see that the stalk at x of the canonical map of the lemma is the map

$$(J \otimes_A B) \otimes_B M = J \otimes_A M = J \otimes_{A'} M' \longrightarrow JM'$$

The assumption that \mathcal{F} is flat over S signifies that M is a flat A -module.

Assume (1). Flatness implies $\text{Tor}_1^{A'}(M', A) = 0$ by Algebra, Lemma 10.72.7. This means $J \otimes_{A'} M' \rightarrow M'$ is injective by Algebra, Remark 10.72.8. Hence $J \otimes_A M \rightarrow JM'$ is an isomorphism.

Assume (2). Then $J \otimes_{A'} M' \rightarrow M'$ is injective. Hence $\text{Tor}_1^{A'}(M', A) = 0$ by Algebra, Remark 10.72.8. Hence M' is flat over A' by Algebra, Lemma 10.95.8. \square

Lemma 69.5.3. *Let (f, f') be a morphism of first order thickenings as in Situation 69.3.1. Let \mathcal{F}' , \mathcal{G}' be $\mathcal{O}_{X'}$ -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -linear map. Assume that \mathcal{G}' is flat over S' and that (f, f') is a strict morphism of thickenings. The set of lifts of φ to an $\mathcal{O}_{X'}$ -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ is, if nonempty, a principal homogeneous space under*

$$\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_X} f^*\mathcal{J})$$

Proof. Combine Lemmas 69.5.1 and 69.5.2. \square

Lemma 69.5.4. *Let $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ be a first order thickening of ringed spaces. Let \mathcal{F}' , \mathcal{G}' be $\mathcal{O}_{X'}$ -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -linear map. There exists an element*

$$o(\varphi) \in \text{Ext}_{\mathcal{O}_X}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of φ to an $\mathcal{O}_{X'}$ -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$.

Proof. It is clear from the proof of Lemma 69.5.1 that the vanishing of the boundary of φ via the map

$$\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) = \text{Hom}_{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{G}) \longrightarrow \text{Ext}_{\mathcal{O}_{X'}}^1(\mathcal{F}', \mathcal{I}\mathcal{G}')$$

is a necessary and sufficient condition for the existence of a lift. We conclude as

$$\text{Ext}_{\mathcal{O}_{X'}}^1(\mathcal{F}', \mathcal{I}\mathcal{G}') = \text{Ext}_{\mathcal{O}_X}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

the adjointness of $i_* = Ri_*$ and Li^* on the derived category (Cohomology, Lemma 20.29.1). \square

Lemma 69.5.5. *Let (f, f') be a morphism of first order thickenings as in Situation 69.3.1. Let \mathcal{F}' , \mathcal{G}' be $\mathcal{O}_{X'}$ -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -linear map. Assume that \mathcal{F}' and \mathcal{G}' are flat over S' and that (f, f') is a strict morphism of thickenings. There exists an element*

$$o(\varphi) \in \text{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_X} f^*\mathcal{J})$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of φ to an $\mathcal{O}_{X'}$ -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$.

First proof. This follows from Lemma 69.5.4 as we claim that under the assumptions of the lemma we have

$$\mathrm{Ext}_{\mathcal{O}_X}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_X} f^*\mathcal{J})$$

Namely, we have $\mathcal{I}\mathcal{G}' = \mathcal{G} \otimes_{\mathcal{O}_X} f^*\mathcal{J}$ by Lemma 69.5.2. On the other hand, observe that

$$H^{-1}(Li^*\mathcal{F}') = \mathrm{Tor}_1^{\mathcal{O}_{X'}}(\mathcal{F}', \mathcal{O}_X)$$

(local computation omitted). Using the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$$

we see that this Tor_1 is computed by the kernel of the map $\mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$ which is zero by the final assertion of Lemma 69.5.2. Thus $\tau_{\geq -1}Li^*\mathcal{F}' = \mathcal{F}$. On the other hand, we have

$$\mathrm{Ext}_{\mathcal{O}_X}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Ext}_{\mathcal{O}_X}^1(\tau_{\geq -1}Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

by the dual of Derived Categories, Lemma 13.17.1. □

Second proof. We can apply Lemma 69.4.2 as follows. Note that $\mathcal{K} = \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$ and $\mathcal{L} = \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{G}$ by Lemma 69.5.2, that $c_{\mathcal{F}'} = 1 \otimes 1$ and $c_{\mathcal{G}'} = 1 \otimes 1$ and taking $\psi = 1 \otimes \varphi$ the diagram of the lemma commutes. Thus $o(\varphi) = o(\varphi, 1 \otimes \varphi)$ works. □

Lemma 69.5.6. *Let (f, f') be a morphism of first order thickenings as in Situation 69.3.1. Let \mathcal{F} be an \mathcal{O}_X -module. Assume (f, f') is a strict morphism of thickenings and \mathcal{F} flat over S . If there exists a pair (\mathcal{F}', α) consisting of an $\mathcal{O}_{X'}$ -module \mathcal{F}' flat over S' and an isomorphism $\alpha : i^*\mathcal{F}' \rightarrow \mathcal{F}$, then the set of isomorphism classes of such pairs is principal homogeneous under $\mathrm{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F})$.*

Proof. If we assume there exists one such module, then the canonical map

$$f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$$

is an isomorphism by Lemma 69.5.2. Apply Lemma 69.4.3 with $\mathcal{K} = \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$ and $c = 1$. By Lemma 69.5.2 the corresponding extensions \mathcal{F}' are all flat over S' . □

Lemma 69.5.7. *Let (f, f') be a morphism of first order thickenings as in Situation 69.3.1. Let \mathcal{F} be an \mathcal{O}_X -module. Assume (f, f') is a strict morphism of thickenings and \mathcal{F} flat over S . There exists an $\mathcal{O}_{X'}$ -module \mathcal{F}' flat over S' with $i^*\mathcal{F}' \cong \mathcal{F}$, if and only if*

- (1) *the canonical map $f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$ is an isomorphism, and*
- (2) *the class $o(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}, 1) \in \mathrm{Ext}_{\mathcal{O}_X}^2(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F})$ of Lemma 69.4.4 is zero.*

Proof. This follows immediately from the characterization of $\mathcal{O}_{X'}$ -modules flat over S' of Lemma 69.5.2 and Lemma 69.4.4. □

69.6. Application to flat modules on flat thickenings of ringed spaces

Consider a commutative diagram

$$\begin{array}{ccc} (X, \mathcal{O}_X) & \xrightarrow{i} & (X', \mathcal{O}_{X'}) \\ f \downarrow & & \downarrow f' \\ (S, \mathcal{O}_S) & \xrightarrow{t} & (S', \mathcal{O}_{S'}) \end{array}$$

of ringed spaces whose horizontal arrows are first order thickenings as in Situation 69.3.1. Set $\mathcal{I} = \text{Ker}(i^\#) \subset \mathcal{O}_{X'}$ and $\mathcal{J} = \text{Ker}(t^\#) \subset \mathcal{O}_{S'}$. Let \mathcal{F} be an \mathcal{O}_X -module. Assume that

- (1) (f, f') is a strict morphism of thickenings,
- (2) f' is flat, and
- (3) \mathcal{F} is flat over S .

Note that (1) + (2) imply that $\mathcal{I} = f^*\mathcal{J}$ (apply Lemma 69.5.2 to $\mathcal{O}_{X'}$). The theory of the preceding section is especially nice under these assumptions. We summarize the results already obtained in the following lemma.

Lemma 69.6.1. *In the situation above.*

- (1) *There exists an $\mathcal{O}_{X'}$ -module \mathcal{F}' flat over S' with $i^*\mathcal{F}' \cong \mathcal{F}$, if and only if the class $o(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F}, 1) \in \text{Ext}_{\mathcal{O}_X}^2(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F})$ of Lemma 69.4.4 is zero.*
- (2) *If such a module exists, then the set of isomorphism classes of lifts is principal homogeneous under $\text{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F})$.*
- (3) *Given a lift \mathcal{F}' , the set of automorphisms of \mathcal{F}' which pull back to $\text{id}_{\mathcal{F}}$ is canonically isomorphic to $\text{Ext}_{\mathcal{O}_X}^0(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}_X} \mathcal{F})$.*

Proof. Part (1) follows from Lemma 69.5.7 as we have seen above that $\mathcal{I} = f^*\mathcal{J}$. Part (2) follows from Lemma 69.5.6. Part (3) follows from Lemma 69.5.3. \square

Situation 69.6.2. Let $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$ be a morphism of ringed spaces. Consider a commutative diagram

$$\begin{array}{ccccc} (X'_1, \mathcal{O}'_1) & \xrightarrow{h} & (X'_2, \mathcal{O}'_2) & \longrightarrow & (X'_3, \mathcal{O}'_3) \\ f'_1 \downarrow & & f'_2 \downarrow & & f'_3 \downarrow \\ (S'_1, \mathcal{O}_{S'_1}) & \longrightarrow & (S'_2, \mathcal{O}_{S'_2}) & \longrightarrow & (S'_3, \mathcal{O}_{S'_3}) \end{array}$$

where (a) the top row is a short exact sequence of first order thickenings of X , (b) the lower row is a short exact sequence of first order thickenings of S , (c) each f'_i restricts to f , (d) each pair (f, f'_i) is a strict morphism of thickenings, and (e) each f'_i is flat. Finally, let \mathcal{F}'_2 be an \mathcal{O}'_2 -module flat over S'_2 and set $\mathcal{F} = \mathcal{F}'_2|_X$. Let $\pi : X'_1 \rightarrow X$ be the canonical splitting (Remark 69.4.9).

Lemma 69.6.3. *In Situation 69.6.2 the modules $\pi^*\mathcal{F}$ and $h^*\mathcal{F}'_2$ are \mathcal{O}'_1 -modules flat over S'_1 restricting to \mathcal{F} on X . Their difference (Lemma 69.6.1) is an element θ of $\text{Ext}_{\mathcal{O}_X}^1(\mathcal{F}, f^*\mathcal{J}_1 \otimes_{\mathcal{O}_X} \mathcal{F})$ whose boundary in $\text{Ext}_{\mathcal{O}_X}^2(\mathcal{F}, f^*\mathcal{J}_3 \otimes_{\mathcal{O}_X} \mathcal{F})$ equals the obstruction (Lemma 69.6.1) to lifting \mathcal{F} to an \mathcal{O}'_3 -module flat over S'_3 .*

Proof. Note that both $\pi^*\mathcal{F}$ and $h^*\mathcal{F}'_2$ restrict to \mathcal{F} on X and that the kernels of $\pi^*\mathcal{F} \rightarrow \mathcal{F}$ and $h^*\mathcal{F}'_2 \rightarrow \mathcal{F}$ are given by $f^*\mathcal{J}_1 \otimes_{\mathcal{O}_X} \mathcal{F}$. Hence flatness by Lemma 69.5.2. Taking the boundary makes sense as the sequence of modules

$$0 \rightarrow f^*\mathcal{J}_3 \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow f^*\mathcal{J}_2 \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow f^*\mathcal{J}_1 \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow 0$$

is short exact due to the assumptions in Situation 69.6.2 and the fact that \mathcal{F} is flat over S . The statement on the obstruction class is a direct translation of the result of Remark 69.4.10 to this particular situation. \square

69.7. Deformations of ringed spaces and the naive cotangent complex

In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a first order thickening $t : (S, \mathcal{O}_S) \rightarrow (S', \mathcal{O}_{S'})$ of ringed spaces. We denote $\mathcal{J} = \text{Ker}(t^\sharp)$ and we identify the underlying topological spaces of S and S' . Moreover we assume given a morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$, an \mathcal{O}_X -module \mathcal{G} , and an f -map $c : \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of modules (Sheaves, Definition 6.21.7 and Section 6.26). In this section we ask ourselves whether we can find the question mark fitting into the following diagram

$$(69.7.0.1) \quad \begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & ? & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \\ & & \uparrow c & & \uparrow & & \uparrow \\ 0 & \longrightarrow & \mathcal{J} & \longrightarrow & \mathcal{O}_{S'} & \longrightarrow & \mathcal{O}_S \longrightarrow 0 \end{array}$$

(where the vertical arrows are f -maps) and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ and a morphism of thickenings (f, f') as in (69.3.1.1) where $\text{Ker}(i^\sharp)$ is identified with \mathcal{G} such that $(f')^\sharp$ induces the given map c . We will say X' is a *solution* to (69.7.0.1).

Lemma 69.7.1. *Assume given a commutative diagram of morphisms ringed spaces*

$$(69.7.1.1) \quad \begin{array}{ccc} (X_2, \mathcal{O}_{X_2}) & \xrightarrow{i_2} & (X'_2, \mathcal{O}_{X'_2}) \\ & \searrow f_2 & \downarrow f'_2 \\ & (S_2, \mathcal{O}_{S_2}) & \xrightarrow{t_2} & (S'_2, \mathcal{O}_{S'_2}) \\ & \nearrow g & & \nearrow \\ (X_1, \mathcal{O}_{X_1}) & \xrightarrow{i_1} & (X'_1, \mathcal{O}_{X'_1}) \\ & \searrow f_1 & \downarrow f'_1 & \searrow \\ & (S_1, \mathcal{O}_{S_1}) & \xrightarrow{t_1} & (S'_1, \mathcal{O}_{S'_1}) \end{array}$$

whose horizontal arrows are first order thickenings. Set $\mathcal{G}_j = \text{Ker}(i_j^\sharp)$ and assume given a g -map $\nu : \mathcal{G}_1 \rightarrow \mathcal{G}_2$ of modules giving rise to the commutative diagram

$$(69.7.1.2) \quad \begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G}_2 & \longrightarrow & \mathcal{O}_{X'_2} & \longrightarrow & \mathcal{O}_{X_2} \longrightarrow 0 \\ & & \uparrow c_2 & & \uparrow & & \uparrow \\ 0 & \longrightarrow & \mathcal{J}_2 & \longrightarrow & \mathcal{O}_{S'_2} & \longrightarrow & \mathcal{O}_{S_2} \longrightarrow 0 \\ & & \nearrow \nu & & \nearrow & & \nearrow \\ 0 & \longrightarrow & \mathcal{G}_1 & \longrightarrow & \mathcal{O}_{X'_1} & \longrightarrow & \mathcal{O}_{X_1} \longrightarrow 0 \\ & & \uparrow c_1 & & \uparrow & & \uparrow \\ 0 & \longrightarrow & \mathcal{J}_1 & \longrightarrow & \mathcal{O}_{S'_1} & \longrightarrow & \mathcal{O}_{S_1} \longrightarrow 0 \end{array}$$

with front and back solutions to (69.7.0.1).

- (1) *There exist a canonical element in $\text{Ext}_{\mathcal{O}_{X_2}}^1(Lg^* NL_{X_1/S_1}, \mathcal{G}_2)$ whose vanishing is a necessary and sufficient condition for the existence of a morphism of ringed spaces $X'_2 \rightarrow X'_1$ fitting into (69.7.1.1) compatibly with ν .*
- (2) *If there exists a morphism $X'_2 \rightarrow X'_1$ fitting into (69.7.1.1) compatibly with ν the set of all such morphisms is a principal homogeneous space under*

$$\text{Hom}_{\mathcal{O}_{X_1}}(\Omega_{X_1/S_1}, g_* \mathcal{G}_2) = \text{Hom}_{\mathcal{O}_{X_2}}(g^* \Omega_{X_1/S_1}, \mathcal{G}_2) = \text{Ext}_{\mathcal{O}_{X_2}}^0(Lg^* NL_{X_1/S_1}, \mathcal{G}_2).$$

Proof. The naive cotangent complex NL_{X_1/S_1} is defined in Modules, Definition 17.24.4. The equalities in the last statement of the lemma follow from the fact that g^* is adjoint to g_* , the fact that $H^0(NL_{X_1/S_1}) = \Omega_{X_1/S_1}$ (by construction of the naive cotangent complex) and the fact that Lg^* is the left derived functor of g^* . Thus we will work with the groups $\text{Ext}_{\mathcal{O}_{X_2}}^k(Lg^* NL_{X_1/S_1}, \mathcal{G}_2)$, $k = 0, 1$ in the rest of the proof. We first argue that we can reduce to the case where the underlying topological spaces of all ringed spaces in the lemma is the same.

To do this, observe that $g^{-1} NL_{X_1/S_1}$ is equal to the naive cotangent complex of the homomorphism of sheaves of rings $g^{-1} f_1^{-1} \mathcal{O}_{S_1} \rightarrow g^{-1} \mathcal{O}_{X_1}$, see Modules, Lemma 17.24.3. Moreover, the degree 0 term of NL_{X_1/S_1} is a flat \mathcal{O}_{X_1} -module, hence the canonical map

$$Lg^* NL_{X_1/S_1} \longrightarrow g^{-1} NL_{X_1/S_1} \otimes_{g^{-1} \mathcal{O}_{X_1}} \mathcal{O}_{X_2}$$

induces an isomorphism on cohomology sheaves in degrees 0 and -1 . Thus we may replace the Ext groups of the lemma with

$$\text{Ext}_{g^{-1} \mathcal{O}_{X_1}}^k(g^{-1} NL_{X_1/S_1}, \mathcal{G}_2) = \text{Ext}_{g^{-1} \mathcal{O}_{X_1}}^k(NL_{g^{-1} \mathcal{O}_{X_1}/g^{-1} f_1^{-1} \mathcal{O}_{S_1}}, \mathcal{G}_2)$$

The set of morphism of ringed spaces $X'_2 \rightarrow X'_1$ fitting into (69.7.1.1) compatibly with ν is in one-to-one bijection with the set of homomorphisms of $g^{-1} f_1^{-1} \mathcal{O}_{S_1}$ -algebras $g^{-1} \mathcal{O}_{X'_1} \rightarrow \mathcal{O}_{X'_2}$ which are compatible with $f^\#$ and ν . In this way we see that we may assume we have a diagram (69.7.1.2) of sheaves on X and we are looking to find a homomorphism of sheaves of rings $\mathcal{O}_{X'_1} \rightarrow \mathcal{O}_{X'_2}$ fitting into it.

In the rest of the proof of the lemma we assume all underlying topological spaces are the same, i.e., we have a diagram (69.7.1.2) of sheaves on a space X and we are looking for homomorphisms of sheaves of rings $\mathcal{O}_{X'_1} \rightarrow \mathcal{O}_{X'_2}$ fitting into it. As ext groups we will use $\text{Ext}_{\mathcal{O}_{X_1}}^k(NL_{\mathcal{O}_{X_1}/\mathcal{O}_{S_1}}, \mathcal{G}_2)$, $k = 0, 1$.

Step 1. Construction of the obstruction class. Consider the sheaf of sets

$$\mathcal{E} = \mathcal{O}_{X'_1} \times_{\mathcal{O}_{X_2}} \mathcal{O}_{X'_2}$$

This comes with a surjective map $\alpha : \mathcal{E} \rightarrow \mathcal{O}_{X_1}$ and hence we can use $NL(\alpha)$ instead of $NL_{\mathcal{O}_{X_1}/\mathcal{O}_{S_1}}$, see Modules, Lemma 17.24.2. Set

$$\mathcal{I}' = \text{Ker}(\mathcal{O}_{S'_1}[\mathcal{E}] \rightarrow \mathcal{O}_{X_1}) \quad \text{and} \quad \mathcal{I} = \text{Ker}(\mathcal{O}_{S_1}[\mathcal{E}] \rightarrow \mathcal{O}_{X_1})$$

There is a surjection $\mathcal{I}' \rightarrow \mathcal{I}$ whose kernel is $\mathcal{J}_1 \mathcal{O}_{S'_1}[\mathcal{E}]$. We obtain two homomorphisms of $\mathcal{O}_{S'_2}$ -algebras

$$a : \mathcal{O}_{S'_1}[\mathcal{E}] \rightarrow \mathcal{O}_{X'_1} \quad \text{and} \quad b : \mathcal{O}_{S_1}[\mathcal{E}] \rightarrow \mathcal{O}_{X'_2}$$

which induce maps $a|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}_1$ and $b|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}_2$. Both a and b annihilate $(\mathcal{I}')^2$. Moreover a and b agree on $\mathcal{J}_1 \mathcal{O}_{S'_1}[\mathcal{E}]$ as maps into \mathcal{G}_2 because the left hand

square of (69.7.1.2) is commutative. Thus the difference $b|_{\mathcal{I}'} - \nu \circ a|_{\mathcal{I}'}$ induces a well defined \mathcal{O}_{X_1} -linear map

$$\xi : \mathcal{I}/\mathcal{I}^2 \longrightarrow \mathcal{G}_2$$

which sends the class of a local section f of \mathcal{I} to $a(f') - \nu(b(f'))$ where f' is a lift of f to a local section of \mathcal{I}' . We let $[\xi] \in \text{Ext}_{\mathcal{O}_{X_1}}^1(NL(\alpha), \mathcal{G}_2)$ be the image (see below).

Step 2. Vanishing of $[\xi]$ is necessary. Let us write $\Omega = \Omega_{\mathcal{O}_{S_1}[\mathcal{E}]/\mathcal{O}_{S_1}} \otimes_{\mathcal{O}_{S_1}[\mathcal{E}]} \mathcal{O}_{X_1}$. Observe that $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega)$ fits into a distinguished triangle

$$\Omega[0] \rightarrow NL(\alpha) \rightarrow \mathcal{I}/\mathcal{I}^2[1] \rightarrow \Omega[1]$$

Thus we see that $[\xi]$ is zero if and only if ξ is a composition $\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega \rightarrow \mathcal{G}_2$ for some map $\Omega \rightarrow \mathcal{G}_2$. Suppose there exists a homomorphisms of sheaves of rings $\varphi : \mathcal{O}_{X'_1} \rightarrow \mathcal{O}_{X'_2}$ fitting into (69.7.1.2). In this case consider the map $\mathcal{O}_{S'_1}[\mathcal{E}] \rightarrow \mathcal{G}_2$, $f' \mapsto b(f') - \varphi(a(f'))$. A calculation shows this annihilates $\mathcal{I}_1\mathcal{O}_{S'_1}[\mathcal{E}]$ and induces a derivation $\mathcal{O}_{S_1}[\mathcal{E}] \rightarrow \mathcal{G}_2$. The resulting linear map $\Omega \rightarrow \mathcal{G}_2$ witnesses the fact that $[\xi] = 0$ in this case.

Step 3. Vanishing of $[\xi]$ is sufficient. Let $\theta : \Omega \rightarrow \mathcal{G}_2$ be a \mathcal{O}_{X_1} -linear map such that ξ is equal to $\theta \circ (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega)$. Then a calculation shows that

$$b + \theta \circ d : \mathcal{O}_{S'_1}[\mathcal{E}] \rightarrow \mathcal{O}_{X'_2}$$

annihilates \mathcal{I}' and hence defines a map $\mathcal{O}_{X'_1} \rightarrow \mathcal{O}_{X'_2}$ fitting into (69.7.1.2).

Proof of (2) in the special case above. Omitted. Hint: This is exactly the same as the proof of (2) of Lemma 69.2.1. \square

Lemma 69.7.2. *Let X be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let \mathcal{G} be a \mathcal{B} -module. Let $\xi \in \text{Ext}_{\mathcal{B}}^1(NL_{\mathcal{B}/\mathcal{A}}, \mathcal{G})$. There exists a map of sheaves of sets $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ such that $\xi \in \text{Ext}_{\mathcal{B}}^1(NL(\alpha), \mathcal{G})$ is the class of a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$ (see proof for notation).*

Proof. Recall that given $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ such that $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$ is surjective with kernel \mathcal{I} the complex $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B})$ is canonically isomorphic to $NL_{\mathcal{B}/\mathcal{A}}$, see Modules, Lemma 17.24.2. Observe moreover, that $\Omega = \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{e \in \mathcal{E}(U)} \mathcal{B}(U)$. In other words, Ω is the free \mathcal{B} -module on the sheaf of sets \mathcal{E} and in particular there is a canonical map $\mathcal{E} \rightarrow \Omega$.

Having said this, pick some \mathcal{E} (for example $\mathcal{E} = \mathcal{B}$ as in the definition of the naive cotangent complex). The obstruction to writing ξ as the class of a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$ is an element in $\text{Ext}_{\mathcal{B}}^1(\Omega, \mathcal{G})$. Say this is represented by the extension $0 \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow \Omega \rightarrow 0$ of \mathcal{B} -modules. Consider the sheaf of sets $\mathcal{E}' = \mathcal{E} \times_{\Omega} \mathcal{H}$ which comes with an induced map $\alpha' : \mathcal{E}' \rightarrow \mathcal{B}$. Let $\mathcal{I}' = \text{Ker}(\mathcal{A}[\mathcal{E}'] \rightarrow \mathcal{B})$ and $\Omega' = \Omega_{\mathcal{A}[\mathcal{E}']/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}']} \mathcal{B}$. The pullback of ξ under the quasi-isomorphism $NL(\alpha') \rightarrow NL(\alpha)$ maps to zero in $\text{Ext}_{\mathcal{B}}^1(\Omega', \mathcal{G})$ because the pullback of the extension \mathcal{H} by the map $\Omega' \rightarrow \Omega$ is split as Ω' is the free \mathcal{B} -module on the sheaf of sets \mathcal{E}' and since by construction there is a commutative diagram

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \mathcal{E} \\ \downarrow & & \downarrow \\ \mathcal{H} & \longrightarrow & \Omega \end{array}$$

This finishes the proof. \square

Lemma 69.7.3. *If there exists a solution to (69.7.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_{\mathcal{O}_X}^1(NL_{X/S}, \mathcal{G})$.*

Proof. We observe right away that given two solutions X'_1 and X'_2 to (69.7.0.1) we obtain by Lemma 69.7.1 an obstruction element $o(X'_1, X'_2) \in \text{Ext}_{\mathcal{O}_X}^1(NL_{X/S}, \mathcal{G})$ to the existence of a map $X'_1 \rightarrow X'_2$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution X' and an element $\xi \in \text{Ext}_{\mathcal{O}_X}^1(NL_{X/S}, \mathcal{G})$ we can find a second solution X'_ξ such that $o(X', X'_\xi) = \xi$.

Pick $\alpha : \mathcal{E} \rightarrow \mathcal{O}_X$ as in Lemma 69.7.2 for the class ξ . Consider the surjection $f^{-1}\mathcal{O}_S[\mathcal{E}] \rightarrow \mathcal{O}_X$ with kernel \mathcal{I} and corresponding naive cotangent complex $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{f^{-1}\mathcal{O}_S[\mathcal{E}]/f^{-1}\mathcal{O}_S} \otimes_{f^{-1}\mathcal{O}_S[\mathcal{E}]} \mathcal{O}_X)$. By the lemma ξ is the class of a morphism $\delta : \mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$. After replacing \mathcal{E} by $\mathcal{E} \times_{\mathcal{O}_X} \mathcal{O}_{X'}$ we may also assume that α factors through a map $\alpha' : \mathcal{E} \rightarrow \mathcal{O}_{X'}$.

These choices determine an $f^{-1}\mathcal{O}_{S'}$ -algebra map $\varphi : \mathcal{O}_{S'}[\mathcal{E}] \rightarrow \mathcal{O}_{X'}$. Let $\mathcal{I}' = \text{Ker}(\varphi)$. Observe that φ induces a map $\varphi|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}$ and that $\mathcal{O}_{X'}$ is the pushout, as in the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & \mathcal{O}_{X'} & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \\ & & \uparrow \varphi|_{\mathcal{I}'} & & \uparrow & & \uparrow = \\ 0 & \longrightarrow & \mathcal{I}' & \longrightarrow & f^{-1}\mathcal{O}_{S'}[\mathcal{E}] & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \end{array}$$

Let $\psi : \mathcal{I}' \rightarrow \mathcal{G}$ be the sum of the map $\varphi|_{\mathcal{I}'}$ and the composition

$$\mathcal{I}' \rightarrow \mathcal{I}'/(\mathcal{I}')^2 \rightarrow \mathcal{I}/\mathcal{I}^2 \xrightarrow{\delta} \mathcal{G}.$$

Then the pushout along ψ is an other ring extension $\mathcal{O}_{X'_\xi}$ fitting into a diagram as above. A calculation (omitted) shows that $o(X', X'_\xi) = \xi$ as desired. \square

Lemma 69.7.4. *Let (S, \mathcal{O}_S) be a ringed space and let \mathcal{J} be an \mathcal{O}_S -module.*

- (1) *The set of extensions of sheaves of rings $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{S'} \rightarrow \mathcal{O}_S \rightarrow 0$ where \mathcal{J} is an ideal of square zero is canonically bijective to $\text{Ext}_{\mathcal{O}_S}^1(NL_{S/\mathbf{Z}}, \mathcal{J})$.*
- (2) *Given a morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$, an \mathcal{O}_X -module \mathcal{G} , an f -map $c : \mathcal{J} \rightarrow \mathcal{G}$, and given extensions of sheaves of rings with square zero kernels:*
 - (a) $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{S'} \rightarrow \mathcal{O}_S \rightarrow 0$ corresponding to $\alpha \in \text{Ext}_{\mathcal{O}_S}^1(NL_{S/\mathbf{Z}}, \mathcal{J})$,
 - (b) $0 \rightarrow \mathcal{G} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$ corresponding to $\beta \in \text{Ext}_{\mathcal{O}_X}^1(NL_{X/\mathbf{Z}}, \mathcal{G})$*then there is a morphism $X' \rightarrow S'$ fitting into a diagram (69.7.0.1) if and only if β and α map to the same element of $\text{Ext}_{\mathcal{O}_X}^1(Lf^*NL_{S/\mathbf{Z}}, \mathcal{G})$.*

Proof. To prove this we apply the previous results where we work over the base ringed space $(*, \mathbf{Z})$ with trivial thickening. Part (1) follows from Lemma 69.7.3 and the fact that there exists a solution, namely $\mathcal{J} \oplus \mathcal{O}_S$. Part (2) follows from Lemma 69.7.1 and a compatibility between the constructions in the proofs of Lemmas 69.7.3 and 69.7.1 whose statement and proof we omit. \square

69.8. Thickenings of ringed topoi

This section is the analogue of Section 69.3 for ringed topoi. In the following few sections we will use the following notions:

- (1) A sheaf of ideals $\mathcal{I} \subset \mathcal{O}'$ on a ringed topos $(Sh(\mathcal{D}), \mathcal{O}')$ is *locally nilpotent* if any local section of \mathcal{I} is locally nilpotent.
- (2) A *thickening* of ringed topoi is a morphism $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ of ringed topoi such that
 - (a) i_* is an equivalence $Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$,
 - (b) the map $i^\sharp : \mathcal{O}' \rightarrow i_*\mathcal{O}$ is surjective, and
 - (c) the kernel of i^\sharp is a locally nilpotent sheaf of ideals.
- (3) A *first order thickening* of ringed topoi is a thickening $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ of ringed topoi such that $\text{Ker}(i^\sharp)$ has square zero.
- (4) It is clear how to define *morphisms of thickenings of ringed topoi*, *morphisms of thickenings of ringed topoi over a base ringed topos*, etc.

If $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ is a thickening of ringed topoi then we identify the underlying topoi and think of \mathcal{O} , \mathcal{O}' , and $\mathcal{I} = \text{Ker}(i^\sharp)$ as sheaves on \mathcal{C} . We obtain a short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0$$

of \mathcal{O}' -modules. By Modules on Sites, Lemma 18.25.1 the category of \mathcal{O} -modules is equivalent to the category of \mathcal{O}' -modules annihilated by \mathcal{I} . In particular, if i is a first order thickening, then \mathcal{I} is a \mathcal{O} -module.

Situation 69.8.1. A morphism of thickenings of ringed topoi (f, f') is given by a commutative diagram

$$(69.8.1.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}), \mathcal{O}) & \xrightarrow{i} & (Sh(\mathcal{D}), \mathcal{O}') \\ f \downarrow & & \downarrow f' \\ (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}}) & \xrightarrow{t} & (Sh(\mathcal{B}'), \mathcal{O}_{\mathcal{B}'}) \end{array}$$

of ringed topoi whose horizontal arrows are thickenings. In this situation we set $\mathcal{I} = \text{Ker}(i^\sharp) \subset \mathcal{O}'$ and $\mathcal{J} = \text{Ker}(t^\sharp) \subset \mathcal{O}_{\mathcal{B}'}$. As $f = f'$ on underlying topoi we will identify the pullback functors f^{-1} and $(f')^{-1}$. Observe that $(f')^\sharp : f^{-1}\mathcal{O}_{\mathcal{B}'} \rightarrow \mathcal{O}'$ induces in particular a map $f^{-1}\mathcal{J} \rightarrow \mathcal{I}$ and therefore a map of \mathcal{O}' -modules

$$(f')^*\mathcal{J} \rightarrow \mathcal{I}$$

If i and t are first order thickenings, then $(f')^*\mathcal{J} = f^*\mathcal{J}$ and the map above becomes a map $f^*\mathcal{J} \rightarrow \mathcal{I}$.

Definition 69.8.2. In Situation 69.8.1 we say that (f, f') is a *strict morphism of thickenings* if the map $(f')^*\mathcal{J} \rightarrow \mathcal{I}$ is surjective.

69.9. Modules on first order thickenings of ringed topoi

In this section we discuss some preliminaries to the deformation theory of modules. Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. We will freely use the notation introduced in Section 69.8, in particular we will identify the underlying topological topoi. In this section we consider short exact sequences

$$(69.9.0.1) \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

of \mathcal{O}' -modules, where \mathcal{F}, \mathcal{K} are \mathcal{O} -modules and \mathcal{F}' is an \mathcal{O}' -module. In this situation we have a canonical \mathcal{O} -module map

$$c_{\mathcal{F}'} : \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \longrightarrow \mathcal{K}$$

where $\mathcal{I} = \text{Ker}(i^\sharp)$. Namely, given local sections f of \mathcal{I} and s of \mathcal{F} we set $c_{\mathcal{F}'}(f \otimes s) = fs'$ where s' is a local section of \mathcal{F}' lifting s .

Lemma 69.9.1. *Let $i : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Assume given extensions*

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

as in (69.9.0.1) and maps $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\psi : \mathcal{K} \rightarrow \mathcal{L}$.

- (1) *If there exists an \mathcal{O}' -module map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ , then the diagram*

$$\begin{array}{ccc} \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_{\mathcal{F}'}} & \mathcal{K} \\ 1 \otimes \varphi \downarrow & & \downarrow \psi \\ \mathcal{I} \otimes_{\mathcal{O}} \mathcal{G} & \xrightarrow{c_{\mathcal{G}'}} & \mathcal{L} \end{array}$$

is commutative.

- (2) *The set of \mathcal{O}' -module maps $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ is, if nonempty, a principal homogeneous space under $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{L})$.*

Proof. Part (1) is immediate from the description of the maps. For (2), if φ' and φ'' are two maps $\mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ , then $\varphi' - \varphi''$ factors as

$$\mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{L} \rightarrow \mathcal{G}'$$

The map in the middle comes from a unique element of $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{L})$ by Modules on Sites, Lemma 18.25.1. Conversely, given an element α of this group we can add the composition (as displayed above with α in the middle) to φ' . Some details omitted. \square

Lemma 69.9.2. *Let $i : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Assume given extensions*

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

as in (69.9.0.1) and maps $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ and $\psi : \mathcal{K} \rightarrow \mathcal{L}$. Assume the diagram

$$\begin{array}{ccc} \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_{\mathcal{F}'}} & \mathcal{K} \\ 1 \otimes \varphi \downarrow & & \downarrow \psi \\ \mathcal{I} \otimes_{\mathcal{O}} \mathcal{G} & \xrightarrow{c_{\mathcal{G}'}} & \mathcal{L} \end{array}$$

is commutative. Then there exists an element

$$o(\varphi, \psi) \in \text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{L})$$

whose vanishing is a necessary and sufficient condition for the existence of a map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ compatible with φ and ψ .

Proof. We can construct explicitly an extension

$$0 \rightarrow \mathcal{L} \rightarrow \mathcal{H} \rightarrow \mathcal{F} \rightarrow 0$$

by taking \mathcal{H} to be the cohomology of the complex

$$\mathcal{K} \xrightarrow{1, -\psi} \mathcal{F}' \oplus \mathcal{G}' \xrightarrow{\varphi, 1} \mathcal{G}$$

in the middle (with obvious notation). A calculation with local sections using the assumption that the diagram of the lemma commutes shows that \mathcal{H} is annihilated by \mathcal{I} . Hence \mathcal{H} defines a class in

$$\text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{L}) \subset \text{Ext}_{\mathcal{O}'}^1(\mathcal{F}, \mathcal{L})$$

Finally, the class of \mathcal{H} is the difference of the pushout of the extension \mathcal{F}' via ψ and the pullback of the extension \mathcal{G}' via φ (calculations omitted). Thus the vanishing of the class of \mathcal{H} is equivalent to the existence of a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} & \longrightarrow & 0 \\ & & \downarrow \psi & & \downarrow \varphi' & & \downarrow \varphi & & \\ 0 & \longrightarrow & \mathcal{L} & \longrightarrow & \mathcal{G}' & \longrightarrow & \mathcal{G} & \longrightarrow & 0 \end{array}$$

as desired. □

Lemma 69.9.3. *Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Assume given \mathcal{O} -modules \mathcal{F}, \mathcal{K} and an \mathcal{O} -linear map $c : \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$. If there exists a sequence (69.9.0.1) with $c_{\mathcal{F}'} = c$ then the set of isomorphism classes of these extensions is principal homogeneous under $\text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{K})$.*

Proof. Assume given extensions

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}'_1 \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F} \rightarrow 0$$

with $c_{\mathcal{F}'_1} = c_{\mathcal{F}'_2} = c$. Then the difference (in the extension group, see Homology, Section 12.6) is an extension

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0$$

where \mathcal{E} is annihilated by \mathcal{I} (local computation omitted). Hence the sequence is an extension of \mathcal{O} -modules, see Modules on Sites, Lemma 18.25.1. Conversely, given such an extension \mathcal{E} we can add the extension \mathcal{E} to the \mathcal{O}' -extension \mathcal{F}' without affecting the map $c_{\mathcal{F}'}$. Some details omitted. □

Lemma 69.9.4. *Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Assume given \mathcal{O} -modules \mathcal{F}, \mathcal{K} and an \mathcal{O} -linear map $c : \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$. Then there exists an element*

$$o(\mathcal{F}, \mathcal{K}, c) \in \text{Ext}_{\mathcal{O}}^2(\mathcal{F}, \mathcal{K})$$

whose vanishing is a necessary and sufficient condition for the existence of a sequence (69.9.0.1) with $c_{\mathcal{F}'} = c$.

Proof. We first show that if \mathcal{K} is an injective \mathcal{O} -module, then there does exist a sequence (69.9.0.1) with $c_{\mathcal{F}'} = c$. To do this, choose a flat \mathcal{O}' -module \mathcal{H}' and a surjection $\mathcal{H}' \rightarrow \mathcal{F}$ (Modules on Sites, Lemma 18.28.6). Let $\mathcal{J} \subset \mathcal{H}'$ be the kernel. Since \mathcal{H}' is flat we have

$$\mathcal{I} \otimes_{\mathcal{O}'} \mathcal{H}' = \mathcal{I}\mathcal{H}' \subset \mathcal{J} \subset \mathcal{H}'$$

Observe that the map

$$\mathcal{I}\mathcal{H}' = \mathcal{I} \otimes_{\mathcal{O}'} \mathcal{H}' \longrightarrow \mathcal{I} \otimes_{\mathcal{O}'} \mathcal{F} = \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$$

annihilates $\mathcal{I}\mathcal{J}$. Namely, if f is a local section of \mathcal{I} and s is a local section of \mathcal{H} , then fs is mapped to $f \otimes \bar{s}$ where \bar{s} is the image of s in \mathcal{F} . Thus we obtain

$$\begin{array}{ccc} \mathcal{I}\mathcal{H}'/\mathcal{I}\mathcal{J}' & \longrightarrow & \mathcal{J}/\mathcal{I}\mathcal{J} \\ \downarrow & & \downarrow \gamma \\ \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c} & \mathcal{K} \end{array}$$

a diagram of \mathcal{O} -modules. If \mathcal{K} is injective as an \mathcal{O} -module, then we obtain the dotted arrow. Denote $\gamma' : \mathcal{J} \rightarrow \mathcal{K}$ the composition of γ with $\mathcal{J} \rightarrow \mathcal{J}/\mathcal{I}\mathcal{J}$. A local calculation shows the pushout

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{J} & \longrightarrow & \mathcal{H}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow \gamma' & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

is a solution to the problem posed by the lemma.

General case. Choose an embedding $\mathcal{K} \subset \mathcal{K}'$ with \mathcal{K}' an injective \mathcal{O} -module. Let \mathcal{Q} be the quotient, so that we have an exact sequence

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{K}' \rightarrow \mathcal{Q} \rightarrow 0$$

Denote $c' : \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}'$ be the composition. By the paragraph above there exists a sequence

$$0 \rightarrow \mathcal{K}' \rightarrow \mathcal{E}' \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.9.0.1) with $c_{\mathcal{E}'} = c'$. Note that c' composed with the map $\mathcal{K}' \rightarrow \mathcal{Q}$ is zero, hence the pushout of \mathcal{E}' by $\mathcal{K}' \rightarrow \mathcal{Q}$ is an extension

$$0 \rightarrow \mathcal{Q} \rightarrow \mathcal{D}' \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.9.0.1) with $c_{\mathcal{D}'} = 0$. This means exactly that \mathcal{D}' is annihilated by \mathcal{I} , in other words, the \mathcal{D}' is an extension of \mathcal{O} -modules, i.e., defines an element

$$o(\mathcal{F}, \mathcal{K}, c) \in \text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{Q}) = \text{Ext}_{\mathcal{O}}^2(\mathcal{F}, \mathcal{K})$$

(the equality holds by the long exact cohomology sequence associated to the exact sequence above and the vanishing of higher ext groups into the injective module \mathcal{K}'). If $o(\mathcal{F}, \mathcal{K}, c) = 0$, then we can choose a splitting $s : \mathcal{F} \rightarrow \mathcal{D}'$ and we can set

$$\mathcal{F}' = \text{Ker}(\mathcal{E}' \rightarrow \mathcal{D}'/s(\mathcal{F}))$$

so that we obtain the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{F}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{K}' & \longrightarrow & \mathcal{E}' & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

with exact rows which shows that $c_{\mathcal{F}'} = c$. Conversely, if \mathcal{F}' exists, then the pushout of \mathcal{F}' by the map $\mathcal{K} \rightarrow \mathcal{K}'$ is isomorphic to \mathcal{E}' by Lemma 69.9.3 and the vanishing of higher ext groups into the injective module \mathcal{K}' . This gives a diagram as above, which implies that \mathcal{D}' is split as an extension, i.e., the class $o(\mathcal{F}, \mathcal{K}, c)$ is zero. \square

Remark 69.9.5. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. A first order thickening $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ is said to be *trivial* if there exists a morphism of ringed topoi $\pi : (Sh(\mathcal{D}), \mathcal{O}') \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ which is a left inverse to i . The choice of such a morphism π is called a *trivialization* of the first order thickening. Given π we obtain a splitting

$$(69.9.5.1) \quad \mathcal{O}' = \mathcal{O} \oplus \mathcal{I}$$

as sheaves of algebras on \mathcal{C} by using π^\sharp to split the surjection $\mathcal{O}' \rightarrow \mathcal{O}$. Conversely, such a splitting determines a morphism π . The category of trivialized first order thickenings of $(Sh(\mathcal{C}), \mathcal{O})$ is equivalent to the category of \mathcal{O} -modules.

Remark 69.9.6. Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a trivial first order thickening of ringed topoi and let $\pi : (Sh(\mathcal{D}), \mathcal{O}') \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ be a trivialization. Then given any triple $(\mathcal{F}, \mathcal{K}, c)$ consisting of a pair of \mathcal{O} -modules and a map $c : \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$ we may set

$$\mathcal{F}'_{c, \text{triv}} = \mathcal{F} \oplus \mathcal{K}$$

and use the splitting (69.9.5.1) associated to π and the map c to define the \mathcal{O}' -module structure and obtain an extension (69.9.0.1). We will call $\mathcal{F}'_{c, \text{triv}}$ the *trivial extension* of \mathcal{F} by \mathcal{K} corresponding to c and the trivialization π . Given any extension \mathcal{F}' as in (69.9.0.1) we can use $\pi^\sharp : \mathcal{O} \rightarrow \mathcal{O}'$ to think of \mathcal{F}' as an \mathcal{O} -module extension, hence a class $\xi_{\mathcal{F}'}$ in $\text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{K})$. Lemma 69.9.3 assures that $\mathcal{F}' \mapsto \xi_{\mathcal{F}'}$ induces a bijection

$$\left\{ \begin{array}{l} \text{isomorphism classes of extensions} \\ \mathcal{F}' \text{ as in (69.9.0.1) with } c = c_{\mathcal{F}'} \end{array} \right\} \longrightarrow \text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{K})$$

Moreover, the trivial extension $\mathcal{F}'_{c, \text{triv}}$ maps to the zero class.

Remark 69.9.7. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $(Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}_i), \mathcal{O}'_i)$, $i = 1, 2$ be first order thickenings with ideal sheaves \mathcal{I}_i . Let $h : (Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_2), \mathcal{O}'_2)$ be a morphism of first order thickenings of $(Sh(\mathcal{C}), \mathcal{O})$. Picture

$$\begin{array}{ccc} & (Sh(\mathcal{C}), \mathcal{O}) & \\ & \swarrow \quad \searrow & \\ (Sh(\mathcal{D}_1), \mathcal{O}'_1) & \xrightarrow{h} & (Sh(\mathcal{D}_2), \mathcal{O}'_2) \end{array}$$

Observe that $h^\sharp : \mathcal{O}'_2 \rightarrow \mathcal{O}'_1$ in particular induces an \mathcal{O} -module map $\mathcal{I}_2 \rightarrow \mathcal{I}_1$. Let \mathcal{F} be an \mathcal{O} -module. Let (\mathcal{K}_i, c_i) , $i = 1, 2$ be a pair consisting of an \mathcal{O} -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume furthermore given a map of \mathcal{O} -modules $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ such that

$$\begin{array}{ccc} \mathcal{I}_2 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\ \downarrow & & \downarrow \\ \mathcal{I}_1 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1 \end{array}$$

is commutative. Then there is a canonical functoriality

$$\left\{ \begin{array}{l} \mathcal{F}'_2 \text{ as in (69.9.0.1) with} \\ c_2 = c_{\mathcal{F}'_2} \text{ and } \mathcal{K} = \mathcal{K}_2 \end{array} \right\} \longrightarrow \left\{ \begin{array}{l} \mathcal{F}'_1 \text{ as in (69.9.0.1) with} \\ c_1 = c_{\mathcal{F}'_1} \text{ and } \mathcal{K} = \mathcal{K}_1 \end{array} \right\}$$

Namely, thinking of all sheaves \mathcal{O} , \mathcal{O}'_i , \mathcal{F} , \mathcal{K}_i , etc as sheaves on \mathcal{C} , we set given \mathcal{F}'_2 the sheaf \mathcal{F}'_1 equal to the pushout, i.e., fitting into the following diagram of

extensions

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \mathcal{K}_2 & \longrightarrow & \mathcal{F}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \parallel \\
 0 & \longrightarrow & \mathcal{K}_1 & \longrightarrow & \mathcal{F}'_1 & \longrightarrow & \mathcal{F} \longrightarrow 0
 \end{array}$$

We omit the construction of the \mathcal{O}'_1 -module structure on the pushout (this uses the commutativity of the diagram involving c_1 and c_2).

Remark 69.9.8. Let $(Sh(\mathcal{C}), \mathcal{O})$, $(Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}_i), \mathcal{O}'_i)$, \mathcal{I}_i , and $h : (Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_2), \mathcal{O}'_2)$ be as in Remark 69.9.7. Assume that we are given given trivializations $\pi_i : (Sh(\mathcal{D}_i), \mathcal{O}'_i) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ such that $\pi_1 = h \circ \pi_2$. In other words, assume h is a morphism of trivialized first order thickenings of $(Sh(\mathcal{C}), \mathcal{O})$. Let (\mathcal{K}_i, c_i) , $i = 1, 2$ be a pair consisting of an \mathcal{O} -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume furthermore given a map of \mathcal{O} -modules $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ such that

$$\begin{array}{ccc}
 \mathcal{I}_2 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\
 \downarrow & & \downarrow \\
 \mathcal{I}_1 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1
 \end{array}$$

is commutative. In this situation the construction of Remark 69.9.6 induces a commutative diagram

$$\begin{array}{ccc}
 \{\mathcal{F}'_2 \text{ as in (69.9.0.1) with } c_2 = c_{\mathcal{F}'_2} \text{ and } \mathcal{K} = \mathcal{K}_2\} & \longrightarrow & \text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{K}_2) \\
 \downarrow & & \downarrow \\
 \{\mathcal{F}'_1 \text{ as in (69.9.0.1) with } c_1 = c_{\mathcal{F}'_1} \text{ and } \mathcal{K} = \mathcal{K}_1\} & \longrightarrow & \text{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{K}_1)
 \end{array}$$

where the vertical map on the right is given by functoriality of Ext and the map $\mathcal{K}_2 \rightarrow \mathcal{K}_1$ and the vertical map on the left is the one from Remark 69.9.7.

Remark 69.9.9. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. We define a sequence of morphisms of first order thickenings

$$(Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_2), \mathcal{O}'_2) \rightarrow (Sh(\mathcal{D}_3), \mathcal{O}'_3)$$

of $(Sh(\mathcal{C}), \mathcal{O})$ to be a *complex* if the corresponding maps between the ideal sheaves \mathcal{I}_i give a complex of \mathcal{O} -modules $\mathcal{I}_3 \rightarrow \mathcal{I}_2 \rightarrow \mathcal{I}_1$ (i.e., the composition is zero). In this case the composition $(Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_3), \mathcal{O}'_3)$ factors through $(Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}_3), \mathcal{O}'_3)$, i.e., the first order thickening $(Sh(\mathcal{D}_1), \mathcal{O}'_1)$ of $(Sh(\mathcal{C}), \mathcal{O})$ is trivial and comes with a canonical trivialization $\pi : (Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$.

We say a sequence of morphisms of first order thickenings

$$(Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_2), \mathcal{O}'_2) \rightarrow (Sh(\mathcal{D}_3), \mathcal{O}'_3)$$

of $(Sh(\mathcal{C}), \mathcal{O})$ is a *short exact sequence* if the corresponding maps between ideal sheaves is a short exact sequence

$$0 \rightarrow \mathcal{I}_3 \rightarrow \mathcal{I}_2 \rightarrow \mathcal{I}_1 \rightarrow 0$$

of \mathcal{O} -modules.

Remark 69.9.10. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let \mathcal{F} be an \mathcal{O} -module. Let

$$(Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{D}_2), \mathcal{O}'_2) \rightarrow (Sh(\mathcal{D}_3), \mathcal{O}'_3)$$

be a complex first order thickenings of $(Sh(\mathcal{C}), \mathcal{O})$, see Remark 69.9.9. Let (\mathcal{K}_i, c_i) , $i = 1, 2, 3$ be pairs consisting of an \mathcal{O} -module \mathcal{K}_i and a map $c_i : \mathcal{I}_i \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}_i$. Assume given a short exact sequence of \mathcal{O} -modules

$$0 \rightarrow \mathcal{K}_3 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{K}_1 \rightarrow 0$$

such that

$$\begin{array}{ccc} \mathcal{I}_2 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \\ \downarrow & & \downarrow \\ \mathcal{I}_1 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_1} & \mathcal{K}_1 \end{array} \quad \text{and} \quad \begin{array}{ccc} \mathcal{I}_3 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_3} & \mathcal{K}_3 \\ \downarrow & & \downarrow \\ \mathcal{I}_2 \otimes_{\mathcal{O}} \mathcal{F} & \xrightarrow{c_2} & \mathcal{K}_2 \end{array}$$

are commutative. Finally, assume given an extension

$$0 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F} \rightarrow 0$$

as in (69.9.0.1) with $\mathcal{K} = \mathcal{K}_2$ of \mathcal{O}'_2 -modules with $c_{\mathcal{F}'_2} = c_2$. In this situation we can apply the functoriality of Remark 69.9.7 to obtain an extension \mathcal{F}'_1 of \mathcal{O}'_1 -modules (we'll describe \mathcal{F}'_1 in this special case below). By Remark 69.9.6 using the canonical splitting $\pi : (Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ of Remark 69.9.9 we obtain $\xi_{\mathcal{F}'_1} \in \text{Ext}^1_{\mathcal{O}}(\mathcal{F}, \mathcal{K}_1)$. Finally, we have the obstruction

$$o(\mathcal{F}, \mathcal{K}_3, c_3) \in \text{Ext}^2_{\mathcal{O}}(\mathcal{F}, \mathcal{K}_3)$$

see Lemma 69.9.4. In this situation we **claim** that the canonical map

$$\partial : \text{Ext}^1_{\mathcal{O}}(\mathcal{F}, \mathcal{K}_1) \longrightarrow \text{Ext}^2_{\mathcal{O}}(\mathcal{F}, \mathcal{K}_3)$$

coming from the short exact sequence $0 \rightarrow \mathcal{K}_3 \rightarrow \mathcal{K}_2 \rightarrow \mathcal{K}_1 \rightarrow 0$ sends $\xi_{\mathcal{F}'_1}$ to the obstruction class $o(\mathcal{F}, \mathcal{K}_3, c_3)$.

To prove this claim choose an embedding $j : \mathcal{K}_3 \rightarrow \mathcal{K}$ where \mathcal{K} is an injective \mathcal{O} -module. We can lift j to a map $j' : \mathcal{K}_2 \rightarrow \mathcal{K}$. Set $\mathcal{E}'_2 = j'_* \mathcal{F}'_2$ equal to the pushout of \mathcal{F}'_2 by j' so that $c_{\mathcal{E}'_2} = j' \circ c_2$. Picture:

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{K}_2 & \longrightarrow & \mathcal{F}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow j' & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{E}'_2 & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

Set $\mathcal{E}'_3 = \mathcal{E}'_2$ but viewed as an \mathcal{O}'_3 -module via $\mathcal{O}'_3 \rightarrow \mathcal{O}'_2$. Then $c_{\mathcal{E}'_3} = j \circ c_3$. The proof of Lemma 69.9.4 constructs $o(\mathcal{F}, \mathcal{K}_3, c_3)$ as the boundary of the class of the extension of \mathcal{O} -modules

$$0 \rightarrow \mathcal{K}/\mathcal{K}_3 \rightarrow \mathcal{E}'_3/\mathcal{K}_3 \rightarrow \mathcal{F} \rightarrow 0$$

On the other hand, note that $\mathcal{F}'_1 = \mathcal{F}'_2/\mathcal{K}_3$ hence the class $\xi_{\mathcal{F}'_1}$ is the class of the extension

$$0 \rightarrow \mathcal{K}_2/\mathcal{K}_3 \rightarrow \mathcal{F}'_2/\mathcal{K}_3 \rightarrow \mathcal{F} \rightarrow 0$$

seen as a sequence of \mathcal{O} -modules using $\pi^\#$ where $\pi : (Sh(\mathcal{D}_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ is the canonical splitting. Thus finally, the claim follows from the fact that we have a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{K}_2/\mathcal{K}_3 & \longrightarrow & \mathcal{F}'_2/\mathcal{K}_3 & \longrightarrow & \mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{K}/\mathcal{K}_3 & \longrightarrow & \mathcal{E}'_3/\mathcal{K}_3 & \longrightarrow & \mathcal{F} \longrightarrow 0 \end{array}$$

which is \mathcal{O} -linear (with the \mathcal{O} -module structures given above).

69.10. Infinitesimal deformations of modules on ringed topoi

Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. We freely use the notation introduced in Section 69.8. Let \mathcal{F}' be an \mathcal{O}' -module and set $\mathcal{F} = i^*\mathcal{F}'$. In this situation we have a short exact sequence

$$0 \rightarrow \mathcal{I}\mathcal{F}' \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

of \mathcal{O}' -modules. Since $\mathcal{I}^2 = 0$ the \mathcal{O}' -module structure on $\mathcal{I}\mathcal{F}'$ comes from a unique \mathcal{O} -module structure. Thus the sequence above is an extension as in (69.9.0.1). As a special case, if $\mathcal{F}' = \mathcal{O}'$ we have $i^*\mathcal{O}' = \mathcal{O}$ and $\mathcal{I}\mathcal{O}' = \mathcal{I}$ and we recover the sequence of structure sheaves

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0$$

Lemma 69.10.1. *Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Let $\mathcal{F}', \mathcal{G}'$ be \mathcal{O}' -modules. Set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O} -linear map. The set of lifts of φ to an \mathcal{O}' -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ is, if nonempty, a principal homogeneous space under $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{I}\mathcal{G}')$.*

Proof. This is a special case of Lemma 69.9.1 but we also give a direct proof. We have short exact sequences of modules

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{I}\mathcal{G}' \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$$

and similarly for \mathcal{F}' . Since \mathcal{I} has square zero the \mathcal{O}' -module structure on \mathcal{I} and $\mathcal{I}\mathcal{G}'$ comes from a unique \mathcal{O} -module structure. It follows that

$$\text{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{I}\mathcal{G}') = \text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{I}\mathcal{G}') \quad \text{and} \quad \text{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{G}) = \text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$$

The lemma now follows from the exact sequence

$$0 \rightarrow \text{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{I}\mathcal{G}') \rightarrow \text{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{G}') \rightarrow \text{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{G})$$

see Homology, Lemma 12.5.8. □

Lemma 69.10.2. *Let (f, f') be a morphism of first order thickenings of ringed topoi as in Situation 69.8.1. Let \mathcal{F}' be an \mathcal{O}' -module and set $\mathcal{F} = i^*\mathcal{F}'$. Assume that \mathcal{F} is flat over $\mathcal{O}_{\mathcal{B}}$ and that (f, f') is a strict morphism of thickenings (Definition 69.8.2). Then the following are equivalent*

- (1) \mathcal{F}' is flat over $\mathcal{O}_{\mathcal{B}'}$, and
- (2) the canonical map $f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$ is an isomorphism.

Moreover, in this case the maps

$$f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$$

are isomorphisms.

Proof. The map $f^*\mathcal{J} \rightarrow \mathcal{I}$ is surjective as (f, f') is a strict morphism of thickenings. Hence the final statement is a consequence of (2).

Proof of the equivalence of (1) and (2). By definition flatness over $\mathcal{O}_{\mathcal{B}}$ means flatness over $f^{-1}\mathcal{O}_{\mathcal{B}}$. Similarly for flatness over $f^{-1}\mathcal{O}_{\mathcal{B}'}$. Note that the strictness of (f, f') and the assumption that $\mathcal{F} = i^*\mathcal{F}'$ imply that

$$\mathcal{F} = \mathcal{F}' / (f^{-1}\mathcal{J})\mathcal{F}'$$

as sheaves on \mathcal{C} . Moreover, observe that $f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} = f^{-1}\mathcal{J} \otimes_{f^{-1}\mathcal{O}_{\mathcal{B}}} \mathcal{F}$. Hence the equivalence of (1) and (2) follows from Modules on Sites, Lemma 18.28.13. \square

Lemma 69.10.3. *Let (f, f') be a morphism of first order thickenings of ringed topoi as in Situation 69.8.1. Let \mathcal{F}' be an \mathcal{O}' -module and set $\mathcal{F} = i^*\mathcal{F}'$. Assume that \mathcal{F}' is flat over $\mathcal{O}_{\mathcal{B}'}$ and that (f, f') is a strict morphism of thickenings. Then the following are equivalent*

- (1) \mathcal{F}' is an \mathcal{O}' -module of finite presentation, and
- (2) \mathcal{F} is an \mathcal{O} -module of finite presentation.

Proof. The implication (1) \Rightarrow (2) follows from Modules on Sites, Lemma 18.23.4. For the converse, assume \mathcal{F} of finite presentation. We may and do assume that $\mathcal{C} = \mathcal{C}'$. By Lemma 69.10.2 we have a short exact sequence

$$0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

Let U be an object of \mathcal{C} such that $\mathcal{F}|_U$ has a presentation

$$\mathcal{O}_U^{\oplus m} \rightarrow \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{F}|_U \rightarrow 0$$

After replacing U by the members of a covering we may assume the map $\mathcal{O}_U^{\oplus n} \rightarrow \mathcal{F}|_U$ lifts to a map $(\mathcal{O}'_U)^{\oplus n} \rightarrow \mathcal{F}'|_U$. The induced map $\mathcal{I}^{\oplus n} \rightarrow \mathcal{I} \otimes \mathcal{F}$ is surjective by right exactness of \otimes . Thus after replacing U by the members of a covering we can find a lift $(\mathcal{O}'|_U)^{\oplus m} \rightarrow (\mathcal{O}'|_U)^{\oplus n}$ of the given map $\mathcal{O}_U^{\oplus m} \rightarrow \mathcal{O}_U^{\oplus n}$ such that

$$(\mathcal{O}'_U)^{\oplus m} \rightarrow (\mathcal{O}'_U)^{\oplus n} \rightarrow \mathcal{F}'|_U \rightarrow 0$$

is a complex. Using right exactness of \otimes once more it is seen that this complex is exact. \square

Lemma 69.10.4. *Let (f, f') be a morphism of first order thickenings as in Situation 69.8.1. Let $\mathcal{F}', \mathcal{G}'$ be \mathcal{O}' -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O} -linear map. Assume that \mathcal{G}' is flat over $\mathcal{O}_{\mathcal{B}'}$ and that (f, f') is a strict morphism of thickenings. The set of lifts of φ to an \mathcal{O}' -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$ is, if nonempty, a principal homogeneous space under*

$$\mathrm{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^*\mathcal{J})$$

Proof. Combine Lemmas 69.10.1 and 69.10.2. \square

Lemma 69.10.5. *Let $i : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}')$ be a first order thickening of ringed topoi. Let $\mathcal{F}', \mathcal{G}'$ be \mathcal{O}' -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O} -linear map. There exists an element*

$$o(\varphi) \in \mathrm{Ext}_{\mathcal{O}}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of φ to an \mathcal{O}' -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$.

Proof. It is clear from the proof of Lemma 69.10.1 that the vanishing of the boundary of φ via the map

$$\mathrm{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = \mathrm{Hom}_{\mathcal{O}'}(\mathcal{F}', \mathcal{G}) \longrightarrow \mathrm{Ext}_{\mathcal{O}'}^1(\mathcal{F}', \mathcal{I}\mathcal{G}')$$

is a necessary and sufficient condition for the existence of a lift. We conclude as

$$\mathrm{Ext}_{\mathcal{O}'}^1(\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Ext}_{\mathcal{O}}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

the adjointness of $i_* = Ri_*$ and Li^* on the derived category (Cohomology on Sites, Lemma 21.19.1). \square

Lemma 69.10.6. *Let (f, f') be a morphism of first order thickenings as in Situation 69.8.1. Let \mathcal{F}' , \mathcal{G}' be \mathcal{O}' -modules and set $\mathcal{F} = i^*\mathcal{F}'$ and $\mathcal{G} = i^*\mathcal{G}'$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be an \mathcal{O} -linear map. Assume that \mathcal{F}' and \mathcal{G}' are flat over $\mathcal{O}_{\mathcal{B}'}$ and that (f, f') is a strict morphism of thickenings. There exists an element*

$$o(\varphi) \in \mathrm{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^*\mathcal{J})$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of φ to an \mathcal{O}' -linear map $\varphi' : \mathcal{F}' \rightarrow \mathcal{G}'$.

First proof. This follows from Lemma 69.10.5 as we claim that under the assumptions of the lemma we have

$$\mathrm{Ext}_{\mathcal{O}}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^*\mathcal{J})$$

Namely, we have $\mathcal{I}\mathcal{G}' = \mathcal{G} \otimes_{\mathcal{O}} f^*\mathcal{J}$ by Lemma 69.10.2. On the other hand, observe that

$$H^{-1}(Li^*\mathcal{F}') = \mathrm{Tor}_1^{\mathcal{O}'}(\mathcal{F}', \mathcal{O})$$

(local computation omitted). Using the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0$$

we see that this Tor_1 is computed by the kernel of the map $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I}\mathcal{F}'$ which is zero by the final assertion of Lemma 69.10.2. Thus $\tau_{\geq -1}Li^*\mathcal{F}' = \mathcal{F}$. On the other hand, we have

$$\mathrm{Ext}_{\mathcal{O}}^1(Li^*\mathcal{F}', \mathcal{I}\mathcal{G}') = \mathrm{Ext}_{\mathcal{O}}^1(\tau_{\geq -1}Li^*\mathcal{F}', \mathcal{I}\mathcal{G}')$$

by the dual of Derived Categories, Lemma 13.17.1. \square

Second proof. We can apply Lemma 69.9.2 as follows. Note that $\mathcal{K} = \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ and $\mathcal{L} = \mathcal{I} \otimes_{\mathcal{O}} \mathcal{G}$ by Lemma 69.10.2, that $c_{\mathcal{F}'} = 1 \otimes 1$ and $c_{\mathcal{G}'} = 1 \otimes 1$ and taking $\psi = 1 \otimes \varphi$ the diagram of the lemma commutes. Thus $o(\varphi) = o(\varphi, 1 \otimes \varphi)$ works. \square

Lemma 69.10.7. *Let (f, f') be a morphism of first order thickenings as in Situation 69.8.1. Let \mathcal{F} be an \mathcal{O} -module. Assume (f, f') is a strict morphism of thickenings and \mathcal{F} flat over $\mathcal{O}_{\mathcal{B}}$. If there exists a pair (\mathcal{F}', α) consisting of an \mathcal{O}' -module \mathcal{F}' flat over $\mathcal{O}_{\mathcal{B}'}$ and an isomorphism $\alpha : i^*\mathcal{F}' \rightarrow \mathcal{F}$, then the set of isomorphism classes of such pairs is principal homogeneous under $\mathrm{Ext}_{\mathcal{O}}^1(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F})$.*

Proof. If we assume there exists one such module, then the canonical map

$$f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$$

is an isomorphism by Lemma 69.10.2. Apply Lemma 69.9.3 with $\mathcal{K} = \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ and $c = 1$. By Lemma 69.10.2 the corresponding extensions \mathcal{F}' are all flat over $\mathcal{O}_{\mathcal{B}'}$. \square

Lemma 69.10.8. *Let (f, f') be a morphism of first order thickenings as in Situation 69.8.1. Let \mathcal{F} be an \mathcal{O} -module. Assume (f, f') is a strict morphism of thickenings and \mathcal{F} flat over $\mathcal{O}_{\mathcal{B}}$. There exists an \mathcal{O}' -module \mathcal{F}' flat over $\mathcal{O}_{\mathcal{B}'}$ with $i^*\mathcal{F}' \cong \mathcal{F}$, if and only if*

- (1) *the canonical map $f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ is an isomorphism, and*
- (2) *the class $o(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}, 1) \in \text{Ext}_{\mathcal{O}}^2(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F})$ of Lemma 69.9.4 is zero.*

Proof. This follows immediately from the characterization of \mathcal{O}' -modules flat over $\mathcal{O}_{\mathcal{B}'}$ of Lemma 69.10.2 and Lemma 69.9.4. \square

69.11. Application to flat modules on flat thickenings of ringed topoi

Consider a commutative diagram

$$\begin{array}{ccc} (Sh(\mathcal{C}), \mathcal{O}) & \xrightarrow{i} & (Sh(\mathcal{D}), \mathcal{O}') \\ f \downarrow & & \downarrow f' \\ (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}}) & \xrightarrow{t} & (Sh(\mathcal{B}'), \mathcal{O}_{\mathcal{B}'}) \end{array}$$

of ringed topoi whose horizontal arrows are first order thickenings as in Situation 69.8.1. Set $\mathcal{I} = \text{Ker}(i^\#) \subset \mathcal{O}'$ and $\mathcal{J} = \text{Ker}(t^\#) \subset \mathcal{O}_{\mathcal{B}'}$. Let \mathcal{F} be an \mathcal{O} -module. Assume that

- (1) (f, f') is a strict morphism of thickenings,
- (2) f' is flat, and
- (3) \mathcal{F} is flat over $\mathcal{O}_{\mathcal{B}}$.

Note that (1) + (2) imply that $\mathcal{I} = f^*\mathcal{J}$ (apply Lemma 69.10.2 to \mathcal{O}'). The theory of the preceding section is especially nice under these assumptions. We summarize the results already obtained in the following lemma.

Lemma 69.11.1. *In the situation above.*

- (1) *There exists an \mathcal{O}' -module \mathcal{F}' flat over $\mathcal{O}_{\mathcal{B}'}$ with $i^*\mathcal{F}' \cong \mathcal{F}$, if and only if the class $o(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}, 1) \in \text{Ext}_{\mathcal{O}}^2(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F})$ of Lemma 69.9.4 is zero.*
- (2) *If such a module exists, then the set of isomorphism classes of lifts is principal homogeneous under $\text{Ext}_{\mathcal{O}}^1(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F})$.*
- (3) *Given a lift \mathcal{F}' , the set of automorphisms of \mathcal{F}' which pull back to $\text{id}_{\mathcal{F}}$ is canonically isomorphic to $\text{Ext}_{\mathcal{O}}^0(\mathcal{F}, f^*\mathcal{J} \otimes_{\mathcal{O}} \mathcal{F})$.*

Proof. Part (1) follows from Lemma 69.10.8 as we have seen above that $\mathcal{I} = f^*\mathcal{J}$. Part (2) follows from Lemma 69.10.7. Part (3) follows from Lemma 69.10.4. \square

Situation 69.11.2. Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$ be a morphism of ringed topoi. Consider a commutative diagram

$$\begin{array}{ccccc} (Sh(\mathcal{C}'_1), \mathcal{O}'_1) & \xrightarrow{h} & (Sh(\mathcal{C}'_2), \mathcal{O}'_2) & \longrightarrow & (Sh(\mathcal{C}'_3), \mathcal{O}'_3) \\ f'_1 \downarrow & & f'_2 \downarrow & & f'_3 \downarrow \\ (Sh(\mathcal{B}'_1), \mathcal{O}_{\mathcal{B}'_1}) & \longrightarrow & (Sh(\mathcal{B}'_2), \mathcal{O}_{\mathcal{B}'_2}) & \longrightarrow & (Sh(\mathcal{B}'_3), \mathcal{O}_{\mathcal{B}'_3}) \end{array}$$

where (a) the top row is a short exact sequence of first order thickenings of $(Sh(\mathcal{C}), \mathcal{O})$, (b) the lower row is a short exact sequence of first order thickenings of $(Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$, (c) each f'_i restricts to f , (d) each pair (f, f'_i) is a strict morphism of thickenings,

and (e) each f'_i is flat. Finally, let \mathcal{F}'_2 be an \mathcal{O}'_2 -module flat over $\mathcal{O}_{\mathcal{B}'_2}$ and set $\mathcal{F} = \mathcal{F}'_2 \otimes \mathcal{O}$. Let $\pi : (Sh(\mathcal{C}'_1), \mathcal{O}'_1) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ be the canonical splitting (Remark 69.9.9).

Lemma 69.11.3. *In Situation 69.11.2 the modules $\pi^*\mathcal{F}$ and $h^*\mathcal{F}'_2$ are \mathcal{O}'_1 -modules flat over $\mathcal{O}_{\mathcal{B}'_1}$ restricting to \mathcal{F} on $(Sh(\mathcal{C}), \mathcal{O})$. Their difference (Lemma 69.11.1) is an element θ of $Ext^1_{\mathcal{O}}(\mathcal{F}, f^*\mathcal{J}_1 \otimes_{\mathcal{O}} \mathcal{F})$ whose boundary in $Ext^2_{\mathcal{O}}(\mathcal{F}, f^*\mathcal{J}_3 \otimes_{\mathcal{O}} \mathcal{F})$ equals the obstruction (Lemma 69.11.1) to lifting \mathcal{F} to an \mathcal{O}'_3 -module flat over $\mathcal{O}_{\mathcal{B}'_3}$.*

Proof. Note that both $\pi^*\mathcal{F}$ and $h^*\mathcal{F}'_2$ restrict to \mathcal{F} on $(Sh(\mathcal{C}), \mathcal{O})$ and that the kernels of $\pi^*\mathcal{F} \rightarrow \mathcal{F}$ and $h^*\mathcal{F}'_2 \rightarrow \mathcal{F}$ are given by $f^*\mathcal{J}_1 \otimes_{\mathcal{O}} \mathcal{F}$. Hence flatness by Lemma 69.10.2. Taking the boundary makes sense as the sequence of modules

$$0 \rightarrow f^*\mathcal{J}_3 \otimes_{\mathcal{O}} \mathcal{F} \rightarrow f^*\mathcal{J}_2 \otimes_{\mathcal{O}} \mathcal{F} \rightarrow f^*\mathcal{J}_1 \otimes_{\mathcal{O}} \mathcal{F} \rightarrow 0$$

is short exact due to the assumptions in Situation 69.11.2 and the fact that \mathcal{F} is flat over $\mathcal{O}_{\mathcal{B}}$. The statement on the obstruction class is a direct translation of the result of Remark 69.9.10 to this particular situation. \square

69.12. Deformations of ringed topoi and the naive cotangent complex

In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a first order thickening $t : (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}}) \rightarrow (Sh(\mathcal{B}'), \mathcal{O}_{\mathcal{B}'})$ of ringed topoi. We denote $\mathcal{J} = \text{Ker}(t^\sharp)$ and we identify the underlying topoi of \mathcal{B} and \mathcal{B}' . Moreover we assume given a morphism of ringed topoi $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$, an \mathcal{O} -module \mathcal{G} , and a map $f^{-1}\mathcal{J} \rightarrow \mathcal{G}$ of sheaves of $f^{-1}\mathcal{O}_{\mathcal{B}}$ -modules. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

$$(69.12.0.1) \quad \begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & ? & \longrightarrow & \mathcal{O} \longrightarrow 0 \\ & & \uparrow c & & \uparrow & & \uparrow \\ 0 & \longrightarrow & f^{-1}\mathcal{J} & \longrightarrow & f^{-1}\mathcal{O}_{\mathcal{B}'} & \longrightarrow & f^{-1}\mathcal{O}_{\mathcal{B}} \longrightarrow 0 \end{array}$$

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}'), \mathcal{O}')$ and a morphism of thickenings (f, f') as in (69.8.1.1) where $\text{Ker}(i^\sharp)$ is identified with \mathcal{G} such that $(f')^\sharp$ induces the given map c . We will say $(Sh(\mathcal{C}'), \mathcal{O}')$ is a *solution* to (69.12.0.1).

Lemma 69.12.1. *Assume given a commutative diagram of morphisms ringed topoi*

$$(69.12.1.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}_2), \mathcal{O}_2) & \xrightarrow{i_2} & (Sh(\mathcal{C}'_2), \mathcal{O}'_2) \\ & \searrow f_2 & \downarrow f'_2 \\ & (Sh(\mathcal{B}_2), \mathcal{O}_{\mathcal{B}_2}) & \xrightarrow{t_2} & (Sh(\mathcal{B}'_2), \mathcal{O}_{\mathcal{B}'_2}) \\ & \swarrow g & & \swarrow \\ (Sh(\mathcal{C}_1), \mathcal{O}_1) & \xrightarrow{i_1} & (Sh(\mathcal{C}'_1), \mathcal{O}'_1) \\ & \searrow f_1 & \downarrow f'_1 \\ & (Sh(\mathcal{B}_1), \mathcal{O}_{\mathcal{B}_1}) & \xrightarrow{t_1} & (Sh(\mathcal{B}'_1), \mathcal{O}_{\mathcal{B}'_1}) \end{array}$$

whose horizontal arrows are first order thickenings. Set $\mathcal{G}_j = \text{Ker}(i_j^\sharp)$ and assume given a map of $g^{-1}\mathcal{O}_1$ -modules $\nu : g^{-1}\mathcal{G}_1 \rightarrow \mathcal{G}_2$ giving rise to the commutative diagram

$$(69.12.1.2) \quad \begin{array}{ccccccccc} 0 & \longrightarrow & \mathcal{G}_2 & \longrightarrow & \mathcal{O}'_2 & \longrightarrow & \mathcal{O}_2 & \longrightarrow & 0 \\ & & \uparrow c_2 & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & f_2^{-1}\mathcal{J}_2 & \longrightarrow & f_2^{-1}\mathcal{O}_{B'_2} & \longrightarrow & f_2^{-1}\mathcal{O}_{B_2} & \longrightarrow & 0 \\ & & \nearrow & & \nearrow & & \nearrow & & \\ 0 & \longrightarrow & \mathcal{G}_1 & \longrightarrow & \mathcal{O}'_1 & \longrightarrow & \mathcal{O}_1 & \longrightarrow & 0 \\ & & \uparrow c_1 & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & f_1^{-1}\mathcal{J}_1 & \longrightarrow & f_1^{-1}\mathcal{O}_{B'_1} & \longrightarrow & f_1^{-1}\mathcal{O}_{B_1} & \longrightarrow & 0 \end{array}$$

with front and back solutions to (69.12.0.1). (The north-north-west arrows are maps on \mathcal{C}_2 after applying g^{-1} to the source.)

- (1) There exist a canonical element in $\text{Ext}_{\mathcal{O}_2}^1(Lg^* NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}, \mathcal{G}_2)$ whose vanishing is a necessary and sufficient condition for the existence of a morphism of ringed topoi $(\text{Sh}(\mathcal{C}_2), \mathcal{O}'_2) \rightarrow (\text{Sh}(\mathcal{C}'_1), \mathcal{O}'_1)$ fitting into (69.12.1.1) compatibly with ν .
- (2) If there exists a morphism $(\text{Sh}(\mathcal{C}_2), \mathcal{O}'_2) \rightarrow (\text{Sh}(\mathcal{C}'_1), \mathcal{O}'_1)$ fitting into (69.12.1.1) compatibly with ν the set of all such morphisms is a principal homogeneous space under

$$\text{Hom}_{\mathcal{O}_1}(\Omega_{\mathcal{O}_1/\mathcal{O}_{B_1}}, g^*\mathcal{G}_2) = \text{Hom}_{\mathcal{O}_2}(g^*\Omega_{\mathcal{O}_1/\mathcal{O}_{B_1}}, \mathcal{G}_2) = \text{Ext}_{\mathcal{O}_2}^0(Lg^* NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}, \mathcal{G}_2).$$

Proof. The proof of this lemma is identical to the proof of Lemma 69.7.1. We urge the reader to read that proof instead of this one. We will identify the underlying topoi for every thickening in sight (we have already used this convention in the statement). The equalities in the last statement of the lemma are immediate from the definitions. Thus we will work with the groups $\text{Ext}_{\mathcal{O}_2}^k(Lg^* NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}, \mathcal{G}_2)$, $k = 0, 1$ in the rest of the proof. We first argue that we can reduce to the case where the underlying topoi of all ringed topoi in the lemma is the same.

To do this, observe that $g^{-1}NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}$ is equal to the naive cotangent complex of the homomorphism of sheaves of rings $g^{-1}f_1^{-1}\mathcal{O}_{B_1} \rightarrow g^{-1}\mathcal{O}_1$, see Modules on Sites, Lemma 18.32.5. Moreover, the degree 0 term of $NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}$ is a flat \mathcal{O}_1 -module, hence the canonical map

$$Lg^* NL_{\mathcal{O}_1/\mathcal{O}_{B_1}} \longrightarrow g^{-1}NL_{\mathcal{O}_1/\mathcal{O}_{B_1}} \otimes_{g^{-1}\mathcal{O}_1} \mathcal{O}_2$$

induces an isomorphism on cohomology sheaves in degrees 0 and -1 . Thus we may replace the Ext groups of the lemma with

$$\text{Ext}_{g^{-1}\mathcal{O}_1}^k(g^{-1}NL_{\mathcal{O}_1/\mathcal{O}_{B_1}}, \mathcal{G}_2) = \text{Ext}_{g^{-1}\mathcal{O}_1}^k(NL_{g^{-1}\mathcal{O}_1/g^{-1}f_1^{-1}\mathcal{O}_{B_1}}, \mathcal{G}_2)$$

The set of morphism of ringed topoi $(\text{Sh}(\mathcal{C}'_2), \mathcal{O}'_2) \rightarrow (\text{Sh}(\mathcal{C}'_1), \mathcal{O}'_1)$ fitting into (69.12.1.1) compatibly with ν is in one-to-one bijection with the set of homomorphisms of $g^{-1}f_1^{-1}\mathcal{O}_{B'_1}$ -algebras $g^{-1}\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$ which are compatible with f^\sharp and ν . In this way we see that we may assume we have a diagram (69.12.1.2) of sheaves on a site \mathcal{C}

(with $f_1 = f_2 = \text{id}$ on underlying topoi) and we are looking to find a homomorphism of sheaves of rings $\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$ fitting into it.

In the rest of the proof of the lemma we assume all underlying topological spaces are the same, i.e., we have a diagram (69.12.1.2) of sheaves on a site \mathcal{C} (with $f_1 = f_2 = \text{id}$ on underlying topoi) and we are looking for homomorphisms of sheaves of rings $\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$ fitting into it. As ext groups we will use $\text{Ext}_{\mathcal{O}'_1}^k(NL_{\mathcal{O}'_1/\mathcal{O}_{\mathcal{B}_1}}, \mathcal{G}_2)$, $k = 0, 1$.

Step 1. Construction of the obstruction class. Consider the sheaf of sets

$$\mathcal{E} = \mathcal{O}'_1 \times_{\mathcal{O}_2} \mathcal{O}'_2$$

This comes with a surjective map $\alpha : \mathcal{E} \rightarrow \mathcal{O}_1$ and hence we can use $NL(\alpha)$ instead of $NL_{\mathcal{O}'_1/\mathcal{O}_{\mathcal{B}_1}}$, see Modules on Sites, Lemma 18.34.2. Set

$$\mathcal{I}' = \text{Ker}(\mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}] \rightarrow \mathcal{O}_1) \quad \text{and} \quad \mathcal{I} = \text{Ker}(\mathcal{O}_{\mathcal{B}_1}[\mathcal{E}] \rightarrow \mathcal{O}_1)$$

There is a surjection $\mathcal{I}' \rightarrow \mathcal{I}$ whose kernel is $\mathcal{J}_1\mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}]$. We obtain two homomorphisms of $\mathcal{O}_{\mathcal{B}'_2}$ -algebras

$$a : \mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}] \rightarrow \mathcal{O}'_1 \quad \text{and} \quad b : \mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}] \rightarrow \mathcal{O}'_2$$

which induce maps $a|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}_1$ and $b|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}_2$. Both a and b annihilate $(\mathcal{I}')^2$. Moreover a and b agree on $\mathcal{J}_1\mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}]$ as maps into \mathcal{G}_2 because the left hand square of (69.12.1.2) is commutative. Thus the difference $b|_{\mathcal{I}'} - \nu \circ a|_{\mathcal{I}'}$ induces a well defined \mathcal{O}_1 -linear map

$$\xi : \mathcal{I}/\mathcal{I}^2 \longrightarrow \mathcal{G}_2$$

which sends the class of a local section f of \mathcal{I} to $a(f') - \nu(b(f'))$ where f' is a lift of f to a local section of \mathcal{I}' . We let $[\xi] \in \text{Ext}_{\mathcal{O}_1}^1(NL(\alpha), \mathcal{G}_2)$ be the image (see below).

Step 2. Vanishing of $[\xi]$ is necessary. Let us write $\Omega = \Omega_{\mathcal{O}_{\mathcal{B}_1}[\mathcal{E}]/\mathcal{O}_{\mathcal{B}_1}} \otimes_{\mathcal{O}_{\mathcal{B}_1}[\mathcal{E}]} \mathcal{O}_1$. Observe that $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega)$ fits into a distinguished triangle

$$\Omega[0] \rightarrow NL(\alpha) \rightarrow \mathcal{I}/\mathcal{I}^2[1] \rightarrow \Omega[1]$$

Thus we see that $[\xi]$ is zero if and only if ξ is a composition $\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega \rightarrow \mathcal{G}_2$ for some map $\Omega \rightarrow \mathcal{G}_2$. Suppose there exists a homomorphism of sheaves of rings $\varphi : \mathcal{O}'_1 \rightarrow \mathcal{O}'_2$ fitting into (69.12.1.2). In this case consider the map $\mathcal{O}'_1[\mathcal{E}] \rightarrow \mathcal{G}_2$, $f' \mapsto b(f') - \varphi(a(f'))$. A calculation shows this annihilates $\mathcal{J}_1\mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}]$ and induces a derivation $\mathcal{O}_{\mathcal{B}_1}[\mathcal{E}] \rightarrow \mathcal{G}_2$. The resulting linear map $\Omega \rightarrow \mathcal{G}_2$ witnesses the fact that $[\xi] = 0$ in this case.

Step 3. Vanishing of $[\xi]$ is sufficient. Let $\theta : \Omega \rightarrow \mathcal{G}_2$ be a \mathcal{O}_1 -linear map such that ξ is equal to $\theta \circ (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega)$. Then a calculation shows that

$$b + \theta \circ d : \mathcal{O}_{\mathcal{B}'_1}[\mathcal{E}] \longrightarrow \mathcal{O}'_2$$

annihilates \mathcal{I}' and hence defines a map $\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$ fitting into (69.12.1.2).

Proof of (2) in the special case above. Omitted. Hint: This is exactly the same as the proof of (2) of Lemma 69.2.1. \square

Lemma 69.12.2. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . Let \mathcal{G} be a \mathcal{B} -module. Let $\xi \in \text{Ext}_{\mathcal{B}}^1(NL_{\mathcal{B}/\mathcal{A}}, \mathcal{G})$. There exists a map of sheaves of sets $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ such that $\xi \in \text{Ext}_{\mathcal{B}}^1(NL(\alpha), \mathcal{G})$ is the class of a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$ (see proof for notation).*

Proof. Recall that given $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ such that $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$ is surjective with kernel \mathcal{I} the complex $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B})$ is canonically isomorphic to $NL_{\mathcal{B}/\mathcal{A}}$, see Modules on Sites, Lemma 18.34.2. Observe moreover, that $\Omega = \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{e \in \mathcal{E}(U)} \mathcal{B}(U)$. In other words, Ω is the free \mathcal{B} -module on the sheaf of sets \mathcal{E} and in particular there is a canonical map $\mathcal{E} \rightarrow \Omega$.

Having said this, pick some \mathcal{E} (for example $\mathcal{E} = \mathcal{B}$ as in the definition of the naive cotangent complex). The obstruction to writing ξ as the class of a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$ is an element in $\text{Ext}_{\mathcal{B}}^1(\Omega, \mathcal{G})$. Say this is represented by the extension $0 \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow \Omega \rightarrow 0$ of \mathcal{B} -modules. Consider the sheaf of sets $\mathcal{E}' = \mathcal{E} \times_{\Omega} \mathcal{H}$ which comes with an induced map $\alpha' : \mathcal{E}' \rightarrow \mathcal{B}$. Let $\mathcal{I}' = \text{Ker}(\mathcal{A}[\mathcal{E}'] \rightarrow \mathcal{B})$ and $\Omega' = \Omega_{\mathcal{A}[\mathcal{E}']/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}']} \mathcal{B}$. The pullback of ξ under the quasi-isomorphism $NL(\alpha') \rightarrow NL(\alpha)$ maps to zero in $\text{Ext}_{\mathcal{B}}^1(\Omega', \mathcal{G})$ because the pullback of the extension \mathcal{H} by the map $\Omega' \rightarrow \Omega$ is split as Ω' is the free \mathcal{B} -module on the sheaf of sets \mathcal{E}' and since by construction there is a commutative diagram

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \mathcal{E} \\ \downarrow & & \downarrow \\ \mathcal{H} & \longrightarrow & \Omega \end{array}$$

This finishes the proof. □

Lemma 69.12.3. *If there exists a solution to (69.12.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_{\mathcal{O}}^1(NL_{\mathcal{O}/\mathcal{O}_{\mathcal{B}}}, \mathcal{G})$.*

Proof. We observe right away that given two solutions \mathcal{O}'_1 and \mathcal{O}'_2 to (69.12.0.1) we obtain by Lemma 69.12.1 an obstruction element $o(\mathcal{O}'_1, \mathcal{O}'_2) \in \text{Ext}_{\mathcal{O}}^1(NL_{\mathcal{O}/\mathcal{O}_{\mathcal{B}}}, \mathcal{G})$ to the existence of a map $\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution \mathcal{O}' and an element $\xi \in \text{Ext}_{\mathcal{O}}^1(NL_{\mathcal{O}/\mathcal{O}_{\mathcal{B}}}, \mathcal{G})$ we can find a second solution \mathcal{O}'_{ξ} such that $o(\mathcal{O}', \mathcal{O}'_{\xi}) = \xi$.

Pick $\alpha : \mathcal{E} \rightarrow \mathcal{O}$ as in Lemma 69.12.2 for the class ξ . Consider the surjection $f^{-1}\mathcal{O}_{\mathcal{B}}[\mathcal{E}] \rightarrow \mathcal{O}$ with kernel \mathcal{I} and corresponding naive cotangent complex $NL(\alpha) = (\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{f^{-1}\mathcal{O}_{\mathcal{B}}[\mathcal{E}]/f^{-1}\mathcal{O}_{\mathcal{B}}} \otimes_{f^{-1}\mathcal{O}_{\mathcal{B}}[\mathcal{E}]} \mathcal{O})$. By the lemma ξ is the class of a morphism $\delta : \mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{G}$. After replacing \mathcal{E} by $\mathcal{E} \times_{\mathcal{O}} \mathcal{O}'$ we may also assume that α factors through a map $\alpha' : \mathcal{E} \rightarrow \mathcal{O}'$.

These choices determine an $f^{-1}\mathcal{O}_{\mathcal{B}'}$ -algebra map $\varphi : \mathcal{O}_{\mathcal{B}'}[\mathcal{E}] \rightarrow \mathcal{O}'$. Let $\mathcal{I}' = \text{Ker}(\varphi)$. Observe that φ induces a map $\varphi|_{\mathcal{I}'} : \mathcal{I}' \rightarrow \mathcal{G}$ and that \mathcal{O}' is the pushout, as in the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & \mathcal{O}' & \longrightarrow & \mathcal{O} \longrightarrow 0 \\ & & \uparrow \varphi|_{\mathcal{I}'} & & \uparrow & & \uparrow = \\ 0 & \longrightarrow & \mathcal{I}' & \longrightarrow & f^{-1}\mathcal{O}_{\mathcal{B}'}[\mathcal{E}] & \longrightarrow & \mathcal{O} \longrightarrow 0 \end{array}$$

Let $\psi : \mathcal{I}' \rightarrow \mathcal{G}$ be the sum of the map $\varphi|_{\mathcal{I}'}$ and the composition

$$\mathcal{I}' \rightarrow \mathcal{I}'/(\mathcal{I}')^2 \rightarrow \mathcal{I}/\mathcal{I}^2 \xrightarrow{\delta} \mathcal{G}.$$

Then the pushout along ψ is an other ring extension \mathcal{O}'_{ξ} fitting into a diagram as above. A calculation (omitted) shows that $o(\mathcal{O}', \mathcal{O}'_{\xi}) = \xi$ as desired. □

Lemma 69.12.4. *Let $(Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$ be a ringed topos and let \mathcal{J} be an $\mathcal{O}_{\mathcal{B}}$ -module.*

- (1) *The set of extensions of sheaves of rings $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{\mathcal{B}'} \rightarrow \mathcal{O}_{\mathcal{B}} \rightarrow 0$ where \mathcal{J} is an ideal of square zero is canonically bijective to $Ext_{\mathcal{O}_{\mathcal{B}}}^1(NL_{\mathcal{O}_{\mathcal{B}}/\mathbf{Z}}, \mathcal{J})$.*
- (2) *Given a morphism of ringed topoi $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$, an \mathcal{O} -module \mathcal{G} , an $f^{-1}\mathcal{O}_{\mathcal{B}}$ -module map $c : f^{-1}\mathcal{J} \rightarrow \mathcal{G}$, and given extensions of sheaves of rings with square zero kernels:

 - (a) $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{\mathcal{B}'} \rightarrow \mathcal{O}_{\mathcal{B}} \rightarrow 0$ corresponding to $\alpha \in Ext_{\mathcal{O}_{\mathcal{B}}}^1(NL_{\mathcal{O}_{\mathcal{B}}/\mathbf{Z}}, \mathcal{J})$,
 - (b) $0 \rightarrow \mathcal{G} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0$ corresponding to $\beta \in Ext_{\mathcal{O}}^1(NL_{\mathcal{O}/\mathbf{Z}}, \mathcal{G})$
 then there is a morphism $(Sh(\mathcal{C}), \mathcal{O}') \rightarrow (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}'})$ fitting into a diagram (69.12.0.1) if and only if β and α map to the same element of $Ext_{\mathcal{O}}^1(Lf^*NL_{\mathcal{O}_{\mathcal{B}}/\mathbf{Z}}, \mathcal{G})$.*

Proof. To prove this we apply the previous results where we work over the base ringed topos $(Sh(*), \mathbf{Z})$ with trivial thickening. Part (1) follows from Lemma 69.12.3 and the fact that there exists a solution, namely $\mathcal{J} \oplus \mathcal{O}_{\mathcal{B}}$. Part (2) follows from Lemma 69.12.1 and a compatibility between the constructions in the proofs of Lemmas 69.12.3 and 69.12.1 whose statement and proof we omit. \square

The Cotangent Complex

70.1. Introduction

The goal of this chapter is to construct the cotangent complex of a ring map, of a morphism of schemes, and of a morphism of algebraic spaces. Some references are the notes [Qui], the paper [Qui70], and the books [And67] and [Ill72].

70.2. Advice for the reader

In writing this chapter we have tried to minimize the use of simplicial techniques. We view the choice of a *resolution* P_\bullet of a ring B over a ring A as a tool to calculating the *homology* of abelian sheaves on the category $\mathcal{C}_{B/A}$, see Remark 70.5.5. This is similar to the role played by a “good cover” to compute cohomology using the Čech complex. To read a bit on homology on categories, please visit Cohomology on Sites, Section 21.29. The derived lower shriek functor $L\pi_!$ is to homology what $R\Gamma(\mathcal{C}_{B/A}, -)$ is to cohomology. The category $\mathcal{C}_{B/A}$, studied in Section 70.4, is the opposite of the category of factorizations $A \rightarrow P \rightarrow B$ where P is a polynomial algebra over A . This category comes with maps of sheaves of rings

$$\underline{A} \longrightarrow \mathcal{O} \longrightarrow \underline{B}$$

where over the object $U = (P \rightarrow B)$ we have $\mathcal{O}(U) = P$. It turns out that we obtain the cotangent complex of B over A as

$$L_{B/A} = L\pi_!(\Omega_{\mathcal{O}/\underline{A}} \otimes_{\mathcal{O}} \underline{B})$$

see Lemma 70.4.3. We have consistently tried to use this point of view to prove the basic properties of cotangent complexes of ring maps. In particular, all of the results can be proven without relying on the existence of standard resolutions, although we have not done so. The theory is quite satisfactory, except that perhaps the proof of the fundamental triangle (Proposition 70.7.4) uses just a little bit more theory on derived lower shriek functors. To provide the reader with an alternative, we give a rather complete sketch of an approach to this result based on simple properties of standard resolutions in Remarks 70.7.5 and 70.7.6.

Our approach to the cotangent complex for morphisms of ringed topoi, morphisms of schemes, morphisms of algebraic spaces, etc is to deduce as much as possible from the case of “plain ring maps” discussed above.

70.3. The cotangent complex of a ring map

Let A be a ring. Let Alg_A be the category of A -algebras. Consider the pair of adjoint functors (F, i) where $i : \text{Alg}_A \rightarrow \text{Sets}$ is the forgetful functor and $F : \text{Sets} \rightarrow \text{Alg}_A$ assigns to a set E the polynomial algebra $A[E]$ on E over A . Let X_\bullet be the simplicial object of $\text{Fun}(\text{Alg}_A, \text{Alg}_A)$ constructed in Simplicial, Section 14.32.

Consider an A -algebra B . Denote $P_\bullet = X_\bullet(B)$ the resulting simplicial A -algebra. Recall that $P_0 = A[B]$, $P_1 = A[A[B]]$, and so on. In particular each term P_n is a polynomial A -algebra. Recall also that there is an augmentation

$$\epsilon : P_\bullet \longrightarrow B$$

where we view B as a constant simplicial A -algebra.

Definition 70.3.1. Let $A \rightarrow B$ be a ring map. The *standard resolution of B over A* is the augmentation $\epsilon : P_\bullet \rightarrow A$ with terms

$$P_0 = A[B], \quad P_1 = A[A[B]], \quad \dots$$

and maps as constructed above.

It will turn out that we can use the standard resolution to compute left derived functors in certain settings.

Definition 70.3.2. The *cotangent complex $L_{B/A}$* of a ring map $A \rightarrow B$ is the complex of B -modules associated to the simplicial B -module

$$\Omega_{P_\bullet/A} \otimes_{P_\bullet, \epsilon} B$$

where $\epsilon : P_\bullet \rightarrow B$ is the standard resolution of B over A .

In *Simplicial*, Section 14.22 we associate a chain complex to a simplicial module, but here we work with cochain complexes. Thus the term $L_{B/A}^{-n}$ in degree $-n$ is the B -module $\Omega_{P_n/A} \otimes_{P_n, \epsilon_n} B$ and $L_{B/A}^m = 0$ for $m > 0$.

Remark 70.3.3. Let $A \rightarrow B$ be a ring map. Let \mathcal{A} be the category of arrows $\psi : C \rightarrow B$ of A -algebras and let \mathcal{S} be the category of maps $E \rightarrow B$ where E is a set. There are adjoint functors $i : \mathcal{A} \rightarrow \mathcal{S}$ (the forgetful functor) and $F : \mathcal{S} \rightarrow \mathcal{A}$ which sends $E \rightarrow B$ to $A[E] \rightarrow B$. Let X_\bullet be the simplicial object of $\text{Fun}(\mathcal{A}, \mathcal{A})$ constructed in *Simplicial*, Section 14.32. The diagram

$$\begin{array}{ccc} \mathcal{A} & \xrightleftharpoons{\quad} & \mathcal{S} \\ \downarrow & & \downarrow \\ \text{Alg}_A & \xrightleftharpoons{\quad} & \text{Sets} \end{array}$$

commutes. It follows that $X_\bullet(\text{id}_B : B \rightarrow B)$ is equal to the standard resolution of B over A .

Lemma 70.3.4. Let $A_i \rightarrow B_i$ be a system of ring maps over a directed index set I . Then $\text{colim } L_{A_i/B_i} = L_{\text{colim } A_i / \text{colim } B_i}$.

Proof. This is true because the forgetful functor $i : A\text{-Alg} \rightarrow \text{Sets}$ and its adjoint $F : \text{Sets} \rightarrow A\text{-Alg}$ commute with filtered colimits. Moreover, the functor $B/A \mapsto \Omega_{B/A}$ does as well (*Algebra*, Lemma 10.127.4). \square

70.4. Simplicial resolutions and derived lower shriek

Let $A \rightarrow B$ be a ring map. Consider the category of A -algebra maps $\alpha : P \rightarrow B$ where P is a polynomial algebra over A (in some set¹ of variables). Let $\mathcal{C} = \mathcal{C}_{B/A}$

¹It suffices to consider sets of cardinality at most the cardinality of B .

denote the **opposite** of this category. The reason for taking the opposite is that we want to think of objects (P, α) as corresponding to the diagram of affine schemes

$$\begin{array}{ccc} \text{Spec}(B) & \longrightarrow & \text{Spec}(P) \\ \downarrow & \swarrow & \\ \text{Spec}(A) & & \end{array}$$

We endow \mathcal{C} with the chaotic topology (Sites, Example 7.6.6), i.e., we endow \mathcal{C} with the structure of a site where coverings are given by identities so that all presheaves are sheaves. Moreover, we endow \mathcal{C} with two sheaves of rings. The first is the sheaf \mathcal{O} which sends to object (P, α) to P . Then second is the constant sheaf B , which we will denote \underline{B} . We obtain the following diagram of morphisms of ringed topoi

$$(70.4.0.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}), \underline{B}) & \xrightarrow{i} & (Sh(\mathcal{C}), \mathcal{O}) \\ \pi \downarrow & & \\ (Sh(*), B) & & \end{array}$$

The morphism i is the identity on underlying topoi and $i^\sharp : \mathcal{O} \rightarrow \underline{B}$ is the obvious map. The map π is as in Cohomology on Sites, Example 21.29.1. An important role will be played in the following by the derived functors $Li^* : D(\mathcal{O}) \rightarrow D(\underline{B})$ left adjoint to $Ri_* = i_* : D(\underline{B}) \rightarrow D(\mathcal{O})$ and $L\pi_! : D(\underline{B}) \rightarrow D(B)$ left adjoint to $\pi^* = \pi^{-1} : D(B) \rightarrow D(\underline{B})$.

Lemma 70.4.1. *With notation as above let P_\bullet be a simplicial A -algebra endowed with an augmentation $\epsilon : P_\bullet \rightarrow B$. Assume each P_n is a polynomial algebra over A and ϵ is a trivial Kan fibration on underlying simplicial sets. Then*

$$L\pi_!(\mathcal{F}) = \mathcal{F}(P_\bullet, \epsilon)$$

in $D(Ab)$, resp. $D(B)$ functorially in \mathcal{F} in $Ab(\mathcal{C})$, resp. $Mod(\underline{B})$.

Proof. We will use the criterion of Cohomology on Sites, Lemma 21.29.7 to prove this. Given an object $U = (Q, \beta)$ of \mathcal{C} we have to show that

$$S_\bullet = \text{Mor}_{\mathcal{C}}((Q, \beta), (P_\bullet, \epsilon))$$

is homotopy equivalent to a singleton. Write $Q = A[E]$ for some set E (this is possible by our choice of the category \mathcal{C}). We see that

$$S_\bullet = \text{Mor}_{Sets}((E, \beta|_E), (P_\bullet, \epsilon))$$

Let $*$ be the constant simplicial set on a singleton. For $b \in B$ let $F_{b, \bullet}$ be the simplicial set defined by the cartesian diagram

$$\begin{array}{ccc} F_{b, \bullet} & \longrightarrow & P_\bullet \\ \downarrow & & \downarrow \epsilon \\ * & \xrightarrow{b} & B \end{array}$$

With this notation $S_\bullet = \prod_{\epsilon \in E} F_{\beta(\epsilon), \bullet}$. Since we assumed ϵ is a trivial Kan fibration we see that $F_{b, \bullet} \rightarrow *$ is a trivial Kan fibration (Simplicial, Lemma 14.29.3). Thus $S_\bullet \rightarrow *$ is a trivial Kan fibration (Simplicial, Lemma 14.29.6). Therefore S_\bullet is homotopy equivalent to $*$ (Simplicial, Lemma 14.29.8). \square

In particular, we can use the standard resolution of B over A to compute derived lower shriek.

Lemma 70.4.2. *Let $A \rightarrow B$ be a ring map. Let $\epsilon : P_\bullet \rightarrow B$ be the standard resolution of B over A . Let π be as in (70.4.0.1). Then*

$$L\pi_!(\mathcal{F}) = \mathcal{F}(P_\bullet, \epsilon)$$

in $D(Ab)$, resp. $D(B)$ functorially in \mathcal{F} in $Ab(\mathcal{C})$, resp. $Mod(\underline{B})$.

First proof. We will apply Lemma 70.4.1. Since the terms P_n are polynomial algebras we see the first assumption of that lemma is satisfied. The second assumption is proved as follows. By Simplicial, Lemma 14.32.5 the map ϵ is a homotopy equivalence of underlying simplicial sets. By Simplicial, Lemma 14.30.9 this implies ϵ induces a quasi-isomorphism of associated complexes of abelian groups. By Simplicial, Lemma 14.30.8 this implies that ϵ is a trivial Kan fibration of underlying simplicial sets. \square

Second proof. We will use the criterion of Cohomology on Sites, Lemma 21.29.7. Let $U = (Q, \beta)$ be an object of \mathcal{C} . We have to show that

$$S_\bullet = \text{Mor}_{\mathcal{C}}((Q, \beta), (P_\bullet, \epsilon))$$

is homotopy equivalent to a singleton. Write $Q = A[E]$ for some set E (this is possible by our choice of the category \mathcal{C}). Using the notation of Remark 70.3.3 we see that

$$S_\bullet = \text{Mor}_{\mathcal{S}}((E \rightarrow B), i(P_\bullet \rightarrow B))$$

By Simplicial, Lemma 14.32.5 the map $i(P_\bullet \rightarrow B) \rightarrow i(B \rightarrow B)$ is a homotopy equivalence in \mathcal{S} . Hence S_\bullet is homotopy equivalent to

$$\text{Mor}_{\mathcal{S}}((E \rightarrow B), (B \rightarrow B)) = \{*\}$$

as desired. \square

Lemma 70.4.3. *Let $A \rightarrow B$ be a ring map. Let π and i be as in (70.4.0.1). There is a canonical isomorphism*

$$L_{B/A} = L\pi_!(Li^*\Omega_{\mathcal{O}/A}) = L\pi_!(i^*\Omega_{\mathcal{O}/A}) = L\pi_!(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B})$$

in $D(B)$.

Proof. For an object $\alpha : P \rightarrow B$ of the category \mathcal{C} the module $\Omega_{P/A}$ is a free P -module. Thus $\Omega_{\mathcal{O}/A}$ is a flat \mathcal{O} -module. Hence $Li^*\Omega_{\mathcal{O}/A} = i^*\Omega_{\mathcal{O}/A}$ is the sheaf of \underline{B} -modules which associates to $\alpha : P \rightarrow A$ the B -module $\Omega_{P/A} \otimes_{P, \alpha} B$. By Lemma 70.4.2 we see that the right hand side is computed by the value of this sheaf on the standard resolution which is our definition of the left hand side (Definition 70.3.2). \square

Lemma 70.4.4. *If $A \rightarrow B$ is a ring map, then $L\pi_!(\pi^{-1}M) = M$ with π as in (70.4.0.1).*

Proof. This follows from Lemma 70.4.1 which tells us $L\pi_!(\pi^{-1}M)$ is computed by $(\pi^{-1}M)(P_\bullet, \epsilon)$ which is the constant simplicial object on M . \square

Lemma 70.4.5. *If $A \rightarrow B$ is a ring map, then $H^0(L_{B/A}) = \Omega_{B/A}$.*

Proof. We will prove this by a direct calculation. We will use the identification of Lemma 70.4.3. There is clearly a map from $\Omega_{\mathcal{O}/A} \otimes \underline{B}$ to the constant sheaf with value $\Omega_{B/A}$. Thus this map induces a map

$$H^0(L_{B/A}) = H^0(L\pi_!(\Omega_{\mathcal{O}/A} \otimes \underline{B})) = \pi_!(\Omega_{\mathcal{O}/A} \otimes \underline{B}) \rightarrow \Omega_{B/A}$$

By choosing an object $P \rightarrow B$ of $\mathcal{C}_{B/A}$ with $P \rightarrow B$ surjective we see that this map is surjective (by Algebra, Lemma 10.127.6). To show that it is injective, suppose that $P \rightarrow B$ is an object of $\mathcal{C}_{B/A}$ and that $\xi \in \Omega_{P/A} \otimes_P B$ is an element which maps to zero in $\Omega_{B/A}$. We first choose factorization $P \rightarrow P' \rightarrow B$ such that $P' \rightarrow B$ is surjective and P' is a polynomial algebra over A . We may replace P by P' . If $B = P/I$, then the kernel $\Omega_{P/A} \otimes_P B \rightarrow \Omega_{B/A}$ is the image of I/I^2 (Algebra, Lemma 10.127.9). Say ξ is the image of $f \in I$. Then we consider the two maps $a, b : P' = P[x] \rightarrow P$, the first of which maps x to 0 and the second of which maps x to f (in both cases $P[x] \rightarrow B$ maps x to zero). We see that ξ and 0 are the image of $dx \otimes 1$ in $\Omega_{P'/A} \otimes_{P'} B$. Thus ξ and 0 have the same image in the colimit (see Cohomology on Sites, Example 21.29.1) $\pi_!(\Omega_{\mathcal{O}/A} \otimes \underline{B})$ as desired. \square

Lemma 70.4.6. *If B is a polynomial algebra over the ring A , then with π as in (70.4.0.1) we have that $\pi_!$ is exact and $\pi_! \mathcal{F} = \mathcal{F}(B \rightarrow B)$.*

Proof. This follows from Lemma 70.4.1 which tells us the constant simplicial algebra on B can be used to compute $L\pi_!$. \square

Lemma 70.4.7. *If B is a polynomial algebra over the ring A , then $L_{B/A}$ is quasi-isomorphic to $\Omega_{B/A}[0]$.*

Proof. Immediate from Lemmas 70.4.3 and 70.4.6. \square

70.5. Constructing a resolution

In the Noetherian finite type case we can construct a “small” simplicial resolution for finite type ring maps.

Lemma 70.5.1. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Let \mathcal{A} be the category of A -algebra maps $C \rightarrow B$. Let $n \geq 0$ and let P_\bullet be a simplicial object of \mathcal{A} such that*

- (1) $P_\bullet \rightarrow B$ is a trivial Kan fibration of simplicial sets,
- (2) P_k is finite type over A for $k \leq n$,
- (3) $P_\bullet = \text{cosk}_n \text{sk}_n P_\bullet$ as simplicial objects of \mathcal{A} .

Then P_{n+1} is a finite type A -algebra.

Proof. Although the proof we give of this lemma is straightforward, it is a bit messy. To clarify the idea we explain what happens for low n before giving the proof in general. For example, if $n = 0$, then (3) means that $P_1 = P_0 \times_B P_0$. Since the ring map $P_0 \rightarrow B$ is surjective, this is of finite type over A by More on Algebra, Lemma 15.4.1.

If $n = 1$, then (3) means that

$$P_2 = \{(f_0, f_1, f_2) \in P_1^3 \mid d_0 f_0 = d_0 f_1, d_1 f_0 = d_0 f_2, d_1 f_1 = d_1 f_2\}$$

where the equalities take place in P_0 . Observe that the triple

$$(d_0 f_0, d_1 f_0, d_1 f_1) = (d_0 f_1, d_0 f_2, d_1 f_2)$$

is an element of the fibre product $P_0 \times_B P_0 \times_B P_0$ over B because the maps $d_i : P_1 \rightarrow P_0$ are morphisms over B . Thus we get a map

$$\psi : P_2 \longrightarrow P_0 \times_B P_0 \times_B P_0$$

The fibre of ψ over an element $(g_0, g_1, g_2) \in P_0 \times_B P_0 \times_B P_0$ is the set of triples (f_0, f_1, f_2) of 1-simplices with $(d_0, d_1)(f_0) = (g_0, g_1)$, $(d_0, d_1)(f_1) = (g_0, g_2)$, and $(d_0, d_1)(f_2) = (g_1, g_2)$. As $P_\bullet \rightarrow B$ is a trivial Kan fibration the map $(d_0, d_1) : P_1 \rightarrow P_0 \times_B P_0$ is surjective. Thus we see that P_2 fits into the cartesian diagram

$$\begin{array}{ccc} P_2 & \longrightarrow & P_1^3 \\ \downarrow & & \downarrow \\ P_0 \times_B P_0 \times_B P_0 & \longrightarrow & (P_0 \times_B P_0)^3 \end{array}$$

By More on Algebra, Lemma 15.4.2 we conclude. The general case is similar, but requires a bit more notation.

The case $n > 1$. By Simplicial, Lemma 14.18.14 the condition $P_\bullet = \text{cosk}_n \text{sk}_n P_\bullet$ implies the same thing is true in the category of simplicial A -algebras and hence in the category of sets (as the forgetful functor from A -algebras to sets commutes with limits). Thus

$$P_{n+1} = \text{Mor}(\Delta[n + 1], P_\bullet) = \text{Mor}(\text{sk}_n \Delta[n + 1], \text{sk}_n P_\bullet)$$

by Simplicial, Lemma 14.11.3 and Equation (14.18.0.1). We will prove by induction on $1 \leq k < m \leq n + 1$ that the ring

$$Q_{k,m} = \text{Mor}(\text{sk}_k \Delta[m], \text{sk}_k P_\bullet)$$

is of finite type over A . The case $k = 1, 1 < m \leq n + 1$ is entirely similar to the discussion above in the case $n = 1$. Namely, there is a cartesian diagram

$$\begin{array}{ccc} Q_{1,m} & \longrightarrow & P_1^N \\ \downarrow & & \downarrow \\ P_0 \times_B \dots \times_B P_0 & \longrightarrow & (P_0 \times_B P_0)^N \end{array}$$

where $N = \binom{m+1}{2}$. We conclude as before.

Let $1 \leq k_0 \leq n$ and assume $Q_{k,m}$ is of finite type over A for all $1 \leq k \leq k_0$ and $k < m \leq n + 1$. For $k_0 + 1 < m \leq n + 1$ we claim there is a cartesian square

$$\begin{array}{ccc} Q_{k_0+1,m} & \longrightarrow & P_{k_0+1}^N \\ \downarrow & & \downarrow \\ Q_{k_0,m} & \longrightarrow & Q_{k_0,k_0+1}^N \end{array}$$

where N is the number of nondegenerate $(k_0 + 1)$ -simplices of $\Delta[m]$. Namely, to see this is true, think of an element of $Q_{k_0+1,m}$ as a function f from the $(k_0 + 1)$ -skeleton of $\Delta[m]$ to P_\bullet . We can restrict f to the k_0 -skeleton which gives the left vertical map of the diagram. We can also restrict to each nondegenerate $(k_0 + 1)$ -simplex which gives the top horizontal arrow. Moreover, to give such an f is the same thing as giving its restriction to k_0 -skeleton and to each nondegenerate $(k_0 + 1)$ -face,

provided these agree on the overlap, and this is exactly the content of the diagram. Moreover, the fact that $P_\bullet \rightarrow B$ is a trivial Kan fibration implies that the map

$$P_{k_0} \rightarrow Q_{k_0, k_0+1} = \text{Mor}(\partial\Delta[k_0 + 1], P_\bullet)$$

is surjective as every map $\partial\Delta[k_0 + 1] \rightarrow B$ can be extended to $\Delta[k_0 + 1] \rightarrow B$ for $k_0 \geq 1$ (small argument about constant simplicial sets omitted). Since by induction hypothesis the rings $Q_{k_0, m}$, Q_{k_0, k_0+1} are finite type A -algebras, so is $Q_{k_0+1, m}$ by More on Algebra, Lemma 15.4.2 once more. \square

Proposition 70.5.2. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. There exists a simplicial A -algebra P_\bullet with an augmentation $\epsilon : P_\bullet \rightarrow B$ such that each P_n is a polynomial algebra of finite type over A and such that ϵ is a trivial Kan fibration of simplicial sets.*

Proof. Let \mathcal{A} be the category of A -algebra maps $C \rightarrow B$. In this proof our simplicial objects and skeleton and coskeleton functors will be taken in this category.

Choose a polynomial algebra P_0 of finite type over A and a surjection $P_0 \rightarrow B$. As a first approximation we take $P_\bullet = \text{cosk}_0(P_0)$. In other words, P_\bullet is the simplicial A -algebra with terms $P_n = P_0 \times_A \dots \times_A P_0$. (In the final paragraph of the proof this simplicial object will be denoted P_\bullet^0 .) By Simplicial, Lemma 14.31.3 the map $P_\bullet \rightarrow B$ is a trivial Kan fibration of simplicial sets. Also, observe that $P_\bullet = \text{cosk}_0 \text{sk}_0 P_\bullet$.

Suppose for some $n \geq 0$ we have constructed P_\bullet (in the final paragraph of the proof this will be P_\bullet^n) such that

- (a) $P_\bullet \rightarrow B$ is a trivial Kan fibration of simplicial sets,
- (b) P_k is a finitely generated polynomial algebra for $0 \leq k \leq n$, and
- (c) $P_\bullet = \text{cosk}_n \text{sk}_n P_\bullet$.

By Lemma 70.5.1 we can find a finitely generated polynomial algebra Q over A and a surjection $Q \rightarrow P_{n+1}$. Since P_n is a polynomial algebra the A -algebra maps $s_i : P_n \rightarrow P_{n+1}$ lift to maps $s'_i : P_n \rightarrow Q$. Set $d'_j : Q \rightarrow P_n$ equal to the composition of $Q \rightarrow P_{n+1}$ and $d_j : P_{n+1} \rightarrow P_n$. We obtain a truncated simplicial object P'_\bullet of \mathcal{A} by setting $P'_k = P_k$ for $k \leq n$ and $P'_{n+1} = Q$ and morphisms $d'_i = d_i$ and $s'_i = s_i$ in degrees $k \leq n - 1$ and using the morphisms d'_j and s'_i in degree n . Extend this to a full simplicial object P'_\bullet of \mathcal{A} using cosk_{n+1} . By functoriality of the coskeleton functors there is a morphism $P'_\bullet \rightarrow P_\bullet$ of simplicial objects extending the given morphism of $(n + 1)$ -truncated simplicial objects. (This morphism will be denoted $P_\bullet^{n+1} \rightarrow P_\bullet^n$ in the final paragraph of the proof.)

Note that conditions (b) and (c) are satisfied for P'_\bullet with n replaced by $n + 1$. We claim the map $P'_\bullet \rightarrow P_\bullet$ satisfies assumptions (1), (2), (3), and (4) of Simplicial, Lemmas 14.31.1 with $n+1$ instead of n . Conditions (1) and (2) hold by construction. By Simplicial, Lemma 14.18.14 we see that we have $P_\bullet = \text{cosk}_{n+1} \text{sk}_{n+1} P_\bullet$ and $P'_\bullet = \text{cosk}_{n+1} \text{sk}_{n+1} P'_\bullet$ not only in \mathcal{A} but also in the category of A -algebras, whence in the category of sets (as the forgetful functor from A -algebras to sets commutes with all limits). This proves (3) and (4). Thus the lemma applies and $P'_\bullet \rightarrow P_\bullet$ is a trivial Kan fibration. By Simplicial, Lemma 14.29.4 we conclude that $P'_\bullet \rightarrow B$ is a trivial Kan fibration and (a) holds as well.

To finish the proof we take the inverse limit $P_\bullet = \lim P_\bullet^n$ of the sequence of simplicial algebras

$$\dots \rightarrow P_\bullet^2 \rightarrow P_\bullet^1 \rightarrow P_\bullet^0$$

constructed above. The map $P_\bullet \rightarrow B$ is a trivial Kan fibration by Simplicial, Lemma 14.29.5. However, the construction above stabilizes in each degree to a fixed finitely generated polynomial algebra as desired. \square

Lemma 70.5.3. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Let π, \underline{B} be as in (70.4.0.1). If \mathcal{F} is an \underline{B} -module such that $\mathcal{F}(P, \alpha)$ is a finite B -module for all $\alpha : P = A[x_1, \dots, x_n] \rightarrow B$, then the cohomology modules of $L\pi_!(\mathcal{F})$ are finite B -modules.*

Proof. By Lemma 70.4.1 and Proposition 70.5.2 we can compute $L\pi_!(\mathcal{F})$ by a complex constructed out of the values of \mathcal{F} on finite type polynomial algebras. \square

Lemma 70.5.4. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Then $H^n(L_{B/A})$ is a finite B -module for all $n \in \mathbf{Z}$.*

Proof. Apply Lemmas 70.4.3 and 70.5.3. \square

Remark 70.5.5 (Resolutions). Let $A \rightarrow B$ be any ring map. Let us call an augmented simplicial A -algebra $\epsilon : P_\bullet \rightarrow B$ a *resolution of B over A* if each P_n is a polynomial algebra and ϵ is a trivial Kan fibration of simplicial sets. If $P_\bullet \rightarrow B$ is an augmentation of a simplicial A -algebra with each P_n a polynomial algebra surjecting onto B , then the following are equivalent

- (1) $\epsilon : P_\bullet \rightarrow B$ is a resolution of B over A ,
- (2) $\epsilon : P_\bullet \rightarrow B$ is a quasi-isomorphism on associated complexes,
- (3) $\epsilon : P_\bullet \rightarrow B$ induces a homotopy equivalence of simplicial sets.

To see this use Simplicial, Lemmas 14.29.8, 14.30.9, and 14.30.8. A resolution P_\bullet of B over A gives a cosimplicial object U_\bullet of $\mathcal{C}_{B/A}$ as in Cohomology on Sites, Lemma 21.29.7 and it follows that

$$L\pi_!\mathcal{F} = \mathcal{F}(P_\bullet)$$

functorially in \mathcal{F} , see Lemma 70.4.1. The (formal part of the) proof of Proposition 70.5.2 shows that resolutions exist. We also have seen in the first proof of Lemma 70.4.2 that the standard resolution of B over A is a resolution (so that this terminology doesn't lead to a conflict). However, the argument in the proof of Proposition 70.5.2 shows the existence of resolutions without appealing to the simplicial computations in Simplicial, Section 14.32. Moreover, for *any* choice of resolution we have a canonical isomorphism

$$L_{B/A} = \Omega_{P_\bullet/A} \otimes_{P_\bullet, \epsilon} B$$

in $D(B)$ by Lemma 70.4.3. The freedom to choose an arbitrary resolution can be quite useful.

Lemma 70.5.6. *Let $A \rightarrow B$ be a ring map. Let $\pi, \mathcal{O}, \underline{B}$ be as in (70.4.0.1). For any \mathcal{O} -module \mathcal{F} we have*

$$L\pi_!(\mathcal{F}) = L\pi_!(Li^*\mathcal{F}) = L\pi_!(\mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B})$$

in $D(Ab)$.

Proof. It suffices to verify the assumptions of Cohomology on Sites, Lemma 21.29.12 hold for $\mathcal{O} \rightarrow \underline{B}$ on $\mathcal{C}_{B/A}$. We will use the results of Remark 70.5.5 without further mention. Choose a resolution P_\bullet of B over A to get a suitable cosimplicial object U_\bullet of $\mathcal{C}_{B/A}$. Since $P_\bullet \rightarrow B$ induces a quasi-isomorphism on associated complexes of abelian groups we see that $L\pi_!\mathcal{O} = B$. On the other hand $L\pi_!\underline{B}$ is computed by

$\underline{B}(U_\bullet) = B$. This verifies the second assumption of Cohomology on Sites, Lemma 21.29.12 and we are done with the proof. \square

Lemma 70.5.7. *Let $A \rightarrow B$ be a ring map. Let $\pi, \mathcal{O}, \underline{B}$ be as in (70.4.0.1). We have*

$$L\pi_!(\mathcal{O}) = L\pi_!(\underline{B}) = B \quad \text{and} \quad L_{B/A} = L\pi_!(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}) = L\pi_!(\Omega_{\mathcal{O}/A})$$

in $D(Ab)$.

Proof. This is just an application of Lemma 70.5.6 (and the first equality on the right is Lemma 70.4.3). \square

Here is a special case of the fundamental triangle that is easy to prove.

Lemma 70.5.8. *Let $A \rightarrow B \rightarrow C$ be ring maps. If B is a polynomial algebra over A , then there is a distinguished triangle $L_{B/A} \otimes_B^{\mathbf{L}} C \rightarrow L_{C/A} \rightarrow L_{C/B} \rightarrow L_{B/A} \otimes_B^{\mathbf{L}} C[1]$ in $D(C)$.*

Proof. We will use the observations of Remark 70.5.5 without further mention. Choose a resolution $\epsilon : P_\bullet \rightarrow C$ of C over B (for example the standard resolution). Since B is a polynomial algebra over A we see that P_\bullet is also a resolution of C over A . Hence $L_{C/A}$ is computed by $\Omega_{P_\bullet/A} \otimes_{P_\bullet, \epsilon} C$ and $L_{C/B}$ is computed by $\Omega_{P_\bullet/B} \otimes_{P_\bullet, \epsilon} C$. Since for each n we have the short exact sequence $0 \rightarrow \Omega_{B/A} \otimes_B P_n \rightarrow \Omega_{P_n/A} \rightarrow \Omega_{P_n/B}$ (Algebra, Lemma 10.133.9) and since $L_{B/A} = \Omega_{B/A}[0]$ (Lemma 70.4.7) we obtain the result. \square

Example 70.5.9. Let $A \rightarrow B$ be a ring map. In this example we will construct an “explicit” resolution P_\bullet of B over A of length 2. To do this we follow the procedure of the proof of Proposition 70.5.2, see also the discussion in Remark 70.5.5.

We choose a surjection $P_0 = A[u_i] \rightarrow B$ where u_i is a set of variables. Choose generators $f_t \in P_0, t \in T$ of the ideal $\text{Ker}(P_0 \rightarrow B)$. We choose $P_1 = A[u_i, x_t]$ with face maps d_0 and d_1 the unique A -algebra maps with $d_j(u_i) = u_i$ and $d_0(x_t) = 0$ and $d_1(x_t) = f_t$. The map $s_0 : P_0 \rightarrow P_1$ is the unique A -algebra map with $s_0(u_i) = u_i$. It is clear that

$$P_1 \xrightarrow{d_0 - d_1} P_0 \rightarrow B \rightarrow 0$$

is exact, in particular the map $(d_0, d_1) : P_1 \rightarrow P_0 \times_B P_0$ is surjective. Thus, if P_\bullet denotes the 1-truncated simplicial A -algebra given by P_0, P_1, d_0, d_1 , and s_0 , then the augmentation $\text{cosk}_1(P_\bullet) \rightarrow B$ is a trivial Kan fibration. The next step of the procedure in the proof of Proposition 70.5.2 is to choose a polynomial algebra P_2 and a surjection

$$P_2 \longrightarrow \text{cosk}_1(P_\bullet)_2$$

Recall that

$$\text{cosk}_1(P_\bullet)_2 = \{(g_0, g_1, g_2) \in P_1^3 \mid d_0(g_0) = d_0(g_1), d_1(g_0) = d_0(g_2), d_1(g_1) = d_1(g_2)\}$$

Thinking of $g_i \in P_1$ as a polynomial in x_t the conditions are

$$g_0(0) = g_1(0), \quad g_0(f_t) = g_2(0), \quad g_1(f_t) = g_2(f_t)$$

Thus $\text{cosk}_1(P_\bullet)_2$ contains the elements $y_t = (x_t, x_t, f_t)$ and $z_t = (0, x_t, x_t)$. Every element G in $\text{cosk}_1(P_\bullet)_2$ is of the form $G = H + (0, 0, g)$ where H is in the image of $A[u_i, y_t, z_t] \rightarrow \text{cosk}_1(P_\bullet)_2$. Here $g \in P_1$ is a polynomial with vanishing constant term such that $g(f_t) = 0$ in P_0 . Observe that

(1) $g = x_t x_{t'} - f_t x_{t'}$ and
 (2) $g = \sum r_t x_t$ with $r_t \in P_0$ if $\sum r_t f_t = 0$ in P_0
 are elements of P_1 of the desired form. Let

$$Rel = \text{Ker}(\bigoplus_{t \in T} P_0 \longrightarrow P_0), \quad (r_t) \longmapsto \sum r_t f_t$$

We set $P_2 = A[u_i, y_t, z_t, v_r, w_{t,t'}]$ where $r = (r_t) \in Rel$, with map

$$P_2 \longrightarrow \text{cosk}_1(P_\bullet)_2$$

given by $y_t \mapsto (x_t, x_t, f_t)$, $z_t \mapsto (0, x_t, x_t)$, $v_r \mapsto (0, 0, \sum r_t x_t)$, and $w_{t,t'} \mapsto (0, 0, x_t x_{t'} - f_t x_{t'})$. A calculation (omitted) shows that this map is surjective. Our choice of the map displayed above determines the maps $d_0, d_1, d_2 : P_2 \rightarrow P_1$. Finally, the procedure in the proof of Proposition 70.5.2 tells us to choose the maps $s_0, s_1 : P_1 \rightarrow P_2$ lifting the two maps $P_1 \rightarrow \text{cosk}_1(P_\bullet)_2$. It is clear that we can take s_i to be the unique A -algebra maps determined by $s_0(x_t) = y_t$ and $s_1(x_t) = z_t$.

70.6. Functoriality

In this section we consider a commutative square

$$(70.6.0.1) \quad \begin{array}{ccc} B & \longrightarrow & B' \\ \uparrow & & \uparrow \\ A & \longrightarrow & A' \end{array}$$

of ring maps. We claim there is a canonical B -linear map of complexes

$$L_{B/A} \longrightarrow L_{B'/A'}$$

associated to this diagram. Namely, if $P_\bullet \rightarrow B$ is the standard resolution of B over A and $P'_\bullet \rightarrow B'$ is the standard resolution of B' over A' , then there is a canonical map $P_\bullet \rightarrow P'_\bullet$ of simplicial A -algebras compatible with the augmentations $P_\bullet \rightarrow B$ and $P'_\bullet \rightarrow B'$. This can be seen in terms of the construction of standard resolutions in *Simplicial*, Section 14.32 but in the special case at hand it probably suffices to say simply that the maps

$$P_0 = A[B] \longrightarrow A'[B'] = P'_0, \quad P_1 = A[A[B]] \longrightarrow A'[A'[B']] = P'_1,$$

and so on are given by the given maps $A \rightarrow A'$ and $B \rightarrow B'$. The desired map $L_{B/A} \rightarrow L_{B'/A'}$ then comes from the associated maps $\Omega_{P_n/A} \rightarrow \Omega_{P'_n/A'}$.

Another description of the functoriality map can be given as follows. Let $\mathcal{C} = \mathcal{C}_{B/A}$ and $\mathcal{C}' = \mathcal{C}'_{B'/A'}$ be the categories considered in Section 70.4. There is a functor

$$u : \mathcal{C} \longrightarrow \mathcal{C}', \quad (P, \alpha) \longmapsto (P \otimes_A A', c \circ (\alpha \otimes 1))$$

where $c : B \otimes_A A' \rightarrow B'$ is the obvious map. As discussed in *Cohomology on Sites*, Example 21.29.3 we obtain a morphism of topoi $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ and a commutative diagram of maps of ringed topoi

$$(70.6.0.2) \quad \begin{array}{ccccc} (Sh(\mathcal{C}), \underline{B}) & \xleftarrow{h} & (Sh(\mathcal{C}'), \underline{B}') & \xrightarrow{g} & (Sh(\mathcal{C}), \underline{B}') \\ \pi \downarrow & & \pi \downarrow & & \pi' \downarrow \\ (Sh(*), B) & \xleftarrow{f} & (Sh(*), B') & \longrightarrow & (Sh(*), B') \end{array}$$

Here h is the identity on underlying topoi and given by the ring map $B \rightarrow B'$ on sheaves of rings. By Cohomology on Sites, Remark 21.28.7 given \mathcal{F} on \mathcal{C} and \mathcal{F}' on \mathcal{C}' and a transformation $t : \mathcal{F} \rightarrow g^{-1}\mathcal{F}'$ we obtain a canonical map $L\pi_!(\mathcal{F}) \rightarrow L\pi'_!(\mathcal{F}')$. If we apply this to the sheaves

$$\mathcal{F} : (P, \alpha) \mapsto \Omega_{P/A} \otimes_P B, \quad \mathcal{F}' : (P', \alpha') \mapsto \Omega_{P'/A'} \otimes_{P'} B',$$

and the transformation t given by the canonical maps

$$\Omega_{P/A} \otimes_P B \longrightarrow \Omega_{P \otimes_{\mathcal{O}} A'/A'} \otimes_{P \otimes_{\mathcal{O}} A'} B'$$

to get a canonical map

$$L\pi_!(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}) \longrightarrow L\pi'_!(\Omega_{\mathcal{O}'/A'} \otimes_{\mathcal{O}'} \underline{B'})$$

By Lemma 70.4.3 this gives $L_{B/A} \rightarrow L_{B'/A'}$. We omit the verification that this map agrees with the map defined above in terms of simplicial resolutions.

Lemma 70.6.1. *Assume (70.6.0.1) induces a quasi-isomorphism $B \otimes_A^{\mathbf{L}} A' = B'$. Then, with notation as in (70.6.0.2) and $\mathcal{F}' \in \text{Ab}(\mathcal{C}')$, we have $L\pi_!(g^{-1}\mathcal{F}') = L\pi'_!(\mathcal{F}')$.*

Proof. We use the results of Remark 70.5.5 without further mention. We will apply Cohomology on Sites, Lemma 21.29.8. Let $P_\bullet \rightarrow B$ be a resolution. If we can show that $u(P_\bullet) = P_\bullet \otimes_A A' \rightarrow B'$ is a quasi-isomorphism, then we are done. The complex of A -modules $s(P_\bullet)$ associated to P_\bullet (viewed as a simplicial A -module) is a free A -module resolution of B . Namely, P_n is a free A -module and $s(P_\bullet) \rightarrow B$ is a quasi-isomorphism. Thus $B \otimes_A^{\mathbf{L}} A'$ is computed by $s(P_\bullet) \otimes_A A' = s(P_\bullet \otimes_A A')$. Therefore the assumption of the lemma signifies that $e' : P_\bullet \otimes_A A' \rightarrow B'$ is a quasi-isomorphism. \square

The following lemma in particular applies when $A \rightarrow A'$ is flat and $B' = B \otimes_A A'$ (flat base change).

Lemma 70.6.2. *If (70.6.0.1) induces a quasi-isomorphism $B \otimes_A^{\mathbf{L}} A' = B'$, then the functoriality map induces an isomorphism*

$$L_{B/A} \otimes_B^{\mathbf{L}} B' \longrightarrow L_{B'/A'}$$

Proof. We will use the notation introduced in Equation (70.6.0.2). We have

$$L_{B/A} \otimes_B^{\mathbf{L}} B' = L\pi_!(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}) \otimes_B^{\mathbf{L}} B' = L\pi_!(Lh^*(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}))$$

the first equality by Lemma 70.4.3 and the second by Cohomology on Sites, Lemma 21.29.6. Since $\Omega_{\mathcal{O}/A}$ is a flat \mathcal{O} -module, we see that $\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}$ is a flat \underline{B} -module. Thus $Lh^*(\Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}) = \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}'$ which is equal to $g^{-1}(\Omega_{\mathcal{O}'/A'} \otimes_{\mathcal{O}'} \underline{B}')$ by inspection. we conclude by Lemma 70.6.1 and the fact that $L_{B'/A'}$ is computed by $L\pi'_!(\Omega_{\mathcal{O}'/A'} \otimes_{\mathcal{O}'} \underline{B}')$. \square

Remark 70.6.3. Suppose that we are given a square (70.6.0.1) such that there exists an arrow $\kappa : B \rightarrow A'$ making the diagram commute:

$$\begin{array}{ccc} B & \longrightarrow & B' \\ & \searrow \beta & \uparrow \\ & \kappa & \\ A & \xrightarrow{\alpha} & A' \end{array}$$

In this case we claim the functoriality map $P_\bullet \rightarrow P'_\bullet$ is homotopic to the composition $P_\bullet \rightarrow B \rightarrow A' \rightarrow P'_\bullet$. Namely, using κ the functoriality map factors as

$$P_\bullet \rightarrow P_{A'/A', \bullet} \rightarrow P'_\bullet$$

where $P_{A'/A', \bullet}$ is the standard resolution of A' over A' . Since A' is the polynomial algebra on the empty set over A' we see from *Simplicial*, Lemma 14.32.5 that the augmentation $\epsilon_{A'/A'} : P_{A'/A', \bullet} \rightarrow A'$ is a homotopy equivalence of simplicial rings. Observe that the homotopy inverse map $c : A' \rightarrow P_{A'/A', \bullet}$ constructed in the proof of that lemma is just the structure morphism, hence we conclude what we want because the two compositions

$$P_\bullet \longrightarrow P_{A'/A', \bullet} \begin{array}{c} \xrightarrow{\text{id}} \\ \xrightarrow{\text{co}\epsilon_{A'/A'}} \end{array} P_{A'/A', \bullet} \longrightarrow P'_\bullet$$

are the two maps discussed above and these are homotopic (*Simplicial*, Remark 14.25.5). Since the second map $P_\bullet \rightarrow P'_\bullet$ induces the zero map $\Omega_{P_\bullet/A} \rightarrow \Omega_{P'_\bullet/A'}$ we conclude that the functoriality map $L_{B/A} \rightarrow L_{B'/A'}$ is homotopic to zero in this case.

Lemma 70.6.4. *Let $A \rightarrow B$ and $A \rightarrow C$ be ring maps. Then the map $L_{B \times C/A} \rightarrow L_{B/A} \oplus L_{C/A}$ is an isomorphism in $D(B \times C)$.*

Proof. Although this lemma can be deduced from the fundamental triangle we will give a direct and elementary proof of this now. Factor the ring map $A \rightarrow B \times C$ as $A \rightarrow A[x] \rightarrow B \times C$ where $x \mapsto (1, 0)$. By Lemma 70.5.8 we have a distinguished triangle

$$L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} (B \times C) \rightarrow L_{B \times C/A} \rightarrow L_{B \times C/A[x]} \rightarrow L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} (B \times C)[1]$$

in $D(B \times C)$. Similarly we have the distinguished triangles

$$\begin{array}{l} L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} B \rightarrow L_{B/A} \rightarrow L_{B/A[x]} \rightarrow L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} B[1] \\ L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} C \rightarrow L_{C/A} \rightarrow L_{C/A[x]} \rightarrow L_{A[x]/A} \otimes_{A[x]}^{\mathbf{L}} C[1] \end{array}$$

Thus it suffices to prove the result for $B \times C$ over $A[x]$. Note that $A[x] \rightarrow A[x, x^{-1}]$ is flat, that $(B \times C) \otimes_{A[x]} A[x, x^{-1}] = B \otimes_{A[x]} A[x, x^{-1}]$, and that $C \otimes_{A[x]} A[x, x^{-1}] = 0$. Thus by base change (Lemma 70.6.2) the map $L_{B \times C/A[x]} \rightarrow L_{B/A[x]} \oplus L_{C/A[x]}$ becomes an isomorphism after inverting x . In the same way one shows that the map becomes an isomorphism after inverting $x - 1$. This proves the lemma. \square

70.7. The fundamental triangle

In this section we consider a sequence of ring maps $A \rightarrow B \rightarrow C$. It is our goal to show that this triangle gives rise to a distinguished triangle

$$(70.7.0.1) \quad L_{B/A} \otimes_B^{\mathbf{L}} C \rightarrow L_{C/A} \rightarrow L_{C/B} \rightarrow L_{B/A} \otimes_B^{\mathbf{L}} C[1]$$

in $D(C)$. This will be proved in Proposition 70.7.4. For an alternative approach see Remark 70.7.5.

Consider the category $\mathcal{C}_{C/B/A}$ which is the **opposite** of the category whose objects are $(P \rightarrow B, Q \rightarrow C)$ where

- (1) P is a polynomial algebra over A ,
- (2) $P \rightarrow B$ is an A -algebra homomorphism,
- (3) Q is a polynomial algebra over P , and

(4) $Q \rightarrow C$ is a P -algebra-homomorphism.

We take the opposite as we want to think of $(P \rightarrow B, Q \rightarrow C)$ as corresponding to the commutative diagram

$$\begin{array}{ccc} \text{Spec}(C) & \longrightarrow & \text{Spec}(Q) \\ \downarrow & & \downarrow \\ \text{Spec}(B) & \longrightarrow & \text{Spec}(P) \\ \downarrow & \swarrow & \\ \text{Spec}(A) & & \end{array}$$

Let $\mathcal{C}_{B/A}, \mathcal{C}_{C/A}, \mathcal{C}_{C/B}$ be the categories considered in Section 70.4. There are functors

$$\begin{aligned} u_1 : \mathcal{C}_{C/B/A} &\rightarrow \mathcal{C}_{B/A}, & (P \rightarrow B, Q \rightarrow C) &\mapsto (P \rightarrow B) \\ u_2 : \mathcal{C}_{C/B/A} &\rightarrow \mathcal{C}_{C/A}, & (P \rightarrow B, Q \rightarrow C) &\mapsto (Q \rightarrow C) \\ u_3 : \mathcal{C}_{C/B/A} &\rightarrow \mathcal{C}_{C/B}, & (P \rightarrow B, Q \rightarrow C) &\mapsto (Q \otimes_P B \rightarrow C) \end{aligned}$$

These functors induce corresponding morphisms of topoi g_i . Let us denote $\mathcal{O}_i = g_i^{-1}\mathcal{O}$ so that we get morphisms of ringed topoi

$$(70.7.0.2) \quad \begin{aligned} g_1 &: (Sh(\mathcal{C}_{C/B/A}), \mathcal{O}_1) \rightarrow (Sh(\mathcal{C}_{B/A}), \mathcal{O}) \\ g_2 &: (Sh(\mathcal{C}_{C/B/A}), \mathcal{O}_2) \rightarrow (Sh(\mathcal{C}_{C/A}), \mathcal{O}) \\ g_3 &: (Sh(\mathcal{C}_{C/B/A}), \mathcal{O}_3) \rightarrow (Sh(\mathcal{C}_{C/B}), \mathcal{O}) \end{aligned}$$

Let us denote $\pi : Sh(\mathcal{C}_{C/B/A}) \rightarrow Sh(*)$, $\pi_1 : Sh(\mathcal{C}_{B/A}) \rightarrow Sh(*)$, $\pi_2 : Sh(\mathcal{C}_{C/A}) \rightarrow Sh(*)$, and $\pi_3 : Sh(\mathcal{C}_{C/B}) \rightarrow Sh(*)$, so that $\pi = \pi_i \circ g_i$. We will obtain our distinguished triangle from the identification of the cotangent complex in Lemma 70.4.3 and the following lemmas.

Lemma 70.7.1. *With notation as in (70.7.0.2) set*

$$\begin{aligned} \Omega_1 &= \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B} \text{ on } \mathcal{C}_{B/A} \\ \Omega_2 &= \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{C} \text{ on } \mathcal{C}_{C/A} \\ \Omega_3 &= \Omega_{\mathcal{O}/B} \otimes_{\mathcal{O}} \underline{C} \text{ on } \mathcal{C}_{C/B} \end{aligned}$$

Then we have a canonical short exact sequence of sheaves of \underline{C} -modules

$$0 \rightarrow g_1^{-1}\Omega_1 \otimes_{\underline{B}} \underline{C} \rightarrow g_2^{-1}\Omega_2 \rightarrow g_3^{-1}\Omega_3 \rightarrow 0$$

on $\mathcal{C}_{C/B/A}$.

Proof. Recall that g_i^{-1} is gotten by simply precomposing with u_i . Given an object $U = (P \rightarrow B, Q \rightarrow C)$ we have a split short exact sequence

$$0 \rightarrow \Omega_{P/A} \otimes Q \rightarrow \Omega_{Q/A} \rightarrow \Omega_{Q/P} \rightarrow 0$$

for example by Algebra, Lemma 10.133.9. Tensoring with C over Q we obtain a short exact sequence

$$0 \rightarrow \Omega_{P/A} \otimes C \rightarrow \Omega_{Q/A} \otimes C \rightarrow \Omega_{Q/P} \otimes C \rightarrow 0$$

We have $\Omega_{P/A} \otimes C = \Omega_{P/A} \otimes B \otimes C$ whence this is the value of $g_1^{-1}\Omega_1 \otimes_{\underline{B}} \underline{C}$ on U . The module $\Omega_{Q/A} \otimes C$ is the value of $g_2^{-1}\Omega_2$ on U . We have $\Omega_{Q/P} \otimes C = \Omega_{Q \otimes_P B/B} \otimes C$ by Algebra, Lemma 10.127.12 hence this is the value of $g_3^{-1}\Omega_3$ on U . Thus the short exact sequence of the lemma comes from assigning to U the last displayed short exact sequence. \square

Lemma 70.7.2. *With notation as in (70.7.0.2) suppose that C is a polynomial algebra over B . Then $L\pi_!(g_3^{-1}\mathcal{F}) = L\pi_{3,!}\mathcal{F} = \pi_{3,!}\mathcal{F}$ for any abelian sheaf \mathcal{F} on $\mathcal{C}_{C/B}$*

Proof. Write $C = B[E]$ for some set E . Choose a resolution $P_\bullet \rightarrow B$ of B over A . For every n consider the object $U_n = (P_n \rightarrow B, P_n[E] \rightarrow C)$ of $\mathcal{C}_{C/B/A}$. Then U_\bullet is a cosimplicial object of $\mathcal{C}_{C/B/A}$. Note that $u_3(U_\bullet)$ is the constant cosimplicial object of $\mathcal{C}_{C/B}$ with value $(C \rightarrow C)$. We will prove that the object U_\bullet of $\mathcal{C}_{C/B/A}$ satisfies the hypotheses of Cohomology on Sites, Lemma 21.29.7. This implies the lemma as it shows that $L\pi_!(g_3^{-1}\mathcal{F})$ is computed by the constant simplicial abelian group $\mathcal{F}(C \rightarrow C)$ which is the value of $L\pi_{3,!}\mathcal{F} = \pi_{3,!}\mathcal{F}$ by Lemma 70.4.6.

Let $U = (\beta : P \rightarrow B, \gamma : Q \rightarrow C)$ be an object of $\mathcal{C}_{C/B/A}$. We may write $P = A[S]$ and $Q = A[S \amalg T]$ by the definition of our category $\mathcal{C}_{C/B/A}$. We have to show that

$$\text{Mor}_{\mathcal{C}_{C/B/A}}(U_\bullet, U)$$

is homotopy equivalent to a singleton simplicial set $*$. Observe that this simplicial set is the product

$$\prod_{s \in S} F_s \times \prod_{t \in T} F'_t$$

where F_s is the corresponding simplicial set for $U_s = (A[\{s\}] \rightarrow B, A[\{s\}] \rightarrow C)$ and F'_t is the corresponding simplicial set for $U_t = (A \rightarrow B, A[\{t\}] \rightarrow C)$. Namely, the object U is the product $\prod U_s \times \prod U_t$ in $\mathcal{C}_{C/B/A}$. It suffices each F_s and F'_t is homotopy equivalent to $*$, see *Simplicial*, Lemma 14.25.10. The case of F_s follows as $P_\bullet \rightarrow B$ is a trivial Kan fibration (as a resolution) and F_s is the fibre of this map over $\beta(s)$. (Use *Simplicial*, Lemmas 14.29.3 and 14.29.8). The case of F'_t is more interesting. Here we are saying that the fibre of

$$P_\bullet[E] \longrightarrow C = B[E]$$

over $\gamma(t) \in C$ is homotopy equivalent to a point. In fact we will show this map is a trivial Kan fibration. Namely, $P_\bullet \rightarrow B$ is a trivial Kan fibration. For any ring R we have

$$R[E] = \text{colim}_{\Sigma \subset \text{Map}(E, \mathbf{Z}_{\geq 0}) \text{ finite}} \prod_{I \in \Sigma} R$$

(filtered colimit). Thus the displayed map of simplicial sets is a filtered colimit of trivial Kan fibrations, whence a trivial Kan fibration by *Simplicial*, Lemma 14.29.7. \square

Lemma 70.7.3. *With notation as in (70.7.0.2) we have $Lg_{i,!} \circ g_i^{-1} = id$ for $i = 1, 2, 3$ and hence also $L\pi_i \circ g_i^{-1} = L\pi_{i,!}$ for $i = 1, 2, 3$.*

Proof. Proof for $i = 1$. We claim the functor $\mathcal{C}_{C/B/A}$ is a fibred category over $\mathcal{C}_{B/A}$. Namely, suppose given $(P \rightarrow B, Q \rightarrow C)$ and a morphism $(P' \rightarrow B) \rightarrow (P \rightarrow B)$ of $\mathcal{C}_{B/A}$. Recall that this means we have an A -algebra homomorphism $P \rightarrow P'$ compatible with maps to B . Then we set $Q' = Q \otimes_P P'$ with induced map to C and the morphism

$$(P' \rightarrow B, Q' \rightarrow C) \longrightarrow (P \rightarrow B, Q \rightarrow C)$$

in $\mathcal{C}_{C/B/A}$ (note reversal arrows again) is strongly cartesian in $\mathcal{C}_{C/B/A}$ over $\mathcal{C}_{B/A}$. Moreover, observe that the fibre category of u_1 over $P \rightarrow B$ is the category $\mathcal{C}_{C/P}$. Let \mathcal{F} be an abelian sheaf on $\mathcal{C}_{B/A}$. Since we have a fibred category we may apply Cohomology on Sites, Lemma 21.30.2. Thus $L_n g_{1,!} g_1^{-1} \mathcal{F}$ is the (pre)sheaf which

assigns to $U \in \text{Ob}(\mathcal{C}_{B/A})$ the n th homology of $g_1^{-1}\mathcal{F}$ restricted to the fibre category over U . Since these restrictions are constant the desired result follows from Lemma 70.4.4 via our identifications of fibre categories above.

The case $i = 2$. We claim $\mathcal{C}_{C/B/A}$ is a fibred category over $\mathcal{C}_{C/A}$ is a fibred category. Namely, suppose given $(P \rightarrow B, Q \rightarrow C)$ and a morphism $(Q' \rightarrow C) \rightarrow (Q \rightarrow C)$ of $\mathcal{C}_{C/A}$. Recall that this means we have a B -algebra homomorphism $Q \rightarrow Q'$ compatible with maps to C . Then

$$(P \rightarrow B, Q' \rightarrow C) \longrightarrow (P \rightarrow B, Q \rightarrow C)$$

is strongly cartesian in $\mathcal{C}_{C/B/A}$ over $\mathcal{C}_{C/A}$. Note that the fibre category of u_2 over $Q \rightarrow C$ has an final (beware reversal arrows) object, namely, $(A \rightarrow B, Q \rightarrow C)$. Let \mathcal{F} be an abelian sheaf on $\mathcal{C}_{C/A}$. Since we have a fibred category we may apply Cohomology on Sites, Lemma 21.30.2. Thus $L_n g_{2,!} g_2^{-1} \mathcal{F}$ is the (pre)sheaf which assigns to $U \in \text{Ob}(\mathcal{C}_{C/A})$ the n th homology of $g_1^{-1} \mathcal{F}$ restricted to the fibre category over U . Since these restrictions are constant the desired result follows from Cohomology on Sites, Lemma 21.29.5 because the fibre categories all have final objects.

The case $i = 3$. In this case we will apply Cohomology on Sites, Lemma 21.30.3 to $u = u_3 : \mathcal{C}_{C/B/A} \rightarrow \mathcal{C}_{C/B}$ and $\mathcal{F}' = g_3^{-1} \mathcal{F}$ for some abelian sheaf \mathcal{F} on $\mathcal{C}_{C/B}$. Suppose $U = (\bar{Q} \rightarrow C)$ is an object of $\mathcal{C}_{C/B}$. Then $\mathcal{I}_U = \mathcal{C}_{\bar{Q}/B/A}$ (again beware of reversal of arrows). The sheaf \mathcal{F}'_U is given by the rule $(P \rightarrow B, Q \rightarrow \bar{Q}) \mapsto \mathcal{F}(Q \otimes_P B \rightarrow C)$. In other words, this sheaf is the pullback of a sheaf on $\mathcal{C}_{\bar{Q}/C}$ via the morphism $Sh(\mathcal{C}_{\bar{Q}/B/A}) \rightarrow Sh(\mathcal{C}_{\bar{Q}/B})$. Thus Lemma 70.7.2 shows that $H_n(\mathcal{I}_U, \mathcal{F}'_U) = 0$ for $n > 0$ and equal to $\mathcal{F}(\bar{Q} \rightarrow C)$ for $n = 0$. The aforementioned Cohomology on Sites, Lemma 21.30.3 implies that $Lg_{3,!}(g_3^{-1} \mathcal{F}) = \mathcal{F}$ and the proof is done. \square

Proposition 70.7.4. *Let $A \rightarrow B \rightarrow C$ be ring maps. There is a canonical distinguished triangle*

$$L_{B/A} \otimes_B^{\mathbf{L}} C \rightarrow L_{C/A} \rightarrow L_{C/B} \rightarrow L_{B/A} \otimes_B^{\mathbf{L}} C[1]$$

in $D(C)$.

Proof. Consider the short exact sequence of sheaves of Lemma 70.7.1 and apply the derived functor $L\pi_!$ to obtain a distinguished triangle

$$L\pi_!(g_1^{-1}\Omega_1 \otimes_{\underline{B}} \underline{C}) \rightarrow L\pi_!(g_2^{-1}\Omega_2) \rightarrow L\pi_!(g_3^{-1}\Omega_3) \rightarrow L\pi_!(g_1^{-1}\Omega_1 \otimes_{\underline{B}} \underline{C})[1]$$

in $D(C)$. Using Lemmas 70.7.3 and 70.4.3 we see that the second and third terms agree with $L_{C/A}$ and $L_{C/B}$ and the first one equals

$$L\pi_{1,!}(\Omega_1 \otimes_{\underline{B}} \underline{C}) = L\pi_{1,!}(\Omega_1) \otimes_B^{\mathbf{L}} C = L_{B/A} \otimes_B^{\mathbf{L}} C$$

The first equality by Cohomology on Sites, Lemma 21.29.6 (and flatness of Ω_1 as a sheaf of modules over \underline{B}) and the second by Lemma 70.4.3. \square

Remark 70.7.5. We sketch an alternative, perhaps simpler, proof of the existence of the fundamental triangle. Let $A \rightarrow B \rightarrow C$ be ring maps and assume that $B \rightarrow C$ is injective. Let $P_\bullet \rightarrow B$ be the standard resolution of B over A and let

$Q_\bullet \rightarrow C$ be the standard resolution of C over B . Picture

$$\begin{array}{ccccccc}
 P_\bullet : & & A[A[A[B]]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} & A[A[B]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} & A[B] & \longrightarrow & B \\
 & & \downarrow & & \downarrow & & \downarrow & & \\
 Q_\bullet : & & A[A[A[C]]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} & A[A[C]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} & A[C] & \longrightarrow & C
 \end{array}$$

Observe that since $B \rightarrow C$ is injective, the ring Q_n is a polynomial algebra over P_n for all n . Hence we obtain a cosimplicial object in $\mathcal{C}_{C/B/A}$ (beware reversal arrows). Now set $\overline{Q}_\bullet = Q_\bullet \otimes_{P_\bullet} B$. The key to the proof of Proposition 70.7.4 is to show that \overline{Q}_\bullet is a resolution of C over B . This follows from Cohomology on Sites, Lemma 21.29.12 applied to $\mathcal{C} = \Delta$, $\mathcal{O} = P_\bullet$, $\mathcal{O}' = B$, and $\mathcal{F} = Q_\bullet$ (this uses that Q_n is flat over P_n ; see Cohomology on Sites, Remark 21.29.11 to relate simplicial modules to sheaves). The key fact implies that the distinguished triangle of Proposition 70.7.4 is the distinguished triangle associated to the short exact sequence of simplicial C -modules

$$0 \rightarrow \Omega_{P_\bullet/A} \otimes_{P_\bullet} C \rightarrow \Omega_{Q_\bullet/A} \otimes_{Q_\bullet} C \rightarrow \Omega_{\overline{Q}_\bullet/B} \otimes_{\overline{Q}_\bullet} C \rightarrow 0$$

which is deduced from the short exact sequences $0 \rightarrow \Omega_{P_n/A} \otimes_{P_n} Q_n \rightarrow \Omega_{Q_n/A} \rightarrow \Omega_{Q_n/P_n} \rightarrow 0$ of Algebra, Lemma 10.133.9. Namely, by Remark 70.5.5 and the key fact the complex on the right hand side represents $L_{C/B}$ in $D(C)$.

If $B \rightarrow C$ is not injective, then we can use the above to get a fundamental triangle for $A \rightarrow B \rightarrow B \times C$. Since $L_{B \times C/B} \rightarrow L_{B/B} \oplus L_{C/B}$ and $L_{B \times C/A} \rightarrow L_{B/A} \oplus L_{C/A}$ are quasi-isomorphism in $D(B \times C)$ (Lemma 70.6.4) this induces the desired distinguished triangle in $D(C)$ by tensoring with the flat ring map $B \times C \rightarrow C$.

Remark 70.7.6. Let $A \rightarrow B \rightarrow C$ be ring maps with $B \rightarrow C$ injective. Recall the notation $P_\bullet, Q_\bullet, \overline{Q}_\bullet$ of Remark 70.7.5. Let R_\bullet be the standard resolution of C over B . In this remark we explain how to get the canonical identification of $\Omega_{\overline{Q}_\bullet/B} \otimes_{\overline{Q}_\bullet} C$ with $L_{C/B} = \Omega_{R_\bullet/B} \otimes_{R_\bullet} C$. Let $S_\bullet \rightarrow B$ be the standard resolution of B over \overline{B} . Note that the functoriality map $S_\bullet \rightarrow R_\bullet$ identifies R_n as a polynomial algebra over S_n because $B \rightarrow C$ is injective. For example in degree 0 we have the map $B[B] \rightarrow B[C]$, in degree 1 the map $B[B[B]] \rightarrow B[B[C]]$, and so on. Thus $\overline{R}_\bullet = R_\bullet \otimes_{S_\bullet} B$ is a simplicial polynomial algebra over B as well and it follows (as in Remark 70.7.5) from Cohomology on Sites, Lemma 21.29.12 that $\overline{R}_\bullet \rightarrow C$ is a resolution. Since we have a commutative diagram

$$\begin{array}{ccccc}
 Q_\bullet & \longrightarrow & R_\bullet & & \\
 \uparrow & & \uparrow & & \\
 P_\bullet & \longrightarrow & S_\bullet & \longrightarrow & B
 \end{array}$$

we obtain a canonical map $\overline{Q}_\bullet = Q_\bullet \otimes_{P_\bullet} B \rightarrow \overline{R}_\bullet$. Thus the maps

$$L_{C/B} = \Omega_{R_\bullet/B} \otimes_{R_\bullet} C \longrightarrow \Omega_{\overline{R}_\bullet/B} \otimes_{\overline{R}_\bullet} C \longleftarrow \Omega_{\overline{Q}_\bullet/B} \otimes_{\overline{Q}_\bullet} C$$

are quasi-isomorphisms (Remark 70.5.5) and composing one with the inverse of the other gives the desired identification.

70.8. Localization and étale ring maps

In this section we study what happens if we localize our rings. Let $A \rightarrow A' \rightarrow B$ be ring maps such that $B = B \otimes_A^{\mathbf{L}} A'$. This happens for example if $A' = S^{-1}A$ is the localization of A at a multiplicative subset $S \subset A$. In this case for an abelian sheaf \mathcal{F}' on $\mathcal{C}_{B/A'}$ the homology of $g^{-1}\mathcal{F}'$ over $\mathcal{C}_{B/A}$ agrees with the homology of \mathcal{F}' over $\mathcal{C}_{B/A'}$, see Lemma 70.6.1 for a precise statement.

Lemma 70.8.1. *Let $A \rightarrow A' \rightarrow B$ be ring maps such that $B = B \otimes_A^{\mathbf{L}} A'$. Then $L_{B/A} = L_{B/A'}$ in $D(B)$.*

Proof. According to the discussion above (i.e., using Lemma 70.6.1) and Lemma 70.4.3 we have to show that the sheaf given by the rule $(P \rightarrow B) \mapsto \Omega_{P/A} \otimes_P B$ on $\mathcal{C}_{B/A}$ is the pullback of the sheaf given by the rule $(P \rightarrow B) \mapsto \Omega_{P/A'} \otimes_P B$. The pullback functor g^{-1} is given by precomposing with the functor $u : \mathcal{C}_{B/A} \rightarrow \mathcal{C}_{B/A'}$, $(P \rightarrow B) \mapsto (P \otimes_A A' \rightarrow B)$. Thus we have to show that

$$\Omega_{P/A} \otimes_P B = \Omega_{P \otimes_A A'/A'} \otimes_{(P \otimes_A A')} B$$

By Algebra, Lemma 10.127.12 the right hand side is equal to

$$(\Omega_{P/A} \otimes_A A') \otimes_{(P \otimes_A A')} B$$

Since P is a polynomial algebra over A the module $\Omega_{P/A}$ is free and the equality is obvious. \square

Lemma 70.8.2. *Let $A \rightarrow B$ be a ring map such that $B = B \otimes_A^{\mathbf{L}} B$. Then $L_{B/A} = 0$ in $D(B)$.*

Proof. This is true because $L_{B/A} = L_{B/B} = 0$ by Lemmas 70.8.1 and 70.4.7. \square

Lemma 70.8.3. *Let $A \rightarrow B$ be a ring map such that $\mathrm{Tor}_i^A(B, B) = 0$ for $i > 0$ and such that $L_{B/B \otimes_A B} = 0$. Then $L_{B/A} = 0$ in $D(B)$.*

Proof. By Lemma 70.6.2 we see that $L_{B/A} \otimes_B^{\mathbf{L}} (B \otimes_A B) = L_{B \otimes_A B/B}$. Now we use the distinguished triangle (70.7.0.1)

$$L_{B \otimes_A B/B} \otimes_{(B \otimes_A B)}^{\mathbf{L}} B \rightarrow L_{B/B} \rightarrow L_{B/B \otimes_A B} \rightarrow L_{B \otimes_A B/B} \otimes_{(B \otimes_A B)}^{\mathbf{L}} B[1]$$

associated to the ring maps $B \rightarrow B \otimes_A B \rightarrow B$ and the vanishing of $L_{B/B}$ (Lemma 70.4.7) and $L_{B/B \otimes_A B}$ (assumed) to see that

$$0 = L_{B \otimes_A B/B} \otimes_{(B \otimes_A B)}^{\mathbf{L}} B = L_{B/A} \otimes_B^{\mathbf{L}} (B \otimes_A B) \otimes_{(B \otimes_A B)}^{\mathbf{L}} B = L_{B/A}$$

as desired. \square

Lemma 70.8.4. *The cotangent complex $L_{B/A}$ is zero in each of the following cases:*

- (1) $A \rightarrow B$ and $B \otimes_A B \rightarrow B$ are flat, i.e., $A \rightarrow B$ is weakly étale (More on Algebra, Definition 15.67.1),
- (2) $A \rightarrow B$ is a flat epimorphism of rings,
- (3) $B = S^{-1}A$ for some multiplicative subset $S \subset A$,
- (4) $A \rightarrow B$ is unramified and flat,
- (5) $A \rightarrow B$ is étale,
- (6) $A \rightarrow B$ is a filtered colimit of ring maps for which the cotangent complex vanishes,
- (7) B is a henselization of a local ring of A ,
- (8) B is a strict henselization of a local ring of A , and

(9) *add more here.*

Proof. In case (1) we may apply Lemma 70.8.2 to the surjective flat ring map $B \otimes_A B \rightarrow B$ to conclude that $L_{B \otimes_A B/B} = 0$ and then we use Lemma 70.8.3 to conclude. The cases (2) – (5) are each special cases of (1). Part (6) follows from Lemma 70.3.4. Parts (7) and (8) follows from the fact that (strict) henselizations are filtered colimits of étale ring extensions of A , see Algebra, Lemmas 10.145.21 and 10.145.27. \square

Lemma 70.8.5. *Let $A \rightarrow B \rightarrow C$ be ring maps such that $L_{C/B} = 0$. Then $L_{C/A} = L_{B/A} \otimes_B^L C$.*

Proof. This is a trivial consequence of the distinguished triangle (70.7.0.1). \square

Lemma 70.8.6. *Let $A \rightarrow B$ be ring maps and $S \subset A$, $T \subset B$ multiplicative subsets such that S maps into T . Then $L_{T^{-1}B/S^{-1}A} = L_{B/A} \otimes_B T^{-1}B$ in $D(T^{-1}B)$.*

Proof. Lemma 70.8.5 shows that $L_{T^{-1}B/A} = L_{B/A} \otimes_B T^{-1}B$ and Lemma 70.8.1 shows that $L_{T^{-1}B/A} = L_{T^{-1}B/S^{-1}A}$. \square

Lemma 70.8.7. *Let $A \rightarrow B$ be a local ring homomorphism of local rings. Let $A^h \rightarrow B^h$, resp. $A^{sh} \rightarrow B^{sh}$ be the induced maps of henselizations, resp. strict henselizations. Then*

$$L_{B^h/A^h} = L_{B^h/A} = L_{B/A} \otimes_B^L B^h \quad \text{resp.} \quad L_{B^{sh}/A^{sh}} = L_{B^{sh}/A} = L_{B/A} \otimes_B^L B^{sh}$$

in $D(B^h)$, resp. $D(B^{sh})$.

Proof. The complexes $L_{A^h/A}$, $L_{A^{sh}/A}$, $L_{B^h/B}$, and $L_{B^{sh}/B}$ are all zero by Lemma 70.8.4. Using the fundamental distinguished triangle (70.7.0.1) for $A \rightarrow B \rightarrow B^h$ we obtain $L_{B^h/A} = L_{B/A} \otimes_B^L B^h$. Using the fundamental triangle for $A \rightarrow A^h \rightarrow B^h$ we obtain $L_{B^h/A^h} = L_{B^h/A}$. Similarly for strict henselizations. \square

70.9. Smooth ring maps

Let $C \rightarrow B$ be a surjection of rings with kernel I . Let us call such a ring map “weakly quasi-regular” if I/I^2 is a flat B -module and $\text{Tor}_*^C(B, B)$ is the exterior algebra on I/I^2 . The generalization to “smooth ring maps” of what is done in Lemma 70.8.4 for “étale ring maps” is to look at flat ring maps $A \rightarrow B$ such that the multiplication map $B \otimes_A B \rightarrow B$ is weakly quasi-regular. For the moment we just stick to smooth ring maps.

Lemma 70.9.1. *If $A \rightarrow B$ is a smooth ring map, then $L_{B/A} = \Omega_{B/A}[0]$.*

Proof. We have the agreement in cohomological degree 0 by Lemma 70.4.5. Thus it suffices to prove the other cohomology groups are zero. It suffices to prove this locally on $\text{Spec}(B)$ as $L_{B_g/A} = (L_{B/A})_g$ for $g \in B$ by Lemma 70.8.5. Thus we may assume that $A \rightarrow B$ is standard smooth (Algebra, Lemma 10.132.10), i.e., that we can factor $A \rightarrow B$ as $A \rightarrow A[x_1, \dots, x_n] \rightarrow B$ with $A[x_1, \dots, x_n] \rightarrow B$ étale. In this case Lemmas 70.8.4 and Lemma 70.8.5 show that $L_{B/A} = L_{A[x_1, \dots, x_n]/A} \otimes_B B$ whence the conclusion by Lemma 70.4.7. \square

70.10. Comparison with the naive cotangent complex

The naive cotangent complex was introduced in Algebra, Section 10.129.

Remark 70.10.1. Let $A \rightarrow B$ be a ring map. Working on $\mathcal{C}_{B/A}$ as in Section 70.4 let $\mathcal{J} \subset \mathcal{O}$ be the kernel of $\mathcal{O} \rightarrow \underline{B}$. Note that $L\pi_!(\mathcal{J}) = 0$ by Lemma 70.5.7. Set $\Omega = \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}$ so that $L_{B/A} = L\pi_!(\Omega)$ by Lemma 70.4.3. It follows that $L\pi_!(\mathcal{J} \rightarrow \Omega) = L\pi_!(\Omega) = L_{B/A}$. Thus, for any object $U = (P \rightarrow B)$ of $\mathcal{C}_{B/A}$ we obtain a map

$$(70.10.1.1) \quad (J \rightarrow \Omega_{P/A} \otimes_P B) \longrightarrow L_{B/A}$$

where $J = \text{Ker}(P \rightarrow B)$ in $D(A)$, see Cohomology on Sites, Remark 21.29.4. Continuing in this manner, note that $L\pi_!(\mathcal{J} \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}) = L\pi_!(\mathcal{J}) = 0$ by Lemma 70.5.6. Since $\text{Tor}_0^{\mathcal{O}}(\mathcal{J}, \underline{B}) = \mathcal{J}/\mathcal{J}^2$ the spectral sequence

$$H_p(\mathcal{C}_{B/A}, \text{Tor}_q^{\mathcal{O}}(\mathcal{J}, \underline{B})) \Rightarrow H_{p+q}(\mathcal{C}_{B/A}, \mathcal{J} \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}) = 0$$

(dual of Derived Categories, Lemma 13.21.3) implies that $H_0(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2) = 0$ and $H_1(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2) = 0$. It follows that the complex of \underline{B} -modules $\mathcal{J}/\mathcal{J}^2 \rightarrow \Omega$ satisfies $\tau_{\geq -1}L\pi_!(\mathcal{J}/\mathcal{J}^2 \rightarrow \Omega) = \tau_{\geq -1}L_{B/A}$. Thus, for any object $U = (P \rightarrow B)$ of $\mathcal{C}_{B/A}$ we obtain a map

$$(70.10.1.2) \quad (J/J^2 \rightarrow \Omega_{P/A} \otimes_P B) \longrightarrow \tau_{\geq -1}L_{B/A}$$

in $D(B)$, see Cohomology on Sites, Remark 21.29.4.

The first case is where we have a surjection of rings.

Lemma 70.10.2. *Let $A \rightarrow B$ be a surjective ring map with kernel I . Then $H^0(L_{B/A}) = 0$ and $H^{-1}(L_{B/A}) = I/I^2$. This isomorphism comes from the map (70.10.1.2) for the object $(A \rightarrow B)$ of $\mathcal{C}_{B/A}$.*

Proof. We will show below (using the surjectivity of $A \rightarrow B$) that there exists a short exact sequence

$$0 \rightarrow \pi^{-1}(I/I^2) \rightarrow \mathcal{J}/\mathcal{J}^2 \rightarrow \Omega \rightarrow 0$$

of sheaves on $\mathcal{C}_{B/A}$. Taking $L\pi_!$ and the associated long exact sequence of homology, and using the vanishing of $H_1(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2)$ and $H_0(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2)$ shown in Remark 70.10.1 we obtain what we want using Lemma 70.4.4.

What is left is to verify the local statement mentioned above. For every object $U = (P \rightarrow B)$ of $\mathcal{C}_{B/A}$ we can choose an isomorphism $P = A[E]$ such that the map $P \rightarrow B$ maps each $e \in E$ to zero. Then $J = \mathcal{J}(U) \subset P = \mathcal{O}(U)$ is equal to $J = IP + (e; e \in E)$. The value on U of the short sequence of sheaves above is the sequence

$$0 \rightarrow I/I^2 \rightarrow J/J^2 \rightarrow \Omega_{P/A} \otimes_P B \rightarrow 0$$

Verification omitted (hint: the only tricky point is that $IP \cap J^2 = IJ$; which follows for example from More on Algebra, Lemma 15.21.8). \square

Lemma 70.10.3. *Let $A \rightarrow B$ be a ring map. Then $\tau_{\geq -1}L_{B/A}$ is canonically quasi-isomorphic to the naive cotangent complex.*

Proof. Consider $P = A[B] \rightarrow B$ with kernel I . The naive cotangent complex $NL_{B/A}$ of B over A is the complex $I/I^2 \rightarrow \Omega_{P/A} \otimes_P B$, see Algebra, Definition 10.129.1. Observe that in (70.10.1.2) we have already constructed a canonical map

$$c : NL_{B/A} \longrightarrow \tau_{\geq -1}L_{B/A}$$

Consider the distinguished triangle (70.7.0.1)

$$L_{P/A} \otimes_P^{\mathbf{L}} B \rightarrow L_{B/A} \rightarrow L_{B/P} \rightarrow (L_{P/A} \otimes_P^{\mathbf{L}} B)[1]$$

associated to the ring maps $A \rightarrow A[B] \rightarrow B$. We know that $L_{P/A} = \Omega_{P/A}[0] = NL_{P/A}$ in $D(P)$ (Lemma 70.4.7 and Algebra, Lemma 10.129.3) and that $\tau_{\geq -1}L_{B/P} = I/I^2[1] = NL_{B/P}$ in $D(B)$ (Lemma 70.10.2 and Algebra, Lemma 10.129.6). To show c is a quasi-isomorphism it suffices by Algebra, Lemma 10.129.4 and the long exact cohomology sequence associated to the distinguished triangle to show that the maps $L_{P/A} \rightarrow L_{B/A} \rightarrow L_{B/P}$ are compatible on cohomology groups with the corresponding maps $NL_{P/A} \rightarrow NL_{B/A} \rightarrow NL_{B/P}$ of the naive cotangent complex. We omit the verification. \square

Remark 70.10.4. We can make the comparison map of Lemma 70.10.3 explicit in the following way. Let P_\bullet be the standard resolution of B over A . Let $I = \text{Ker}(A[B] \rightarrow B)$. Recall that $P_0 = A[B]$. The map of the lemma is given by the commutative diagram

$$\begin{array}{ccccccc} L_{B/A} & \cdots \longrightarrow & \Omega_{P_2/A} \otimes_{P_2} B & \longrightarrow & \Omega_{P_1/A} \otimes_{P_1} B & \longrightarrow & \Omega_{P_0/A} \otimes_{P_0} B \\ & & \downarrow & & \downarrow & & \downarrow \\ NL_{B/A} & \cdots \longrightarrow & 0 & \longrightarrow & I/I^2 & \longrightarrow & \Omega_{P_0/A} \otimes_{P_0} B \end{array}$$

We construct the downward arrow with target I/I^2 by sending $df \otimes b$ to the class of $(d_0(f) - d_1(f))b$ in I/I^2 . Here $d_i : P_1 \rightarrow P_0$, $i = 0, 1$ are the two face maps of the simplicial structure. This makes sense as $d_0 - d_1$ maps P_1 into $I = \text{Ker}(P_0 \rightarrow B)$. We omit the verification that this rule is well defined. Our map is compatible with the differential $\Omega_{P_1/A} \otimes_{P_1} B \rightarrow \Omega_{P_0/A} \otimes_{P_0} B$ as this differential maps $df \otimes b$ to $d(d_0(f) - d_1(f)) \otimes b$. Moreover, the differential $\Omega_{P_2/A} \otimes_{P_2} B \rightarrow \Omega_{P_1/A} \otimes_{P_1} B$ maps $df \otimes b$ to $d(d_0(f) - d_1(f) + d_2(f)) \otimes b$ which are annihilated by our downward arrow. Hence a map of complexes. We omit the verification that this is the same as the map of Lemma 70.10.3.

Remark 70.10.5. Adopt notation as in Remark 70.10.1. The arguments given there show that the differential

$$H_2(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2) \longrightarrow H_0(\mathcal{C}_{B/A}, \text{Tor}_1^{\mathcal{O}}(\mathcal{J}, \underline{B}))$$

of the spectral sequence is an isomorphism. Let $\mathcal{C}'_{B/A}$ denote the full subcategory of $\mathcal{C}_{B/A}$ consisting of surjective maps $P \rightarrow B$. The agreement of the cotangent complex with the naive cotangent complex (Lemma 70.10.3) shows that we have an exact sequence of sheaves

$$0 \rightarrow \underline{H}_1(L_{B/A}) \rightarrow \mathcal{J}/\mathcal{J}^2 \xrightarrow{d} \Omega \rightarrow \underline{H}_2(L_{B/A}) \rightarrow 0$$

on $\mathcal{C}'_{B/A}$. It follows that $\text{Ker}(d)$ and $\text{Coker}(d)$ on the whole category $\mathcal{C}_{B/A}$ have vanishing higher homology groups, since these are computed by the homology groups

of constant simplicial abelian groups by Lemma 70.4.1. Hence we conclude that

$$H_n(\mathcal{C}_{B/A}, \mathcal{J}/\mathcal{J}^2) \rightarrow H_n(L_{B/A})$$

is an isomorphism for all $n \geq 2$. Combined with the remark above we obtain the formula $H_2(L_{B/A}) = H_0(\mathcal{C}_{B/A}, \text{Tor}_1^{\mathcal{O}}(\mathcal{J}, \underline{B}))$.

70.11. A spectral sequence of Quillen

In this section we discuss a spectral sequence relating derived tensor product to the cotangent complex.

Lemma 70.11.1. *Notation and assumptions as in Cohomology on Sites, Example 21.29.1. Assume \mathcal{C} has a cosimplicial object as in Cohomology on Sites, Lemma 21.29.7. Let \mathcal{F} be a flat \underline{B} -module such that $H_0(\mathcal{C}, \mathcal{F}) = 0$. Then $H_l(\mathcal{C}, \text{Sym}_{\underline{B}}^k(\mathcal{F})) = 0$ for $l < k$.*

Proof. We drop the subscript \underline{B} from tensor products, wedge powers, and symmetric powers. We will prove the lemma by induction on k . The cases $k = 0, 1$ follow from the assumptions. If $k > 1$ consider the exact complex

$$\dots \rightarrow \wedge^2 \mathcal{F} \otimes \text{Sym}^{k-2} \mathcal{F} \rightarrow \mathcal{F} \otimes \text{Sym}^{k-1} \mathcal{F} \rightarrow \text{Sym}^k \mathcal{F} \rightarrow 0$$

with differentials as in the Koszul complex. If we think of this as a resolution of $\text{Sym}^k \mathcal{F}$, then this gives a first quadrant spectral sequence

$$E_1^{p,q} = H_p(\mathcal{C}, \wedge^{q+1} \mathcal{F} \otimes \text{Sym}^{k-q-1} \mathcal{F}) \Rightarrow H_{p+q}(\mathcal{C}, \text{Sym}^k(\mathcal{F}))$$

By Cohomology on Sites, Lemma 21.29.10 we have

$$L\pi_!(\wedge^{q+1} \mathcal{F} \otimes \text{Sym}^{k-q-1} \mathcal{F}) = L\pi_!(\wedge^{q+1} \mathcal{F}) \otimes_B^L L\pi_!(\text{Sym}^{k-q-1} \mathcal{F})$$

It follows (from the construction of derived tensor products) that the induction hypothesis combined with the vanishing of $H_0(\mathcal{C}, \wedge^{q+1}(\mathcal{F})) = 0$ will prove what we want. This is true because $\wedge^{q+1}(\mathcal{F})$ is a quotient of $\mathcal{F}^{\otimes q+1}$ and $H_0(\mathcal{C}, \mathcal{F}^{\otimes q+1})$ is a quotient of $H_0(\mathcal{C}, \mathcal{F})^{\otimes q+1}$ which is zero. \square

Remark 70.11.2. In the situation of Lemma 70.11.1 one can show that $H_k(\mathcal{C}, \text{Sym}^k(\mathcal{F})) = \wedge_B^k(H_1(\mathcal{C}, \mathcal{F}))$. Namely, it can be deduced from the proof that $H_k(\mathcal{C}, \text{Sym}^k(\mathcal{F}))$ is the S_k -coinvariants of

$$H^{-k}(L\pi_!(\mathcal{F}) \otimes_B^L L\pi_!(\mathcal{F}) \otimes_B^L \dots \otimes_B^L L\pi_!(\mathcal{F})) = H_1(\mathcal{C}, \mathcal{F})^{\otimes k}$$

Thus our claim is that this action is given by the usual action of S_k on the tensor product multiplied by the sign character. To prove this one has to work through the sign conventions in the definition of the total complex associated to a multi-complex. We omit the verification.

Lemma 70.11.3. *Let A be a ring. Let $P = A[E]$ be a polynomial ring. Set $I = (e; e \in E) \subset P$. The maps $\text{Tor}_i^P(A, I^{n+1}) \rightarrow \text{Tor}_i^P(A, I^n)$ are zero for all i and n .*

Proof. Denote $x_e \in P$ the variable corresponding to $e \in E$. A free resolution of A over P is given by the Koszul complex K_\bullet on the x_e . Here K_i has basis given by wedges $e_1 \wedge \dots \wedge e_i, e_1, \dots, e_i \in E$ and $d(e) = x_e$. Thus $K_\bullet \otimes_P I^n = I^n K_\bullet$ computes $\text{Tor}_i^P(A, I^n)$. Observe that everything is graded with $\deg(x_e) = 1, \deg(e) = 1$, and $\deg(a) = 0$ for $a \in A$. Suppose $\xi \in I^{n+1} K_i$ is a cocycle homogeneous of degree m . Note that $m \geq i + 1 + n$. Then $\xi = d\eta$ for some $\eta \in K_{i+1}$ as K_\bullet is exact in degrees

> 0 . (The case $i = 0$ is left to the reader.) Now $\deg(\eta) = m \geq i + 1 + n$. Hence writing η in terms of the basis we see the coordinates are in I^n . Thus ξ maps to zero in the homology of $I^n K_\bullet$ as desired. \square

Theorem 70.11.4 (Quillen spectral sequence). *Let $A \rightarrow B$ be a surjective ring map. Consider the sheaf $\Omega = \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{B}$ of \underline{B} -modules on $\mathcal{C}_{B/A}$, see Section 70.4. Then there is a spectral sequence with E_1 -page*

$$E_1^{p,q} = H_{-p-q}(\mathcal{C}_{B/A}, \text{Sym}_{\underline{B}}^p(\Omega)) \Rightarrow \text{Tor}_{-p-q}^A(B, B)$$

with d_r of bidegree $(r, -r + 1)$. Moreover, $H_i(\mathcal{C}_{B/A}, \text{Sym}_{\underline{B}}^k(\Omega)) = 0$ for $i < k$.

Proof. Let $I \subset A$ be the kernel of $A \rightarrow B$. Let $\mathcal{J} \subset \mathcal{O}$ be the kernel of $\mathcal{O} \rightarrow \underline{B}$. Then $I\mathcal{O} \subset \mathcal{J}$. Set $\mathcal{K} = \mathcal{J}/I\mathcal{O}$ and $\overline{\mathcal{O}} = \mathcal{O}/I\mathcal{O}$.

For every object $U = (P \rightarrow B)$ of $\mathcal{C}_{B/A}$ we can choose an isomorphism $P = A[E]$ such that the map $P \rightarrow B$ maps each $e \in E$ to zero. Then $J = \mathcal{J}(U) \subset P = \mathcal{O}(U)$ is equal to $J = IP + (e; e \in E)$. Moreover $\overline{\mathcal{O}}(U) = B[E]$ and $K = \mathcal{K}(U) = (e; e \in E)$ is the ideal generated by the variables in the polynomial ring $B[E]$. In particular it is clear that

$$K/K^2 \xrightarrow{\cong} \Omega_{P/A} \otimes_P B$$

is a bijection. In other words, $\Omega = \mathcal{K}/\mathcal{K}^2$ and $\text{Sym}_{\underline{B}}^k(\Omega) = \mathcal{K}^k/\mathcal{K}^{k+1}$. Note that $\pi_1(\Omega) = \Omega_{B/A} = 0$ (Lemma 70.4.5) as $A \rightarrow B$ is surjective (Algebra, Lemma 10.127.5). By Lemma 70.11.1 we conclude that

$$H_i(\mathcal{C}_{B/A}, \mathcal{K}^k/\mathcal{K}^{k+1}) = H_i(\mathcal{C}_{B/A}, \text{Sym}_{\underline{B}}^k(\Omega)) = 0$$

for $i < k$. This proves the final statement of the theorem.

The approach to the theorem is to note that

$$B \otimes_A^L B = L\pi_1(\mathcal{O}) \otimes_A^L B = L\pi_1(\mathcal{O} \otimes_A^L \underline{B}) = L\pi_1(\overline{\mathcal{O}})$$

The first equality by Lemma 70.5.7, the second equality by Cohomology on Sites, Lemma 21.29.6, and the third equality as \mathcal{O} is flat over \underline{A} . The sheaf $\overline{\mathcal{O}}$ has a filtration

$$\dots \subset \mathcal{K}^3 \subset \mathcal{K}^2 \subset \mathcal{K} \subset \overline{\mathcal{O}}$$

This induces a filtration F on a complex C representing $L\pi_1(\overline{\mathcal{O}})$ with $F^p C$ representing $L\pi_1(\mathcal{K}^p)$ (construction of C and F omitted). Consider the spectral sequence of Homology, Section 12.21 associated to (C, F) . It has E_1 -page

$$E_1^{p,q} = H_{-p-q}(\mathcal{C}_{B/A}, \mathcal{K}^p/\mathcal{K}^{p+1}) \Rightarrow H_{-p-q}(\mathcal{C}_{B/A}, \overline{\mathcal{O}}) = \text{Tor}_{-p-q}^A(B, B)$$

and differentials $E_r^{p,q} \rightarrow E_r^{p+r, q-r+1}$. To show convergence we will show that for every k there exists a c such that $H_i(\mathcal{C}_{B/A}, \mathcal{K}^n) = 0$ for $i < k$ and $n > c^2$.

Given $k \geq 0$ set $c = k^2$. We claim that

$$H_i(\mathcal{C}_{B/A}, \mathcal{K}^{n+c}) \rightarrow H_i(\mathcal{C}_{B/A}, \mathcal{K}^n)$$

is zero for $i < k$ and all $n \geq 0$. Note that $\mathcal{K}^n/\mathcal{K}^{n+c}$ has a finite filtration whose successive quotients $\mathcal{K}^m/\mathcal{K}^{m+1}$, $n \leq m < n + c$ have $H_i(\mathcal{C}_{B/A}, \mathcal{K}^m/\mathcal{K}^{m+1}) = 0$ for $i < n$ (see above). Hence the claim implies $H_i(\mathcal{C}_{B/A}, \mathcal{K}^{n+c}) = 0$ for $i < k$ and all $n \geq k$ which is what we need to show.

²A posteriori the “correct” vanishing $H_i(\mathcal{C}_{B/A}, \mathcal{K}^n) = 0$ for $i < n$ can be concluded.

Proof of the claim. Recall that for any \mathcal{O} -module \mathcal{F} the map $\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} B$ induces an isomorphism on applying $L\pi_1$, see Lemma 70.5.6. Consider the map

$$\mathcal{K}^{n+k} \otimes_{\mathcal{O}}^{\mathbf{L}} B \longrightarrow \mathcal{K}^n \otimes_{\mathcal{O}}^{\mathbf{L}} B$$

We claim that this map induces the zero map on cohomology sheaves in degrees $0, -1, \dots, -k + 1$. If this second claim holds, then the k -fold composition

$$\mathcal{K}^{n+c} \otimes_{\mathcal{O}}^{\mathbf{L}} B \longrightarrow \mathcal{K}^n \otimes_{\mathcal{O}}^{\mathbf{L}} B$$

factors through $\tau_{\leq -k} \mathcal{K}^n \otimes_{\mathcal{O}}^{\mathbf{L}} B$ hence induces zero on $H_i(\mathcal{C}_{B/A}, -) = L_i\pi_1(-)$ for $i < k$, see Derived Categories, Lemma 13.12.5. By the remark above this means the same thing is true for $H_i(\mathcal{C}_{B/A}, \mathcal{K}^{n+c}) \rightarrow H_i(\mathcal{C}_{B/A}, \mathcal{K}^n)$ which proves the (first) claim.

Proof of the second claim. The statement is local, hence we may work over an object $U = (P \rightarrow B)$ as above. We have to show the maps

$$\mathrm{Tor}_i^P(B, K^{n+k}) \rightarrow \mathrm{Tor}_i^P(B, K^n)$$

are zero for $i < k$. There is a spectral sequence

$$\mathrm{Tor}_a^P(P/IP, \mathrm{Tor}_b^{P/IP}(B, K^n)) \Rightarrow \mathrm{Tor}_{a+b}^P(B, K^n),$$

see More on Algebra, Example 15.48.2. Thus it suffices to prove the maps

$$\mathrm{Tor}_i^{P/IP}(B, K^{n+1}) \rightarrow \mathrm{Tor}_i^{P/IP}(B, K^n)$$

are zero for all i . This is Lemma 70.11.3. □

Remark 70.11.5. In the situation of Theorem 70.11.4 let $I = \mathrm{Ker}(A \rightarrow B)$. Then $H^{-1}(L_{B/A}) = H_1(\mathcal{C}_{B/A}, \Omega) = I/I^2$, see Lemma 70.10.2. Hence $H_k(\mathcal{C}_{B/A}, \mathrm{Sym}^k(\Omega)) = \wedge_B^k(I/I^2)$ by Remark 70.11.2. Thus the E_1 -page looks like

$$\begin{array}{ccccccc} B & & & & & & \\ 0 & & & & & & \\ 0 & & I/I^2 & & & & \\ 0 & H^{-2}(L_{B/A}) & & & & & \\ 0 & H^{-3}(L_{B/A}) & & \wedge^2(I/I^2) & & & \\ 0 & H^{-4}(L_{B/A}) & H_3(\mathcal{C}_{B/A}, \mathrm{Sym}^2(\Omega)) & & & & \\ 0 & H^{-5}(L_{B/A}) & H_4(\mathcal{C}_{B/A}, \mathrm{Sym}^2(\Omega)) & \wedge^3(I/I^2) & & & \end{array}$$

with horizontal differential. Thus we obtain edge maps $\mathrm{Tor}_i^A(B, B) \rightarrow H^{-i}(L_{B/A})$, $i > 0$ and $\wedge_B^i(I/I^2) \rightarrow \mathrm{Tor}_i^A(B, B)$. Finally, we have $\mathrm{Tor}_1^A(B, B) = I/I^2$ and there is a five term exact sequence

$$\mathrm{Tor}_3^A(B, B) \rightarrow H^{-3}(L_{B/A}) \rightarrow \wedge_B^2(I/I^2) \rightarrow \mathrm{Tor}_2^A(B, B) \rightarrow H^{-2}(L_{B/A}) \rightarrow 0$$

of low degree terms.

Remark 70.11.6. Let $A \rightarrow B$ be a ring map. Let P_\bullet be a resolution of B over A (Remark 70.5.5). Set $J_n = \mathrm{Ker}(P_n \rightarrow B)$. Note that

$$\mathrm{Tor}_2^{P_n}(B, B) = \mathrm{Tor}_1^{P_n}(J_n, B) = \mathrm{Ker}(J_n \otimes_{P_n} J_n \rightarrow J_n^2).$$

Hence $H_2(L_{B/A})$ is canonically equal to

$$\mathrm{Coker}(\mathrm{Tor}_2^{P_1}(B, B) \rightarrow \mathrm{Tor}_2^{P_0}(B, B))$$

by Remark 70.10.5. To make this more explicit we choose P_2, P_1, P_0 as in Example 70.5.9. We claim that

$$\mathrm{Tor}_2^{P_1}(B, B) = \wedge^2\left(\bigoplus_{t \in T} B\right) \oplus \bigoplus_{t \in T} J_0 \oplus \mathrm{Tor}_2^{P_0}(B, B)$$

Namely, the basis elements $x_t \wedge x_{t'}$ of the first summand corresponds to the element $x_t \otimes x_{t'} - x_{t'} \otimes x_t$ of $J_1 \otimes_{P_1} J_1$. For $f \in J_0$ the element $x_t \otimes f$ of the second summand corresponds to the element $x_t \otimes s_0(f) - s_0(f) \otimes x_t$ of $J_1 \otimes_{P_1} J_1$. Finally, the map $\mathrm{Tor}_2^{P_0}(B, B) \rightarrow \mathrm{Tor}_2^{P_1}(B, B)$ is given by s_0 . The map $d_0 - d_1 : \mathrm{Tor}_2^{P_1}(B, B) \rightarrow \mathrm{Tor}_2^{P_0}(B, B)$ is zero on the last summand, maps $x_t \otimes f$ to $f \otimes f_t - f_t \otimes f$, and maps $x_t \wedge x_{t'}$ to $f_t \otimes f_{t'} - f_{t'} \otimes f_t$. All in all we conclude that there is an exact sequence

$$\wedge_B^2(J_0/J_0^2) \rightarrow \mathrm{Tor}_2^{P_0}(B, B) \rightarrow H^{-2}(L_{B/A}) \rightarrow 0$$

In this way we obtain a direct proof of a consequence of Quillen's spectral sequence discussed in Remark 70.11.5.

70.12. Comparison with Lichtenbaum-Schlessinger

Let $A \rightarrow B$ be a ring map. In [LS67] there is a fairly explicit determination of $\tau_{\geq -2}L_{B/A}$ which is often used in calculations of versal deformation spaces of singularities. The construction follows. Choose a polynomial algebra P over A and a surjection $P \rightarrow B$ with kernel I . Choose generators $f_t, t \in T$ for I which induces a surjection $F = \bigoplus_{t \in T} P \rightarrow I$ with F a free P algebra. Let $Rel \subset F$ be the kernel of $F \rightarrow I$, in other words Rel is the set of relations among the f_t . Let $TrivRel \subset Rel$ be the submodule of trivial relations, i.e., the submodule of Rel generated by the elements $(\dots, f_{t'}, 0, \dots, 0, -f_t, 0, \dots)$. Consider the complex of B -modules

$$(70.12.0.1) \quad Rel/TrivRel \longrightarrow F \otimes_P B \longrightarrow \Omega_{P/A} \otimes_P B$$

where the last term is placed in degree 0. The first map is the obvious one and the second map sends the basis element corresponding to $t \in T$ to $df_t \otimes 1$.

Definition 70.12.1. Let $A \rightarrow B$ be a ring map. Let M be a (B, B) -bimodule over A . An A -biderivation is an A -linear map $\lambda : B \rightarrow M$ such that $\lambda(xy) = x\lambda(y) + \lambda(x)y$.

For a polynomial algebra the biderivations are easy to describe.

Lemma 70.12.2. Let $P = A[S]$ be a polynomial ring over A . Let M be a (P, P) -bimodule over A . Given $m_s \in M$ for $s \in S$, there exists a unique A -biderivation $\lambda : P \rightarrow M$ mapping s to m_s for $s \in S$.

Proof. We set

$$\lambda(s_1 \dots s_t) = \sum s_1 \dots s_{i-1} m_{s_i} s_{i+1} \dots s_t$$

in M . Extending by A -linearity we obtain a biderivation. \square

Here is the comparison statement. The reader may also read about this in [And74, page 206, Proposition 12] or in the paper [DRGV92] which extends the complex (70.12.0.1) by one term and the comparison to $\tau_{\geq -3}$.

Lemma 70.12.3. In the situation above denote L the complex (70.12.0.1). There is a canonical map $L_{B/A} \rightarrow L$ in $D(A)$ which induces an isomorphism $\tau_{\geq -2}L_{B/A} \rightarrow L$ in $D(B)$.

Proof. Let $P_\bullet \rightarrow B$ be a resolution of B over A (Remark 70.5.5). We will identify $L_{B/A}$ with $\Omega_{P_\bullet/A} \otimes B$. To construct the map we make some choices.

Choose an A -algebra map $\psi : P_0 \rightarrow P$ compatible with the given maps $P_0 \rightarrow B$ and $P \rightarrow B$.

Write $P_1 = A[S]$ for some set S . For $s \in S$ we may write

$$\psi(d_0(s) - d_1(s)) = \sum p_{s,t} f_t$$

for some $p_{s,t} \in P$. Think of $F = \bigoplus_{t \in T} P$ as a (P_1, P_1) -bimodule via the maps $(\psi \circ d_0, \psi \circ d_1)$. By Lemma 70.12.2 we obtain a unique A -biderivation $\lambda : P_1 \rightarrow F$ mapping s to the vector with coordinates $p_{s,t}$. By construction the composition

$$P_1 \longrightarrow F \longrightarrow P$$

sends $f \in P_1$ to $\psi(d_0(f) - d_1(f))$ because the map $f \mapsto \psi(d_0(f) - d_1(f))$ is an A -biderivation agreeing with the composition on generators.

For $g \in P_2$ we claim that $\lambda(d_0(g) - d_1(g) + d_2(g))$ is an element of Rel . Namely, by the last remark of the previous paragraph the image of $\lambda(d_0(g) - d_1(g) + d_2(g))$ in P is

$$\psi((d_0 - d_1)(d_0(g) - d_1(g) + d_2(g)))$$

which is zero by Simplicial, Section 14.22).

The choice of ψ determines a map

$$d\psi \otimes 1 : \Omega_{P_0/A} \otimes B \longrightarrow \Omega_{P/A} \otimes B$$

Composing λ with the map $F \rightarrow F \otimes B$ gives a usual A -derivation as the two P_1 -module structures on $F \otimes B$ agree. Thus λ determines a map

$$\bar{\lambda} : \Omega_{P_1/A} \otimes B \longrightarrow F \otimes B$$

Finally, We obtain a B -linear map

$$q : \Omega_{P_2/A} \otimes B \longrightarrow Rel/TrivRel$$

by mapping dg to the class of $\lambda(d_0(g) - d_1(g) + d_2(g))$ in the quotient.

The diagram

$$\begin{array}{ccccccc} \Omega_{P_3/A} \otimes B & \longrightarrow & \Omega_{P_2/A} \otimes B & \longrightarrow & \Omega_{P_1/A} \otimes B & \longrightarrow & \Omega_{P_0/A} \otimes B \\ \downarrow & & \downarrow q & & \downarrow \bar{\lambda} & & \downarrow d\psi \otimes 1 \\ 0 & \longrightarrow & Rel/TrivRel & \longrightarrow & F \otimes B & \longrightarrow & \Omega_{P/A} \otimes B \end{array}$$

commutes (calculation omitted) and we obtain the map of the lemma. By Remark 70.10.4 and Lemma 70.10.3 we see that this map induces isomorphisms $H_1(L_{B/A}) \rightarrow H_1(L)$ and $H_0(L_{B/A}) \rightarrow H_0(L)$.

It remains to see that our map $L_{B/A} \rightarrow L$ induces an isomorphism $H_2(L_{B/A}) \rightarrow H_2(L)$. Choose a resolution of B over A with $P_0 = P = A[u_i]$ and then P_1 and P_2 as in Example 70.5.9. In Remark 70.11.6 we have constructed an exact sequence

$$\wedge_B^2(J_0/J_0^2) \rightarrow \text{Tor}_2^{P_0}(B, B) \rightarrow H^{-2}(L_{B/A}) \rightarrow 0$$

where $P_0 = P$ and $J_0 = \text{Ker}(P \rightarrow B) = I$. Calculating the Tor group using the short exact sequences $0 \rightarrow I \rightarrow P \rightarrow B \rightarrow 0$ and $0 \rightarrow Rel \rightarrow F \rightarrow I \rightarrow 0$ we find that $\text{Tor}_2^{P_0}(B, B) = \text{Ker}(Rel \otimes B \rightarrow F \otimes B)$. The image of the map $\wedge_B^2(I/I^2) \rightarrow$

$\text{Tor}_2^P(B, B)$ under this identification is exactly the image of $\text{TrivRel} \otimes B$. Thus we see that $H_2(L_{B/A}) \cong H_2(L)$.

Finally, we have to check that our map $L_{B/A} \rightarrow L$ actually induces this isomorphism. We will use the notation and results discussed in Example 70.5.9 and Remarks 70.11.6 and 70.10.5 without further mention. Pick an element ξ of $\text{Tor}_2^P(B, B) = \text{Ker}(I \otimes_P I \rightarrow I^2)$. Write $\xi = \sum h_{t',t} f_{t'} \otimes f_t$ for some $h_{t',t} \in P$. Tracing through the exact sequences above we find that ξ corresponds to the image in $\text{Rel} \otimes B$ of the element $r \in \text{Rel} \subset F = \bigoplus_{t \in T} P$ with t th coordinate $r_t = \sum_{t' \in T} h_{t',t} f_{t'}$. On the other hand, ξ corresponds to the element of $H_2(L_{B/A}) = H_2(\Omega)$ which is the image via $d : H_2(\mathcal{J}/\mathcal{J}^2) \rightarrow H_2(\Omega)$ of the boundary of ξ under the 2-extension

$$0 \rightarrow \text{Tor}_2^{\mathcal{O}}(\underline{B}, \underline{B}) \rightarrow \mathcal{J} \otimes_{\mathcal{O}} \mathcal{J} \rightarrow \mathcal{J} \rightarrow \mathcal{J}/\mathcal{J}^2 \rightarrow 0$$

We compute the successive transgressions of our element. First we have

$$\xi = (d_0 - d_1)(-\sum s_0(h_{t',t} f_{t'}) \otimes x_t)$$

and next we have

$$\sum s_0(h_{t',t} f_{t'}) x_t = d_0(v_r) - d_1(v_r) + d_2(v_r)$$

by our choice of the variables v in Example 70.5.9. We may choose our map λ above such that $\lambda(u_i) = 0$ and $\lambda(x_t) = -e_t$ where $e_t \in F$ denotes the basis vector corresponding to $t \in T$. Hence the construction of our map q above sends dv_r to

$$\lambda(\sum s_0(h_{t',t} f_{t'}) x_t) = \sum_t \left(\sum_{t'} h_{t',t} f_{t'} \right) e_t$$

matching the image of ξ in $\text{Rel} \otimes B$ (the two minus signs we found above cancel out). This agreement finishes the proof. \square

Remark 70.12.4 (Functoriality of the Lichtenbaum-Schlessinger complex). Consider a commutative square

$$\begin{array}{ccc} A' & \longrightarrow & B' \\ \uparrow & & \uparrow \\ A & \longrightarrow & B \end{array}$$

of ring maps. Choose a factorization

$$\begin{array}{ccccc} A' & \longrightarrow & P' & \longrightarrow & B' \\ \uparrow & & \uparrow & & \uparrow \\ A & \longrightarrow & P & \longrightarrow & B \end{array}$$

with P a polynomial algebra over A and P' a polynomial algebra over A' . Choose generators $f_t, t \in T$ for $\text{Ker}(P \rightarrow B)$. For $t \in T$ denote f'_t the image of f_t in P' . Choose $f'_s \in P'$ such that the elements f'_t for $t \in T' = T \amalg S$ generate the kernel of $P' \rightarrow B'$. Set $F = \bigoplus_{t \in T} P$ and $F' = \bigoplus_{t' \in T'} P'$. Let $\text{Rel} = \text{Ker}(F \rightarrow P)$ and $\text{Rel}' = \text{Ker}(F' \rightarrow P')$ where the maps are given by multiplication by f_t , resp. f'_t on the coordinates. Finally, set TrivRel , resp. $\text{TrivRel}'$ equal to the submodule of Rel , resp. $\text{TrivRel}'$ generated by the elements $(\dots, f_{t'}, 0, \dots, 0, -f_t, 0, \dots)$ for

$t, t' \in T$, resp. T' . Having made these choices we obtain a canonical commutative diagram

$$\begin{array}{ccccccc}
 L' : & \text{Rel}'/\text{TrivRel}' & \longrightarrow & F' \otimes_{P'} B' & \longrightarrow & \Omega_{P'/A'} \otimes_{P'} B' \\
 \uparrow & \uparrow & & \uparrow & & \uparrow \\
 L : & \text{Rel}/\text{TrivRel} & \longrightarrow & F \otimes_P B & \longrightarrow & \Omega_{P/A} \otimes_P B
 \end{array}$$

Moreover, tracing through the choices made in the proof of Lemma 70.12.3 the reader sees that one obtains a commutative diagram

$$\begin{array}{ccc}
 L_{B'/A'} & \longrightarrow & L' \\
 \uparrow & & \uparrow \\
 L_{B/A} & \longrightarrow & L
 \end{array}$$

70.13. The cotangent complex of a local complete intersection

If $A \rightarrow B$ is a local complete intersection map, then $L_{B/A}$ is a perfect complex. The key to proving this is the following lemma.

Lemma 70.13.1. *Let $A = \mathbf{Z}[x] \rightarrow B = \mathbf{Z}$ be the ring map which sends x to 0. Let $I = (x) \subset A$. Then $L_{B/A}$ is quasi-isomorphic to $I/I^2[1]$.*

Proof. There are several ways to prove this. For example one can explicitly construct a resolution of B over A and compute. Or one can use the spectral sequence of Quillen (Theorem 70.11.4) and the vanishing of $\text{Tor}_i^A(B, B)$ for $i > 1$. Finally, one can use (70.7.0.1) which is what we will do here. Namely, consider the distinguished triangle

$$L_{\mathbf{Z}[x]/\mathbf{Z}} \otimes_{\mathbf{Z}[x]} \mathbf{Z} \rightarrow L_{\mathbf{Z}/\mathbf{Z}} \rightarrow L_{\mathbf{Z}/\mathbf{Z}[x]} \rightarrow L_{\mathbf{Z}[x]/\mathbf{Z}} \otimes_{\mathbf{Z}[x]} \mathbf{Z}[1]$$

The complex $L_{\mathbf{Z}[x]/\mathbf{Z}}$ is quasi-isomorphic to $\Omega_{\mathbf{Z}[x]/\mathbf{Z}}$ by Lemma 70.4.7. The complex $L_{\mathbf{Z}/\mathbf{Z}}$ is zero in $D(\mathbf{Z})$ by Lemma 70.8.4. Thus we see that $L_{B/A}$ has only one nonzero cohomology group which is as described in the lemma by Lemma 70.10.2. \square

Lemma 70.13.2. *Let $A \rightarrow B$ be a surjective ring map whose kernel I is generated by a regular sequence. Then $L_{B/A}$ is quasi-isomorphic to $I/I^2[1]$.*

Proof. This is true if $I = (0)$. If $I = (f)$ is generated by a single nonzerodivisor, then consider the ring map $\mathbf{Z}[x] \rightarrow A$ which sends x to f . By assumption we have $B = A \otimes_{\mathbf{Z}[x]} \mathbf{Z}$. Thus we obtain $L_{B/A} = I/I^2[1]$ from Lemmas 70.6.2 and 70.13.1.

We prove the general case by induction. Suppose that we have $I = (f_1, \dots, f_r)$ where f_1, \dots, f_r is a regular sequence. Set $C = A/(f_1, \dots, f_{r-1})$. By induction the result is true for $A \rightarrow C$ and $C \rightarrow B$. We have a distinguished triangle (70.7.0.1)

$$L_{C/A} \otimes_C^{\mathbf{L}} B \rightarrow L_{B/A} \rightarrow L_{B/C} \rightarrow L_{C/A} \otimes_C^{\mathbf{L}} B[1]$$

which shows that $L_{B/A}$ has only one nonzero cohomology group which is as described in the lemma by Lemma 70.10.2. \square

Lemma 70.13.3. *Let $A \rightarrow B$ be a surjective ring map whose kernel I is Koszul. Then $L_{B/A}$ is quasi-isomorphic to $I/I^2[1]$.*

Proof. Flat locally on $\text{Spec}(A)$ the ideal I is generated by a regular sequence, see More on Algebra, Lemma 15.21.17. Hence this follows from Lemma 70.6.2 and flat descent. \square

Proposition 70.13.4. *Let $A \rightarrow B$ be a local complete intersection map. Then $L_{B/A}$ is a perfect complex with tor amplitude in $[-1, 0]$.*

Proof. Choose a surjection $P = A[x_1, \dots, x_n] \rightarrow B$ with kernel J . By Lemma 70.10.3 we see that $J/J^2 \rightarrow \bigoplus B dx_i$ is quasi-isomorphic to $\tau_{\geq -1} L_{B/A}$. Note that J/J^2 is finite projective (More on Algebra, Lemma 15.22.3), hence $\tau_{\geq -1} L_{B/A}$ is a perfect complex with tor amplitude in $[-1, 0]$. Thus it suffices to show that $H^i(L_{B/A}) = 0$ for $i \notin [-1, 0]$. This follows from (70.7.0.1)

$$L_{P/A} \otimes_P^{\mathbf{L}} B \rightarrow L_{B/A} \rightarrow L_{B/P} \rightarrow L_{P/A} \otimes_P^{\mathbf{L}} B[1]$$

and Lemma 70.13.3 to see that $H^i(L_{B/P})$ is zero unless $i \in \{-1, 0\}$. (We also use Lemma 70.4.7 for the term on the left.) \square

70.14. Tensor products and the cotangent complex

Let R be a ring and let A, B be R -algebras. In this section we discuss $L_{A \otimes_R B/R}$. Most of the information we want is contained in the following diagram (70.14.0.1)

$$\begin{array}{ccccc}
 L_{A/R} \otimes_A^{\mathbf{L}} (A \otimes_R B) & \longrightarrow & L_{A \otimes_R B/B} & \longrightarrow & E \\
 \parallel & & \uparrow & & \uparrow \\
 L_{A/R} \otimes_A^{\mathbf{L}} (A \otimes_R B) & \longrightarrow & L_{A \otimes_R B/R} & \longrightarrow & L_{A \otimes_R B/A} \\
 & & \uparrow & & \uparrow \\
 & & L_{B/R} \otimes_B^{\mathbf{L}} (A \otimes_R B) & \xlongequal{\quad} & L_{B/R} \otimes_B^{\mathbf{L}} (A \otimes_R B)
 \end{array}$$

Explanation: The middle row is the fundamental triangle (70.7.0.1) for the ring maps $R \rightarrow A \rightarrow A \otimes_R B$. The middle column is the fundamental triangle (70.7.0.1) for the ring maps $R \rightarrow B \rightarrow A \otimes_R B$. Next, E is an object of $D(A \otimes_R B)$ which “fits” into the upper right corner, i.e., which turns both the top row and the right column into distinguished triangles. Such an E exists by Derived Categories, Proposition 13.4.21 applied to the lower left square (with 0 placed in the missing spot). To be more explicit, we could for example define E as the cone (Derived Categories, Definition 13.9.1) of the map of complexes

$$L_{A/R} \otimes_A^{\mathbf{L}} (A \otimes_R B) \oplus L_{B/R} \otimes_B^{\mathbf{L}} (A \otimes_R B) \longrightarrow L_{A \otimes_R B/R}$$

and get the two maps with target E by an application of TR3. In the Tor independent case the object E is zero.

Lemma 70.14.1. *If A and B are Tor independent R -algebras, then the object E in (70.14.0.1) is zero. In this case we have*

$$L_{A \otimes_R B/R} = L_{A/R} \otimes_A^{\mathbf{L}} (A \otimes_R B) \oplus L_{B/R} \otimes_B^{\mathbf{L}} (A \otimes_R B)$$

which is represented by the complex $L_{A/R} \otimes_R B \oplus L_{B/R} \otimes_R A$ of $A \otimes_R B$ -modules.

Proof. The first two statements are immediate from Lemma 70.6.2. The last statement follows as $L_{A/R}$ is a complex of free A -modules, hence $L_{A/R} \otimes_A^{\mathbf{L}} (A \otimes_R B)$ is represented by $L_{A/R} \otimes_A (A \otimes_R B) = L_{A/R} \otimes_R B$ \square

In general we can say this about the object E .

Lemma 70.14.2. *Let R be a ring and let A, B be R -algebras. The object E in (70.14.0.1) satisfies*

$$H^i(E) = \begin{cases} 0 & \text{if } i \geq -1 \\ \text{Tor}_1^R(A, B) & \text{if } i = -2 \end{cases}$$

Proof. We use the description of E as the cone on $L_{B/R} \otimes_B^{\mathbf{L}} (A \otimes_R B) \rightarrow L_{A \otimes_R B/A}$. By Lemma 70.12.3 the canonical truncations $\tau_{\geq -2} L_{B/R}$ and $\tau_{\geq -2} L_{A \otimes_R B/A}$ are computed by the Lichtenbaum-Schlessinger complex (70.12.0.1). These isomorphisms are compatible with functoriality (Remark 70.12.4). Thus in this proof we work with the Lichtenbaum-Schlessinger complexes.

Choose a polynomial algebra P over R and a surjection $P \rightarrow B$. Choose generators $f_t \in P, t \in T$ of the kernel of this surjection. Let $Rel \subset F = \bigoplus_{t \in T} P$ be the kernel of the map $F \rightarrow P$ which maps the basis vector corresponding to t to f_t . Set $P_A = A \otimes_R P$ and $F_A = A \otimes_R F = P_A \otimes_P F$. Let Rel_A be the kernel of the map $F_A \rightarrow P_A$. Using the exact sequence

$$0 \rightarrow Rel \rightarrow F \rightarrow P \rightarrow B \rightarrow 0$$

and standard short exact sequences for Tor we obtain an exact sequence

$$A \otimes_R Rel \rightarrow Rel_A \rightarrow \text{Tor}_1^R(A, B) \rightarrow 0$$

Note that $P_A \rightarrow A \otimes_R B$ is a surjection whose kernel is generated by the elements $1 \otimes f_t$ in P_A . Denote $TrivRel_A \subset Rel_A$ the P_A -submodule generated by the elements $(\dots, 1 \otimes f_{t'}, 0, \dots, 0, -1 \otimes f_t \otimes 1, 0, \dots)$. Since $TrivRel \otimes_R A \rightarrow TrivRel_A$ is surjective, we find a canonical exact sequence

$$A \otimes_R (Rel/TrivRel) \rightarrow Rel_A/TrivRel_A \rightarrow \text{Tor}_1^R(A, B) \rightarrow 0$$

The map of Lichtenbaum-Schlessinger complexes is given by the diagram

$$\begin{array}{ccccc} Rel_A/TrivRel_A & \longrightarrow & F_A \otimes_{P_A} (A \otimes_R B) & \longrightarrow & \Omega_{P_A/A \otimes_R B} \otimes_{P_A} (A \otimes_R B) \\ \uparrow -2 & & \uparrow -1 & & \uparrow 0 \\ Rel/TrivRel & \longrightarrow & F \otimes_P B & \longrightarrow & \Omega_{P/A} \otimes_P B \end{array}$$

Note that vertical maps -1 and -0 induce an isomorphism after applying the functor $A \otimes_R - = P_A \otimes_P -$ to the source and the vertical map -2 gives exactly the map whose cokernel is the desired Tor module as we saw above. \square

70.15. Deformations of ring maps and the cotangent complex

This section is the continuation of Deformation Theory, Section 69.2 which we urge the reader to read first. We start with a surjective ring map $A' \rightarrow A$ whose kernel is an ideal I of square zero. Moreover we assume given a ring map $A \rightarrow B$, a

B -module N , and an A -module map $c : I \rightarrow N$. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

$$(70.15.0.1) \quad \begin{array}{ccccccc} 0 & \longrightarrow & N & \longrightarrow & ? & \longrightarrow & B \longrightarrow 0 \\ & & \uparrow c & & \uparrow & & \uparrow \\ 0 & \longrightarrow & I & \longrightarrow & A' & \longrightarrow & A \longrightarrow 0 \end{array}$$

and moreover how unique the solution is (if it exists). More precisely, we look for a surjection of A' -algebras $B' \rightarrow B$ whose kernel is identified with N such that $A' \rightarrow B'$ induces the given map c . We will say B' is a *solution* to (70.15.0.1).

Lemma 70.15.1. *In the situation above we have*

- (1) *There is a canonical element $\xi \in \text{Ext}_B^2(L_{B/A}, N)$ whose vanishing is a sufficient and necessary condition for the existence of a solution to (70.15.0.1).*
- (2) *If there exists a solution, then then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_B^1(L_{B/A}, N)$.*
- (3) *Given a solution B' , the set of automorphisms of B' fitting into (70.15.0.1) is canonically isomorphic to $\text{Ext}_B^0(L_{B/A}, N)$.*

Proof. Via the identifications $NL_{B/A} = \tau_{\geq -1}L_{B/A}$ (Lemma 70.10.3) and $H^0(L_{B/A}) = \Omega_{B/A}$ (Lemma 70.4.5) we have seen parts (2) and (3) in Deformation Theory, Lemmas 69.2.1 and 69.2.3.

Proof of (1). We will use the results of Deformation Theory, Lemma 69.2.4 without further mention. Let $\alpha \in \text{Ext}_A^1(NL_{A/\mathbf{Z}}, I)$ be the element corresponding to the isomorphism class of A' . The existence of B' corresponds to an element $\beta \in \text{Ext}_B^1(NL_{B/\mathbf{Z}}, N)$ which maps to the image of α in $\text{Ext}_A^1(NL_{A/\mathbf{Z}}, N)$. Note that

$$\text{Ext}_A^1(NL_{A/\mathbf{Z}}, N) = \text{Ext}_A^1(L_{A/\mathbf{Z}}, N) = \text{Ext}_B^1(L_{A/\mathbf{Z}} \otimes_A^{\mathbf{L}} B, N)$$

and

$$\text{Ext}_B^1(NL_{B/\mathbf{Z}}, N) = \text{Ext}_B^1(L_{B/\mathbf{Z}}, N)$$

by Lemma 70.10.3. Since the distinguished triangle (70.7.0.1) for $\mathbf{Z} \rightarrow A \rightarrow B$ gives rise to a long exact sequence

$$\dots \rightarrow \text{Ext}_B^1(L_{B/\mathbf{Z}}, N) \rightarrow \text{Ext}_B^1(L_{A/\mathbf{Z}} \otimes_A^{\mathbf{L}} B, N) \rightarrow \text{Ext}_B^2(L_{B/A}, N) \rightarrow \dots$$

we obtain the result with ξ the image of α . □

70.16. The Atiyah class of a module

Let $A \rightarrow B$ be a ring map. Let M be a B -module. Let $P \rightarrow B$ be an object of $\mathcal{C}_{B/A}$ (Section 70.4). Consider the extension of principal parts

$$0 \rightarrow \Omega_{P/A} \otimes_P M \rightarrow P_{P/A}^1(M) \rightarrow M \rightarrow 0$$

see Algebra, Lemma 10.128.6. This sequence is functorial in P by Algebra, Remark 10.128.7. Thus we obtain a short exact sequence of sheaves of \mathcal{O} -modules

$$0 \rightarrow \Omega_{\mathcal{O}/A} \otimes_{\mathcal{O}} \underline{M} \rightarrow P_{\mathcal{O}/A}^1(M) \rightarrow \underline{M} \rightarrow 0$$

on $\mathcal{C}_{B/A}$. We have $L\pi_!(\Omega_{\mathcal{O}/\underline{A}} \otimes_{\mathcal{O}} \underline{M}) = L_{B/A} \otimes_B M = L_{B/A} \otimes_B^{\mathbf{L}} M$ by Lemma 70.4.2 and the flatness of the terms of $L_{B/A}$. We have $L\pi_!(\underline{M}) = M$ by Lemma 70.4.4. Thus a distinguished triangle

$$(70.16.0.1) \quad L_{B/A} \otimes_B^{\mathbf{L}} M \rightarrow L\pi_! \left(P_{\mathcal{O}/\underline{A}}^1(M) \right) \rightarrow M \rightarrow L_{B/A} \otimes_B^{\mathbf{L}} M[1]$$

in $D(B)$. Here we use Cohomology on Sites, Remark 21.29.13 to get a distinguished triangle in $D(B)$ and not just in $D(A)$.

Definition 70.16.1. Let $A \rightarrow B$ be a ring map. Let M be a B -module. The map $M \rightarrow L_{B/A} \otimes_B^{\mathbf{L}} M[1]$ in (70.16.0.1) is called the *Atiyah class* of M .

70.17. The cotangent complex

In this section we discuss the cotangent complex of a map of sheaves of rings on a site. In later sections we specialize this to obtain the cotangent complex of a morphism of ringed topoi, a morphism of ringed spaces, a morphism of schemes, a morphism of algebraic space, etc.

Let \mathcal{C} be a site and let $Sh(\mathcal{C})$ denote the associated topos. Let \mathcal{A} denote a sheaf of rings on \mathcal{C} . Let $\mathcal{A}\text{-Alg}$ be the category of \mathcal{A} -algebras. Consider the pair of adjoint functors (F, i) where $i : \mathcal{A}\text{-Alg} \rightarrow Sh(\mathcal{C})$ is the forgetful functor and $F : Sh(\mathcal{C}) \rightarrow \mathcal{A}\text{-Alg}$ assigns to a sheaf of sets \mathcal{E} the polynomial algebra $\mathcal{A}[\mathcal{E}]$ on \mathcal{E} over \mathcal{A} . Let X_{\bullet} be the simplicial object of $\text{Fun}(\mathcal{A}\text{-Alg}, \mathcal{A}\text{-Alg})$ constructed in Simplicial, Section 14.32.

Now assume that $\mathcal{A} \rightarrow \mathcal{B}$ is a homomorphism of sheaves of rings. Then \mathcal{B} is an object of the category $\mathcal{A}\text{-Alg}$. Denote $\mathcal{P}_{\bullet} = X_{\bullet}(\mathcal{B})$ the resulting simplicial \mathcal{A} -algebra. Recall that $\mathcal{P}_0 = \mathcal{A}[\mathcal{B}]$, $\mathcal{P}_1 = \mathcal{A}[\mathcal{A}[\mathcal{B}]]$, and so on. Recall also that there is an augmentation

$$\epsilon : \mathcal{P}_{\bullet} \longrightarrow \mathcal{B}$$

where we view \mathcal{B} as a constant simplicial \mathcal{A} -algebra.

Definition 70.17.1. Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . The *standard resolution of \mathcal{B} over \mathcal{A}* is the augmentation $\epsilon : \mathcal{P}_{\bullet} \rightarrow \mathcal{B}$ with terms

$$\mathcal{P}_0 = \mathcal{A}[\mathcal{B}], \quad \mathcal{P}_1 = \mathcal{A}[\mathcal{A}[\mathcal{B}]], \quad \dots$$

and maps as constructed above.

With this definition in hand the cotangent complex of a map of sheaves of rings is defined as follows. We will use the module of differentials as defined in Modules on Sites, Section 18.32.

Definition 70.17.2. Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . The *cotangent complex* $L_{\mathcal{B}/\mathcal{A}}$ is the complex of \mathcal{B} -modules associated to the simplicial module

$$\Omega_{\mathcal{P}_{\bullet}/\mathcal{A}} \otimes_{\mathcal{P}_{\bullet}, \epsilon} \mathcal{B}$$

where $\epsilon : \mathcal{P}_{\bullet} \rightarrow \mathcal{B}$ is the standard resolution of \mathcal{B} over \mathcal{A} . We usually think of $L_{\mathcal{B}/\mathcal{A}}$ as an object of $D(\mathcal{B})$.

These constructions satisfy a functoriality similar to that discussed in Section 70.6. Namely, given a commutative diagram

$$(70.17.2.1) \quad \begin{array}{ccc} \mathcal{B} & \longrightarrow & \mathcal{B}' \\ \uparrow & & \uparrow \\ \mathcal{A} & \longrightarrow & \mathcal{A}' \end{array}$$

of sheaves of rings on \mathcal{C} there is a canonical \mathcal{B} -linear map of complexes

$$L_{\mathcal{B}/\mathcal{A}} \longrightarrow L_{\mathcal{B}'/\mathcal{A}'}$$

constructed as follows. If $\mathcal{P}_\bullet \rightarrow \mathcal{B}$ is the standard resolution of \mathcal{B} over \mathcal{A} and $\mathcal{P}'_\bullet \rightarrow \mathcal{B}'$ is the standard resolution of \mathcal{B}' over \mathcal{A}' , then there is a canonical map $\mathcal{P}_\bullet \rightarrow \mathcal{P}'_\bullet$ of simplicial \mathcal{A} -algebras compatible with the augmentations $\mathcal{P}_\bullet \rightarrow \mathcal{B}$ and $\mathcal{P}'_\bullet \rightarrow \mathcal{B}'$. The maps

$$\mathcal{P}_0 = \mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{A}'[\mathcal{B}'] = \mathcal{P}'_0, \quad \mathcal{P}_1 = \mathcal{A}[\mathcal{A}[\mathcal{B}]] \longrightarrow \mathcal{A}'[\mathcal{A}'[\mathcal{B}']] = \mathcal{P}'_1$$

and so on are given by the given maps $\mathcal{A} \rightarrow \mathcal{A}'$ and $\mathcal{B} \rightarrow \mathcal{B}'$. The desired map $L_{\mathcal{B}/\mathcal{A}} \rightarrow L_{\mathcal{B}'/\mathcal{A}'}$ then comes from the associated maps on sheaves of differentials.

Lemma 70.17.3. *Let $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ be a morphism of topoi. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . Then $f^{-1}L_{\mathcal{B}/\mathcal{A}} = L_{f^{-1}\mathcal{B}/f^{-1}\mathcal{A}}$.*

Proof. The diagram

$$\begin{array}{ccc} \mathcal{A}\text{-Alg} & \rightleftarrows & Sh(\mathcal{C}) \\ f^{-1} \downarrow & & \downarrow f^{-1} \\ f^{-1}\mathcal{A}\text{-Alg} & \rightleftarrows & Sh(\mathcal{D}) \end{array}$$

commutes. □

Lemma 70.17.4. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . Then $H^i(L_{\mathcal{B}/\mathcal{A}})$ is the sheaf associated to the presheaf $U \mapsto H^i(L_{\mathcal{B}(U)/\mathcal{A}(U)})$.*

Proof. Let \mathcal{C}' be the site we get by endowing \mathcal{C} with the chaotic topology (presheaves are sheaves). There is a morphism of topoi $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ where f_* is the inclusion of sheaves into presheaves and f^{-1} is sheafification. By Lemma 70.17.3 it suffices to prove the result for \mathcal{C}' , i.e., in case \mathcal{C} has the chaotic topology.

If \mathcal{C} carries the chaotic topology, then $L_{\mathcal{B}/\mathcal{A}}(U)$ is equal to $L_{\mathcal{B}(U)/\mathcal{A}(U)}$ because

$$\begin{array}{ccc} \mathcal{A}\text{-Alg} & \rightleftarrows & Sh(\mathcal{C}) \\ \text{sections over } U \downarrow & & \downarrow \text{sections over } U \\ \mathcal{A}(U)\text{-Alg} & \rightleftarrows & Sets \end{array}$$

commutes. □

Remark 70.17.5. It is clear from the proof of Lemma 70.17.4 that for any $U \in \text{Ob}(\mathcal{C})$ there is a canonical map $L_{\mathcal{B}(U)/\mathcal{A}(U)} \rightarrow L_{\mathcal{B}/\mathcal{A}}(U)$ of complexes of $\mathcal{B}(U)$ -modules. Moreover, these maps are compatible with restriction maps and the complex $L_{\mathcal{B}/\mathcal{A}}$ is the sheafification of the rule $U \mapsto L_{\mathcal{B}(U)/\mathcal{A}(U)}$.

Lemma 70.17.6. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . Then $H^0(L_{\mathcal{B}/\mathcal{A}}) = \Omega_{\mathcal{B}/\mathcal{A}}$.*

Proof. Follows from Lemmas 70.17.4 and 70.4.5 and Modules on Sites, Lemma 18.32.4. \square

Lemma 70.17.7. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ and $\mathcal{A} \rightarrow \mathcal{B}'$ be homomorphisms of sheaves of rings on \mathcal{C} . Then*

$$L_{\mathcal{B} \times \mathcal{B}' / \mathcal{A}} \longrightarrow L_{\mathcal{B} / \mathcal{A}} \oplus L_{\mathcal{B}' / \mathcal{A}}$$

is an isomorphism in $D(\mathcal{B} \times \mathcal{B}')$.

Proof. By Lemma 70.17.4 it suffices to prove this for ring maps. In the case of rings this is Lemma 70.6.4. \square

The fundamental triangle for the cotangent complex of sheaves of rings is an easy consequence of the result for homomorphisms of rings.

Lemma 70.17.8. *Let \mathcal{D} be a site. Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be homomorphisms of sheaves of rings on \mathcal{D} . There is a canonical distinguished triangle*

$$L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{C} \rightarrow L_{\mathcal{C} / \mathcal{A}} \rightarrow L_{\mathcal{C} / \mathcal{B}} \rightarrow L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{C}[1]$$

in $D(\mathcal{C})$.

Proof. We will use the method described in Remarks 70.7.5 and 70.7.6 to construct the triangle; we will freely use the results mentioned there. As in those remarks we first construct the triangle in case $\mathcal{B} \rightarrow \mathcal{C}$ is an injective map of sheaves of rings. In this case we set

- (1) \mathcal{P}_\bullet is the standard resolution of \mathcal{B} over \mathcal{A} ,
- (2) \mathcal{Q}_\bullet is the standard resolution of \mathcal{C} over \mathcal{A} ,
- (3) \mathcal{R}_\bullet is the standard resolution of \mathcal{C} over \mathcal{B} ,
- (4) \mathcal{S}_\bullet is the standard resolution of \mathcal{B} over \mathcal{B} ,
- (5) $\overline{\mathcal{Q}}_\bullet = \mathcal{Q}_\bullet \otimes_{\mathcal{P}_\bullet} \mathcal{B}$, and
- (6) $\overline{\mathcal{R}}_\bullet = \mathcal{R}_\bullet \otimes_{\mathcal{S}_\bullet} \mathcal{B}$.

The distinguished triangle is the distinguished triangle associated to the short exact sequence of simplicial \mathcal{C} -modules

$$0 \rightarrow \Omega_{\mathcal{P}_\bullet / \mathcal{A}} \otimes_{\mathcal{P}_\bullet} \mathcal{C} \rightarrow \Omega_{\mathcal{Q}_\bullet / \mathcal{A}} \otimes_{\mathcal{Q}_\bullet} \mathcal{C} \rightarrow \Omega_{\overline{\mathcal{Q}}_\bullet / \mathcal{B}} \otimes_{\overline{\mathcal{Q}}_\bullet} \mathcal{C} \rightarrow 0$$

The first two terms are equal to the first two terms of the triangle of the statement of the lemma. The identification of the last term with $L_{\mathcal{C} / \mathcal{B}}$ uses the quasi-isomorphisms of complexes

$$L_{\mathcal{C} / \mathcal{B}} = \Omega_{\mathcal{R}_\bullet / \mathcal{B}} \otimes_{\mathcal{R}_\bullet} \mathcal{C} \longrightarrow \Omega_{\overline{\mathcal{R}}_\bullet / \mathcal{B}} \otimes_{\overline{\mathcal{R}}_\bullet} \mathcal{C} \longleftarrow \Omega_{\overline{\mathcal{Q}}_\bullet / \mathcal{B}} \otimes_{\overline{\mathcal{Q}}_\bullet} \mathcal{C}$$

All the constructions used above can first be done on the level of presheaves and then sheafified. Hence to prove sequences are exact, or that maps are quasi-isomorphisms it suffices to prove the corresponding statement for the ring maps $\mathcal{A}(U) \rightarrow \mathcal{B}(U) \rightarrow \mathcal{C}(U)$ which are known. This finishes the proof in the case that $\mathcal{B} \rightarrow \mathcal{C}$ is injective.

In general, we reduce to the case where $\mathcal{B} \rightarrow \mathcal{C}$ is injective by replacing \mathcal{C} by $\mathcal{B} \times \mathcal{C}$ if necessary. This is possible by the argument given in Remark 70.7.5 by Lemma 70.17.7. \square

Lemma 70.17.9. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . If p is a point of \mathcal{C} , then $(L_{\mathcal{B} / \mathcal{A}})_p = L_{\mathcal{B}_p / \mathcal{A}_p}$.*

Proof. This is a special case of Lemma 70.17.3. \square

For the construction of the naive cotangent complex and its properties we refer to Modules on Sites, Section 18.34.

Lemma 70.17.10. *Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . There is a canonical map $L_{\mathcal{B}/\mathcal{A}} \rightarrow NL_{\mathcal{B}/\mathcal{A}}$ which identifies the naive cotangent complex with the truncation $\tau_{\geq -1}L_{\mathcal{B}/\mathcal{A}}$.*

Proof. Let \mathcal{P}_\bullet be the standard resolution of \mathcal{B} over \mathcal{A} . Let $\mathcal{I} = \text{Ker}(\mathcal{A}[\mathcal{B}] \rightarrow \mathcal{B})$. Recall that $\mathcal{P}_0 = \mathcal{A}[\mathcal{B}]$. The map of the lemma is given by the commutative diagram

$$\begin{array}{ccccccc}
 L_{\mathcal{B}/\mathcal{A}} & \cdots \longrightarrow & \Omega_{\mathcal{P}_2/\mathcal{A}} \otimes_{\mathcal{P}_2} \mathcal{B} & \longrightarrow & \Omega_{\mathcal{P}_1/\mathcal{A}} \otimes_{\mathcal{P}_1} \mathcal{B} & \longrightarrow & \Omega_{\mathcal{P}_0/\mathcal{A}} \otimes_{\mathcal{P}_0} \mathcal{B} \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 NL_{\mathcal{B}/\mathcal{A}} & \cdots \longrightarrow & 0 & \longrightarrow & \mathcal{I}/\mathcal{I}^2 & \longrightarrow & \Omega_{\mathcal{P}_0/\mathcal{A}} \otimes_{\mathcal{P}_0} \mathcal{B}
 \end{array}$$

We construct the downward arrow with target $\mathcal{I}/\mathcal{I}^2$ by sending a local section $df \otimes b$ to the class of $(d_0(f) - d_1(f))b$ in $\mathcal{I}/\mathcal{I}^2$. Here $d_i : \mathcal{P}_1 \rightarrow \mathcal{P}_0$, $i = 0, 1$ are the two face maps of the simplicial structure. This makes sense as $d_0 - d_1$ maps \mathcal{P}_1 into $\mathcal{I} = \text{Ker}(\mathcal{P}_0 \rightarrow \mathcal{B})$. We omit the verification that this rule is well defined. Our map is compatible with the differential $\Omega_{\mathcal{P}_1/\mathcal{A}} \otimes_{\mathcal{P}_1} \mathcal{B} \rightarrow \Omega_{\mathcal{P}_0/\mathcal{A}} \otimes_{\mathcal{P}_0} \mathcal{B}$ as this differential maps a local section $df \otimes b$ to $d(d_0(f) - d_1(f)) \otimes b$. Moreover, the differential $\Omega_{\mathcal{P}_2/\mathcal{A}} \otimes_{\mathcal{P}_2} \mathcal{B} \rightarrow \Omega_{\mathcal{P}_1/\mathcal{A}} \otimes_{\mathcal{P}_1} \mathcal{B}$ maps a local section $df \otimes b$ to $d(d_0(f) - d_1(f) + d_2(f)) \otimes b$ which are annihilated by our downward arrow. Hence a map of complexes.

To see that our map induces an isomorphism on the cohomology sheaves H^0 and H^{-1} we argue as follows. Let \mathcal{C}' be the site with the same underlying category as \mathcal{C} but endowed with the chaotic topology. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ be the morphism of topoi whose pullback functor is sheafification. Let $\mathcal{A}' \rightarrow \mathcal{B}'$ be the given map, but thought of as a map of sheaves of rings on \mathcal{C}' . The construction above gives a map $L_{\mathcal{B}'/\mathcal{A}'} \rightarrow NL_{\mathcal{B}'/\mathcal{A}'}$ on \mathcal{C}' whose value over any object U of \mathcal{C}' is just the map

$$L_{\mathcal{B}(U)/\mathcal{A}(U)} \rightarrow NL_{\mathcal{B}(U)/\mathcal{A}(U)}$$

of Remark 70.10.4 which induces an isomorphism on H^0 and H^{-1} . Since $f^{-1}L_{\mathcal{B}'/\mathcal{A}'} = L_{\mathcal{B}/\mathcal{A}}$ (Lemma 70.17.3) and $f^{-1}NL_{\mathcal{B}'/\mathcal{A}'} = NL_{\mathcal{B}/\mathcal{A}}$ (Modules on Sites, Lemma 18.34.3) the lemma is proved. \square

70.18. The Atiyah class of a sheaf of modules

Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let \mathcal{F} be a sheaf of \mathcal{B} -modules. Let $\mathcal{P}_\bullet \rightarrow \mathcal{B}$ be the standard resolution of \mathcal{B} over \mathcal{A} (Section 70.17). For every $n \geq 0$ consider the extension of principal parts

$$(70.18.0.1) \quad 0 \rightarrow \Omega_{\mathcal{P}_n/\mathcal{A}} \otimes_{\mathcal{P}_n} \mathcal{F} \rightarrow \mathcal{P}_{\mathcal{P}_n/\mathcal{A}}^1(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow 0$$

see Modules on Sites, Lemma 18.33.6. The functoriality of this construction (Modules on Sites, Remark 18.33.7) tells us (70.18.0.1) is the degree n part of a short exact sequence of simplicial \mathcal{P}_\bullet -modules (Cohomology on Sites, Section 21.31). Using the functor $L\pi_! : D(\mathcal{P}_\bullet) \rightarrow D(\mathcal{B})$ of Cohomology on Sites, Remark 21.31.3 (here we use that $\mathcal{P}_\bullet \rightarrow \mathcal{A}$ is a resolution) we obtain a distinguished triangle

$$(70.18.0.2) \quad L_{\mathcal{B}/\mathcal{A}} \otimes_{\mathcal{B}}^L \mathcal{F} \rightarrow L\pi_! \left(\mathcal{P}_{\mathcal{P}_\bullet/\mathcal{A}}^1(\mathcal{F}) \right) \rightarrow \mathcal{F} \rightarrow L_{\mathcal{B}/\mathcal{A}} \otimes_{\mathcal{B}}^L \mathcal{F}[1]$$

in $D(\mathcal{B})$.

Definition 70.18.1. Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let \mathcal{F} be a sheaf of \mathcal{B} -modules. The map $\mathcal{F} \rightarrow L_{\mathcal{B}/\mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{F}[1]$ in (70.18.0.2) is called the *Atiyah class* of \mathcal{F} .

70.19. The cotangent complex of a morphism of ringed spaces

The cotangent complex of a morphism of ringed spaces is defined in terms of the cotangent complex we defined above.

Definition 70.19.1. Let $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$ be a morphism of ringed spaces. The *cotangent complex* L_f of f is $L_f = L_{\mathcal{O}_X/f^{-1}\mathcal{O}_S}$. We will also use the notation $L_f = L_{X/S} = L_{\mathcal{O}_X/\mathcal{O}_S}$.

More precisely, this means that we consider the cotangent complex (Definition 70.17.2) of the homomorphism $f^\# : f^{-1}\mathcal{O}_S \rightarrow \mathcal{O}_X$ of sheaves of rings on the site associated to the topological space X (Sites, Example 7.6.4).

Lemma 70.19.2. Let $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$ be a morphism of ringed spaces. Then $H^0(L_{X/S}) = \Omega_{X/S}$.

Proof. Special case of Lemma 70.17.6. □

Lemma 70.19.3. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of ringed spaces. Then there is a canonical distinguished triangle

$$L_f^* L_{Y/Z} \rightarrow L_{X/Z} \rightarrow L_{X/Y} \rightarrow L_f^* L_{Y/Z}[1]$$

in $D(\mathcal{O}_X)$.

Proof. Set $h = g \circ f$ so that $h^{-1}\mathcal{O}_Z = f^{-1}g^{-1}\mathcal{O}_Z$. By Lemma 70.17.3 we have $f^{-1}L_{Y/Z} = L_{f^{-1}\mathcal{O}_Y/h^{-1}\mathcal{O}_Z}$ and this is a complex of flat $f^{-1}\mathcal{O}_Y$ -modules. Hence the distinguished triangle above is an example of the distinguished triangle of Lemma 70.17.8 with $\mathcal{A} = h^{-1}\mathcal{O}_Z$, $\mathcal{B} = f^{-1}\mathcal{O}_Y$, and $\mathcal{C} = \mathcal{O}_X$. □

Lemma 70.19.4. Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. There is a canonical map $L_{X/Y} \rightarrow NL_{X/Y}$ which identifies the naive cotangent complex with the truncation $\tau_{\geq -1}L_{X/Y}$.

Proof. Special case of Lemma 70.17.10. □

70.20. Deformations of ringed spaces and the cotangent complex

This section is the continuation of Deformation Theory, Section 69.7 which we urge the reader to read first. We briefly recall the setup. We have a first order thickening $t : (S, \mathcal{O}_S) \rightarrow (S', \mathcal{O}_{S'})$ of ringed spaces with $\mathcal{J} = \text{Ker}(t^\#)$, a morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$, an \mathcal{O}_X -module \mathcal{G} , and an f -map $c : \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of modules. We ask whether we can find the question mark fitting into the following diagram

$$(70.20.0.1) \quad \begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & ? & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \\ & & \uparrow c & & \uparrow & & \uparrow \\ 0 & \longrightarrow & \mathcal{J} & \longrightarrow & \mathcal{O}_{S'} & \longrightarrow & \mathcal{O}_S \longrightarrow 0 \end{array}$$

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$ and a morphism of thickenings

(f, f') as in Deformation Theory, Equation (69.3.1.1) where $\text{Ker}(i^\sharp)$ is identified with \mathcal{G} such that $(f')^\sharp$ induces the given map c . We will say X' is a *solution* to (70.20.0.1).

Lemma 70.20.1. *In the situation above we have*

- (1) *There is a canonical element $\xi \in \text{Ext}_{\mathcal{O}_X}^2(L_{X/S}, \mathcal{G})$ whose vanishing is a sufficient and necessary condition for the existence of a solution to (70.20.0.1).*
- (2) *If there exists a solution, then then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_{\mathcal{O}_X}^1(L_{X/S}, \mathcal{G})$.*
- (3) *Given a solution X' , the set of automorphisms of X' fitting into (70.20.0.1) is canonically isomorphic to $\text{Ext}_{\mathcal{O}_X}^0(L_{X/S}, \mathcal{G})$.*

Proof. Via the identifications $NL_{X/S} = \tau_{\geq -1}L_{X/S}$ (Lemma 70.19.4) and $H^0(L_{X/S}) = \Omega_{X/S}$ (Lemma 70.19.2) we have seen parts (2) and (3) in Deformation Theory, Lemmas 69.7.1 and 69.7.3.

Proof of (1). We will use the results of Deformation Theory, Lemma 69.7.4 without further mention. Let $\alpha \in \text{Ext}_{\mathcal{O}_S}^1(NL_{S/\mathbf{Z}}, \mathcal{J})$ be the element corresponding to the isomorphism class of S' . The existence of X' corresponds to an element $\beta \in \text{Ext}_{\mathcal{O}_X}^1(NL_{X/\mathbf{Z}}, \mathcal{G})$ which maps to the image of α in $\text{Ext}_{\mathcal{O}_X}^1(Lf^*NL_{S/\mathbf{Z}}, \mathcal{G})$. Note that

$$\text{Ext}_{\mathcal{O}_X}^1(Lf^*NL_{S/\mathbf{Z}}, \mathcal{G}) = \text{Ext}_{\mathcal{O}_X}^1(Lf^*L_{S/\mathbf{Z}}, \mathcal{G})$$

and

$$\text{Ext}_{\mathcal{O}_X}^1(NL_{X/\mathbf{Z}}, \mathcal{G}) = \text{Ext}_{\mathcal{O}_X}^1(L_{X/\mathbf{Z}}, \mathcal{G})$$

by Lemma 70.19.4. The distinguished triangle of Lemma 70.19.3 for $X \rightarrow S \rightarrow (*, \mathbf{Z})$ gives rise to a long exact sequence

$$\dots \rightarrow \text{Ext}_{\mathcal{O}_X}^1(L_{X/\mathbf{Z}}, \mathcal{G}) \rightarrow \text{Ext}_{\mathcal{O}_X}^1(Lf^*L_{S/\mathbf{Z}}, \mathcal{G}) \rightarrow \text{Ext}_{\mathcal{O}_X}^2(L_{X/S}, \mathcal{G}) \rightarrow \dots$$

We obtain the result with ξ the image of α . □

70.21. The cotangent complex of a morphism of ringed topoi

The cotangent complex of a morphism of ringed topoi is defined in terms of the cotangent complex we defined above.

Definition 70.21.1. Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. The *cotangent complex* L_f of f is $L_f = L_{\mathcal{O}_{\mathcal{C}}/f^{-1}\mathcal{O}_{\mathcal{D}}}$. We sometimes write $L_f = L_{\mathcal{O}_{\mathcal{C}}/\mathcal{O}_{\mathcal{D}}}$.

This definition applies to many situations, but it doesn't always produce the thing one expects. For example, if $f : X \rightarrow Y$ is a morphism of schemes, then f induces a morphism of big étale sites $f_{big} : (Sch/X)_{\acute{e}tale} \rightarrow (Sch/Y)_{\acute{e}tale}$ which is a morphism of ringed topoi (Descent, Remark 34.7.4). However, $L_{f_{big}} = 0$ since $(f_{big})^\sharp$ is an isomorphism. On the other hand, if we take L_f where we think of f as a morphism between the underlying Zariski ringed topoi, then L_f does agree with the cotangent complex $L_{X/Y}$ (as defined below) whose zeroth cohomology sheaf is $\Omega_{X/Y}$.

Lemma 70.21.2. *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_{\mathcal{B}})$ be a morphism of ringed topoi. Then $H^0(L_f) = \Omega_f$.*

Proof. Special case of Lemma 70.17.6. □

Lemma 70.21.3. *Let $f : (Sh(\mathcal{C}_1), \mathcal{O}_1) \rightarrow (Sh(\mathcal{C}_2), \mathcal{O}_2)$ and $g : (Sh(\mathcal{C}_2), \mathcal{O}_2) \rightarrow (Sh(\mathcal{C}_3), \mathcal{O}_3)$ be morphisms of ringed topoi. Then there is a canonical distinguished triangle*

$$Lf^*Lg \rightarrow L_{g \circ f} \rightarrow Lf \rightarrow Lf^*Lg[1]$$

in $D(\mathcal{O}_1)$.

Proof. Set $h = g \circ f$ so that $h^{-1}\mathcal{O}_3 = f^{-1}g^{-1}\mathcal{O}_3$. By Lemma 70.17.3 we have $f^{-1}Lg = L_{f^{-1}\mathcal{O}_2/h^{-1}\mathcal{O}_3}$ and this is a complex of flat $f^{-1}\mathcal{O}_2$ -modules. Hence the distinguished triangle above is an example of the distinguished triangle of Lemma 70.17.8 with $\mathcal{A} = h^{-1}\mathcal{O}_3$, $\mathcal{B} = f^{-1}\mathcal{O}_2$, and $\mathcal{C} = \mathcal{O}_1$. \square

Lemma 70.21.4. *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_\mathcal{B})$ be a morphism of ringed topoi. There is a canonical map $Lf \rightarrow NL_f$ which identifies the naive cotangent complex with the truncation $\tau_{\geq -1}Lf$.*

Proof. Special case of Lemma 70.17.10. \square

70.22. Deformations of ringed topoi and the cotangent complex

This section is the continuation of Deformation Theory, Section 69.12 which we urge the reader to read first. We briefly recall the setup. We have a first order thickening $t : (Sh(\mathcal{B}), \mathcal{O}_\mathcal{B}) \rightarrow (Sh(\mathcal{B}'), \mathcal{O}_{\mathcal{B}'})$ of ringed topoi with $\mathcal{J} = \text{Ker}(t^\sharp)$, a morphism of ringed topoi $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{B}), \mathcal{O}_\mathcal{B})$, an \mathcal{O} -module \mathcal{G} , and a map $f^{-1}\mathcal{J} \rightarrow \mathcal{G}$ of sheaves of $f^{-1}\mathcal{O}_\mathcal{B}$ -modules. We ask whether we can find the question mark fitting into the following diagram

$$(70.22.0.1) \quad \begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{G} & \longrightarrow & ? & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \\ & & \uparrow c & & \uparrow & & \uparrow \\ 0 & \longrightarrow & f^{-1}\mathcal{J} & \longrightarrow & f^{-1}\mathcal{O}_{S'} & \longrightarrow & f^{-1}\mathcal{O}_S \longrightarrow 0 \end{array}$$

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i : (Sh(\mathcal{C}'), \mathcal{O}')$ and a morphism of thickenings (f, f') as in Deformation Theory, Equation (69.8.1.1) where $\text{Ker}(i^\sharp)$ is identified with \mathcal{G} such that $(f')^\sharp$ induces the given map c . We will say $(Sh(\mathcal{C}'), \mathcal{O}')$ is a *solution* to (70.22.0.1).

Lemma 70.22.1. *In the situation above we have*

- (1) *There is a canonical element $\xi \in \text{Ext}_{\mathcal{O}}^2(L_f, \mathcal{G})$ whose vanishing is a sufficient and necessary condition for the existence of a solution to (70.22.0.1).*
- (2) *If there exists a solution, then the set of isomorphism classes of solutions is principal homogeneous under $\text{Ext}_{\mathcal{O}}^1(L_f, \mathcal{G})$.*
- (3) *Given a solution X' , the set of automorphisms of X' fitting into (70.22.0.1) is canonically isomorphic to $\text{Ext}_{\mathcal{O}}^0(L_f, \mathcal{G})$.*

Proof. Via the identifications $NL_f = \tau_{\geq -1}Lf$ (Lemma 70.21.4) and $H^0(L_{X/S}) = \Omega_{X/S}$ (Lemma 70.21.2) we have seen parts (2) and (3) in Deformation Theory, Lemmas 69.12.1 and 69.12.3.

Proof of (1). We will use the results of Deformation Theory, Lemma 69.12.4 without further mention. Denote

$$p : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(*), \mathbf{Z}) \quad \text{and} \quad q : (Sh(\mathcal{B}), \mathcal{O}_\mathcal{B}) \rightarrow (Sh(*), \mathbf{Z}).$$

Let $\alpha \in \text{Ext}_{\mathcal{O}_B}^1(NL_q, \mathcal{J})$ be the element corresponding to the isomorphism class of $\mathcal{O}_{B'}$. The existence of \mathcal{O}' corresponds to an element $\beta \in \text{Ext}_{\mathcal{O}}^1(NL_p, \mathcal{G})$ which maps to the image of α in $\text{Ext}_{\mathcal{O}_X}^1(Lf^*NL_q, \mathcal{G})$. Note that

$$\text{Ext}_{\mathcal{O}_X}^1(Lf^*NL_q, \mathcal{G}) = \text{Ext}_{\mathcal{O}_X}^1(Lf^*L_q, \mathcal{G})$$

and

$$\text{Ext}_{\mathcal{O}_X}^1(NL_p, \mathcal{G}) = \text{Ext}_{\mathcal{O}_X}^1(L_p, \mathcal{G})$$

by Lemma 70.21.4. The distinguished triangle of Lemma 70.21.3 for $p = q \circ f$ gives rise to a long exact sequence

$$\dots \rightarrow \text{Ext}_{\mathcal{O}_X}^1(L_p, \mathcal{G}) \rightarrow \text{Ext}_{\mathcal{O}_X}^1(Lf^*L_q, \mathcal{G}) \rightarrow \text{Ext}_{\mathcal{O}_X}^2(L_f, \mathcal{G}) \rightarrow \dots$$

We obtain the result with ξ the image of α . □

70.23. The cotangent complex of a morphism of schemes

As promised above we define the cotangent complex of a morphism of schemes as follows.

Definition 70.23.1. Let $f : X \rightarrow Y$ be a morphism of schemes. The *cotangent complex* $L_{X/Y}$ of X over Y is the cotangent complex of f as a morphism of ringed spaces (Definition 70.19.1).

In particular, the results of Section 70.19 apply to cotangent complexes of morphisms of schemes. The next lemma shows this definition is compatible with the definition for ring maps and it also implies that $L_{X/Y}$ is an object of $D_{Qcoh}(\mathcal{O}_X)$.

Lemma 70.23.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $U = \text{Spec}(A) \subset X$ and $V = \text{Spec}(B) \subset Y$ be affine opens such that $f(U) \subset V$. There is a canonical map*

$$\widetilde{L}_{B/A} \longrightarrow L_{X/Y}|_U$$

of complexes which is an isomorphism in $D(\mathcal{O}_U)$. This map is compatible with restricting to smaller affine opens of X and Y .

Proof. By Remark 70.17.5 there is a canonical map of complexes $L_{\mathcal{O}_X(U)/f^{-1}\mathcal{O}_Y(U)} \rightarrow L_{X/Y}(U)$ of $B = \mathcal{O}_X(U)$ -modules, which is compatible with further restrictions. Using the canonical map $A \rightarrow f^{-1}\mathcal{O}_Y(U)$ we obtain a canonical map $L_{B/A} \rightarrow L_{B/A}(U)$ of B -modules. Using the universal property of the $\widetilde{}$ functor (see Schemes, Lemma 25.7.1) we obtain a map as in the statement of the lemma. We may check this map is an isomorphism on cohomology sheaves by checking it induces isomorphisms on stalks. This follows immediately from Lemmas 70.17.9 and 70.8.6 (and the description of the stalks of \mathcal{O}_X and $f^{-1}\mathcal{O}_Y$ at a point $\mathfrak{p} \in \text{Spec}(B)$ as $B_{\mathfrak{p}}$ and $A_{\mathfrak{q}}$ where $\mathfrak{q} = A \cap \mathfrak{p}$; references used are Schemes, Lemma 25.5.4 and Sheaves, Lemma 6.21.5). □

Lemma 70.23.3. *Let Λ be a ring. Let X be a scheme over Λ . Then*

$$L_{X/\text{Spec}(\Lambda)} = L_{\mathcal{O}_X/\underline{\Lambda}}$$

where $\underline{\Lambda}$ is the constant sheaf with value Λ on X .

Proof. Let $p : X \rightarrow \text{Spec}(\Lambda)$ be the structure morphism. Let $q : \text{Spec}(\Lambda) \rightarrow (*, \Lambda)$ be the obvious morphism. By the distinguished triangle of Lemma 70.19.3 it suffices to show that $L_q = 0$. To see this it suffices to show for $\mathfrak{p} \in \text{Spec}(\Lambda)$ that

$$(L_q)_{\mathfrak{p}} = L_{\mathcal{O}_{\text{Spec}(\Lambda), \mathfrak{p}}/\Lambda} = L_{\Lambda_{\mathfrak{p}}/\Lambda}$$

(Lemma 70.17.9) is zero which follows from Lemma 70.8.4. □

70.24. The cotangent complex of a scheme over a ring

Let Λ be a ring and let X be a scheme over Λ . Write $L_{X/\text{Spec}(\Lambda)} = L_{X/\Lambda}$ which is justified by Lemma 70.23.3. In this section we give a description of $L_{X/\Lambda}$ similar to Lemma 70.4.3. Namely, we construct a category $\mathcal{C}_{X/\Lambda}$ fibred over X_{Zar} and endow it with a sheaf of (polynomial) Λ -algebras \mathcal{O} such that

$$L_{X/\Lambda} = L\pi_!(\Omega_{\mathcal{O}/\Lambda} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X).$$

We will later use the category $\mathcal{C}_{X/\Lambda}$ to construct a naive obstruction theory for the stack of coherent sheaves.

Let Λ be a ring. Let X be a scheme over Λ . Let $\mathcal{C}_{X/\Lambda}$ be the category whose objects are commutative diagrams

$$(70.24.0.1) \quad \begin{array}{ccc} X & \longleftarrow & U \\ \downarrow & & \downarrow \\ \text{Spec}(\Lambda) & \longleftarrow & \mathbf{A} \end{array}$$

of schemes where

- (1) U is an open subscheme of X ,
- (2) there exists an isomorphism $\mathbf{A} = \text{Spec}(P)$ where P is a polynomial algebra over Λ (on some set of variables).

In other words, \mathbf{A} is an (infinite dimensional) affine space over $\text{Spec}(\Lambda)$. Morphisms are given by commutative diagrams. Recall that X_{Zar} denotes the small Zariski site X . There is a forgetful functor

$$u : \mathcal{C}_{X/\Lambda} \rightarrow X_{Zar}, (U \rightarrow \mathbf{A}) \mapsto U$$

Observe that the fibre category over U is canonically equivalent to the category $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ introduced in Section 70.4.

Lemma 70.24.1. *In the situation above the category $\mathcal{C}_{X/\Lambda}$ is fibred over X_{Zar} .*

Proof. Given an object $U \rightarrow \mathbf{A}$ of $\mathcal{C}_{X/\Lambda}$ and a morphism $U' \rightarrow U$ of X_{Zar} consider the object $U' \rightarrow \mathbf{A}$ of $\mathcal{C}_{X/\Lambda}$ where $U' \rightarrow \mathbf{A}$ is the composition of $U \rightarrow \mathbf{A}$ and $U' \rightarrow U$. The morphism $(U' \rightarrow \mathbf{A}) \rightarrow (U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X/\Lambda}$ is strongly cartesian over X_{Zar} . □

We endow $\mathcal{C}_{X/\Lambda}$ with the topology inherited from X_{Zar} (see Stacks, Section 8.10). The functor u defines a morphism of topoi $\pi : Sh(\mathcal{C}_{X/\Lambda}) \rightarrow Sh(X_{Zar})$. The site $\mathcal{C}_{X/\Lambda}$ comes with several sheaves of rings.

- (1) The sheaf \mathcal{O} given by the rule $(U \rightarrow \mathbf{A}) \mapsto \Gamma(\mathbf{A}, \mathcal{O}_{\mathbf{A}})$.
- (2) The sheaf $\underline{\mathcal{O}}_X = \pi^{-1}\mathcal{O}_X$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{O}_X(U)$.
- (3) The constant sheaf $\underline{\Lambda}$.

We obtain morphisms of ringed topoi

$$(70.24.1.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}_{X/\Lambda}), \underline{\mathcal{O}}_X) & \xrightarrow{i} & (Sh(\mathcal{C}_{X/\Lambda}), \mathcal{O}) \\ \pi \downarrow & & \\ (Sh(X_{Zar}), \mathcal{O}_X) & & \end{array}$$

The morphism i is the identity on underlying topoi and $i^\sharp : \mathcal{O} \rightarrow \underline{\mathcal{O}}_X$ is the obvious map. The map π is a special case of Cohomology on Sites, Situation 21.28.1. An important role will be played in the following by the derived functors $Li^* : D(\mathcal{O}) \rightarrow D(\underline{\mathcal{O}}_X)$ left adjoint to $Ri_* = i_* : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O})$ and $L\pi_! : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O}_X)$ left adjoint to $\pi^* = \pi^{-1} : D(\mathcal{O}_X) \rightarrow D(\underline{\mathcal{O}}_X)$. We can compute $L\pi_!$ thanks to our earlier work.

Remark 70.24.2. In the situation above, for every $U \subset X$ open let $P_{\bullet,U}$ be the standard resolution of $\mathcal{O}_X(U)$ over Λ . Set $\mathbf{A}_{n,U} = \text{Spec}(P_{n,U})$. Then $\mathbf{A}_{\bullet,U}$ is a cosimplicial object of the fibre category $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ of $\mathcal{C}_{X/\Lambda}$ over U . Moreover, as discussed in Remark 70.5.5 we have that $\mathbf{A}_{\bullet,U}$ is a cosimplicial object of $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ as in Cohomology on Sites, Lemma 21.29.7. Since the construction $U \mapsto \mathbf{A}_{\bullet,U}$ is functorial in U , given any (abelian) sheaf \mathcal{F} on $\mathcal{C}_{X/\Lambda}$ we obtain a complex of presheaves

$$U \mapsto \mathcal{F}(\mathbf{A}_{\bullet,U})$$

whose cohomology groups compute the homology of \mathcal{F} on the fibre category. We conclude by Cohomology on Sites, Lemma 21.30.2 that the sheafification computes $L_n\pi_!(\mathcal{F})$. In other words, the complex of sheaves whose term in degree $-n$ is the sheafification of $U \mapsto \mathcal{F}(\mathbf{A}_{n,U})$ computes $L\pi_!(\mathcal{F})$.

With this remark out of the way we can state the main result of this section.

Lemma 70.24.3. *In the situation above there is a canonical isomorphism*

$$L_{X/\Lambda} = L\pi_!(Li^*\Omega_{\underline{\mathcal{O}}/\underline{\Lambda}}) = L\pi_!(i^*\Omega_{\mathcal{O}/\underline{\Lambda}}) = L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)$$

in $D(\mathcal{O}_X)$.

Proof. We first observe that for any object $(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X/\Lambda}$ the value of the sheaf \mathcal{O} is a polynomial algebra over Λ . Hence $\Omega_{\mathcal{O}/\underline{\Lambda}}$ is a flat \mathcal{O} -module and we conclude the second and third equalities of the statement of the lemma hold.

By Remark 70.24.2 the object $L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)$ is computed as the sheafification of the complex of presheaves

$$U \mapsto (\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)(\mathbf{A}_{\bullet,U}) = \Omega_{P_{\bullet,U}/\Lambda} \otimes_{P_{\bullet,U}} \mathcal{O}_X(U) = L_{\mathcal{O}_X(U)/\Lambda}$$

using notation as in Remark 70.24.2. Now Remark 70.17.5 shows that $L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)$ computes the cotangent complex of the map of rings $\underline{\Lambda} \rightarrow \mathcal{O}_X$ on X . This is what we want by Lemma 70.23.3. \square

70.25. The cotangent complex of a morphism of algebraic spaces

We define the cotangent complex of a morphism of algebraic spaces using the associated morphism between the small étale sites.

Definition 70.25.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The *cotangent complex* $L_{X/Y}$ of X over Y is the cotangent complex of the morphism of ringed topoi f_{small} between the small étale sites of X and Y (see Properties of Spaces, Lemma 48.18.3 and Definition 70.21.1).

In particular, the results of Section 70.21 apply to cotangent complexes of morphisms of algebraic spaces. The next lemmas show this definition is compatible with the definition for ring maps and for schemes and that $L_{X/Y}$ is an object of $D_{QCoh}(\mathcal{O}_X)$.

Lemma 70.25.2. *Let S be a scheme. Consider a commutative diagram*

$$\begin{array}{ccc} U & \xrightarrow{g} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{f} & Y \end{array}$$

of algebraic spaces over S with p and q étale. Then there is a canonical identification $L_{X/Y}|_{U_{\text{étale}}} = L_{U/V}$ in $D(\mathcal{O}_U)$.

Proof. Formation of the cotangent complex commutes with pullback (Lemma 70.17.3) and we have $p_{small}^{-1}\mathcal{O}_X = \mathcal{O}_U$ and $g_{small}^{-1}\mathcal{O}_{V_{\text{étale}}} = p_{small}^{-1}f_{small}^{-1}\mathcal{O}_{Y_{\text{étale}}}$ because $q_{small}^{-1}\mathcal{O}_{Y_{\text{étale}}} = \mathcal{O}_{V_{\text{étale}}}$ (Properties of Spaces, Lemma 48.24.1). Tracing through the definitions we conclude that $L_{X/Y}|_{U_{\text{étale}}} = L_{U/V}$. \square

Lemma 70.25.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume X and Y representable by schemes X_0 and Y_0 . Then there is a canonical identification $L_{X/Y} = \epsilon^*L_{X_0/Y_0}$ in $D(\mathcal{O}_X)$ where ϵ is as in Derived Categories of Spaces, Section 57.4 and L_{X_0/Y_0} is as in Definition 70.23.1.*

Proof. Let $f_0 : X_0 \rightarrow Y_0$ be the morphism of schemes corresponding to f . There is a canonical map $\epsilon^{-1}f_0^{-1}\mathcal{O}_{Y_0} \rightarrow f_{small}^{-1}\mathcal{O}_Y$ compatible with $\epsilon^\# : \epsilon^{-1}\mathcal{O}_{X_0} \rightarrow \mathcal{O}_X$ because there is a commutative diagram

$$\begin{array}{ccc} X_{0,Zar} & \xleftarrow{\epsilon} & X_{\text{étale}} \\ f_0 \downarrow & & \downarrow f \\ Y_{0,Zar} & \xleftarrow{\epsilon} & Y_{\text{étale}} \end{array}$$

see Derived Categories of Spaces, Remark 57.6.3. Thus we obtain a canonical map

$$\epsilon^{-1}L_{X_0/Y_0} = \epsilon^{-1}L_{\mathcal{O}_{X_0}/f_0^{-1}\mathcal{O}_{Y_0}} = L_{\epsilon^{-1}\mathcal{O}_{X_0}/\epsilon^{-1}f_0^{-1}\mathcal{O}_{Y_0}} \longrightarrow L_{\mathcal{O}_X/f_{small}^{-1}\mathcal{O}_Y} = L_{X/Y}$$

by the functoriality discussed in Section 70.17 and Lemma 70.17.3. To see that the induced map $\epsilon^*L_{X_0/Y_0} \rightarrow L_{X/Y}$ is an isomorphism we may check on stalks at geometric points (Properties of Spaces, Theorem 48.16.12). We will use Lemma 70.17.9 to compute the stalks. Let $\bar{x} : \text{Spec}(k) \rightarrow X_0$ be a geometric point lying over $x \in X_0$, with $\bar{y} = f \circ \bar{x}$ lying over $y \in Y_0$. Then

$$L_{X/Y,\bar{x}} = L_{\mathcal{O}_{X,\bar{x}}/\mathcal{O}_{Y,\bar{y}}}$$

and

$$(\epsilon^*L_{X_0/Y_0})_{\bar{x}} = L_{X_0/Y_0,x} \otimes_{\mathcal{O}_{X_0,x}} \mathcal{O}_{X,\bar{x}} = L_{\mathcal{O}_{X_0,x}/\mathcal{O}_{Y_0,y}} \otimes_{\mathcal{O}_{X_0,x}} \mathcal{O}_{X,\bar{x}}$$

Some details omitted (hint: use that the stalk of a pullback is the stalk at the image point, see Sites, Lemma 7.33.1, as well as the corresponding result for modules, see

Modules on Sites, Lemma 18.35.4). Observe that $\mathcal{O}_{X,\bar{x}}$ is the strict henselization of $\mathcal{O}_{X_0,x}$ and similarly for $\mathcal{O}_{Y,\bar{y}}$ (Properties of Spaces, Lemma 48.19.1). Thus the result follows from Lemma 70.8.7. \square

Lemma 70.25.4. *Let Λ be a ring. Let X be an algebraic space over Λ . Then*

$$L_{X/\mathrm{Spec}(\Lambda)} = L_{\mathcal{O}_X/\underline{\Lambda}}$$

where $\underline{\Lambda}$ is the constant sheaf with value Λ on $X_{\acute{e}tale}$.

Proof. Let $p : X \rightarrow \mathrm{Spec}(\Lambda)$ be the structure morphism. Let $q : \mathrm{Spec}(\Lambda)_{\acute{e}tale} \rightarrow (*, \Lambda)$ be the obvious morphism. By the distinguished triangle of Lemma 70.21.3 it suffices to show that $L_q = 0$. To see this it suffices to show (Properties of Spaces, Theorem 48.16.12) for a geometric point $\bar{t} : \mathrm{Spec}(k) \rightarrow \mathrm{Spec}(\Lambda)$ that

$$(L_q)_{\bar{t}} = L_{\mathcal{O}_{\mathrm{Spec}(\Lambda)_{\acute{e}tale},\bar{t}}/\Lambda}$$

(Lemma 70.17.9) is zero. Since $\mathcal{O}_{\mathrm{Spec}(\Lambda)_{\acute{e}tale},\bar{t}}$ is a strict henselization of a local ring of Λ (Properties of Spaces, Lemma 48.19.1) this follows from Lemma 70.8.4. \square

70.26. The cotangent complex of an algebraic space over a ring

Let Λ be a ring and let X be an algebraic space over Λ . Write $L_{X/\mathrm{Spec}(\Lambda)} = L_{X/\Lambda}$ which is justified by Lemma 70.25.4. In this section we give a description of $L_{X/\Lambda}$ similar to Lemma 70.4.3. Namely, we construct a category $\mathcal{C}_{X/\Lambda}$ fibred over $X_{\acute{e}tale}$ and endow it with a sheaf of (polynomial) Λ -algebras \mathcal{O} such that

$$L_{X/\Lambda} = L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \mathcal{O}_X).$$

We will later use the category $\mathcal{C}_{X/\Lambda}$ to construct a naive obstruction theory for the stack of coherent sheaves.

Let Λ be a ring. Let X be an algebraic space over Λ . Let $\mathcal{C}_{X/\Lambda}$ be the category whose objects are commutative diagrams

$$(70.26.0.1) \quad \begin{array}{ccc} X & \longleftarrow & U \\ \downarrow & & \downarrow \\ \mathrm{Spec}(\Lambda) & \longleftarrow & \mathbf{A} \end{array}$$

of schemes where

- (1) U is a scheme,
- (2) $U \rightarrow X$ is étale,
- (3) there exists an isomorphism $\mathbf{A} = \mathrm{Spec}(P)$ where P is a polynomial algebra over Λ (on some set of variables).

In other words, \mathbf{A} is an (infinite dimensional) affine space over $\mathrm{Spec}(\Lambda)$. Morphisms are given by commutative diagrams. Recall that $X_{\acute{e}tale}$ denotes the small étale site of X whose objects are schemes étale over X . There is a forgetful functor

$$u : \mathcal{C}_{X/\Lambda} \rightarrow X_{\acute{e}tale}, \quad (U \rightarrow \mathbf{A}) \mapsto U$$

Observe that the fibre category over U is canonically equivalent to the category $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ introduced in Section 70.4.

Lemma 70.26.1. *In the situation above the category $\mathcal{C}_{X/\Lambda}$ is fibred over $X_{\acute{e}tale}$.*

Proof. Given an object $U \rightarrow \mathbf{A}$ of $\mathcal{C}_{X/\Lambda}$ and a morphism $U' \rightarrow U$ of $X_{\acute{e}tale}$ consider the object $U' \rightarrow \mathbf{A}$ of $\mathcal{C}_{X/\Lambda}$ where $U' \rightarrow \mathbf{A}$ is the composition of $U \rightarrow \mathbf{A}$ and $U' \rightarrow U$. The morphism $(U' \rightarrow \mathbf{A}) \rightarrow (U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X/\Lambda}$ is strongly cartesian over $X_{\acute{e}tale}$. \square

We endow $\mathcal{C}_{X/\Lambda}$ with the topology inherited from $X_{\acute{e}tale}$ (see Stacks, Section 8.10). The functor u defines a morphism of topoi $\pi : Sh(\mathcal{C}_{X/\Lambda}) \rightarrow Sh(X_{\acute{e}tale})$. The site $\mathcal{C}_{X/\Lambda}$ comes with several sheaves of rings.

- (1) The sheaf \mathcal{O} given by the rule $(U \rightarrow \mathbf{A}) \mapsto \Gamma(\mathbf{A}, \mathcal{O}_{\mathbf{A}})$.
- (2) The sheaf $\underline{\mathcal{O}}_X = \pi^{-1}\mathcal{O}_X$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{O}_X(U)$.
- (3) The constant sheaf $\underline{\Lambda}$.

We obtain morphisms of ringed topoi

$$(70.26.1.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}_{X/\Lambda}), \underline{\mathcal{O}}_X) & \xrightarrow{i} & (Sh(\mathcal{C}_{X/\Lambda}), \mathcal{O}) \\ \pi \downarrow & & \\ (Sh(X_{\acute{e}tale}), \mathcal{O}_X) & & \end{array}$$

The morphism i is the identity on underlying topoi and $i^\# : \mathcal{O} \rightarrow \underline{\mathcal{O}}_X$ is the obvious map. The map π is a special case of Cohomology on Sites, Situation 21.28.1. An important role will be played in the following by the derived functors $Li^* : D(\mathcal{O}) \rightarrow D(\underline{\mathcal{O}}_X)$ left adjoint to $Ri_* = i_* : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O})$ and $L\pi_! : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O}_X)$ left adjoint to $\pi^* = \pi^{-1} : D(\mathcal{O}_X) \rightarrow D(\underline{\mathcal{O}}_X)$. We can compute $L\pi_!$ thanks to our earlier work.

Remark 70.26.2. In the situation above, for every object $U \rightarrow X$ of $X_{\acute{e}tale}$ let $P_{\bullet,U}$ be the standard resolution of $\mathcal{O}_X(U)$ over Λ . Set $\mathbf{A}_{n,U} = \text{Spec}(P_{n,U})$. Then $\mathbf{A}_{\bullet,U}$ is a cosimplicial object of the fibre category $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ of $\mathcal{C}_{X/\Lambda}$ over U . Moreover, as discussed in Remark 70.5.5 we have that $\mathbf{A}_{\bullet,U}$ is a cosimplicial object of $\mathcal{C}_{\mathcal{O}_X(U)/\Lambda}$ as in Cohomology on Sites, Lemma 21.29.7. Since the construction $U \mapsto \mathbf{A}_{\bullet,U}$ is functorial in U , given any (abelian) sheaf \mathcal{F} on $\mathcal{C}_{X/\Lambda}$ we obtain a complex of presheaves

$$U \mapsto \mathcal{F}(\mathbf{A}_{\bullet,U})$$

whose cohomology groups compute the homology of \mathcal{F} on the fibre category. We conclude by Cohomology on Sites, Lemma 21.30.2 that the sheafification computes $L_n\pi_!(\mathcal{F})$. In other words, the complex of sheaves whose term in degree $-n$ is the sheafification of $U \mapsto \mathcal{F}(\mathbf{A}_{n,U})$ computes $L\pi_!(\mathcal{F})$.

With this remark out of the way we can state the main result of this section.

Lemma 70.26.3. *In the situation above there is a canonical isomorphism*

$$L_{X/\Lambda} = L\pi_!(Li^*\Omega_{\mathcal{O}/\underline{\Lambda}}) = L\pi_!(i^*\Omega_{\mathcal{O}/\underline{\Lambda}}) = L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)$$

in $D(\mathcal{O}_X)$.

Proof. We first observe that for any object $(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X/\Lambda}$ the value of the sheaf \mathcal{O} is a polynomial algebra over Λ . Hence $\Omega_{\mathcal{O}/\underline{\Lambda}}$ is a flat \mathcal{O} -module and we conclude the second and third equalities of the statement of the lemma hold.

By Remark 70.26.2 the object $L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)$ is computed as the sheafification of the complex of presheaves

$$U \mapsto (\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_X)(\mathbf{A}_{\bullet,U}) = \Omega_{P_{\bullet,U}/\Lambda} \otimes_{P_{\bullet,U}} \mathcal{O}_X(U) = L_{\mathcal{O}_X(U)/\Lambda}$$

using notation as in Remark 70.26.2. Now Remark 70.17.5 shows that $L\pi_!(\Omega_{\mathcal{O}/\underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{Q}}_X)$ computes the cotangent complex of the map of rings $\underline{\Lambda} \rightarrow \mathcal{O}_X$ on $X_{\text{étale}}$. This is what we want by Lemma 70.25.4. \square

70.27. Fibre products of algebraic spaces and the cotangent complex

Let S be a scheme. Let $X \rightarrow B$ and $Y \rightarrow B$ be morphisms of algebraic spaces pver S . Consider the fibre product $X \times_B Y$ with projection morphisms $p : X \times_B Y \rightarrow X$ and $q : X \times_B Y \rightarrow Y$. In this section we discuss $L_{X \times_B Y/B}$. Most of the information we want is contained in the following diagram

$$(70.27.0.1) \quad \begin{array}{ccccc} Lp^*L_{X/B} & \longrightarrow & L_{X \times_B Y/Y} & \longrightarrow & E \\ \parallel & & \uparrow & & \uparrow \\ Lp^*L_{X/B} & \longrightarrow & L_{X \times_B Y/B} & \longrightarrow & L_{X \times_B Y/X} \\ & & \uparrow & & \uparrow \\ & & Lq^*L_{Y/B} & \xlongequal{\quad} & Lq^*L_{Y/B} \end{array}$$

Explanation: The middle row is the fundamental triangle of Lemma 70.21.3 for the morphisms $X \times_B Y \rightarrow X \rightarrow B$. The middle column is the fundamental triangle for the morphisms $X \times_B Y \rightarrow Y \rightarrow B$. Next, E is an object of $D(\mathcal{O}_{X \times_B Y})$ which “fits” into the upper right corner, i.e., which turns both the top row and the right column into distinguished triangles. Such an E exists by Derived Categories, Proposition 13.4.21 applied to the lower left square (with 0 placed in the missing spot). To be more explicit, we could for example define E as the cone (Derived Categories, Definition 13.9.1) of the map of complexes

$$Lp^*L_{X/B} \oplus Lq^*L_{Y/B} \longrightarrow L_{X \times_B Y/B}$$

and get the two maps with target E by an application of TR3. In the Tor independent case the object E is zero.

Lemma 70.27.1. *In the situation above, if X and Y are Tor independent over B , then the object E in (70.27.0.1) is zero. In this case we have*

$$L_{X \times_B Y/B} = Lp^*L_{X/B} \oplus Lq^*L_{Y/B}$$

Proof. Choose a scheme W and a surjective étale morphism $W \rightarrow B$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_B W$. Choose a scheme V and a surjective étale morphism $V \rightarrow Y \times_B W$. Then $U \times_W V \rightarrow X \times_B Y$ is surjective étale too. Hence it suffices to prove that the restriction of E to $U \times_W V$ is zero. By Lemma 70.25.3 and Derived Categories of Spaces, Lemma 57.17.3 this reduces us to the case of schemes. Taking suitable affine opens we reduce to the case of affine schemes. Using Lemma 70.23.2 we reduce to the case of a tensor product of rings, i.e., to Lemma 70.14.1. \square

In general we can say the following about the object E .

Lemma 70.27.2. *Let S be a scheme. Let $X \rightarrow B$ and $Y \rightarrow B$ be morphisms of algebraic spaces over S . The object E in (70.27.0.1) satisfies $H^i(E) = 0$ for $i = 0, -1$ and for a geometric point $(\bar{x}, \bar{y}) : \text{Spec}(k) \rightarrow X \times_B Y$ we have*

$$H^{-2}(E)_{(\bar{x}, \bar{y})} = \text{Tor}_1^R(A, B) \otimes_{A \otimes_R B} C$$

where $R = \mathcal{O}_{B, \bar{b}}$, $A = \mathcal{O}_{X, \bar{x}}$, $B = \mathcal{O}_{Y, \bar{y}}$, and $C = \mathcal{O}_{X \times_B Y, (\bar{x}, \bar{y})}$.

Proof. The formation of the cotangent complex commutes with taking stalks and pullbacks, see Lemmas 70.17.9 and 70.17.3. Note that C is a henselization of $A \otimes_R B$. $L_{C/R} = L_{A \otimes_R B/R} \otimes_{A \otimes_R B} C$ by the results of Section 70.8. Thus the stalk of E at our geometric point is the cone of the map $L_{A/R} \otimes C \rightarrow L_{A \otimes_R B/R} \otimes C$. Therefore the results of the lemma follow from the case of rings, i.e., Lemma 70.14.2. \square

Algebraic Stacks

71.1. Introduction

This is where we define algebraic stacks and make some very elementary observations. The general philosophy will be to have no separation conditions whatsoever and add those conditions necessary to make lemmas, propositions, theorems true/provable. Thus the notions discussed here differ slightly from those in other places in the literature, e.g., [LMB00].

This chapter is not an introduction to algebraic stacks. For an informal discussion of algebraic stacks, please take a look at *Introducing Algebraic Stacks*, Section 81.1.

71.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic spaces. For convenience we repeat them here.

We work in a suitable big fppf site Sch_{fppf} as in *Topologies*, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf} . We discuss what changes if you change the big fppf site in Section 71.18.

We will always work relative to a base S contained in Sch_{fppf} . And we will then work with the big fppf site $(Sch/S)_{fppf}$, see *Topologies*, Definition 33.7.8. The absolute case can be recovered by taking $S = \text{Spec}(\mathbf{Z})$.

If U, T are schemes over S , then we denote $U(T)$ for the set of T -valued points over S . In a formula: $U(T) = \text{Mor}_S(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see *Descent*, Lemma 34.9.3. Hence the topology on Sch_{fppf} is weaker than the canonical topology and all representable presheaves are sheaves.

71.3. Notation

We use the letters S, T, U, V, X, Y to indicate schemes. We use the letters $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ to indicate categories (fibred, fibred in groupoids, stacks, ...) over $(Sch/S)_{fppf}$. We use small case letters f, g for functors such as $f : \mathcal{X} \rightarrow \mathcal{Y}$ over $(Sch/S)_{fppf}$. We use capital F, G, H for algebraic spaces over S , and more generally for presheaves of sets on $(Sch/S)_{fppf}$. (In future chapters we will revert to using also X, Y , etc for algebraic spaces.)

The reason for these choices is that we want to clearly distinguish between the different types of objects in this chapter, to build the foundations.

71.4. Representable categories fibred in groupoids

Let S be a scheme contained in Sch_{fppf} . The basic object of study in this chapter will be a category fibred in groupoids $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$, see Categories, Definition 4.33.1. We will often simply say “let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$ ” to indicate this situation. A 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ of categories in groupoids over $(Sch/S)_{fppf}$ will be a 1-morphism in the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$, see Categories, Definition 4.33.6. It is simply a functor $\mathcal{X} \rightarrow \mathcal{Y}$ over $(Sch/S)_{fppf}$. We recall this is really a $(2, 1)$ -category and that all 2-fibre products exist.

Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Recall that \mathcal{X} is said to be *representable* if there exists a scheme $U \in \text{Ob}((Sch/S)_{fppf})$ and an equivalence

$$j : \mathcal{X} \longrightarrow (Sch/U)_{fppf}$$

of categories over $(Sch/S)_{fppf}$, see Categories, Definition 4.38.1. We will sometimes say that \mathcal{X} is *representable by a scheme* to distinguish from the case where \mathcal{X} is representable by an algebraic space (see below).

If \mathcal{X}, \mathcal{Y} are fibred in groupoids and representable by U, V , then we have

$$(71.4.0.1) \quad \text{Mor}_{\text{Cat}/(Sch/S)_{fppf}}(\mathcal{X}, \mathcal{Y}) / 2\text{-isomorphism} = \text{Mor}_{Sch/S}(U, V)$$

see Categories, Lemma 4.38.3. More precisely, any 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ gives rise to a morphism $U \rightarrow V$. Conversely, given a morphism of schemes $U \rightarrow V$ over S there exists a 1-morphism $\phi : \mathcal{X} \rightarrow \mathcal{Y}$ which gives rise to $U \rightarrow V$ and which is unique up to unique 2-isomorphism.

71.5. The 2-Yoneda lemma

Let $U \in \text{Ob}((Sch/S)_{fppf})$, and let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We will frequently use the 2-Yoneda lemma, see Categories, Lemma 4.39.1. Technically it says that there is an equivalence of categories

$$\text{Mor}_{\text{Cat}/(Sch/S)_{fppf}}((Sch/U)_{fppf}, \mathcal{X}) \longrightarrow \mathcal{X}_U, \quad f \longmapsto f(U/U).$$

It says that 1-morphisms $(Sch/U)_{fppf} \rightarrow \mathcal{X}$ correspond to objects x of the fibre category \mathcal{X}_U . Namely, given a 1-morphism $f : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ we obtain the object $x = f(U/U) \in \text{Ob}(\mathcal{X}_U)$. Conversely, given a choice of pullbacks for \mathcal{X} as in Categories, Definition 4.31.6, and an object x of \mathcal{X}_U , we obtain a functor $(Sch/U)_{fppf} \rightarrow \mathcal{X}$ defined by the rule

$$(\varphi : V \rightarrow U) \longmapsto \varphi^* x$$

on objects. By abuse of notation we use $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ to indicate this functor. It indeed has the property that $x(U/U) = x$ and moreover, given any other functor f with $f(U/U) = x$ there exists a unique 2-isomorphism $x \rightarrow f$. In other words the functor x is well determined by the object x up to unique 2-isomorphism.

We will use this without further mention in the following.

71.6. Representable morphisms of categories fibred in groupoids

Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a *representable 1-morphism*, see Categories, Definition 4.39.5. This means that for every $U \in \text{Ob}((Sch/S)_{fppf})$ and any $y \in \text{Ob}(\mathcal{Y}_U)$ the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable. Choose a representing object V_y and an equivalence

$$(Sch/V_y)_{fppf} \xrightarrow{\sim} (Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}.$$

The projection $(Sch/V_y)_{fppf} \rightarrow (Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{Y} \rightarrow (Sch/U)_{fppf}$ comes from a morphism of schemes $f_y : V_y \rightarrow U$, see Section 71.4. We represent this by the diagram

$$(71.6.0.2) \quad \begin{array}{ccccc} V_y & \xrightarrow{\sim} & (Sch/V_y)_{fppf} & \longrightarrow & \mathcal{X} \\ f_y \downarrow & & \downarrow & & \downarrow f \\ U & \xrightarrow{\sim} & (Sch/U)_{fppf} & \xrightarrow{y} & \mathcal{Y} \end{array}$$

where the squiggly arrows represent the 2-Yoneda embedding. Here are some lemmas about this notion that work in great generality (namely, they work for categories fibred in groupoids over any base category which has fibre products).

Lemma 71.6.1. *Let S, X, Y be objects of Sch_{fppf} . Let $f : X \rightarrow Y$ be a morphism of schemes. Then the 1-morphism induced by f*

$$(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{fppf}$$

is a representable 1-morphism.

Proof. This is formal and relies only on the fact that the category $(Sch/S)_{fppf}$ has fibre products. □

Lemma 71.6.2. *Let S be an object of Sch_{fppf} . Consider a 2-commutative diagram*

$$\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences. Then f is representable if and only if f' is representable.

Proof. Omitted. □

Lemma 71.6.3. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}, g : \mathcal{Y} \rightarrow \mathcal{Z}$ be representable 1-morphisms. Then*

$$g \circ f : \mathcal{X} \longrightarrow \mathcal{Z}$$

is a representable 1-morphism.

Proof. This is entirely formal and works in any category. □

Lemma 71.6.4. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a representable 1-morphism. Let $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*

$$\begin{array}{ccc} \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Z} & \xrightarrow{g} & \mathcal{Y} \end{array}$$

Then the base change f' is a representable 1-morphism.

Proof. This is entirely formal and works in any category. □

Lemma 71.6.5. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \rightarrow \mathcal{Y}_i$, $i = 1, 2$ be representable 1-morphisms. Then*

$$f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \longrightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$$

is a representable 1-morphism.

Proof. Write $f_1 \times f_2$ as the composition $\mathcal{X}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$. The first arrow is the base change of f_1 by the map $\mathcal{Y}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1$, and the second arrow is the base change of f_2 by the map $\mathcal{Y}_1 \times \mathcal{Y}_2 \rightarrow \mathcal{Y}_2$. Hence this lemma is a formal consequence of Lemmas 71.6.3 and 71.6.4. □

71.7. Split categories fibred in groupoids

Let S be a scheme contained in Sch_{fppf} . Recall that given a “presheaf of groupoids”

$$F : (Sch/S)_{fppf}^{opp} \longrightarrow Groupoids$$

we get a category fibred in groupoids \mathcal{S}_F over $(Sch/S)_{fppf}$, see Categories, Example 4.35.1. Any category fibred in groupoids isomorphic (!) to one of these is called a *split category fibred in groupoids*. Any category fibred in groupoids is equivalent to a split one.

If F is a presheaf of sets then \mathcal{S}_F is fibred in sets, see Categories, Definition 4.36.2, and Categories, Example 4.36.5. The rule $F \mapsto \mathcal{S}_F$ is in some sense fully faithful on presheaves, see Categories, Lemma 4.36.6. If F, G are presheaves, then

$$\mathcal{S}_{F \times G} = \mathcal{S}_F \times_{(Sch/S)_{fppf}} \mathcal{S}_G$$

and if $F \rightarrow H$ and $G \rightarrow H$ are maps of presheaves of sets, then

$$\mathcal{S}_{F \times_H G} = \mathcal{S}_F \times_{\mathcal{S}_H} \mathcal{S}_G$$

where the right hand sides are 2-fibre products. This is immediate from the definitions as the fibre categories of $\mathcal{S}_F, \mathcal{S}_G, \mathcal{S}_H$ have only identity morphisms.

An even more special case is where $F = h_X$ is a representable presheaf. In this case we have $\mathcal{S}_{h_X} = (Sch/X)_{fppf}$, see Categories, Example 4.36.7.

We will use the notation \mathcal{S}_F without further mention in the following.

71.8. Categories fibred in groupoids representable by algebraic spaces

A slightly weaker notion than being representable is the notion of being representable by algebraic spaces which we discuss in this section. This discussion might have been avoided had we worked with some category $Spaces_{fppf}$ of algebraic spaces instead of the category Sch_{fppf} . However, it seems to us natural to consider the category of schemes as the natural collection of “test objects” over which the fibre categories of an algebraic stack are defined.

In analogy with Categories, Definitions 4.38.1 we make the following definition.

Definition 71.8.1. Let S be a scheme contained in Sch_{fppf} . A category fibred in groupoids $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ is called *representable by an algebraic space over S* if there exists an algebraic space F over S and an equivalence $j : \mathcal{X} \rightarrow \mathcal{S}_F$ of categories over $(Sch/S)_{fppf}$.

We continue our abuse of notation in suppressing the equivalence j whenever we encounter such a situation. It follows formally from the above that if \mathcal{X} is representable (by a scheme), then it is representable by an algebraic space. Here is the analogue of Categories, Lemma 4.38.2.

Lemma 71.8.2. *Let S be a scheme contained in Sch_{fppf} . Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Then \mathcal{X} is representable by an algebraic space over S if and only if the following conditions are satisfied:*

- (1) \mathcal{X} is fibred in setoids¹, and
- (2) the presheaf $U \mapsto \text{Ob}(\mathcal{X}_U)/\cong$ is an algebraic space.

Proof. Omitted, but see Categories, Lemma 4.38.2. □

If \mathcal{X}, \mathcal{Y} are fibred in groupoids and representable by algebraic spaces F, G over S , then we have

$$(71.8.2.1) \quad \text{Mor}_{\text{Cat}/(Sch/S)_{fppf}}(\mathcal{X}, \mathcal{Y}) / \text{2-isomorphism} = \text{Mor}_{Sch/S}(F, G)$$

see Categories, Lemma 4.37.6. More precisely, any 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ gives rise to a morphism $F \rightarrow G$. Conversely, give a morphism of sheaves $F \rightarrow G$ over S there exists a 1-morphism $\phi : \mathcal{X} \rightarrow \mathcal{Y}$ which gives rise to $F \rightarrow G$ and which is unique up to unique 2-isomorphism.

71.9. Morphisms representable by algebraic spaces

In analogy with Categories, Definition 4.39.5 we make the following definition.

Definition 71.9.1. Let S be a scheme contained in Sch_{fppf} . A 1-morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of categories fibred in groupoids over $(Sch/S)_{fppf}$ is called *representable by algebraic spaces* if for any $U \in \text{Ob}((Sch/S)_{fppf})$ and any $y : (Sch/U)_{fppf} \rightarrow \mathcal{Y}$ the category fibred in groupoids

$$(Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$$

over $(Sch/U)_{fppf}$ is representable by an algebraic space over U .

¹This means that it is fibred in groupoids and objects in the fibre categories have no nontrivial automorphisms, see Categories, Definition 4.36.2.

Choose an algebraic space F_y over U which represents $(Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$. We may think of F_y as an algebraic space over S which comes equipped with a canonical morphism $f_y : F_y \rightarrow U$ over S , see Spaces, Section 47.16. Here is the diagram

$$(71.9.1.1) \quad \begin{array}{ccccc} F_y & \overset{\sim}{\longleftarrow} & (Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X} & \xrightarrow{\text{pr}_1} & \mathcal{X} \\ f_y \downarrow & & \text{pr}_0 \downarrow & & \downarrow f \\ U & \overset{\sim}{\longleftarrow} & (Sch/U)_{fppf} & \xrightarrow{y} & \mathcal{Y} \end{array}$$

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The right square is 2-commutative, and is a 2-fibre product square.

Here is the analogue of Categories, Lemma 4.39.7.

Lemma 71.9.2. *Let S be a scheme contained in Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The following are necessary and sufficient conditions for f to be representable by algebraic spaces:*

- (1) *for each scheme U/S the functor $f_U : \mathcal{X}_U \rightarrow \mathcal{Y}_U$ between fibre categories is faithful, and*
- (2) *for each U and each $y \in \text{Ob}(\mathcal{Y}_U)$ the presheaf*

$$(h : V \rightarrow U) \mapsto \{(x, \phi) \mid x \in \text{Ob}(\mathcal{X}_V), \phi : h^*y \rightarrow f(x)\} / \cong$$
is an algebraic space over U .

Here we have made a choice of pullbacks for \mathcal{Y} .

Proof. This follows from the description of fibre categories of the 2-fibre products $(Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ in Categories, Lemma 4.39.3 combined with Lemma 71.8.2. \square

Here are some lemmas about this notion that work in great generality.

Lemma 71.9.3. *Let S be an object of Sch_{fppf} . Consider a 2-commutative diagram*

$$\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences. Then f is representable by algebraic spaces if and only if f' is representable by algebraic spaces.

Proof. Omitted. \square

Lemma 71.9.4. *Let S be an object of Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over S . If \mathcal{X} and \mathcal{Y} are representable by algebraic spaces over S , then the 1-morphism f is representable by algebraic spaces.*

Proof. Omitted. This relies only on the fact that the category of algebraic spaces over S has fibre products, see Spaces, Lemma 47.7.3. \square

Lemma 71.9.5. *Let S be an object of Sch_{fppf} . Let $a : F \rightarrow G$ be a map of presheaves of sets on $(Sch/S)_{fppf}$. Denote $a' : \mathcal{S}_F \rightarrow \mathcal{S}_G$ the associated map of categories fibred in sets. Then a is representable by algebraic spaces (see Bootstrap, Definition 62.3.1) if and only if a' is representable by algebraic spaces.*

Proof. Omitted. □

Lemma 71.9.6. *Let S be an object of Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in setoids over $(Sch/S)_{fppf}$. Let F , resp. G be the presheaf which to T associates the set of isomorphism classes of objects of \mathcal{X}_T , resp. \mathcal{Y}_T . Let $a : F \rightarrow G$ be the map of presheaves corresponding to f . Then a is representable by algebraic spaces (see Bootstrap, Definition 62.3.1) if and only if f is representable by algebraic spaces.*

Proof. Omitted. Hint: Combine Lemmas 71.9.3 and 71.9.5. □

Lemma 71.9.7. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*

$$\begin{array}{ccc} \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Z} & \xrightarrow{g} & \mathcal{Y} \end{array}$$

Then the base change f' is a 1-morphism representable by algebraic spaces.

Proof. This is formal. □

Lemma 71.9.8. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$, $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms. Assume*

- (1) f is representable by algebraic spaces, and
- (2) \mathcal{Z} is representable by an algebraic space over S .

Then the 2-fibre product $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X}$ is representable by an algebraic space.

Proof. This is a reformulation of Bootstrap, Lemma 62.3.6. First note that $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X}$ is fibred in setoids over $(Sch/S)_{fppf}$. Hence it is equivalent to \mathcal{S}_F for some presheaf F on $(Sch/S)_{fppf}$, see Categories, Lemma 4.37.5. Moreover, let G be an algebraic space which represents \mathcal{Z} . The 1-morphism $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} \rightarrow \mathcal{Z}$ is representable by algebraic spaces by Lemma 71.9.7. And $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} \rightarrow \mathcal{Z}$ corresponds to a morphism $F \rightarrow G$ by Categories, Lemma 4.37.6. Then $F \rightarrow G$ is representable by algebraic spaces by Lemma 71.9.6. Hence Bootstrap, Lemma 62.3.6 implies that F is an algebraic space as desired. □

Let $S, \mathcal{X}, \mathcal{Y}, \mathcal{Z}, f, g$ be as in Lemma 71.9.8. Let F and G be algebraic spaces over S such that F represents $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X}$ and G represents \mathcal{Z} . The 1-morphism $f' : \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} \rightarrow \mathcal{Z}$ corresponds to a morphism $f' : F \rightarrow G$ of algebraic spaces by (71.8.2.1). Thus we have the following diagram

$$(71.9.8.1) \quad \begin{array}{ccccc} F & \overset{\sim}{\leftarrow} & \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} & \longrightarrow & \mathcal{X} \\ f' \downarrow & & \downarrow & & \downarrow f \\ G & \overset{\sim}{\leftarrow} & \mathcal{Z} & \xrightarrow{g} & \mathcal{Y} \end{array}$$

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The middle square is 2-commutative with equivalences as horizontal arrows.

Lemma 71.9.9. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. If $f : \mathcal{X} \rightarrow \mathcal{Y}$, $g : \mathcal{Y} \rightarrow \mathcal{Z}$ are 1-morphisms representable by algebraic spaces, then*

$$g \circ f : \mathcal{X} \longrightarrow \mathcal{Z}$$

is a 1-morphism representable by algebraic spaces.

Proof. This follows from Lemma 71.9.8. Details omitted. \square

Lemma 71.9.10. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \rightarrow \mathcal{Y}_i$, $i = 1, 2$ be 1-morphisms representable by algebraic spaces. Then*

$$f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \longrightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$$

is a 1-morphism representable by algebraic spaces.

Proof. Write $f_1 \times f_2$ as the composition $\mathcal{X}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$. The first arrow is the base change of f_1 by the map $\mathcal{Y}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1$, and the second arrow is the base change of f_2 by the map $\mathcal{Y}_1 \times \mathcal{Y}_2 \rightarrow \mathcal{Y}_2$. Hence this lemma is a formal consequence of Lemmas 71.9.9 and 71.9.7. \square

71.10. Properties of morphisms representable by algebraic spaces

Here is the definition that makes this work.

Definition 71.10.1. Let S be a scheme contained in Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume f is representable by algebraic spaces. Let \mathcal{P} be a property of morphisms of algebraic spaces which

- (1) is preserved under any base change, and
- (2) is fppf local on the base, see Descent on Spaces, Definition 56.9.1.

In this case we say that f has *property \mathcal{P}* if for every $U \in \text{Ob}((Sch/S)_{fppf})$ and any $y \in \mathcal{Y}_U$ the resulting morphism of algebraic spaces $f_y : F_y \rightarrow U$, see diagram (71.9.1.1), has property \mathcal{P} .

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the target. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

Lemma 71.10.2. *Let S be an object of Sch_{fppf} . Let \mathcal{P} be as in Definition 71.10.1. Consider a 2-commutative diagram*

$$\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences and f (or equivalently f') is representable by algebraic spaces. Then f has \mathcal{P} if and only if f' has \mathcal{P} .

Proof. Note that this makes sense by Lemma 71.9.3. Proof omitted. \square

Here is a sanity check.

Lemma 71.10.3. *Let S be a scheme contained in Sch_{fppf} . Let $a : F \rightarrow G$ be a map of presheaves on $(Sch/S)_{fppf}$. Let \mathcal{P} be as in Definition 71.10.1. Assume a is representable by algebraic spaces. Then $a : F \rightarrow G$ has property \mathcal{P} (see Bootstrap, Definition 62.4.1) if and only if the corresponding morphism $\mathcal{S}_F \rightarrow \mathcal{S}_G$ of categories fibred in groupoids has property \mathcal{P} .*

Proof. Note that the lemma makes sense by Lemma 71.9.5. Proof omitted. \square

Lemma 71.10.4. *Let S be an object of Sch_{fppf} . Let \mathcal{P} be as in Definition 71.10.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in setoids over $(Sch/S)_{fppf}$. Let F , resp. G be the presheaf which to T associates the set of isomorphism classes of objects of \mathcal{X}_T , resp. \mathcal{Y}_T . Let $a : F \rightarrow G$ be the map of presheaves corresponding to f . Then a has \mathcal{P} if and only if f has \mathcal{P} .*

Proof. The lemma makes sense by Lemma 71.9.6. The lemma follows on combining Lemmas 71.10.2 and 71.10.3. \square

Lemma 71.10.5. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{P} be a property as in Definition 71.10.1 which is stable under composition. Let $f : \mathcal{X} \rightarrow \mathcal{Y}, g : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms which are representable by algebraic spaces. If f and g have property \mathcal{P} so does $g \circ f : \mathcal{X} \rightarrow \mathcal{Z}$.*

Proof. Note that the lemma makes sense by Lemma 71.9.9. Proof omitted. \square

Lemma 71.10.6. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{P} be a property as in Definition 71.10.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the 2-fibre product diagram*

$$\begin{array}{ccc} \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Z} & \xrightarrow{g} & \mathcal{Y} \end{array}$$

If f has \mathcal{P} , then the base change f' has \mathcal{P} .

Proof. The lemma makes sense by Lemma 71.9.7. Proof omitted. \square

Lemma 71.10.7. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{P} be a property as in Definition 71.10.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*

$$\begin{array}{ccc} \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Z} & \xrightarrow{g} & \mathcal{Y} \end{array}$$

Assume that for every scheme U and object x of \mathcal{Y}_U , there exists an fppf covering $\{U_i \rightarrow U\}$ such that $x|_{U_i}$ is in the essential image of the functor $g : \mathcal{Z}_{U_i} \rightarrow \mathcal{Y}_{U_i}$. In this case, if f' has \mathcal{P} , then f has \mathcal{P} .

Proof. Proof omitted. Hint: Compare with the proof of Spaces, Lemma 47.5.6. \square

Lemma 71.10.8. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{P} be a property as in Definition 71.10.1 which is stable under composition. Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \rightarrow \mathcal{Y}_i$, $i = 1, 2$ be 1-morphisms representable by algebraic spaces. If f_1 and f_2 have property \mathcal{P} so does $f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$.*

Proof. The lemma makes sense by Lemma 71.9.10. Proof omitted. \square

Lemma 71.10.9. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $\mathcal{P}, \mathcal{P}'$ be properties as in Definition 71.10.1. Suppose that for any morphism of algebraic spaces $a : F \rightarrow G$ we have $\mathcal{P}(a) \Rightarrow \mathcal{P}'(a)$. If f has property \mathcal{P} then f has property \mathcal{P}' .*

Proof. Formal. \square

Lemma 71.10.10. *Let S be a scheme contained in Sch_{fppf} . Let $j : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume j is representable by algebraic spaces and a monomorphism (see Definition 71.10.1 and Descent on Spaces, Lemma 56.10.28). Then j is fully faithful on fibre categories.*

Proof. We have seen in Lemma 71.9.2 that j is faithful on fibre categories. Consider a scheme U , two objects u, v of \mathcal{X}_U , and an isomorphism $t : j(u) \rightarrow j(v)$ in \mathcal{Y}_U . We have to construct an isomorphism in \mathcal{X}_U between u and v . By the 2-Yoneda lemma (see Section 71.5) we think of u, v as 1-morphisms $u, v : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ and we consider the 2-fibre product

$$(Sch/U)_{fppf} \times_{j \circ v, \mathcal{Y}} \mathcal{X}.$$

By assumption this is representable by an algebraic space $F_{j \circ v}$, over U and the morphism $F_{j \circ v} \rightarrow U$ is a monomorphism. But since $(1_U, v, 1_{j(v)})$ gives a 1-morphism of $(Sch/U)_{fppf}$ into the displayed 2-fibre product, we see that $F_{j \circ v} = U$ (here we use that if $V \rightarrow U$ is a monomorphism of algebraic spaces which has a section, then $V = U$). Therefore the 1-morphism projecting to the first coordinate

$$(Sch/U)_{fppf} \times_{j \circ v, \mathcal{Y}} \mathcal{X} \rightarrow (Sch/U)_{fppf}$$

is an equivalence of fibre categories. Since $(1_U, u, t)$ and $(1_U, v, 1_{j(v)})$ give two objects in $((Sch/U)_{fppf} \times_{j \circ v, \mathcal{Y}} \mathcal{X})_U$ which have the same first coordinate, there must be a 2-morphism between them in the 2-fibre product. This is by definition a morphism $\tilde{t} : u \rightarrow v$ such that $j(\tilde{t}) = t$. \square

Here is a characterization of those categories fibred in groupoids for which the diagonal is representable by algebraic spaces.

Lemma 71.10.11. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. The following are equivalent:*

- (1) *the diagonal $\mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,*
- (2) *for every scheme U over S , and any $x, y \in \text{Ob}(\mathcal{X}_U)$ the sheaf $\text{Isom}(x, y)$ is representable by an algebraic space over U ,*
- (3) *for every scheme U over S , and any $x \in \text{Ob}(\mathcal{X}_U)$ the associated 1-morphism $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ is representable by algebraic spaces,*
- (4) *for every pair of schemes T_1, T_2 over S , and any $x_i \in \text{Ob}(\mathcal{X}_{T_i})$, $i = 1, 2$ the 2-fibre product $(Sch/T_1)_{fppf} \times_{x_1, \mathcal{X}, x_2} (Sch/T_2)_{fppf}$ is representable by an algebraic space,*

- (5) for every representable category fibred in groupoids \mathcal{U} over $(Sch/S)_{fppf}$ every 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces,
- (6) for every pair $\mathcal{T}_1, \mathcal{T}_2$ of representable categories fibred in groupoids over $(Sch/S)_{fppf}$ and any 1-morphisms $x_i : \mathcal{T}_i \rightarrow \mathcal{X}$, $i = 1, 2$ the 2-fibre product $\mathcal{T}_1 \times_{x_1, \mathcal{X}, x_2} \mathcal{T}_2$ is representable by an algebraic space,
- (7) for every category fibred in groupoids \mathcal{U} over $(Sch/S)_{fppf}$ which is representable by an algebraic space every 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces,
- (8) for every pair $\mathcal{T}_1, \mathcal{T}_2$ of categories fibred in groupoids over $(Sch/S)_{fppf}$ which are representable by algebraic spaces, and any 1-morphisms $x_i : \mathcal{T}_i \rightarrow \mathcal{X}$ the 2-fibre product $\mathcal{T}_1 \times_{x_1, \mathcal{X}, x_2} \mathcal{T}_2$ is representable by an algebraic space.

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.2.5 and the definitions. Let us prove the equivalence of (1) and (3). Write $\mathcal{C} = (Sch/S)_{fppf}$ for the base category. We will use some of the observations of the proof of the similar Categories, Lemma 4.39.8. We will use the symbol \cong to mean “equivalence of categories fibred in groupoids over $\mathcal{C} = (Sch/S)_{fppf}$ ”. Assume (1). Suppose given U and x as in (3). For any scheme V and $y \in \text{Ob}(\mathcal{X}_V)$ we see (compare reference above) that

$$\mathcal{C}/U \times_{x, \mathcal{X}, y} \mathcal{C}/V \cong (\mathcal{C}/U \times_S V) \times_{(x, y), \mathcal{X} \times \mathcal{X}, \Delta} \mathcal{X}$$

which is representable by an algebraic space by assumption. Conversely, assume (3). Consider any scheme U over S and a pair (x, x') of objects of \mathcal{X} over U . We have to show that $\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, (x, x')} U$ is representable by an algebraic space. This is clear because (compare reference above)

$$\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, (x, x')} \mathcal{C}/U \cong (\mathcal{C}/U \times_{x, \mathcal{X}, x'} \mathcal{C}/U) \times_{\mathcal{C}/U \times_S U, \Delta} \mathcal{C}/U$$

and the right hand side is representable by an algebraic space by assumption and the fact that the category of algebraic spaces over S has fibre products and contains U and S .

The equivalences (3) \Leftrightarrow (4), (5) \Leftrightarrow (6), and (7) \Leftrightarrow (8) are formal. The equivalences (3) \Leftrightarrow (5) and (4) \Leftrightarrow (6) follow from Lemma 71.9.3. Assume (3), and let $\mathcal{U} \rightarrow \mathcal{X}$ be as in (7). To prove (7) we have to show that for every scheme V and 1-morphism $y : (Sch/V)_{fppf} \rightarrow \mathcal{X}$ the 2-fibre product $(Sch/V)_{fppf} \times_{y, \mathcal{X}} \mathcal{U}$ is representable by an algebraic space. Property (3) tells us that y is representable by algebraic spaces hence Lemma 71.9.8 implies what we want. Finally, (7) directly implies (3). \square

In the situation of the lemma, for any 1-morphism $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ as in the lemma, it makes sense to say that x has property \mathcal{P} , for any property as in Definition 71.10.1. In particular this holds for $\mathcal{P} =$ “surjective”, $\mathcal{P} =$ “smooth”, and $\mathcal{P} =$ “étale”, see Descent on Spaces, Lemmas 56.10.5, 56.10.24, and 56.10.26. We will use these three cases in the definitions of algebraic stacks below.

71.11. Stacks in groupoids

Let S be a scheme contained in Sch_{fppf} . Recall that a category $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ over $(Sch/S)_{fppf}$ is said to be a *stack in groupoids* (see Stacks, Definition 8.5.1) if and only if

- (1) $p : \mathcal{X} \rightarrow \mathcal{C}$ is fibred in groupoids over $(Sch/S)_{fppf}$,

- (2) for all $U \in \text{Ob}((Sch/S)_{fppf})$, for all $x, y \in \text{Ob}(\mathcal{X}_U)$ the presheaf $Isom(x, y)$ is a sheaf on the site $(Sch/U)_{fppf}$, and
- (3) for all coverings $\mathcal{U} = \{U_i \rightarrow U\}$ in $(Sch/S)_{fppf}$, all descent data (x_i, ϕ_{ij}) for \mathcal{U} are effective.

For examples see Examples of Stacks, Section 72.8 ff.

71.12. Algebraic stacks

Here is the definition of an algebraic stack. We remark that condition (2) implies we can make sense out of the condition in part (3) that $(Sch/U)_{fppf} \rightarrow \mathcal{X}$ is smooth and surjective, see discussion following Lemma 71.10.11.

Definition 71.12.1. Let S be a base scheme contained in Sch_{fppf} . An *algebraic stack over S* is a category

$$p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$$

over $(Sch/S)_{fppf}$ with the following properties:

- (1) The category \mathcal{X} is a stack in groupoids over $(Sch/S)_{fppf}$.
- (2) The diagonal $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces.
- (3) There exists a scheme $U \in \text{Ob}((Sch/S)_{fppf})$ and a 1-morphism $(Sch/U)_{fppf} \rightarrow \mathcal{X}$ which is surjective and smooth².

There are some differences with other definitions found in the literature.

The first is that we require \mathcal{X} to be a stack in groupoids in the fppf topology, whereas in many references the étale topology is used. It somehow seems to us that the fppf topology is the natural topology to work with. In the end the resulting 2-category of algebraic stacks ends up being the same. This is explained in Criteria for Representability, Section 74.19.

The second is that we only require the diagonal map of \mathcal{X} to be representable by algebraic spaces, whereas in most references some other conditions are imposed. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of \mathcal{X} be representable by algebraic spaces, and simply add an additional hypothesis wherever this is necessary. It has the added benefit that any algebraic space (as defined in Spaces, Definition 47.6.1) gives rise to an algebraic stack.

The third is that in some papers it is required that there exists a scheme U and a surjective and étale morphism $U \rightarrow \mathcal{X}$. In the groundbreaking paper [DM69] where algebraic stacks were first introduced Deligne and Mumford used this definition and showed that the moduli stack of stable genus $g > 1$ curves is an algebraic stack which has an étale covering by a scheme. Michael Artin, see [Art74], realized that many natural results on algebraic stacks generalize to the case where one only assume a smooth covering by a scheme. Hence our choice above. To distinguish the two cases one sees the terms “Deligne-Mumford stack” and “Artin stack” used in the literature. We will reserve the term “Artin stack” for later use (insert future reference here), and continue to use “algebraic stack”, but we will use “Deligne-Mumford stack” to indicate those algebraic stacks which have an étale covering by a scheme.

²In future chapters we will denote this simply $U \rightarrow \mathcal{X}$ as is customary in the literature. Another good alternative would be to formulate this condition as the existence of a representable category fibred in groupoids \mathcal{U} and a surjective smooth 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$.

Definition 71.12.2. Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be an algebraic stack over S . We say \mathcal{X} is a *Deligne-Mumford stack* if there exists a scheme U and a surjective étale morphism $(Sch/U)_{fppf} \rightarrow \mathcal{X}$.

We will compare our notion of a Deligne-Mumford stack with the notion as defined in the paper by Deligne and Mumford later (see insert future reference here).

The category of algebraic stacks over S forms a 2-category. Here is the precise definition.

Definition 71.12.3. Let S be a scheme contained in Sch_{fppf} . The 2-category of algebraic stacks over S is the sub 2-category of the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$ (see Categories, Definition 4.33.6) defined as follows:

- (1) Its objects are those categories fibred in groupoids over $(Sch/S)_{fppf}$ which are algebraic stacks over S .
- (2) Its 1-morphisms $f : \mathcal{X} \rightarrow \mathcal{Y}$ are any functors of categories over $(Sch/S)_{fppf}$, as in Categories, Definition 4.30.1.
- (3) Its 2-morphisms are transformations between functors over $(Sch/S)_{fppf}$, as in Categories, Definition 4.30.1.

In other words this 2-category is the full sub 2-category of $Cat/(Sch/S)_{fppf}$ whose objects are algebraic stacks. Note that every 2-morphism is automatically an isomorphism. Hence this is actually a (2, 1)-category and not just a 2-category.

We will see later (insert future reference here) that this 2-category has 2-fibre products.

Similar to the remark above the 2-category of algebraic stacks over S is a full sub 2-category of the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$. It turns out that it is closed under equivalences. Here is the precise statement.

Lemma 71.12.4. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X}, \mathcal{Y} be categories over $(Sch/S)_{fppf}$. Assume \mathcal{X}, \mathcal{Y} are equivalent as categories over $(Sch/S)_{fppf}$. Then \mathcal{X} is an algebraic stack if and only if \mathcal{Y} is an algebraic stack. Similarly, \mathcal{X} is a Deligne-Mumford stack if and only if \mathcal{Y} is a Deligne-Mumford stack.*

Proof. Assume \mathcal{X} is an algebraic stack (resp. a Deligne-Mumford stack). By Stacks, Lemma 8.5.4 this implies that \mathcal{Y} is a stack in groupoids over Sch_{fppf} . Choose an equivalence $f : \mathcal{X} \rightarrow \mathcal{Y}$ over Sch_{fppf} . This gives a 2-commutative diagram

$$\begin{array}{ccc} \mathcal{X} & \xrightarrow{\quad} & \mathcal{Y} \\ \Delta_{\mathcal{X}} \downarrow & \searrow f & \downarrow \Delta_{\mathcal{Y}} \\ \mathcal{X} \times \mathcal{X} & \xrightarrow{f \times f} & \mathcal{Y} \times \mathcal{Y} \end{array}$$

whose horizontal arrows are equivalences. This implies that $\Delta_{\mathcal{Y}}$ is representable by algebraic spaces according to Lemma 71.9.3. Finally, let U be a scheme over S , and let $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ be a 1-morphism which is surjective and smooth (resp. étale). Considering the diagram

$$\begin{array}{ccc} (Sch/U)_{fppf} & \xrightarrow{\text{id}} & (Sch/U)_{fppf} \\ x \downarrow & & \downarrow f \circ x \\ \mathcal{X} & \xrightarrow{\quad f \quad} & \mathcal{Y} \end{array}$$

and applying Lemma 71.10.2 we conclude that $x \circ f$ is surjective and smooth (resp. étale) as desired. \square

71.13. Algebraic stacks and algebraic spaces

In this section we discuss some simple criteria which imply that an algebraic stack is an algebraic space. The main result is that this happens exactly when objects of fibre categories have no nontrivial automorphisms. This is not a triviality! Before we come to this we first do a sanity check.

Lemma 71.13.1. *Let S be a scheme contained in Sch_{fppf} .*

- (1) *A category fibred in groupoids $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ which is representable by an algebraic space is a Deligne-Mumford stack.*
- (2) *If F is an algebraic space over S , then the associated category fibred in groupoids $p : \mathcal{S}_F \rightarrow (Sch/S)_{fppf}$ is a Deligne-Mumford stack.*
- (3) *If $X \in \text{Ob}((Sch/S)_{fppf})$, then $(Sch/X)_{fppf} \rightarrow (Sch/S)_{fppf}$ is a Deligne-Mumford stack.*

Proof. It is clear that (2) implies (3). Parts (1) and (2) are equivalent by Lemma 71.12.4. Hence it suffices to prove (2). First, we note that \mathcal{S}_F is stack in sets since F is a sheaf (Stacks, Lemma 8.6.3). A fortiori it is a stack in groupoids. Second the diagonal morphism $\mathcal{S}_F \rightarrow \mathcal{S}_F \times \mathcal{S}_F$ is the same as the morphism $\mathcal{S}_F \rightarrow \mathcal{S}_{F \times F}$ which comes from the diagonal of F . Hence this is representable by algebraic spaces according to Lemma 71.9.4. Actually it is even representable (by schemes), as the diagonal of an algebraic space is representable, but we do not need this. Let U be a scheme and let $h_U \rightarrow F$ be a surjective étale morphism. We may think of this a surjective étale morphism of algebraic spaces. Hence by Lemma 71.10.3 the corresponding 1-morphism $(Sch/U)_{fppf} \rightarrow \mathcal{S}_F$ is surjective and étale. \square

The following result says that a Deligne-Mumford stack whose inertia is trivial “is” an algebraic space. This lemma will be obsoleted by the stronger Proposition 71.13.3 below which says that this holds more generally for algebraic stacks...

Lemma 71.13.2. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be an algebraic stack over S . The following are equivalent*

- (1) *\mathcal{X} is a Deligne-Mumford stack and is a stack in setoids,*
- (2) *\mathcal{X} is a Deligne-Mumford stack such that the canonical 1-morphism $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is an equivalence, and*
- (3) *\mathcal{X} is representable by an algebraic space.*

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.7.2. The implication (3) \Rightarrow (1) follows from Lemma 71.13.1. Finally, assume (1). By Stacks, Lemma 8.6.3 there exists a sheaf F on $(Sch/S)_{fppf}$ and an equivalence $j : \mathcal{X} \rightarrow \mathcal{S}_F$. By Lemma 71.9.5 the fact that $\Delta_{\mathcal{X}}$ is representable by algebraic spaces, means that $\Delta_F : F \rightarrow F \times F$ is representable by algebraic spaces. Let U be a scheme, and let $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ be a surjective étale morphism. The composition $j \circ x : (Sch/U)_{fppf} \rightarrow \mathcal{S}_F$ corresponds to a morphism $h_U \rightarrow F$ of sheaves. By Bootstrap, Lemma 62.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 71.10.4 we conclude that $h_U \rightarrow F$ is surjective and étale. Finally, we apply Bootstrap, Theorem 62.6.1 to see that F is an algebraic space. \square

Proposition 71.13.3. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be an algebraic stack over S . The following are equivalent*

- (1) \mathcal{X} is a stack in setoids,
- (2) the canonical 1-morphism $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is an equivalence, and
- (3) \mathcal{X} is representable by an algebraic space.

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.7.2. The implication (3) \Rightarrow (1) follows from Lemma 71.13.2. Finally, assume (1). By Stacks, Lemma 8.6.3 there exists an equivalence $j : \mathcal{X} \rightarrow \mathcal{S}_F$ where F is a sheaf on $(Sch/S)_{fppf}$. By Lemma 71.9.5 the fact that $\Delta_{\mathcal{X}}$ is representable by algebraic spaces, means that $\Delta_F : F \rightarrow F \times F$ is representable by algebraic spaces. Let U be a scheme and let $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ be a surjective smooth morphism. The composition $j \circ x : (Sch/U)_{fppf} \rightarrow \mathcal{S}_F$ corresponds to a morphism $h_U \rightarrow F$ of sheaves. By Bootstrap, Lemma 62.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 71.10.4 we conclude that $h_U \rightarrow F$ is surjective and smooth. In particular it is surjective, flat and locally of finite presentation (by Lemma 71.10.9 and the fact that a smooth morphism of algebraic spaces is flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 49.34.5 and 49.34.7). Finally, we apply Bootstrap, Theorem 62.10.1 to see that F is an algebraic space. \square

71.14. 2-Fibre products of algebraic stacks

The 2-category of algebraic stacks has products and 2-fibre products. The first lemma is really a special case of Lemma 71.14.3 but its proof is slightly easier.

Lemma 71.14.1. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X}, \mathcal{Y} be algebraic stacks over S . Then $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is an algebraic stack, and is a product in the 2-category of algebraic stacks over S .*

Proof. An object of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over T is just a pair (x, y) where x is an object of \mathcal{X}_T and y is an object of \mathcal{Y}_T . Hence it is immediate from the definitions that $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is a stack in groupoids. If (x, y) and (x', y') are two objects of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over T , then

$$Isom((x, y), (x', y')) = Isom(x, x') \times Isom(y, y').$$

Hence it follows from the equivalences in Lemma 71.10.11 and the fact that the category of algebraic spaces has products that the diagonal of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is representable by algebraic spaces. Finally, suppose that $U, V \in \text{Ob}((Sch/S)_{fppf})$, and let x, y be surjective smooth morphisms $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$, $y : (Sch/V)_{fppf} \rightarrow \mathcal{Y}$. Note that

$$(Sch/U \times_S V)_{fppf} = (Sch/U)_{fppf} \times_{(Sch/S)_{fppf}} (Sch/V)_{fppf}.$$

The object $(\text{pr}_U^* x, \text{pr}_V^* y)$ of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over $(Sch/U \times_S V)_{fppf}$ thus defines a 1-morphism

$$(Sch/U \times_S V)_{fppf} \longrightarrow \mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$$

which is the composition of base changes of x and y , hence is surjective and smooth, see Lemmas 71.10.6 and 71.10.5. We conclude that $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is indeed an algebraic stack. We omit the verification that it really is a product. \square

Lemma 71.14.2. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{Z} be a stack in groupoids over $(Sch/S)_{fppf}$ whose diagonal is representable by algebraic spaces. Let \mathcal{X}, \mathcal{Y} be algebraic stacks over S . Let $f : \mathcal{X} \rightarrow \mathcal{Z}, g : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of stacks in groupoids. Then the 2-fibre product $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack.*

Proof. We have to check conditions (1), (2), and (3) of Definition 71.12.1. The first condition follows from Stacks, Lemma 8.5.6.

The second condition we have to check is that the *Isom*-sheaves are representable by algebraic spaces. To do this, suppose that T is a scheme over S , and u, v are objects of $(\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y})_T$. By our construction of 2-fibre products (which goes all the way back to Categories, Lemma 4.30.3) we may write $u = (x, y, \alpha)$ and $v = (x', y', \alpha')$. Here $\alpha : f(x) \rightarrow g(y)$ and similarly for α' . Then it is clear that

$$\begin{array}{ccc} Isom(u, v) & \longrightarrow & Isom(y, y') \\ \downarrow & & \downarrow \phi \mapsto g(\phi) \circ \alpha \\ Isom(x, x') & \xrightarrow{\psi \mapsto \alpha' \circ f(\psi)} & Isom(f(x), g(y')) \end{array}$$

is a cartesian diagram of sheaves on $(Sch/T)_{fppf}$. Since by assumption the sheaves $Isom(y, y'), Isom(x, x'), Isom(f(x), g(y'))$ are algebraic spaces (see Lemma 71.10.11) we see that $Isom(u, v)$ is an algebraic space.

Let $U, V \in \text{Ob}((Sch/S)_{fppf})$, and let x, y be surjective smooth morphisms $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}, y : (Sch/V)_{fppf} \rightarrow \mathcal{Y}$. Consider the morphism

$$(Sch/U)_{fppf} \times_{f \circ x, \mathcal{Z}, g \circ y} (Sch/V)_{fppf} \longrightarrow \mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}.$$

As the diagonal of \mathcal{Z} is representable by algebraic spaces the source of this arrow is representable by an algebraic space F , see Lemma 71.10.11. Moreover, the morphism is the composition of base changes of x and y , hence surjective and smooth, see Lemmas 71.10.6 and 71.10.5. Choosing a scheme W and a surjective étale morphism $W \rightarrow F$ we see that the composition of the displayed 1-morphism with the corresponding 1-morphism

$$(Sch/W)_{fppf} \longrightarrow (Sch/U)_{fppf} \times_{f \circ x, \mathcal{Z}, g \circ y} (Sch/V)_{fppf}$$

is surjective and smooth which proves the last condition. \square

Lemma 71.14.3. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be algebraic stacks over S . Let $f : \mathcal{X} \rightarrow \mathcal{Z}, g : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of algebraic stacks. Then the 2-fibre product $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack. It is also the 2-fibre product in the 2-category of algebraic stacks over $(Sch/S)_{fppf}$.*

Proof. The fact that $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack follows from the stronger Lemma 71.14.2. The fact that $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is a 2-fibre product in the 2-category of algebraic stacks over S follows formally from the fact that the 2-category of algebraic stacks over S is a full sub 2-category of the 2-category of stacks in groupoids over $(Sch/S)_{fppf}$. \square

71.15. Algebraic stacks, overhauled

Some basic results on algebraic stacks.

Lemma 71.15.1. *Let S be a scheme contained in Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over S . Let $V \in \text{Ob}((Sch/S)_{fppf})$. Let $y : (Sch/V)_{fppf} \rightarrow \mathcal{Y}$ be surjective and smooth. Then there exists an object $U \in \text{Ob}((Sch/S)_{fppf})$ and a 2-commutative diagram*

$$\begin{array}{ccc} (Sch/U)_{fppf} & \xrightarrow{a} & (Sch/V)_{fppf} \\ x \downarrow & & \downarrow y \\ \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \end{array}$$

with x surjective and smooth.

Proof. First choose $W \in \text{Ob}((Sch/S)_{fppf})$ and a surjective smooth 1-morphism $z : (Sch/W)_{fppf} \rightarrow \mathcal{X}$. As \mathcal{Y} is an algebraic stack we may choose an equivalence

$$j : \mathcal{S}_F \longrightarrow (Sch/W)_{fppf} \times_{f \circ z, \mathcal{Y}, y} (Sch/V)_{fppf}$$

where F is an algebraic space. By Lemma 71.10.6 the morphism $\mathcal{S}_F \rightarrow (Sch/W)_{fppf}$ is surjective and smooth as a base change of y . Hence by Lemma 71.10.5 we see that $\mathcal{S}_F \rightarrow \mathcal{X}$ is surjective and smooth. Choose an object $U \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $U \rightarrow F$. Then applying Lemma 71.10.5 once more we obtain the desired properties. \square

This lemma is a generalization of Proposition 71.13.3.

Lemma 71.15.2. *Let S be a scheme contained in Sch_{fppf} . Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over S . The following are equivalent:*

- (1) *for $U \in \text{Ob}((Sch/S)_{fppf})$ the functor $f : \mathcal{X}_U \rightarrow \mathcal{Y}_U$ is faithful,*
- (2) *the functor f is faithful, and*
- (3) *f is representable by algebraic spaces.*

Proof. Parts (1) and (2) are equivalent by general properties of 1-morphisms of categories fibred in groupoids, see Categories, Lemma 4.33.8. We see that (3) implies (2) by Lemma 71.9.2. Finally, assume (2). Let U be a scheme. Let $y \in \text{Ob}(\mathcal{Y}_U)$. We have to prove that

$$\mathcal{W} = (Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$$

is representable by an algebraic space over U . Since $(Sch/U)_{fppf}$ is an algebraic stack we see from Lemma 71.14.3 that \mathcal{W} is an algebraic stack. On the other hand the explicit description of objects of \mathcal{W} as triples $(V, x, \alpha : y(V) \rightarrow f(x))$ and the fact that f is faithful, shows that the fibre categories of \mathcal{W} are setoids. Hence Proposition 71.13.3 guarantees that \mathcal{W} is representable by an algebraic space. \square

Lemma 71.15.3. *Let S be a scheme contained in Sch_{fppf} . Let $u : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

- (1) *\mathcal{U} is representable by an algebraic space, and*
- (2) *u is representable by algebraic spaces, surjective and smooth,*

then \mathcal{X} is an algebraic stack over S .

Proof. We have to show that $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces, see Definition 71.12.1. Given two schemes T_1, T_2 over S denote $\mathcal{T}_i = (Sch/T_i)_{fppf}$ the associated representable fibre categories. Suppose given 1-morphisms $f_i : \mathcal{T}_i \rightarrow \mathcal{X}$. According to Lemma 71.10.11 it suffices to prove that the 2-fibered product

$\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is representable by an algebraic space. By Stacks, Lemma 8.6.8 this is in any case a stack in setoids. Thus $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ corresponds to some sheaf F on $(Sch/S)_{fppf}$, see Stacks, Lemma 8.6.3. Let \mathcal{U} be the algebraic space which represents \mathcal{U} . By assumption

$$\mathcal{T}'_i = \mathcal{U} \times_{u, \mathcal{X}, f_i} \mathcal{T}_i$$

is representable by an algebraic space \mathcal{T}'_i over S . Hence $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2$ is representable by the algebraic space $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2$. Consider the commutative diagram

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 \rightarrow \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is the “base change” of $\mathcal{U} \rightarrow \mathcal{X}$, more precisely the diagram

$$\begin{array}{ccc}
 \mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 & \longrightarrow & \mathcal{U} \\
 \downarrow & & \downarrow \\
 \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 & \longrightarrow & \mathcal{X}
 \end{array}$$

is a 2-fibre square. Hence $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 \rightarrow F$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 71.9.6, 71.9.7, 71.10.4, and 71.10.6. Therefore F is an algebraic space by Bootstrap, Theorem 62.10.1 and we win. \square

An application of Lemma 71.15.3 is that something which is an algebraic space over an algebraic stack is an algebraic stack. This is the analogue of Bootstrap, Lemma 62.3.6. Actually, it suffices to assume the morphism $\mathcal{X} \rightarrow \mathcal{Y}$ is “algebraic”, as we will see in Criteria for Representability, Lemma 74.8.2.

Lemma 71.15.4. *Let S be a scheme contained in Sch_{fppf} . Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that*

- (1) $\mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces, and
- (2) \mathcal{Y} is an algebraic stack over S .

Then \mathcal{X} is an algebraic stack over S .

Proof. Let $\mathcal{V} \rightarrow \mathcal{Y}$ be a surjective smooth 1-morphism from a representable stack in groupoids to \mathcal{Y} . This exists by Definition 71.12.1. Then the 2-fibre product $\mathcal{U} = \mathcal{V} \times_{\mathcal{Y}} \mathcal{X}$ is representable by an algebraic space by Lemma 71.9.8. The 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 71.9.7 and 71.10.6. By Lemma 71.15.3 we conclude that \mathcal{X} is an algebraic stack. \square

Lemma 71.15.5. *Let S be a scheme contained in Sch_{fppf} . Let $j : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume j is representable by algebraic spaces and a monomorphism³. Then, if \mathcal{Y} is a stack in groupoids (resp. an algebraic stack), so is \mathcal{X} .*

Proof. We prove that \mathcal{X} is a stack. The case of algebraic stacks will then follow from Lemma 71.15.4. It suffices to check effectiveness of descent for \mathcal{X} . Fix a scheme T and an fppf covering $\{f_i : T_i \rightarrow T\}$. Suppose we have objects x_i of the fibre categories \mathcal{X}_{T_i} together with a descent datum. Then since \mathcal{Y} is a stack, there exists an object y in the fibre category \mathcal{Y}_T such that $f_i^*(y) \simeq j(x_i)$ in \mathcal{Y}_{T_i} . By hypothesis, the 2-fibered product

$$\mathcal{X} \times_{j, \mathcal{Y}, y} (Sch/T)_{fppf}$$

is representable by an algebraic space U such that the induced morphism $U \rightarrow T$ is a monomorphism of algebraic spaces. By the universal property of the 2-fibre product and the fact that $f_i^*(y) \simeq j(x_i)$, we have that $f_i : T_i \rightarrow T$ factors through $U \rightarrow T$ for all i . Hence $U \rightarrow T$ is a monomorphism of fppf sheaves, but also surjective as $\{f_i : T_i \rightarrow T\}$ is a covering. We conclude that $U = T$. Thus y comes from some object x of the fibre category \mathcal{X}_T . We have $f_i^*x \simeq x_i$ in the fibre category \mathcal{X}_{T_i} as the functor j is fully faithful on fibre categories, see Lemma 71.10.10. \square

71.16. From an algebraic stack to a presentation

Given an algebraic stack over S we obtain a groupoid in algebraic spaces over S whose associated quotient stack is the algebraic stack.

Recall that if (U, R, s, t, c) is a groupoid in algebraic spaces over S then $[U/R]$ denotes the quotient stack associated to this datum, see Groupoids in Spaces, Definition 60.19.1. In general $[U/R]$ is **not** an algebraic stack. In particular the stack $[U/R]$ occurring in the following lemma is in general not algebraic.

Lemma 71.16.1. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be an algebraic stack over S . Let \mathcal{U} be an algebraic stack over S which is representable by an algebraic space. Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism. Then*

- (1) *the 2-fibre product $\mathcal{R} = \mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U}$ is representable by an algebraic space,*
- (2) *there is a canonical equivalence*

$$\mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U} = \mathcal{R} \times_{pr_1, \mathcal{U}, pr_0} \mathcal{R},$$

- (3) *the projection pr_{02} induces via (2) a 1-morphism*

$$pr_{02} : \mathcal{R} \times_{pr_1, \mathcal{U}, pr_0} \mathcal{R} \longrightarrow \mathcal{R}$$

- (4) *let U, R be the algebraic spaces representing \mathcal{U}, \mathcal{R} and $t, s : R \rightarrow U$ and $c : R \times_{s, U, t} R \rightarrow U$ are the morphisms corresponding to the 1-morphisms $pr_0, pr_1 : \mathcal{R} \rightarrow \mathcal{U}$ and $pr_{02} : \mathcal{R} \times_{pr_1, \mathcal{U}, pr_0} \mathcal{R} \rightarrow \mathcal{R}$ above, then the quintuple (U, R, s, t, c) is a groupoid in algebraic spaces over S ,*
- (5) *the morphism f induces a canonical 1-morphism $f_{can} : [U/R] \rightarrow \mathcal{X}$ of stacks in groupoids over $(Sch/S)_{fppf}$, and*
- (6) *the 1-morphism $f_{can} : [U/R] \rightarrow \mathcal{X}$ is fully faithful.*

³For example an open immersion.

Proof. Proof of (1). By definition $\Delta_{\mathcal{X}}$ is representable by algebraic spaces so Lemma 71.10.11 applies to show that $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces. Hence the result follows from Lemma 71.9.8.

Let T be a scheme over S . By construction of the 2-fibre product (see Categories, Lemma 4.30.3) we see that the objects of the fibre category \mathcal{R}_T are triples (a, b, α) where $a, b \in \text{Ob}(\mathcal{U}_T)$ and $\alpha : f(a) \rightarrow f(b)$ is a morphism in the fibre category \mathcal{X}_T .

Proof of (2). The equivalence comes from repeatedly applying Categories, Lemmas 4.29.8 and 4.29.10. Let us identify $\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \times_{\mathcal{X}} \mathcal{U}$ with $(\mathcal{U} \times_{\mathcal{X}} \mathcal{U}) \times_{\mathcal{X}} \mathcal{U}$. If T is a scheme over S , then on fibre categories over T this equivalence maps the object $((a, b, \alpha), c, \beta)$ on the left hand side to the object $((a, b, \alpha), (b, c, \beta))$ of the right hand side.

Proof of (3). The 1-morphism pr_{02} is constructed in the proof of Categories, Lemma 4.29.9. In terms of the description of objects of the fibre category above we see that $((a, b, \alpha), (b, c, \beta))$ maps to $(a, c, \beta \circ \alpha)$.

Unfortunately, this is *not compatible* with our conventions on groupoids where we always have $j = (t, s) : R \rightarrow U$, and we “think” of a T -valued point r of R as a morphism $r : s(r) \rightarrow t(r)$. However, this does not affect the proof of (4), since the opposite of a groupoid is a groupoid. But in the proof of (5) it is responsible for the inverses in the displayed formula below.

Proof of (4). Recall that the sheaf U is isomorphic to the sheaf $T \mapsto \text{Ob}(\mathcal{U}_T)/\cong$, and similarly for R , see Lemma 71.8.2. It follows from Categories, Lemma 4.37.8 that this description is compatible with 2-fibre products so we get a similar matching of $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R}$ and $R \times_{s, U, t} R$. The morphisms $t, s : R \rightarrow U$ and $c : R \times_{s, U, t} R \rightarrow R$ we get from the general equality (71.8.2.1). Explicitly these maps are the transformations of functors that come from letting $\text{pr}_0, \text{pr}_1, \text{pr}_{02}$ act on isomorphism classes of objects of fibre categories. Hence to show that we obtain a groupoid in algebraic spaces it suffices to show that for every scheme T over S the structure

$$(\text{Ob}(\mathcal{U}_T)/\cong, \text{Ob}(\mathcal{R}_T)/\cong, \text{pr}_1, \text{pr}_0, \text{pr}_{02})$$

is a groupoid which is clear from our description of objects of \mathcal{R}_T above.

Proof of (5). We will eventually apply Groupoids in Spaces, Lemma 60.22.2 to obtain the functor $[U/R] \rightarrow \mathcal{X}$. Consider the 1-morphism $f : \mathcal{U} \rightarrow \mathcal{X}$. We have a 2-arrow $\tau : f \circ \text{pr}_1 \rightarrow f \circ \text{pr}_0$ by definition of \mathcal{R} as the 2-fibre product. Namely, on an object (a, b, α) of \mathcal{R} over T it is the map $\alpha^{-1} : b \rightarrow a$. We claim that

$$\tau \circ \text{id}_{\text{pr}_{02}} = (\tau \star \text{id}_{\text{pr}_0}) \circ (\tau \star \text{id}_{\text{pr}_1}).$$

This identity says that given an object $((a, b, \alpha), (b, c, \beta))$ of $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R}$ over T , then the composition of

$$c \xrightarrow{\beta^{-1}} b \xrightarrow{\alpha^{-1}} a$$

is the same as the arrow $(\beta \circ \alpha)^{-1} : a \rightarrow c$. This is clearly true, hence the claim holds. In this way we see that all the assumption of Groupoids in Spaces, Lemma 60.22.2 are satisfied for the structure $(\mathcal{U}, \mathcal{R}, \text{pr}_0, \text{pr}_1, \text{pr}_{02})$ and the 1-morphism f and the 2-morphism τ . Except, to apply the lemma we need to prove this holds for the structure $(\mathcal{S}_U, \mathcal{S}_R, s, t, c)$ with suitable morphisms.

Now there should be some general abstract nonsense argument which transfer these data between the two, but it seems to be quite long. Instead, we use the following

trick. Pick a quasi-inverse $j^{-1} : \mathcal{S}_U \rightarrow \mathcal{U}$ of the canonical equivalence $j : \mathcal{U} \rightarrow \mathcal{S}_U$ which comes from $U(T) = \text{Ob}(\mathcal{U}_T)/\cong$. This just means that for every scheme T/S and every object $a \in \mathcal{U}_T$ we have picked out a particular element of its isomorphism class, namely $j^{-1}(j(a))$. Using j^{-1} we may therefore see \mathcal{S}_U as a subcategory of \mathcal{U} . Having chosen this subcategory we can consider those objects (a, b, α) of \mathcal{R}_T such that a, b are objects of $(\mathcal{S}_U)_T$, i.e., such that $j^{-1}(j(a)) = a$ and $j^{-1}(j(b)) = b$. Then it is clear that this forms a subcategory of \mathcal{R} which maps isomorphically to \mathcal{S}_R via the canonical equivalence $\mathcal{R} \rightarrow \mathcal{S}_R$. Moreover, this is clearly compatible with forming the 2-fibre product $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R}$. Hence we see that we may simply restrict f to \mathcal{S}_U and restrict τ to a transformation between functors $\mathcal{S}_R \rightarrow \mathcal{X}$. Hence it is clear that the displayed equality of Groupoids in Spaces, Lemma 60.22.2 holds since it holds even as an equality of transformations of functors $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R} \rightarrow \mathcal{X}$ before restricting to the subcategory $\mathcal{S}_{R \times_{s, U, t} R}$.

This proves that Groupoids in Spaces, Lemma 60.22.2 applies and we get our desired morphism of stacks $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$. We briefly spell out how f_{can} is defined in this special case. On an object a of \mathcal{S}_U over T we have $f_{\text{can}}(a) = f(a)$, where we think of $\mathcal{S}_U \subset \mathcal{U}$ by the chosen embedding above. If a, b are objects of \mathcal{S}_U over T , then a morphism $\varphi : a \rightarrow b$ in $[U/R]$ is by definition an object of the form $\varphi = (b, a, \alpha)$ of \mathcal{R} over T . (Note switch.) And the rule in the proof of Groupoids in Spaces, Lemma 60.22.2 is that

$$(71.16.1.1) \quad f_{\text{can}}(\varphi) = \left(f(a) \xrightarrow{\alpha^{-1}} f(b) \right).$$

Proof of (6). Both $[U/R]$ and \mathcal{X} are stacks. Hence given a scheme T/S and objects a, b of $[U/R]$ over T we obtain a transformation of fppf sheaves

$$\text{Isom}(a, b) \longrightarrow \text{Isom}(f_{\text{can}}(a), f_{\text{can}}(b))$$

on $(\text{Sch}/T)_{\text{fppf}}$. We have to show that this is an isomorphism. We may work fppf locally on T , hence we may assume that a, b come from morphisms $a, b : T \rightarrow U$. By the embedding $\mathcal{S}_U \subset \mathcal{U}$ above we may also think of a, b as objects of \mathcal{U} over T . In Groupoids in Spaces, Lemma 60.21.1 we have seen that the left hand sheaf is represented by the algebraic space

$$R \times_{(t, s), U \times_S U, (b, a)} T$$

over T . On the other hand, the right hand side is by Stacks, Lemma 8.2.5 equal to the sheaf associated to the following stack in setoids:

$$\mathcal{X} \times_{\mathcal{X} \times_{\mathcal{X}, (f \circ b, f \circ a)}} T = \mathcal{X} \times_{\mathcal{X} \times_{\mathcal{X}, (f, f)}} (\mathcal{U} \times \mathcal{U}) \times_{\mathcal{U} \times \mathcal{U}, (b, a)} T = \mathcal{R} \times_{(\text{pr}_0, \text{pr}_1), \mathcal{U} \times \mathcal{U}, (b, a)} T$$

which is representable by the fibre product displayed above. At this point we have shown that the two *Isom*-sheaves are isomorphic. Our 1-morphism $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$ induces this isomorphism on *Isom*-sheaves by Equation (71.16.1.1). \square

We can use the previous very abstract lemma to produce presentations.

Lemma 71.16.2. *Let S be a scheme contained in Sch_{fppf} . Let \mathcal{X} be an algebraic stack over S . Let U be an algebraic space over S . Let $f : \mathcal{S}_U \rightarrow \mathcal{X}$ be a surjective smooth morphism. Let (U, R, s, t, c) be the groupoid in algebraic spaces and $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$ be the result of applying Lemma 71.16.1 to U and f . Then*

- (1) *the morphisms s, t are smooth, and*
- (2) *the 1-morphism $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$ is an equivalence.*

Proof. The morphisms s, t are smooth by Lemmas 71.10.2 and 71.10.3. As the 1-morphism f is smooth and surjective it is clear that given any scheme T and any object $a \in \text{Ob}(\mathcal{X}_T)$ there exists a smooth and surjective morphism $T' \rightarrow T$ such that $a|_{T'}$ comes from an object of $[U/R]_{T'}$. Since $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$ is fully faithful, we deduce that $[U/R] \rightarrow \mathcal{X}$ is essentially surjective as descent data on objects are effective on both sides, see Stacks, Lemma 8.4.8. \square

Remark 71.16.3. If the morphism $f : \mathcal{S}_U \rightarrow \mathcal{X}$ of Lemma 71.16.2 is only assumed surjective, flat and locally of finite presentation, then it will still be the case that $f_{\text{can}} : [U/R] \rightarrow \mathcal{X}$ is an equivalence. In this case the morphisms s, t will be flat and locally of finite presentation, but of course not smooth in general.

Lemma 71.16.2 suggests the following definitions.

Definition 71.16.4. Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . We say (U, R, s, t, c) is a *smooth groupoid*⁴ if $s, t : R \rightarrow U$ are smooth morphisms of algebraic spaces.

Definition 71.16.5. Let \mathcal{X} be an algebraic stack over S . A *presentation* of \mathcal{X} is given by a smooth groupoid (U, R, s, t, c) in algebraic spaces over S , and an equivalence $f : [U/R] \rightarrow \mathcal{X}$.

We have seen above that every algebraic stack has a presentation. Our next task is to show that every smooth groupoid in algebraic spaces over S gives rise to an algebraic stack.

71.17. The algebraic stack associated to a smooth groupoid

In this section we start with a smooth groupoid in algebraic spaces and we show that the associated quotient stack is an algebraic stack.

Lemma 71.17.1. *Let S be a scheme contained in Sch_{fppf} . Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . Then the diagonal of $[U/R]$ is representable by algebraic spaces.*

Proof. It suffices to show that the *Isom*-sheaves are algebraic spaces, see Lemma 71.10.11. This follows from Bootstrap, Lemma 62.11.5. \square

Lemma 71.17.2. *Let S be a scheme contained in Sch_{fppf} . Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces over S . Then the morphism $\mathcal{S}_U \rightarrow [U/R]$ is smooth and surjective.*

Proof. Let T be a scheme and let $x : (\text{Sch}/T)_{\text{fppf}} \rightarrow [U/R]$ be a 1-morphism. We have to show that the projection

$$\mathcal{S}_U \times_{[U/R]} (\text{Sch}/T)_{\text{fppf}} \longrightarrow (\text{Sch}/T)_{\text{fppf}}$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space F , see Lemmas 71.17.1 and 71.10.11. Hence we have to show the corresponding morphism $F \rightarrow T$ of algebraic spaces is surjective and smooth. Since we are working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on T . By construction, there exists an fppf covering $\{T_i \rightarrow T\}$ of T such that $x|_{(\text{Sch}/T_i)_{\text{fppf}}}$

⁴This terminology might be a bit confusing: it does not imply that $[U/R]$ is smooth over anything.

comes from a morphism $x_i : T_i \rightarrow U$. (Note that $F \times_T T_i$ represents the 2-fibre product $\mathcal{S}_U \times_{[U/R]} (\text{Sch}/T_i)_{fppf}$ so everything is compatible with the base change via $T_i \rightarrow T$.) Hence we may assume that x comes from $x : T \rightarrow U$. In this case we see that

$$\mathcal{S}_U \times_{[U/R]} (\text{Sch}/T)_{fppf} = (\mathcal{S}_U \times_{[U/R]} \mathcal{S}_U) \times_{\mathcal{S}_U} (\text{Sch}/T)_{fppf} = \mathcal{S}_R \times_{\mathcal{S}_U} (\text{Sch}/T)_{fppf}$$

The first equality by Categories, Lemma 4.29.10 and the second equality by Groupoids in Spaces, Lemma 60.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F = R \times_{s,U,x} T$ and the projection $R \times_{s,U,x} T \rightarrow T$ is smooth as the base change of the smooth morphism of algebraic spaces $s : R \rightarrow U$. It is also surjective as s has a section (namely the identity $e : U \rightarrow R$ of the groupoid). This proves the lemma. \square

Here is the main result of this section.

Theorem 71.17.3. *Let S be a scheme contained in Sch_{fppf} . Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces over S . Then the quotient stack $[U/R]$ is an algebraic stack over S .*

Proof. We check the three conditions of Definition 71.12.1. By construction we have that $[U/R]$ is a stack in groupoids which is the first condition.

The second condition follows from the stronger Lemma 71.17.1.

Finally, we have to show there exists a scheme W over S and a surjective smooth 1-morphism $(\text{Sch}/W)_{fppf} \rightarrow \mathcal{X}$. First choose $W \in \text{Ob}((\text{Sch}/S)_{fppf})$ and a surjective étale morphism $W \rightarrow U$. Note that this gives a surjective étale morphism $\mathcal{S}_W \rightarrow \mathcal{S}_U$ of categories fibred in sets, see Lemma 71.10.3. Of course then $\mathcal{S}_W \rightarrow \mathcal{S}_U$ is also surjective and smooth, see Lemma 71.10.9. Hence $\mathcal{S}_W \rightarrow \mathcal{S}_U \rightarrow [U/R]$ is surjective and smooth by a combination of Lemmas 71.17.2 and 71.10.5. \square

71.18. Change of big site

In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. We encourage the reader to skip this section.

Pullbacks of stacks is defined in Stacks, Section 8.12.

Lemma 71.18.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf} . Assume that Sch_{fppf} is contained in Sch'_{fppf} , see Topologies, Section 33.10. Let S be an object of Sch_{fppf} . Let $f : (\text{Sch}'/S)_{fppf} \rightarrow (\text{Sch}/S)_{fppf}$ the morphism of sites corresponding to the inclusion functor $u : (\text{Sch}/S)_{fppf} \rightarrow (\text{Sch}'/S)_{fppf}$. Let \mathcal{X} be a stack in groupoids over $(\text{Sch}/S)_{fppf}$.*

- (1) *if \mathcal{X} is representable by some $X \in \text{Ob}((\text{Sch}/S)_{fppf})$, then $f^{-1}\mathcal{X}$ is representable too, in fact it is representable by the same scheme X , now viewed as an object of $(\text{Sch}'/S)_{fppf}$,*
- (2) *if \mathcal{X} is representable by $F \in \text{Sh}((\text{Sch}/S)_{fppf})$ which is an algebraic space, then $f^{-1}\mathcal{X}$ is representable by the algebraic space $f^{-1}F$,*
- (3) *if \mathcal{X} is an algebraic stack, then $f^{-1}\mathcal{X}$ is an algebraic stack, and*
- (4) *if \mathcal{X} is a Deligne-Mumford stack, then $f^{-1}\mathcal{X}$ is a Deligne-Mumford stack too.*

Proof. Let us prove (3). By Lemma 71.16.2 we may write $\mathcal{X} = [U/R]$ for some smooth groupoid in algebraic spaces (U, R, s, t, c) . By Groupoids in Spaces, Lemma 60.27.1 we see that $f^{-1}[U/R] = [f^{-1}U/f^{-1}R]$. Of course $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a smooth groupoid in algebraic spaces too. Hence (3) is proved.

Now the other cases (1), (2), (4) each mean that \mathcal{X} has a presentation $[U/R]$ of a particular kind, and hence translate into the same kind of presentation for $f^{-1}\mathcal{X} = [f^{-1}U/f^{-1}R]$. Whence the lemma is proved. \square

It is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.

Lemma 71.18.2. *Suppose Sch_{fppf} is contained in Sch'_{fppf} . Let S be an object of Sch_{fppf} . Denote $Algebraic-Stacks/S$ the 2-category of algebraic spaces over S defined using Sch_{fppf} . Similarly, denote $Algebraic-Stacks'/S$ the 2-category of algebraic spaces over S defined using Sch'_{fppf} . The rule $\mathcal{X} \mapsto f^{-1}\mathcal{X}$ of Lemma 71.18.1 defines a functor of 2-categories*

$$Algebraic-Stacks/S \longrightarrow Algebraic-Stacks'/S$$

which defines equivalences of morphism categories

$$\text{Mor}_{Algebraic-Stacks/S}(\mathcal{X}, \mathcal{Y}) \longrightarrow \text{Mor}_{Algebraic-Stacks'/S}(f^{-1}\mathcal{X}, f^{-1}\mathcal{Y})$$

for every objects \mathcal{X}, \mathcal{Y} of $Algebraic-Stacks/S$. An object \mathcal{X}' of $Algebraic-Stacks'/S$ is equivalence to $f^{-1}\mathcal{X}$ for some \mathcal{X} in $Algebraic-Stacks/S$ if and only if it has a presentation $\mathcal{X}' = [U'/R']$ with U', R' isomorphic to $f^{-1}U, f^{-1}R$ for some $U, R \in Spaces/S$.

Proof. The statement on morphism categories is a consequence of the more general Stacks, Lemma 8.12.12. The characterization of the “essential image” follows from the description of f^{-1} in the proof of Lemma 71.18.1. \square

71.19. Change of base scheme

In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \rightarrow S'$ of base schemes, any algebraic stack over S can be viewed as an algebraic stack over S' .

Lemma 71.19.1. *Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. The constructions A and B of Stacks, Section 8.13 above give isomorphisms of 2-categories*

$$\left\{ \begin{array}{l} \text{2-category of algebraic} \\ \text{stacks } \mathcal{X} \text{ over } S \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{2-category of pairs } (\mathcal{X}', f) \text{ consisting of an} \\ \text{algebraic stack } \mathcal{X}' \text{ over } S' \text{ and a morphism} \\ f : \mathcal{X}' \rightarrow (Sch/S)_{fppf} \text{ of algebraic stacks over } S' \end{array} \right\}$$

Proof. The statement makes sense as the functor $j : (Sch/S)_{fppf} \rightarrow (Sch/S')_{fppf}$ is the localization functor associated to the object S/S' of $(Sch/S')_{fppf}$. By Stacks, Lemma 8.13.2 the only thing to show is that the constructions A and B preserve the subcategories of algebraic stacks. For example, if $\mathcal{X} = [U/R]$ then construction A applied to \mathcal{X} just produces $\mathcal{X}' = \mathcal{X}$. Conversely, if $\mathcal{X}' = [U'/R']$ the morphism p induces morphisms of algebraic spaces $U' \rightarrow S$ and $R' \rightarrow S$, and then $\mathcal{X} = [U'/R']$ but now viewed as a stack over S . Hence the lemma is clear. \square

Definition 71.19.2. Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. If $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ is an algebraic stack over S , then \mathcal{X} viewed as an algebraic stack over S' is the algebraic stack

$$\mathcal{X} \longrightarrow (Sch/S')_{fppf}$$

gotten by applying construction A of Lemma 71.19.1 to \mathcal{X} .

Conversely, what if we start with an algebraic stack \mathcal{X}' over S' and we want to get an algebraic stack over S ? Well, then we consider the 2-fibre product

$$\mathcal{X}'_S = (Sch/S)_{fppf} \times_{(Sch/S')_{fppf}} \mathcal{X}'$$

which is an algebraic stack over S' according to Lemma 71.14.3. Moreover, it comes equipped with a natural 1-morphism $p : \mathcal{X}'_S \rightarrow (Sch/S)_{fppf}$ and hence by Lemma 71.19.1 it corresponds in a canonical way to an algebraic stack over S .

Definition 71.19.3. Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. Let \mathcal{X}' be an algebraic stack over S' . The *change of base of \mathcal{X}'* is the algebraic space \mathcal{X}'_S over S described above.

Examples of Stacks

72.1. Introduction

This is a discussion of examples of stacks in algebraic geometry. Some of them are algebraic stacks, some are not. We will discuss which are algebraic stacks in a later chapter. This means that in this chapter we mainly worry about the descent conditions. See [Vis04] for example.

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 76.1 for an explanation.

72.2. Notation

In this chapter we fix a suitable big fppf site Sch_{fppf} as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf} . We will always work relative to a base S contained in Sch_{fppf} . And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S = \text{Spec}(\mathbf{Z})$.

72.3. Examples of stacks

We first give some important examples of stacks over $(Sch/S)_{fppf}$.

72.4. Quasi-coherent sheaves

We define a category $QCoh$ as follows:

- (1) An object of $QCoh$ is a pair (X, \mathcal{F}) , where X/S is an object of $(Sch/S)_{fppf}$, and \mathcal{F} is a quasi-coherent \mathcal{O}_X -module, and
- (2) a morphism $(f, \varphi) : (Y, \mathcal{G}) \rightarrow (X, \mathcal{F})$ is a pair consisting of a morphism $f : Y \rightarrow X$ of schemes over S and an f -map (see Sheaves, Section 6.26) $\varphi : \mathcal{F} \rightarrow \mathcal{G}$.
- (3) The composition of morphisms

$$(Z, \mathcal{H}) \xrightarrow{(g, \psi)} (Y, \mathcal{G}) \xrightarrow{(f, \phi)} (X, \mathcal{F})$$

is $(f \circ g, \psi \circ \phi)$ where $\psi \circ \phi$ is the composition of f -maps.

Thus $QCoh$ is a category and

$$p : QCoh \rightarrow (Sch/S)_{fppf}, \quad (X, \mathcal{F}) \mapsto X$$

is a functor. Note that the fibre category of $QCoh$ over a scheme X is just the category $QCoh(\mathcal{O}_X)$ of quasi-coherent \mathcal{O}_X -modules. We remark for later use that

given $(X, \mathcal{F}), (Y, \mathcal{G}) \in \text{Ob}(QCoh)$ we have

$$(72.4.0.1) \quad \text{Mor}_{QCoh}((Y, \mathcal{G}), (X, \mathcal{F})) = \coprod_{f \in \text{Mor}_S(Y, X)} \text{Mor}_{QCoh(\mathcal{O}_Y)}(f^* \mathcal{F}, \mathcal{G})$$

See the discussion on f -maps of modules in Sheaves, Section 6.26.

The category $QCoh$ is not a stack over $(Sch/S)_{fppf}$ because its collection of objects is a proper class. On the other hand we will see that it does satisfy all the axioms of a stack. We will get around the set theoretical issue in Section 72.5.

Lemma 72.4.1. *A morphism $(f, \varphi) : (Y, \mathcal{G}) \rightarrow (X, \mathcal{F})$ of $QCoh$ is strongly cartesian if and only if the map φ induces an isomorphism $f^* \mathcal{F} \rightarrow \mathcal{G}$.*

Proof. Let $(X, \mathcal{F}) \in \text{Ob}(QCoh)$. Let $f : Y \rightarrow X$ be a morphism of $(Sch/S)_{fppf}$. Note that there is a canonical f -map $c : \mathcal{F} \rightarrow f^* \mathcal{F}$ and hence we get a morphism $(f, c) : (Y, f^* \mathcal{F}) \rightarrow (X, \mathcal{F})$. We claim that (f, c) is strongly cartesian. Namely, for any object (Z, \mathcal{H}) of $QCoh$ we have

$$\begin{aligned} \text{Mor}_{QCoh}((Z, \mathcal{H}), (Y, f^* \mathcal{F})) &= \coprod_{g \in \text{Mor}_S(Z, Y)} \text{Mor}_{QCoh(\mathcal{O}_Z)}(g^* f^* \mathcal{F}, \mathcal{H}) \\ &= \coprod_{g \in \text{Mor}_S(Z, Y)} \text{Mor}_{QCoh(\mathcal{O}_Z)}((f \circ g)^* \mathcal{F}, \mathcal{H}) \\ &= \text{Mor}_{QCoh}((Z, \mathcal{H}), (X, \mathcal{F})) \times_{\text{Mor}_S(Z, X)} \text{Mor}_S(Z, Y) \end{aligned}$$

where we have used Equation (72.4.0.1) twice. This proves that the condition of Categories, Definition 4.31.1 holds for (f, c) , and hence our claim is true. Now by Categories, Lemma 4.31.2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the “if” part of the lemma. For the converse, note that given (X, \mathcal{F}) and $f : Y \rightarrow X$, if there exists a strongly cartesian morphism lifting f with target (X, \mathcal{F}) then it has to be isomorphic to (f, c) (see discussion following Categories, Definition 4.31.1). Hence the “only if” part of the lemma holds. \square

Lemma 72.4.2. *The functor $p : QCoh \rightarrow (Sch/S)_{fppf}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 8.4.1.*

Proof. It is clear from Lemma 72.4.1 that $QCoh$ is a fibred category over $(Sch/S)_{fppf}$. Given covering $\mathcal{U} = \{X_i \rightarrow X\}_{i \in I}$ of $(Sch/S)_{fppf}$ the functor

$$QCoh(\mathcal{O}_T) \longrightarrow DD(\mathcal{U})$$

is fully faithful and essentially surjective, see Descent, Proposition 34.5.2. Hence Stacks, Lemma 8.4.2 applies to show that $QCoh$ satisfies all the axioms of a stack. \square

72.5. The stack of finitely generated quasi-coherent sheaves

It turns out that we can get a stack of quasi-coherent sheaves if we only consider finite type quasi-coherent modules. Let us denote

$$p_{fg} : QCoh_{fg} \rightarrow (Sch/S)_{fppf}$$

the full subcategory of $QCoh$ over $(Sch/S)_{fppf}$ consisting of pairs (T, \mathcal{F}) such that \mathcal{F} is a quasi-coherent \mathcal{O}_T -module of finite type.

Lemma 72.5.1. *The functor $p_{fg} : QCoh_{fg} \rightarrow (Sch/S)_{fppf}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 8.4.1.*

Proof. We will verify assumptions (1), (2), (3) of Stacks, Lemma 8.4.3 to prove this. By Lemma 72.4.1 a morphism $(Y, \mathcal{G}) \rightarrow (X, \mathcal{F})$ is strongly cartesian if and only if it induces an isomorphism $f^*\mathcal{F} \rightarrow \mathcal{G}$. By Modules, Lemma 17.9.2 the pullback of a finite type \mathcal{O}_X -module is of finite type. Hence assumption (1) of Stacks, Lemma 8.4.3 holds. Assumption (2) holds trivially. Finally, to prove assumption (3) we have to show: If \mathcal{F} is a quasi-coherent \mathcal{O}_X -module and $\{f_i : X_i \rightarrow X\}$ is an fppf covering such that each $f_i^*\mathcal{F}$ is of finite type, then \mathcal{F} is of finite type. Considering the restriction of \mathcal{F} to an affine open of X this reduces to the following algebra statement: Suppose that $R \rightarrow S$ is a finitely presented, faithfully flat ring map and M an R -module. If $M \otimes_R S$ is a finitely generated S -module, then M is a finitely generated R -module. A stronger form of the algebra fact can be found in Algebra, Lemma 10.80.2. \square

Lemma 72.5.2. *Let (X, \mathcal{O}_X) be a ringed space.*

- (1) *The category of finite type \mathcal{O}_X -modules has a set of isomorphism classes.*
- (2) *The category of finite type quasi-coherent \mathcal{O}_X -modules has a set of isomorphism classes.*

Proof. Part (2) follows from part (1) as the category in (2) is a full subcategory of the category in (1). Consider any open covering $\mathcal{U} : X = \bigcup_{i \in I} U_i$. Denote $j_i : U_i \rightarrow X$ the inclusion maps. Consider any map $r : I \rightarrow \mathbf{N}$. If \mathcal{F} is an \mathcal{O}_X -module whose restriction to U_i is generated by at most $r(i)$ sections from $\mathcal{F}(U_i)$, then \mathcal{F} is a quotient of the sheaf

$$\mathcal{H}_{\mathcal{U}, r} = \bigoplus_{i \in I} j_{i,!} \mathcal{O}_{U_i}^{\oplus r(i)}$$

By definition, if \mathcal{F} is of finite type, then there exists some open covering with \mathcal{U} whose index set is $I = X$ such that this condition is true. Hence it suffices to show that there is a set of possible choices for \mathcal{U} (obvious), a set of possible choices for $r : I \rightarrow \mathbf{N}$ (obvious), and a set of possible quotient modules of $\mathcal{H}_{\mathcal{U}, r}$ for each \mathcal{U} and r . In other words, it suffices to show that given an \mathcal{O}_X -module \mathcal{H} there is at most a set of isomorphism classes of quotients. This last assertion becomes obvious by thinking of the kernels of a quotient map $\mathcal{H} \rightarrow \mathcal{F}$ as being parametrized by a subset of the power set of $\prod_{U \subset X \text{ open}} \mathcal{H}(U)$. \square

Lemma 72.5.3. *There exists a subcategory $QCoh_{fg, small} \subset QCoh_{fg}$ with the following properties:*

- (1) *the inclusion functor $QCoh_{fg, small} \rightarrow QCoh_{fg}$ is fully faithful and essentially surjective, and*
- (2) *the functor $p_{fg, small} : QCoh_{fg, small} \rightarrow (Sch/S)_{fppf}$ turns $QCoh_{fg, small}$ into a stack over $(Sch/S)_{fppf}$.*

Proof. We have seen in Lemmas 72.5.1 and 72.5.2 that $p_{fg} : QCoh_{fg} \rightarrow (Sch/S)_{fppf}$ satisfies (1), (2) and (3) of Stacks, Definition 8.4.1 as well as the additional condition (4) of Stacks, Remark 8.4.9. Hence we obtain $QCoh_{fg, small}$ from the discussion in that remark. \square

We will often perform the replacement

$$QCoh_{fg} \rightsquigarrow QCoh_{fg, small}$$

without further remarking on it, and by abuse of notation we will simply denote $QCoh_{fg}$ this replacement.

Remark 72.5.4. Note that the whole discussion in this section works if we want to consider those quasi-coherent sheaves which are locally generated by at most κ sections, for some infinite cardinal κ , e.g., $\kappa = \aleph_0$.

72.6. Algebraic spaces

We define a category Spaces as follows:

- (1) An object of Spaces is a morphism $X \rightarrow U$ of algebraic spaces over S , where U is representable by an object of $(\mathit{Sch}/S)_{fppf}$, and
- (2) a morphism $(f, g) : (X \rightarrow U) \rightarrow (Y \rightarrow V)$ is a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\quad} & Y \\ \downarrow & \scriptstyle f & \downarrow \\ U & \xrightarrow{\quad g} & V \end{array}$$

of morphisms of algebraic spaces over S .

Thus Spaces is a category and

$$p : \mathit{Spaces} \rightarrow (\mathit{Sch}/S)_{fppf}, \quad (X \rightarrow U) \mapsto U$$

is a functor. Note that the fibre category of Spaces over a scheme U is just the category Spaces/U of algebraic spaces over U (see Topologies on Spaces, Section 55.2). Hence we sometimes think of an object of Spaces as a pair X/U consisting of a scheme U and an algebraic space X over U . We remark for later use that given $(X/U), (Y/V) \in \text{Ob}(\mathit{Spaces})$ we have

$$(72.6.0.1) \quad \text{Mor}_{\mathit{Spaces}}(X/U, Y/V) = \coprod_{g \in \text{Mor}_S(U, V)} \text{Mor}_{\mathit{Spaces}/U}(X, U \times_{g, V} Y)$$

The category Spaces is almost, but not quite a stack over $(\mathit{Sch}/S)_{fppf}$. The problem is a set theoretical issue as we will explain below.

Lemma 72.6.1. *A morphism $(f, g) : X/U \rightarrow Y/V$ of Spaces is strongly cartesian if and only if the map f induces an isomorphism $X \rightarrow U \times_{g, V} Y$.*

Proof. Let $Y/V \in \text{Ob}(\mathit{Spaces})$. Let $g : U \rightarrow V$ be a morphism of $(\mathit{Sch}/S)_{fppf}$. Note that the projection $p : U \times_{g, V} Y \rightarrow Y$ gives rise a morphism $(p, g) : U \times_{g, V} Y/U \rightarrow Y/V$ of Spaces . We claim that (p, g) is strongly cartesian. Namely, for any object Z/W of Spaces we have

$$\begin{aligned} \text{Mor}_{\mathit{Spaces}}(Z/W, U \times_{g, V} Y/U) &= \coprod_{h \in \text{Mor}_S(W, U)} \text{Mor}_{\mathit{Spaces}/W}(Z, W \times_{h, U} U \times_{g, V} Y) \\ &= \coprod_{h \in \text{Mor}_S(W, U)} \text{Mor}_{\mathit{Spaces}/W}(Z, W \times_{g \circ h, V} Y) \\ &= \text{Mor}_{\mathit{Spaces}}(Z/W, Y/V) \times_{\text{Mor}_S(W, V)} \text{Mor}_S(W, U) \end{aligned}$$

where we have used Equation (72.6.0.1) twice. This proves that the condition of Categories, Definition 4.31.1 holds for (p, g) , and hence our claim is true. Now by Categories, Lemma 4.31.2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the “if” part of the lemma. For the converse, note that given Y/V and $g : U \rightarrow V$, if there exists a strongly cartesian morphism lifting g with target Y/V then it has to be isomorphic to (p, g) (see discussion following Categories, Definition 4.31.1). Hence the “only if” part of the lemma holds. \square

Lemma 72.6.2. *The functor $p : Spaces \rightarrow (Sch/S)_{fppf}$ satisfies conditions (1) and (2) of Stacks, Definition 8.4.1.*

Proof. It follows from Lemma 72.6.1 that $Spaces$ is a fibred category over $(Sch/S)_{fppf}$ which proves (1). Suppose that $\{U_i \rightarrow U\}_{i \in I}$ is a covering of $(Sch/S)_{fppf}$. Suppose that X, Y are algebraic spaces over U . Finally, suppose that $\varphi_i : X_{U_i} \rightarrow Y_{U_i}$ are morphisms of $Spaces/U_i$ such that φ_i and φ_j restrict to the same morphisms $X_{U_i \times_U U_j} \rightarrow Y_{U_i \times_U U_j}$ of algebraic spaces over $U_i \times_U U_j$. To prove (2) we have to show that there exists a unique morphism $\varphi : X \rightarrow Y$ over U whose base change to U_i is equal to φ_i . As a morphism from X to Y is the same thing as a map of sheaves this follows directly from Sites, Lemma 7.25.1. \square

Remark 72.6.3. Ignoring set theoretical difficulties¹ $Spaces$ also satisfies descent for objects and hence is a stack. Namely, we have to show that given

- (1) an fppf covering $\{U_i \rightarrow U\}_{i \in I}$,
- (2) for each $i \in I$ an algebraic space X_i/U_i , and
- (3) for each $i, j \in I$ an isomorphism $\varphi_{ij} : X_i \times_U U_j \rightarrow U_i \times_U X_j$ of algebraic spaces over $U_i \times_U U_j$ satisfying the cocycle condition over $U_i \times_U U_j \times_U U_k$,

there exists an algebraic space X/U and isomorphisms $X_{U_i} \cong X_i$ over U_i recovering the isomorphisms φ_{ij} . First, note that by Sites, Lemma 7.25.2 there exists a sheaf X on $(Sch/U)_{fppf}$ recovering the X_i and the φ_{ij} . Then by Bootstrap, Lemma 62.11.1 we see that X is an algebraic space (if we ignore the set theoretic condition of that lemma). We will use this argument in the next section to show that if we consider only algebraic spaces of finite type, then we obtain a stack.

72.7. The stack of finite type algebraic spaces

It turns out that we can get a stack of spaces if we only consider spaces of finite type. Let us denote

$$p_{ft} : Spaces_{ft} \rightarrow (Sch/S)_{fppf}$$

the full subcategory of $Spaces$ over $(Sch/S)_{fppf}$ consisting of pairs X/U such that $X \rightarrow U$ is a morphism of finite type.

Lemma 72.7.1. *The functor $p_{ft} : Spaces_{ft} \rightarrow (Sch/S)_{fppf}$ satisfies the conditions (1), (2) and (3) of Stacks, Definition 8.4.1.*

Proof. We are going to write this out in ridiculous detail (which may make it hard to see what is going on).

We have seen in Lemma 72.6.1 that a morphism $(f, g) : X/U \rightarrow Y/V$ of $Spaces$ is strongly cartesian if the induced morphism $f : X \rightarrow U \times_V Y$ is an isomorphism. Note that if $Y \rightarrow V$ is of finite type then also $U \times_V Y \rightarrow U$ is of finite type, see Morphisms of Spaces, Lemma 49.23.3. So if $(f, g) : X/U \rightarrow Y/V$ of $Spaces$ is strongly cartesian in $Spaces$ and Y/V is an object of $Spaces_{ft}$ then automatically also X/U is an object of $Spaces_{ft}$, and of course (f, g) is also strongly cartesian in $Spaces_{ft}$. In this way we conclude that $Spaces_{ft}$ is a fibred category over $(Sch/S)_{fppf}$. This proves (1).

¹The difficulty is not that $Spaces$ is a proper class, since by our definition of an algebraic space over S there is only a set worth of isomorphism classes of algebraic spaces over S . It is rather that arbitrary disjoint unions of algebraic spaces may end up being too large, hence lie outside of our chosen “partial universe” of sets.

The argument above also shows that the inclusion functor $Spaces_{ft} \rightarrow Spaces$ transforms strongly cartesian morphisms into strongly cartesian morphisms. In other words $Spaces_{ft} \rightarrow Spaces$ is a 1-morphism of fibred categories over $(Sch/S)_{fppf}$.

Let $U \in \text{Ob}((Sch/S)_{fppf})$. Let X, Y be algebraic spaces of finite type over U . By Stacks, Lemma 8.2.3 we obtain a map of presheaves

$$Mor_{Spaces_{ft}}(X, Y) \longrightarrow Mor_{Spaces}(X, Y)$$

which is an isomorphism as $Spaces_{ft}$ is a full subcategory of $Spaces$. Hence the left hand side is a sheaf, because in Lemma 72.6.2 we showed the right hand side is a sheaf. This proves (2).

To prove condition (3) of Stacks, Definition 8.4.1 we have to show the following: Given

- (1) a covering $\{U_i \rightarrow U\}_{i \in I}$ of $(Sch/S)_{fppf}$,
- (2) for each $i \in I$ an algebraic space X_i of finite type over U_i , and
- (3) for each $i, j \in I$ an isomorphism $\varphi_{ij} : X_i \times_U U_j \rightarrow U_i \times_U X_j$ of algebraic spaces over $U_i \times_U U_j$ satisfying the cocycle condition over $U_i \times_U U_j \times_U U_k$,

there exists an algebraic space X of finite type over U and isomorphisms $X_{U_i} \cong X_i$ over U_i recovering the isomorphisms φ_{ij} . By Sites, Lemma 7.25.2 there exists a sheaf X on $(Sch/U)_{fppf}$ recovering the X_i and the φ_{ij} . Then by Bootstrap, Lemma 62.11.4 we see that X is an algebraic space. By Descent on Spaces, Lemma 56.10.8 we see that $X \rightarrow U$ is of finite type which concludes the proof. \square

Lemma 72.7.2. *There exists a subcategory $Spaces_{ft,small} \subset Spaces_{ft}$ with the following properties:*

- (1) *the inclusion functor $Spaces_{ft,small} \rightarrow Spaces_{ft}$ is fully faithful and essentially surjective, and*
- (2) *the functor $p_{ft,small} : Spaces_{ft,small} \rightarrow (Sch/S)_{fppf}$ turns $Spaces_{ft,small}$ into a stack over $(Sch/S)_{fppf}$.*

Proof. We have seen in Lemmas 72.7.1 that $p_{fg} : QCoh_{fg} \rightarrow (Sch/S)_{fppf}$ satisfies (1), (2) and (3) of Stacks, Definition 8.4.1. The additional condition (4) of Stacks, Remark 8.4.9 holds because every algebraic space X over S is of the form U/R for $U, R \in \text{Ob}((Sch/S)_{fppf})$, see Spaces, Lemma 47.9.1. Thus there is only a set worth of isomorphism classes of objects. Hence we obtain $Spaces_{ft,small}$ from the discussion in that remark. \square

We will often perform the replacement

$$Spaces_{ft} \rightsquigarrow Spaces_{ft,small}$$

without further remarking on it, and by abuse of notation we will simply denote $Spaces_{ft}$ this replacement.

Remark 72.7.3. Note that the whole discussion in this section works if we want to consider those algebraic spaces X/U which are locally of finite type such that the inverse image in X of an affine open of U can be covered by countably many affines. If needed we can also introduce the notion of a morphism of κ -type (meaning some bound on the number of generators of ring extensions and some bound on the cardinality of the affines over a given affine in the base) where κ is a cardinal, and then we can produce a stack

$$Spaces_{\kappa} \longrightarrow (Sch/S)_{fppf}$$

in exactly the same manner as above (provided we make sure that Sch is large enough depending on κ).

72.8. Examples of stacks in groupoids

The examples above are examples of stacks which are not stacks in groupoids. In the rest of this chapter we give algebraic geometric examples of stacks in groupoids.

72.9. The stack associated to a sheaf

Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a presheaf. We obtain a category fibred in sets

$$p_F : \mathcal{S}_F \rightarrow (Sch/S)_{fppf},$$

see Categories, Example 4.36.5. This is a stack in sets if and only if F is a sheaf, see Stacks, Lemma 8.6.3.

72.10. The stack in groupoids of finitely generated quasi-coherent sheaves

Let $p : QCoh_{fg} \rightarrow (Sch/S)_{fppf}$ be the stack introduced in Section 72.5 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p' : QCoh'_{fg} \rightarrow (Sch/S)_{fppf}$ by the procedure of Categories, Lemma 4.33.3, see Stacks, Lemma 8.5.3. In this particular case this simply means $QCoh'_{fg}$ has the same objects as $QCoh_{fg}$ but the morphisms are pairs $(f, g) : (U, \mathcal{F}) \rightarrow (U', \mathcal{F}')$ where g is an isomorphism $g : f^*\mathcal{F}' \rightarrow \mathcal{F}$.

72.11. The stack in groupoids of finite type algebraic spaces

Let $p : Spaces_{ft} \rightarrow (Sch/S)_{fppf}$ be the stack introduced in Section 72.7 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p' : Spaces'_{ft} \rightarrow (Sch/S)_{fppf}$ by the procedure of Categories, Lemma 4.33.3, see Stacks, Lemma 8.5.3. In this particular case this simply means $Spaces'_{ft}$ has the same objects as $Spaces_{ft}$, i.e., finite type morphisms $X \rightarrow U$ where X is an algebraic space over S and U is a scheme over S . But the morphisms $(f, g) : X/U \rightarrow Y/V$ are now commutative diagrams

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & \searrow f & \downarrow \\ U & \xrightarrow{g} & V \end{array}$$

which are cartesian.

72.12. Quotient stacks

Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . In this case the quotient stack

$$[U/R] \longrightarrow (Sch/S)_{fppf}$$

is a stack in groupoids by construction, see Groupoids in Spaces, Definition 60.19.1. It is even the case that the *Isom*-sheaves are representable by algebraic spaces, see Bootstrap, Lemma 62.11.5. These quotient stacks are of fundamental importance to the theory of algebraic stacks.

A special case of the construction above is the quotient stack

$$[X/G] \longrightarrow (Sch/S)_{fppf}$$

associated to a datum $(B, G/B, m, X/B, a)$. Here

- (1) B is an algebraic space over S ,
- (2) (G, m) is a group algebraic space over B ,
- (3) X is an algebraic space over B , and
- (4) $a : G \times_B X \rightarrow X$ is an action of G on X over B .

Namely, by Groupoids in Spaces, Definition 60.19.1 the stack in groupoids $[X/G]$ is the quotient stack $[X/G \times_B X]$ given above. It behooves us to spell out what the category $[X/G]$ really looks like. We will do this in Section 72.14.

72.13. Classifying torsors

We want to carefully explain a number of variants of what it could mean to study the stack of torsors for a group algebraic space G or a sheaf of groups \mathcal{G} .

72.13.1. Torsors for a sheaf of groups. Let \mathcal{G} be a sheaf of groups on $(Sch/S)_{fppf}$. For $U \in \text{Ob}((Sch/S)_{fppf})$ we denote $\mathcal{G}|_U$ the restriction of \mathcal{G} to $(Sch/U)_{fppf}$. We define a category \mathcal{G} -Torsors as follows:

- (1) An object of \mathcal{G} -Torsors is a pair (U, \mathcal{F}) where U is an object of $(Sch/S)_{fppf}$ and \mathcal{F} is a $\mathcal{G}|_U$ -torsor, see Cohomology on Sites, Definition 21.5.1.
- (2) A morphism $(U, \mathcal{F}) \rightarrow (V, \mathcal{H})$ is given by a pair (f, α) , where $f : U \rightarrow V$ is a morphism of schemes over S , and $\alpha : f^{-1}\mathcal{H} \rightarrow \mathcal{F}$ is an isomorphism of $\mathcal{G}|_U$ -torsors.

Thus \mathcal{G} -Torsors is a category and

$$p : \mathcal{G}\text{-Torsors} \longrightarrow (Sch/S)_{fppf}, \quad (U, \mathcal{F}) \longmapsto U$$

is a functor. Note that the fibre category of \mathcal{G} -Torsors over U is the category of $\mathcal{G}|_U$ -torsors which is a groupoid.

Lemma 72.13.2. *Up to a replacement as in Stacks, Remark 8.4.9 the functor*

$$p : \mathcal{G}\text{-Torsors} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Suppose that for each i we are given a $\mathcal{G}|_{U_i}$ -torsor \mathcal{F}_i , and for each $i, j \in I$ an isomorphism $\varphi_{ij} : \mathcal{F}_i|_{U_i \times_U U_j} \rightarrow \mathcal{F}_j|_{U_i \times_U U_j}$ of $\mathcal{G}|_{U_i \times_U U_j}$ -torsors satisfying a suitable cocycle condition on $U_i \times_U U_j \times_U U_k$. Then by Sites, Section 7.25 we obtain a sheaf \mathcal{F} on $(Sch/U)_{fppf}$ whose restriction to each U_i recovers \mathcal{F}_i as well as recovering the descent data. By the equivalence of categories in Sites, Lemma 7.25.3 the action maps $\mathcal{G}|_{U_i} \times \mathcal{F}_i \rightarrow \mathcal{F}_i$ glue to give a map $a : \mathcal{G}|_U \times \mathcal{F} \rightarrow \mathcal{F}$. Now we have to show that a is an action and that \mathcal{F} becomes a $\mathcal{G}|_U$ -torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions $\mathcal{G}|_{U_i} \times \mathcal{F}_i \rightarrow \mathcal{F}_i$. This proves that descent for objects holds in \mathcal{G} -Torsors. Some details omitted. \square

72.13.3. Variant on torsors for a sheaf. The construction of Subsection 72.13.1 can be generalized slightly. Namely, let $\mathcal{G} \rightarrow \mathcal{B}$ be a map of sheaves on $(Sch/S)_{fppf}$ and let

$$m : \mathcal{G} \times_{\mathcal{B}} \mathcal{G} \longrightarrow \mathcal{G}$$

be a group law on \mathcal{G}/\mathcal{B} . In other words, the pair (\mathcal{G}, m) is a group object of the topos $Sh((Sch/S)_{fppf})/\mathcal{B}$. See Sites, Section 7.29 for information regarding localizations of topoi. In this setting we can define a category $\mathcal{G}/\mathcal{B}\text{-Torsors}$ as follows (where we use the Yoneda embedding to think of schemes as sheaves):

- (1) An object of $\mathcal{G}/\mathcal{B}\text{-Torsors}$ is a triple (U, b, \mathcal{F}) where
 - (a) U is an object of $(Sch/S)_{fppf}$,
 - (b) $b : U \rightarrow \mathcal{B}$ is a section of \mathcal{B} over U , and
 - (c) \mathcal{F} is a $U \times_{b, \mathcal{B}} \mathcal{G}$ -torsor over U .
- (2) A morphism $(U, b, \mathcal{F}) \rightarrow (U', b', \mathcal{F}')$ is given by a pair (f, g) , where $f : U \rightarrow U'$ is a morphism of schemes over S such that $b = b' \circ f$, and $g : f^{-1}\mathcal{F}' \rightarrow \mathcal{F}$ is an isomorphism of $U \times_{b, \mathcal{B}} \mathcal{G}$ -torsors.

Thus $\mathcal{G}/\mathcal{B}\text{-Torsors}$ is a category and

$$p : \mathcal{G}/\mathcal{B}\text{-Torsors} \longrightarrow (Sch/S)_{fppf}, \quad (U, b, \mathcal{F}) \longmapsto U$$

is a functor. Note that the fibre category of $\mathcal{G}/\mathcal{B}\text{-Torsors}$ over U is the disjoint union over $b : U \rightarrow \mathcal{B}$ of the categories of $U \times_{b, \mathcal{B}} \mathcal{G}$ -torsors, hence is a groupoid.

In the special case $\mathcal{B} = S$ we recover the category $\mathcal{G}\text{-Torsors}$ introduced in Subsection 72.13.1.

Lemma 72.13.4. *Up to a replacement as in Stacks, Remark 8.4.9 the functor*

$$p : \mathcal{G}/\mathcal{B}\text{-Torsors} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. This proof is a repeat of the proof of Lemma 72.13.2. The reader is encouraged to read that proof first since the notation is less cumbersome. The most difficult part of the proof is to show that we have descent for objects. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Suppose that for each i we are given a pair (b_i, \mathcal{F}_i) consisting of a morphism $b_i : U_i \rightarrow \mathcal{B}$ and a $U_i \times_{b_i, \mathcal{B}} \mathcal{G}$ -torsor \mathcal{F}_i , and for each $i, j \in I$ we have $b_i|_{U_i \times_U U_j} = b_j|_{U_i \times_U U_j}$ and we are given an isomorphism $\varphi_{ij} : \mathcal{F}_i|_{U_i \times_U U_j} \rightarrow \mathcal{F}_j|_{U_i \times_U U_j}$ of $(U_i \times_U U_j) \times_{\mathcal{B}} \mathcal{G}$ -torsors satisfying a suitable cocycle condition on $U_i \times_U U_j \times_U U_k$. Then by Sites, Section 7.25 we obtain a sheaf \mathcal{F} on $(Sch/U)_{fppf}$ whose restriction to each U_i recovers \mathcal{F}_i as well as recovering the descent data. By the sheaf axiom for \mathcal{B} the morphisms b_i come from a unique morphism $b : U \rightarrow \mathcal{B}$. By the equivalence of categories in Sites, Lemma 7.25.3 the action maps $(U_i \times_{b_i, \mathcal{B}} \mathcal{G}) \times_{U_i} \mathcal{F}_i \rightarrow \mathcal{F}_i$ glue to give a map $(U \times_{b, \mathcal{B}} \mathcal{G}) \times \mathcal{F} \rightarrow \mathcal{F}$. Now we have to show that this is an action and that \mathcal{F} becomes a $U \times_{b, \mathcal{B}} \mathcal{G}$ -torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions on the \mathcal{F}_i . This proves that descent for objects holds in $\mathcal{G}/\mathcal{B}\text{-Torsors}$. Some details omitted. \square

72.13.5. Principal homogeneous spaces. Let B be an algebraic space over S . Let G be a group algebraic space over B . We define a category $G\text{-Principal}$ as follows:

- (1) An object of $G\text{-Principal}$ is a triple (U, b, X) where

- (a) U is an object of $(Sch/S)_{fppf}$,
 (b) $b : U \rightarrow B$ is a morphism over S , and
 (c) X is a principal homogeneous G_U -space over U where $G_U = U \times_{b,B} G$.
 See Groupoids in Spaces, Definition 60.9.3.
- (2) A morphism $(U, b, X) \rightarrow (U', b', X')$ is given by a pair (f, g) , where $f : U \rightarrow U'$ is a morphism of schemes over B , and $g : X \rightarrow U \times_{f,U'} X'$ is an isomorphism of principal homogeneous G_U -spaces.

Thus $G\text{-Principal}$ is a category and

$$p : G\text{-Principal} \longrightarrow (Sch/S)_{fppf}, \quad (U, b, X) \longmapsto U$$

is a functor. Note that the fibre category of $G\text{-Principal}$ over U is the disjoint union over $b : U \rightarrow B$ of the categories of principal homogeneous $U \times_{b,B} G$ -spaces, hence is a groupoid.

In the special case $S = B$ the objects are simply pairs (U, X) where U is a scheme over S , and X is a principal homogeneous G_U -space over U . Moreover, morphisms are simply cartesian diagrams

$$\begin{array}{ccc} X & \xrightarrow{g} & X' \\ \downarrow & & \downarrow \\ U & \xrightarrow{f} & U' \end{array}$$

where g is G -equivariant.

Remark 72.13.6. We conjecture that up to a replacement as in Stacks, Remark 8.4.9 the functor

$$p : G\text{-Principal} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$. This would follow if one could show that given

- (1) a covering $\{U_i \rightarrow U\}_{i \in I}$ of $(Sch/S)_{fppf}$,
- (2) an algebraic space H over U ,
- (3) for every i a principal homogeneous H_{U_i} -space X_i over U_i , and
- (4) H -equivariant isomorphisms $\varphi_{ij} : X_{i,U_i \times_U U_j} \rightarrow X_{j,U_i \times_U U_j}$ satisfying the cocycle condition,

there exists a principal homogeneous H -space X over U which recovers (X_i, φ_{ij}) . The technique of the proof of Bootstrap, Lemma 62.11.8 reduces this to a set theoretical question, so the reader who ignores set theoretical questions will “know” that the result is true. In <http://math.columbia.edu/~dejong/wordpress/?p=591> there is a suggestion as to how to approach this problem.

72.13.7. Variant on principal homogeneous spaces. Let S be a scheme. Let $B = S$. Let G be a group scheme over $B = S$. In this setting we can define a full subcategory $G\text{-Principal-Schemes} \subset G\text{-Principal}$ whose objects are pairs (U, X) where U is an object of $(Sch/S)_{fppf}$ and $X \rightarrow U$ is a principal homogeneous G -space over U which is representable, i.e., a scheme.

It is in general not the case that $G\text{-Principal-Schemes}$ is a stack in groupoids over $(Sch/S)_{fppf}$. The reason is that in general there really do exist principal homogeneous spaces which are not schemes, hence descent for objects will not be satisfied in general.

72.13.8. Torsors in fppf topology. Let B be an algebraic space over S . Let G be a group algebraic space over B . We define a category G -Torsors as follows:

- (1) An object of G -Torsors is a triple (U, b, X) where
 - (a) U is an object of $(Sch/S)_{fppf}$,
 - (b) $b : U \rightarrow B$ is a morphism, and
 - (c) X is an fppf G_U -torsor over U where $G_U = U \times_{b,B} G$.
 See Groupoids in Spaces, Definition 60.9.3.
- (2) A morphism $(U, b, X) \rightarrow (U', b', X')$ is given by a pair (f, g) , where $f : U \rightarrow U'$ is a morphism of schemes over B , and $g : X \rightarrow U \times_{f,U'} X'$ is an isomorphism of G_U -torsors.

Thus G -Torsors is a category and

$$p : G\text{-Torsors} \longrightarrow (Sch/S)_{fppf}, \quad (U, a, X) \longmapsto U$$

is a functor. Note that the fibre category of G -Torsors over U is the disjoint union over $b : U \rightarrow B$ of the categories of fppf $U \times_{b,B} G$ -torsors, hence is a groupoid.

In the special case $S = B$ the objects are simply pairs (U, X) where U is a scheme over S , and X is an fppf G_U -torsor over U . Moreover, morphisms are simply cartesian diagrams

$$\begin{array}{ccc} X & \xrightarrow{g} & X' \\ \downarrow & & \downarrow \\ U & \xrightarrow{f} & U' \end{array}$$

where g is G -equivariant.

Lemma 72.13.9. *Up to a replacement as in Stacks, Remark 8.4.9 the functor*

$$p : G\text{-Torsors} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects, which is Bootstrap, Lemma 62.11.8. We omit the proof of axioms (1) and (2) of Stacks, Definition 8.5.1. \square

Lemma 72.13.10. *Let B be an algebraic space over S . Let G be a group algebraic space over B . Denote \mathcal{G} , resp. \mathcal{B} the algebraic space G , resp. B seen as a sheaf on $(Sch/S)_{fppf}$. The functor*

$$G\text{-Torsors} \longrightarrow \mathcal{G}/\mathcal{B}\text{-Torsors}$$

which associates to a triple (U, b, X) the triple (U, b, \mathcal{X}) where \mathcal{X} is X viewed as a sheaf is an equivalence of stacks in groupoids over $(Sch/S)_{fppf}$.

Proof. We will use the result of Stacks, Lemma 8.4.8 to prove this. The functor is fully faithful since the category of algebraic spaces over S is a full subcategory of the category of sheaves on $(Sch/S)_{fppf}$. Moreover, all objects (on both sides) are locally trivial torsors so condition (2) of the lemma referenced above holds. Hence the functor is an equivalence. \square

72.13.11. Variant on torsors in fppf topology. Let S be a scheme. Let $B = S$. Let G be a group scheme over $B = S$. In this setting we can define a full subcategory $G\text{-Torsors-Schemes} \subset G\text{-Torsors}$ whose objects are pairs (U, X) where U is an object of $(Sch/S)_{fppf}$ and $X \rightarrow U$ is an fppf G -torsor over U which is representable, i.e., a scheme.

It is in general not the case that $G\text{-Torsors-Schemes}$ is a stack in groupoids over $(Sch/S)_{fppf}$. The reason is that in general there really do exist fppf G -torsors which are not schemes, hence descent for objects will not be satisfied in general.

72.14. Quotients by group actions

At this point we have introduced enough notation that we can work out in more detail what the stacks $[X/G]$ of Section 72.12 look like.

Situation 72.14.1. Here

- (1) S is a scheme contained in Sch_{fppf} ,
- (2) B is an algebraic space over S ,
- (3) (G, m) is a group algebraic space over B ,
- (4) $\pi : X \rightarrow B$ is an algebraic space over B , and
- (5) $a : G \times_B X \rightarrow X$ is an action of G on X over B .

In this situation we construct a category $[[X/G]]^2$ as follows:

- (1) An object of $[[X/G]]$ consists of a quadruple $(U, b, P, \varphi : P \rightarrow X)$ where
 - (a) U is an object of $(Sch/S)_{fppf}$,
 - (b) $b : U \rightarrow B$ is a morphism over S ,
 - (c) P is an fppf G_U -torsor over U where $G_U = U \times_{b,B} G$, and
 - (d) $\varphi : P \rightarrow X$ is a G -equivariant morphism fitting into the commutative diagram

- (2) A morphism of $[[X/G]]$ is a pair $(f, g) : (U, b, P, \varphi) \rightarrow (U', b', P', \varphi')$ where $f : U \rightarrow U'$ is a morphism of schemes over B and $g : P \rightarrow P'$ is a G -equivariant morphism over f which induces an isomorphism $P \cong U \times_{f,U'} P'$, and has the property that $\varphi = \varphi' \circ g$. In other words (f, g) fits into the following commutative diagram

²The notation $[[X/G]]$ with double brackets serves to distinguish this category from the stack $[X/G]$ introduced earlier. In Proposition 72.14.3 we show that the two are canonically equivalent. Afterwards we will use the notation $[X/G]$ to indicate either.

Thus $[[X/G]]$ is a category and

$$p : [[X/G]] \longrightarrow (Sch/S)_{fppf}, \quad (U, b, P, \varphi) \longmapsto U$$

is a functor. Note that the fibre category of $[[X/G]]$ over U is the disjoint union over $b \in \text{Mor}_S(U, B)$ of $U \times_{b, B} G$ -torsors P endowed with a G -equivariant morphism to X . Hence the fibre categories of $[[X/G]]$ are groupoids.

Note that the functor

$$[[X/G]] \longrightarrow G\text{-Torsors}, \quad (U, b, P, \varphi) \longmapsto (U, b, P)$$

is a 1-morphism of categories over $(Sch/S)_{fppf}$.

Lemma 72.14.2. *Up to a replacement as in Stacks, Remark 8.4.9 the functor*

$$p : [[X/G]] \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects. Suppose that $\{U_i \rightarrow U\}_{i \in I}$ is a covering in $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, b_i, P_i, \varphi_i)$ be objects of $[[X/G]]$ over U_i , and let $\varphi_{ij} : \text{pr}_0^* \xi_i \rightarrow \text{pr}_1^* \xi_j$ be a descent datum. This in particular implies that we get a descent datum on the triples (U_i, b_i, P_i) for the stack in groupoids $G\text{-Torsors}$ by applying the functor $[[X/G]] \rightarrow G\text{-Torsors}$ above. We have seen that $G\text{-Torsors}$ is a stack in groupoids (Lemma 72.13.9). Hence we may assume that $b_i = b|_{U_i}$ for some morphism $b : U \rightarrow B$, and that $P_i = U_i \times_U P$ for some fppf $G_U = U \times_{b, B} G$ -torsor P over U . The morphisms φ_i are compatible with the canonical descent datum on the restrictions $U_i \times_U P$ and hence define a morphism $\varphi : P \rightarrow X$. (For example you can use Sites, Lemma 7.25.3 or you can use Descent on Spaces, Lemma 56.6.2 to get φ .) This proves descent for objects. We omit the proof of axioms (1) and (2) of Stacks, Definition 8.5.1. \square

Proposition 72.14.3. *In Situation 72.14.1 there exists a canonical equivalence*

$$[X/G] \longrightarrow [[X/G]]$$

of stacks in groupoids over $(Sch/S)_{fppf}$.

Proof. We write this out in detail, to make sure that all the definitions work out in exactly the correct manner. Recall that $[X/G]$ is the quotient stack associated to the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$, see Groupoids in Spaces, Definition 60.19.1. This means that $[X/G]$ is the stackification of the category fibred in groupoids $[X/pG]$ associated to the functor

$$(Sch/S)_{fppf} \longrightarrow \text{Groupoids}, \quad U \longmapsto (X(U), G(U) \times_{B(U)} X(U), s, t, c)$$

where $s(g, x) = x$, $t(g, x) = a(g, x)$, and $c((g, x), (g', x')) = (m(g, g'), x')$. By the construction of Categories, Example 4.35.1 an object of $[X/pG]$ is a pair (U, x) with $x \in X(U)$ and a morphism $(f, g) : (U, x) \rightarrow (U', x')$ of $[X/pG]$ is given by a morphism of schemes $f : U \rightarrow U'$ and an element $g \in G(U)$ such that $a(g, x) = x' \circ f$. Hence we can define a 1-morphism of stacks in groupoids

$$F_p : [X/pG] \longrightarrow [[X/G]]$$

by the following rules: On objects we set

$$F_p(U, x) = (U, \pi \circ x, G \times_{B, \pi \circ x} U, a \circ (\text{id}_G \times x))$$

This makes sense because the diagram

$$\begin{array}{ccccc} G \times_{B, \pi \circ x} U & \xrightarrow{\text{id}_G \times x} & G \times_{B, \pi} X & \xrightarrow{a} & X \\ \downarrow & & & & \downarrow \pi \\ U & \xrightarrow{\pi \circ x} & & & B \end{array}$$

commutes, and the two horizontal arrows are G -equivariant if we think of the fibre products as trivial G -torsors over U , resp. X . On morphisms $(f, g) : (U, x) \rightarrow (U', x')$ we set $F_p(f, g) = (f, R_g)$ where R_g denotes right translation by g . More precisely, the morphism of $F_p(f, g) : F_p(U, x) \rightarrow F_p(U', x')$ is given by the cartesian diagram

$$\begin{array}{ccc} G \times_{B, \pi \circ x} U & \xrightarrow{R_g} & G \times_{B, \pi \circ x'} U' \\ \downarrow & & \downarrow \\ U & \xrightarrow{f} & U' \end{array}$$

where R_g on T -valued points is given by

$$R_g(g', u) = (m(g', g), f(u))$$

To see that this works we have to verify that

$$a \circ (\text{id}_G \times x) = a \circ (\text{id}_G \times x') \circ R_g$$

which is true because the right hand side applied to the T -valued point (g', u) gives

$$\begin{aligned} a((\text{id}_G \times x')(m(g', g), f(u))) &= a(m(g', g), x'(f(u))) \\ &= a(g', a(g, x'(f(u)))) \\ &= a(g', x(u)) \end{aligned}$$

because $a(g, x) = x' \circ f$ as desired.

By the universal property of stackification from Stacks, Lemma 8.9.2 we obtain a canonical extension $F : [X/G] \rightarrow [[X/G]]$ of the 1-morphism F_p above. We first prove that F is fully faithful. To do this, since both source and target are stacks in groupoids, it suffices to prove that the *Isom*-sheaves are identified under F . Pick a scheme U and objects ξ, ξ' of $[X/G]$ over U . We want to show that

$$F : \text{Isom}_{[X/G]}(\xi, \xi') \longrightarrow \text{Isom}_{[[X/G]]}(F(\xi), F(\xi'))$$

is an isomorphism of sheaves. To do this it suffices to work locally on U , and hence we may assume that ξ, ξ' come from objects $(U, x), (U, x')$ of $[X/pG]$ over U ; this follows directly from the construction of the stackification, and it is also worked out in detail in Groupoids in Spaces, Section 60.23. Either by directly using the description of morphisms in $[X/pG]$ above, or using Groupoids in Spaces, Lemma 60.21.1 we see that in this case

$$\text{Isom}_{[X/G]}(\xi, \xi') = U \times_{(x, x'), X \times_S X, (s, t)} (G \times_B X)$$

A T -valued point of this fibre product corresponds to a pair (u, g) with $u \in U(T)$, and $g \in G(T)$ such that $a(g, x \circ u) = x' \circ u$. (Note that this implies $\pi \circ x \circ u = \pi \circ x' \circ u$.) On the other hand, a T -valued point of $\text{Isom}_{[[X/G]]}(F(\xi), F(\xi'))$ by definition corresponds to a morphism $u : T \rightarrow U$ such that $\pi \circ x \circ u = \pi \circ x' \circ u : T \rightarrow B$ and an isomorphism

$$R : G \times_{B, \pi \circ x \circ u} T \longrightarrow G \times_{B, \pi \circ x' \circ u} T$$

of trivial G_T -torsors compatible with the given maps to X . Since the torsors are trivial we see that $R = R_g$ (right multiplication) by some $g \in G(T)$. Compatibility with the maps $a \circ (1_G, x \circ u), a \circ (1_G, x' \circ u) : G \times_B T \rightarrow X$ is equivalent to the condition that $a(g, x \circ u) = x' \circ u$. Hence we obtain the desired equality of *Isom*-sheaves.

Now that we know that F is fully faithful we see that Stacks, Lemma 8.4.8 applies. Thus to show that F is an equivalence it suffices to show that objects of $[[X/G]]$ are fppf locally in the essential image of F . This is clear as fppf torsors are locally trivial, and hence we win. \square

Remark 72.14.4. Let S be a scheme. Let G be an abstract group. Let X be an algebraic space over S . Let $G \rightarrow \text{Aut}_S(X)$ be a group homomorphism. In this setting we can define $[[X/G]]$ similarly to the above as follows:

- (1) An object of $[[X/G]]$ consists of a triple $(U, P, \varphi : P \rightarrow X)$ where
 - (a) U is an object of $(\text{Sch}/S)_{\text{fppf}}$,
 - (b) P is a sheaf on $(\text{Sch}/U)_{\text{fppf}}$ which comes with an action of G that turns it into a torsor under the constant sheaf with value G , and
 - (c) $\varphi : P \rightarrow X$ is a G -equivariant map of sheaves.
- (2) A morphism $(f, g) : (U, P, \varphi) \rightarrow (U', P', \varphi')$ is given by a morphism of schemes $f : T \rightarrow T'$ and a G -equivariant isomorphism $g : P \rightarrow f^{-1}P'$ such that $\varphi = \varphi' \circ g$.

In exactly the same manner as above we obtain a functor

$$[[X/G]] \longrightarrow (\text{Sch}/S)_{\text{fppf}}$$

which turns $[[X/G]]$ into a stack in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. The constant sheaf \underline{G} is (provided the cardinality of G is not too large) representable by G_S on $(\text{Sch}/S)_{\text{fppf}}$ and this version of $[[X/G]]$ is equivalent to the stack $[[X/G_S]]$ introduced above.

72.15. The Picard stack

Let S be a scheme. Let $\pi : X \rightarrow B$ be a morphism of algebraic spaces over S . We define a category $\text{Pic}_{X/B}$ as follows:

- (1) An object is a triple (U, b, \mathcal{L}) , where
 - (a) U is an object of $(\text{Sch}/S)_{\text{fppf}}$,
 - (b) $b : U \rightarrow B$ is a morphism over S , and
 - (c) \mathcal{L} is an invertible sheaf on the base change $X_U = U \times_{b,B} X$.
- (2) A morphism $(f, g) : (U, b, \mathcal{L}) \rightarrow (U', b', \mathcal{L}')$ is given by a morphism of schemes $f : U \rightarrow U'$ over B and an isomorphism $g : f^*\mathcal{L}' \rightarrow \mathcal{L}$.

The composition of $(f, g) : (U, b, \mathcal{L}) \rightarrow (U', b', \mathcal{L}')$ with $(f', g') : (U', b', \mathcal{L}') \rightarrow (U'', b'', \mathcal{L}'')$ is given by $(f \circ f', g \circ f'^*(g'))$. Thus we get a category $\text{Pic}_{X/B}$ and

$$p : \text{Pic}_{X/B} \longrightarrow (\text{Sch}/S)_{\text{fppf}}, \quad (U, b, \mathcal{L}) \longmapsto U$$

is a functor. Note that the fibre category of $\text{Pic}_{X/B}$ over U is the disjoint union over $b \in \text{Mor}_S(U, B)$ of the categories of invertible sheaves on $X_U = U \times_{b,B} X$. Hence the fibre categories are groupoids.

Lemma 72.15.1. *Up to a replacement as in Stacks, Remark 8.4.9 the functor*

$$\text{Pic}_{X/B} \longrightarrow (\text{Sch}/S)_{\text{fppf}}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. As usual, the hardest part is to show descent for objects. To see this let $\{U_i \rightarrow U\}$ be a covering of $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, b_i, \mathcal{L}_i)$ be an object of $Pic_{X/B}$ lying over U , and let $\varphi_{ij} : pr_0^* \xi_i \rightarrow pr_1^* \xi_j$ be a descent datum. This implies in particular that the morphisms b_i are the restrictions of a morphism $b : U \rightarrow B$. Write $X_U = U \times_{b,B} X$ and $X_i = U_i \times_{b_i,B} X = U_i \times_U U \times_{b,B} X = U_i \times_U X_U$. Observe that \mathcal{L}_i is an invertible \mathcal{O}_{X_i} -module. Note that $\{X_i \rightarrow X_U\}$ forms an fppf covering as well. Moreover, the descent datum φ_{ij} translates into a descent datum on the invertible sheaves \mathcal{L}_i relative to the fppf covering $\{X_i \rightarrow X_U\}$. Hence by Descent on Spaces, Proposition 56.4.1 we obtain a unique invertible sheaf \mathcal{L} on X_U which recovers \mathcal{L}_i and the descent data over X_i . The triple (U, b, \mathcal{L}) is therefore the object of $Pic_{X/B}$ over U we were looking for. Details omitted. \square

72.16. Examples of inertia stacks

Here are some examples of inertia stacks.

Example 72.16.1. Let S be a scheme. Let G be a commutative group. Let $X \rightarrow S$ be a scheme over S . Let $a : G \times X \rightarrow X$ be an action of G on X . For $g \in G$ we denote $g : X \rightarrow X$ the corresponding automorphism. In this case the inertia stack of $[X/G]$ (see Remark 72.14.4) is given by

$$I_{[X/G]} = \coprod_{g \in G} [X^g/G],$$

where, given an element g of G , the symbol X^g denotes the scheme $X^g = \{x \in X \mid g(x) = x\}$. In a formula X^g is really the fibre product

$$X^g = X \times_{(1,1), X \times_S X, (g,1)} X.$$

Indeed, for any S -scheme T , a T -point on the inertia stack of $[X/G]$ consists of a triple $(P/T, \phi, \alpha)$ consisting of a G -torsor $P \rightarrow T$ together with a G -equivariant isomorphism $\phi : P \rightarrow X$, together with an automorphism α of $P \rightarrow T$ over T such that $\phi \circ \alpha = \phi$. Since G is a sheaf of commutative groups, α is, locally in the fppf topology over T , given by multiplication by some element g of G . The condition that $\phi \circ \alpha = \phi$ means that ϕ factors through the inclusion of X^g in X , i.e., ϕ is obtained by composing that inclusion with a morphism $P \rightarrow X^g$. The above discussion allows us to define a morphism of fibred categories $I_{[X/G]} \rightarrow \coprod_{g \in G} [X^g/G]$ given on T -points by the discussion above. We omit showing that this is an equivalence.

Example 72.16.2. Let $X \rightarrow S$ be a morphism of schemes. Assume that for any $T \rightarrow S$ the base change $f_T : X_T \rightarrow T$ has the property that the map $\mathcal{O}_T \rightarrow f_{T,*} \mathcal{O}_{X_T}$ is an isomorphism. (This implies that f is cohomologically flat in dimension 0 (insert future reference here) but is stronger.) Consider the Picard stack $Pic_{X/S}$, see Section 72.15. The points of its inertia stack over an S -scheme T consist of pairs (\mathcal{L}, α) where \mathcal{L} is a line bundle on X_T and α is an automorphism of that line bundle. I.e., we can think of α as an element of $H^0(X_T, \mathcal{O}_{X_T})^\times = H^0(T, \mathcal{O}_T^*)$ by our condition. Note that $H^0(T, \mathcal{O}_T^*) = \mathbf{G}_{m,S}(T)$, see Groupoids, Example 38.5.1. Hence the inertia stack of $Pic_{X/S}$ is

$$I_{Pic_{X/S}} = \mathbf{G}_{m,S} \times_S Pic_{X/S}.$$

as a stack over $(Sch/S)_{fppf}$.

72.17. Finite Hilbert stacks

We formulate this in somewhat greater generality than is perhaps strictly needed. Fix a 1-morphism

$$F : \mathcal{X} \longrightarrow \mathcal{Y}$$

of stacks in groupoids over $(Sch/S)_{fppf}$. For each integer $d \geq 1$ consider a category $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ defined as follows:

- (1) An object (U, Z, y, x, α) where U, Z are objects of in $(Sch/S)_{fppf}$ and Z is a finite locally free of degree d over U , where $y \in \text{Ob}(\mathcal{Y}_U)$, $x \in \text{Ob}(\mathcal{X}_Z)$ and $\alpha : y|_Z \rightarrow F(x)$ is an isomorphism³.
- (2) A morphism $(U, Z, y, x, \alpha) \rightarrow (U', Z', y', x', \alpha')$ is given by a morphism of schemes $f : U \rightarrow U'$, a morphism of schemes $g : Z \rightarrow Z'$ which induces an isomorphism $Z \rightarrow Z' \times_U U'$, and isomorphisms $b : y \rightarrow f^*y'$, $a : x \rightarrow g^*x'$ inducing a commutative diagram

$$\begin{array}{ccc} y|_Z & \xrightarrow{\alpha} & F(x) \\ b|_Z \downarrow & & \downarrow F(a) \\ f^*y'|_Z & \xrightarrow{\alpha'} & F(g^*x') \end{array}$$

It is clear from the definitions that there is a canonical forgetful functor

$$p : \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow (Sch/S)_{fppf}$$

which assigns to the quintuple (U, Z, y, x, α) the scheme U and to the morphism $(f, g, b, a) : (U, Z, y, x, \alpha) \rightarrow (U', Z', y', x', \alpha')$ the morphism $f : U \rightarrow U'$.

Lemma 72.17.1. *The category $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ endowed with the functor p above defines a stack in groupoids over $(Sch/S)_{fppf}$.*

Proof. As usual, the hardest part is to show descent for objects. To see this let $\{U_i \rightarrow U\}$ be a covering of $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, Z_i, y_i, x_i, \alpha_i)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ lying over U_i , and let $\varphi_{ij} : \text{pr}_0^*\xi_i \rightarrow \text{pr}_1^*\xi_j$ be a descent datum. First, observe that φ_{ij} induces a descent datum $(Z_i/U_i, \varphi_{ij})$ which is effective by Descent, Lemma 34.33.1 This produces a scheme Z/U which is finite locally free of degree d by Descent, Lemma 34.19.28. From now on we identify Z_i with $Z \times_U U_i$. Next, the objects y_i in the fibre categories \mathcal{Y}_{U_i} descend to an object y in \mathcal{Y}_U because \mathcal{Y} is a

³ This means the data gives rise, via the 2-Yoneda lemma (Categories, Lemma 4.39.1), to a 2-commutative diagram

$$\begin{array}{ccc} (Sch/Z)_{fppf} & \xrightarrow{x} & \mathcal{X} \\ \downarrow & & \downarrow F \\ (Sch/U)_{fppf} & \xrightarrow{y} & \mathcal{Y} \end{array}$$

of stacks in groupoids over $(Sch/S)_{fppf}$. Alternatively, we may picture α as a 2-morphism

$$(Sch/Z)_{fppf} \begin{array}{c} \xrightarrow{y \circ (Z \rightarrow U)} \\ \Downarrow \alpha \\ \xrightarrow{F \circ x} \end{array} \mathcal{Y}.$$

stack in groupoids. Similarly the objects x_i in the fibre categories \mathcal{X}_{Z_i} descend to an object x in \mathcal{X}_Z because \mathcal{X} is a stack in groupoids. Finally, the given isomorphisms

$$\alpha_i : (y|_Z)_{Z_i} = y_i|_{Z_i} \longrightarrow F(x_i) = F(x|_{Z_i})$$

glue to a morphism $\alpha : y|_Z \rightarrow F(x)$ as the \mathcal{Y} is a stack and hence $Isom_{\mathcal{Y}}(y|_Z, F(x))$ is a sheaf. Details omitted. \square

Definition 72.17.2. We will denote $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ the *degree d finite Hilbert stack of \mathcal{X} over \mathcal{Y}* constructed above. If $\mathcal{Y} = S$ we write $\mathcal{H}_d(\mathcal{X}) = \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. If $\mathcal{X} = \mathcal{Y} = S$ we denote it \mathcal{H}_d .

Note that given $F : \mathcal{X} \rightarrow \mathcal{Y}$ as above we have the following natural 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$:

$$(72.17.2.1) \quad \begin{array}{ccc} \mathcal{H}_d(\mathcal{X}) & \longleftarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) & \longrightarrow \mathcal{Y} \\ & \searrow & \downarrow \\ & & \mathcal{H}_d \end{array}$$

Each of the arrows is given by a "forgetful functor".

Lemma 72.17.3. *The 1-morphism $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X})$ is faithful.*

Proof. To check that $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X})$ is faithful it suffices to prove that it is faithful on fibre categories. Suppose that $\xi = (U, Z, y, x, \alpha)$ and $\xi' = (U, Z', y', x', \alpha')$ are two objects of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over the scheme U . Let $(g, b, a), (g', b', a') : \xi \rightarrow \xi'$ be two morphisms in the fibre category of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U . The image of these morphisms in $\mathcal{H}_d(\mathcal{X})$ agree if and only if $g = g'$ and $a = a'$. Then the commutative diagram

$$\begin{array}{ccc} y|_Z & \xrightarrow{\alpha} & F(x) \\ b|_Z, b'|_Z \downarrow & & \downarrow F(a)=F(a') \\ y'|_Z & \xrightarrow{\alpha'} & F(g^*x') = F((g')^*x') \end{array}$$

implies that $b|_Z = b'|_Z$. Since $Z \rightarrow U$ is finite locally free of degree d we see $\{Z \rightarrow U\}$ is an fppf covering, hence $b = b'$. \square

Sheaves on Algebraic Stacks

73.1. Introduction

There is a myriad of ways to think about sheaves on algebraic stacks. In this chapter we discuss one approach, which is particularly well adapted to our foundations for algebraic stacks. Whenever we introduce a type of sheaves we will indicate the precise relationship with similar notions in the literature. The goal of this chapter is to state those results that are either obviously true or straightforward to prove and leave more intricate constructions till later.

In fact, it turns out that to develop a fully fledged theory of constructible étale sheaves and/or an adequate discussion of derived categories of complexes \mathcal{O} -modules whose cohomology sheaves are quasi-coherent takes a significant amount of work, see [Ols07b]. We will return to this in Cohomology of Stacks, Section 79.1.

In the literature and in research papers on sheaves on algebraic stacks the lisse-étale site of an algebraic stack often plays a prominent role. However, it is a problematic beast, because it turns out that a morphism of algebraic stacks does not induce a morphism of lisse-étale topoi. We have therefore made the design decision to avoid any mention of the lisse-étale site as long as possible. Arguments that traditionally use the lisse-étale site will be replaced by an argument using a Čech covering in the site \mathcal{X}_{smooth} defined below.

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 76.1 for an explanation.

73.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 71.2. For convenience we repeat them here.

We work in a suitable big fppf site Sch_{fppf} as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf} . We record what changes if you change the big fppf site elsewhere (insert future reference here).

We will always work relative to a base S contained in Sch_{fppf} . And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S = \text{Spec}(\mathbf{Z})$.

73.3. Presheaves

In this section we define presheaves on categories fibred in groupoids over $(Sch/S)_{fppf}$, but most of the discussion works for categories over any base category. This section also serves to introduce the notation we will use later on.

Definition 73.3.1. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids.

- (1) A *presheaf on \mathcal{X}* is a presheaf on the underlying category of \mathcal{X} .
- (2) A *morphism of presheaves on \mathcal{X}* is a morphism of presheaves on the underlying category of \mathcal{X} .

We denote $PSh(\mathcal{X})$ the category of presheaves on \mathcal{X} .

This defines presheaves of sets. Of course we can also talk about presheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of *abelian presheaves*, i.e., presheaves of abelian groups, is denoted $PAb(\mathcal{X})$.

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Recall that this means just that f is a functor over $(Sch/S)_{fppf}$. The material in Sites, Section 7.18 provides us with a pair of adjoint functors¹

$$(73.3.1.1) \quad f^p : PSh(\mathcal{Y}) \longrightarrow PSh(\mathcal{X}) \quad \text{and} \quad {}_p f : PSh(\mathcal{X}) \longrightarrow PSh(\mathcal{Y}).$$

The adjointness is

$$\text{Mor}_{PSh(\mathcal{X})}(f^p \mathcal{G}, \mathcal{F}) = \text{Mor}_{PSh(\mathcal{Y})}(\mathcal{G}, {}_p f \mathcal{F})$$

where $\mathcal{F} \in \text{Ob}(PSh(\mathcal{X}))$ and $\mathcal{G} \in \text{Ob}(PSh(\mathcal{Y}))$. We call $f^p \mathcal{G}$ the *pullback* of \mathcal{G} . It follows from the definitions that

$$f^p \mathcal{G}(x) = \mathcal{G}(f(x))$$

for any $x \in \text{Ob}(\mathcal{X})$. The presheaf ${}_p f \mathcal{F}$ is called the *pushforward* of \mathcal{F} . It is described by the formula

$$({}_p f \mathcal{F})(y) = \lim_{f(x) \rightarrow y} \mathcal{F}(x).$$

The rest of this section should probably be moved to the chapter on sites and in any case should be skipped on a first reading.

Lemma 73.3.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Then $(g \circ f)^p = f^p \circ g^p$ and there is a canonical isomorphism ${}_p(g \circ f) \rightarrow {}_p g \circ {}_p f$ compatible with with adjointness of $(f^p, {}_p f)$, $(g^p, {}_p g)$, and $((g \circ f)^p, {}_p(g \circ f))$.*

Proof. Let \mathcal{H} be a presheaf on \mathcal{Z} . Then $(g \circ f)^p \mathcal{H} = f^p(g^p \mathcal{H})$ is given by the equalities

$$(g \circ f)^p \mathcal{H}(x) = \mathcal{H}((g \circ f)(x)) = \mathcal{H}(g(f(x))) = f^p(g^p \mathcal{H})(x).$$

We omit the verification that this is compatible with restriction maps.

Next, we define the transformation ${}_p(g \circ f) \rightarrow {}_p g \circ {}_p f$. Let \mathcal{F} be a presheaf on \mathcal{X} . If z is an object of \mathcal{Z} then we get a category \mathcal{J} of quadruples $(x, f(x) \rightarrow y, y, g(y) \rightarrow z)$ and a category \mathcal{I} of pairs $(x, g(f(x)) \rightarrow z)$. There is a canonical functor $\mathcal{J} \rightarrow \mathcal{I}$

¹These functors will be denoted f^{-1} and f_* after Lemma 73.4.4 has been proved.

sending the object $(x, \alpha : f(x) \rightarrow y, y, \beta : g(y) \rightarrow z)$ to $(x, \beta \circ f(\alpha) : g(f(x)) \rightarrow z)$. This gives the arrow in

$$\begin{aligned} ({}_p(g \circ f)\mathcal{F})(z) &= \lim_{g(f(x)) \rightarrow z} \mathcal{F}(x) \\ &= \lim_{\mathcal{I}} \mathcal{F} \\ &\rightarrow \lim_{\mathcal{J}} \mathcal{F} \\ &= \lim_{g(y) \rightarrow z} \left(\lim_{f(x) \rightarrow y} \mathcal{F}(x) \right) \\ &= ({}_p g \circ {}_p f \mathcal{F})(x) \end{aligned}$$

by Categories, Lemma 4.14.8. We omit the verification that this is compatible with restriction maps. An alternative to this direct construction is to define ${}_p(g \circ f) \cong {}_p g \circ {}_p f$ as the unique map compatible with the adjointness properties. This also has the advantage that one does not need to prove the compatibility.

Compatibility with adjointness of $(f^p, {}_p f)$, $(g^p, {}_p g)$, and $((g \circ f)^p, {}_p(g \circ f))$ means that given presheaves \mathcal{H} and \mathcal{F} as above we have a commutative diagram

$$\begin{array}{ccccc} \text{Mor}_{\text{PSh}(\mathcal{X})}(f^p g^p \mathcal{H}, \mathcal{F}) & \xlongequal{\quad} & \text{Mor}_{\text{PSh}(\mathcal{Y})}(g^p \mathcal{H}, {}_p f \mathcal{F}) & \xlongequal{\quad} & \text{Mor}_{\text{PSh}(\mathcal{Y})}(\mathcal{H}, {}_p g {}_p f \mathcal{F}) \\ \parallel & & & & \uparrow \\ \text{Mor}_{\text{PSh}(\mathcal{X})}((g \circ f)^p \mathcal{G}, \mathcal{F}) & \xlongequal{\quad} & & \xlongequal{\quad} & \text{Mor}_{\text{PSh}(\mathcal{Y})}(\mathcal{G}, {}_p(g \circ f)\mathcal{F}) \end{array}$$

Proof omitted. \square

Lemma 73.3.3. *Let $f, g : \mathcal{X} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Let $t : f \rightarrow g$ be a 2-morphism of categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Assigned to t there are canonical isomorphisms of functors*

$$t^p : g^p \longrightarrow f^p \quad \text{and} \quad {}_p t : {}_p f \longrightarrow {}_p g$$

which compatible with adjointness of $(f^p, {}_p f)$ and $(g^p, {}_p g)$ and with vertical and horizontal composition of 2-morphisms.

Proof. Let \mathcal{G} be a presheaf on \mathcal{Y} . Then $t^p : g^p \mathcal{G} \rightarrow f^p \mathcal{G}$ is given by the family of maps

$$g^p \mathcal{G}(x) = \mathcal{G}(g(x)) \xrightarrow{\mathcal{G}(t_x)} \mathcal{G}(f(x)) = f^p \mathcal{G}(x)$$

parametrized by $x \in \text{Ob}(\mathcal{X})$. This makes sense as $t_x : f(x) \rightarrow g(x)$ and \mathcal{G} is a contravariant functor. We omit the verification that this is compatible with restriction mappings.

To define the transformation ${}_p t$ for $y \in \text{Ob}(\mathcal{Y})$ define ${}_y^f \mathcal{I}$, resp. ${}_y^g \mathcal{I}$ to be the category of pairs $(x, \psi : f(x) \rightarrow y)$, resp. $(x, \psi : g(x) \rightarrow y)$, see Sites, Section 7.18. Note that t defines a functor ${}_y t : {}_y^g \mathcal{I} \rightarrow {}_y^f \mathcal{I}$ given by the rule

$$(x, g(x) \rightarrow y) \mapsto (x, f(x) \xrightarrow{t_x} g(x) \rightarrow y).$$

Note that for \mathcal{F} a presheaf on \mathcal{X} the composition of ${}_y t$ with $\mathcal{F} : {}_y^f \mathcal{I}^{opp} \rightarrow \text{Sets}$, $(x, f(x) \rightarrow y) \mapsto \mathcal{F}(x)$ is equal to $\mathcal{F} : {}_y^g \mathcal{I}^{opp} \rightarrow \text{Sets}$. Hence by Categories, Lemma 4.14.8 we get for every $y \in \text{Ob}(\mathcal{Y})$ a canonical map

$$({}_p f \mathcal{F})(y) = \lim_{{}_y^f \mathcal{I}} \mathcal{F} \longrightarrow \lim_{{}_y^g \mathcal{I}} \mathcal{F} = ({}_p g \mathcal{F})(y)$$

We omit the verification that this is compatible with restriction mappings. An alternative to this direct construction is to define ${}_p t$ as the unique map compatible

with the adjointness properties of the pairs $(f^p, {}_p f)$ and $(g^p, {}_p g)$ (see below). This also has the advantage that one does not need to prove the compatibility.

Compatibility with adjointness of $(f^p, {}_p f)$ and $(g^p, {}_p g)$ means that given presheaves \mathcal{G} and \mathcal{F} as above we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Mor}_{\mathrm{PSh}(\mathcal{X})}(f^p \mathcal{G}, \mathcal{F}) & \xlongequal{\quad} & \mathrm{Mor}_{\mathrm{PSh}(\mathcal{Y})}(\mathcal{G}, {}_p f \mathcal{F}) \\ \downarrow \scriptstyle - \circ t^p & & \downarrow \scriptstyle {}_p t \circ - \\ \mathrm{Mor}_{\mathrm{PSh}(\mathcal{X})}(g^p \mathcal{G}, \mathcal{F}) & \xlongequal{\quad} & \mathrm{Mor}_{\mathrm{PSh}(\mathcal{Y})}(\mathcal{G}, {}_p g \mathcal{F}) \end{array}$$

Proof omitted. Hint: Work through the proof of Sites, Lemma 7.18.2 and observe the compatibility from the explicit description of the horizontal and vertical maps in the diagram.

We omit the verification that this is compatible with vertical and horizontal compositions. Hint: The proof of this for t^p is straightforward and one can conclude that this holds for the ${}_p t$ maps using compatibility with adjointness. \square

73.4. Sheaves

We first make an observation that is important and trivial (especially for those readers who do not worry about set theoretical issues).

Consider a big fppf site Sch_{fppf} as in Topologies, Definition 33.7.6 and denote its underlying category Sch_α . Besides being the underlying category of a fppf site, the category Sch_α can also serve as the underlying category for a big Zariski site, a big étale site, a big smooth site, and a big syntomic site, see Topologies, Remark 33.9.1. We denote these sites Sch_{Zar} , $Sch_{\acute{e}tale}$, Sch_{smooth} , and $Sch_{syntomic}$. In this situation, since we have defined the big Zariski site $(Sch/S)_{Zar}$ of S , the big étale site $(Sch/S)_{\acute{e}tale}$ of S , the big smooth site $(Sch/S)_{smooth}$ of S , the big syntomic site $(Sch/S)_{syntomic}$ of S , and the big fppf site $(Sch/S)_{fppf}$ of S as the localizations (see Sites, Section 7.24) Sch_{Zar}/S , $Sch_{\acute{e}tale}/S$, Sch_{smooth}/S , $Sch_{syntomic}/S$, and Sch_{fppf}/S of these (absolute) big sites we see that all of these have the same underlying category, namely Sch_α/S .

It follows that if we have a category $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ fibred in groupoids, then \mathcal{X} inherits a Zariski, étale, smooth, syntomic, and fppf topology, see Stacks, Definition 8.10.2.

Definition 73.4.1. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$.

- (1) The *associated Zariski site*, denoted \mathcal{X}_{Zar} , is the structure of site on \mathcal{X} inherited from $(Sch/S)_{Zar}$.
- (2) The *associated étale site*, denoted $\mathcal{X}_{\acute{e}tale}$, is the structure of site on \mathcal{X} inherited from $(Sch/S)_{\acute{e}tale}$.
- (3) The *associated smooth site*, denoted \mathcal{X}_{smooth} , is the structure of site on \mathcal{X} inherited from $(Sch/S)_{smooth}$.
- (4) The *associated syntomic site*, denoted $\mathcal{X}_{syntomic}$, is the structure of site on \mathcal{X} inherited from $(Sch/S)_{syntomic}$.
- (5) The *associated fppf site*, denoted \mathcal{X}_{fppf} , is the structure of site on \mathcal{X} inherited from $(Sch/S)_{fppf}$.

This definition makes sense by the discussion above. If \mathcal{X} is an algebraic stack, the literature calls \mathcal{X}_{fppf} (or a site equivalent to it) the *big fppf site* of \mathcal{X} and similarly for the other ones. We may occasionally use this terminology to distinguish this construction from others.

Remark 73.4.2. We only use this notation when the symbol \mathcal{X} refers to a category fibred in groupoids, and not a scheme, an algebraic space, etc. In this way we will avoid confusion with the small étale site of a scheme, or algebraic space which is denoted $X_{\acute{e}tale}$ (in which case we use a roman capital instead of a calligraphic one).

Now that we have these topologies defined we can say what it means to have a sheaf on \mathcal{X} , i.e., define the corresponding topoi.

Definition 73.4.3. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{F} be a presheaf on \mathcal{X} .

- (1) We say \mathcal{F} is a *Zariski sheaf*, or a *sheaf for the Zariski topology* if \mathcal{F} is a sheaf on the associated Zariski site \mathcal{X}_{Zar} .
- (2) We say \mathcal{F} is an *étale sheaf*, or a *sheaf for the étale topology* if \mathcal{F} is a sheaf on the associated étale site $\mathcal{X}_{\acute{e}tale}$.
- (3) We say \mathcal{F} is a *smooth sheaf*, or a *sheaf for the smooth topology* if \mathcal{F} is a sheaf on the associated smooth site \mathcal{X}_{smooth} .
- (4) We say \mathcal{F} is a *syntomic sheaf*, or a *sheaf for the syntomic topology* if \mathcal{F} is a sheaf on the associated syntomic site $\mathcal{X}_{syntomic}$.
- (5) We say \mathcal{F} is an *fppf sheaf*, or a *sheaf for the fppf topology* if \mathcal{F} is a sheaf on the associated fppf site \mathcal{X}_{fppf} .

A morphism of sheaves is just a morphism of presheaves. We denote these categories of sheaves $Sh(\mathcal{X}_{Zar})$, $Sh(\mathcal{X}_{\acute{e}tale})$, $Sh(\mathcal{X}_{smooth})$, $Sh(\mathcal{X}_{syntomic})$, and $Sh(\mathcal{X}_{fppf})$.

Of course we can also talk about sheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of *abelian sheaves*, i.e., sheaves of abelian groups, is denoted $Ab(\mathcal{X}_{fppf})$ and similarly for the other topologies. If \mathcal{X} is an algebraic stack, then $Sh(\mathcal{X}_{fppf})$ is equivalent (modulo set theoretical problems) to what in the literature would be termed the *category of sheaves on the big fppf site of \mathcal{X}* . Similar for other topologies. We may occasionally use this terminology to distinguish this construction from others.

Since the topologies are listed in increasing order of strength we have the following strictly full inclusions

$$Sh(\mathcal{X}_{fppf}) \subset Sh(\mathcal{X}_{syntomic}) \subset Sh(\mathcal{X}_{smooth}) \subset Sh(\mathcal{X}_{\acute{e}tale}) \subset Sh(\mathcal{X}_{Zar}) \subset PSh(\mathcal{X})$$

We sometimes write $Sh(\mathcal{X}_{fppf}) = Sh(\mathcal{X})$ and $Ab(\mathcal{X}_{fppf}) = Ab(\mathcal{X})$ in accordance with our terminology that a sheaf on \mathcal{X} is an fppf sheaf on \mathcal{X} .

With this setup functoriality of these topoi is straightforward, and moreover, is compatible with the inclusion functors above.

Lemma 73.4.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. The functors $_p f$ and f^p of (73.3.1.1) transform τ sheaves into τ sheaves and define a morphism of topoi $f : Sh(\mathcal{X}_\tau) \rightarrow Sh(\mathcal{Y}_\tau)$.*

Proof. This follows immediately from Stacks, Lemma 8.10.3. □

In other words, pushforward and pullback of presheaves as defined in Section 73.3 also produces *pushforward* and *pullback* of τ -sheaves. Having said all of the above we see that we can write $f^p = f^{-1}$ and ${}_p f = f_*$ without any possibility of confusion.

Definition 73.4.5. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. We denote

$$f = (f^{-1}, f_*) : Sh(\mathcal{X}_{fppf}) \longrightarrow Sh(\mathcal{Y}_{fppf})$$

the *associated morphism of fppf topoi* constructed above. Similarly for the associated Zariski, étale, smooth, and syntomic topoi.

As discussed in Sites, Section 7.43 the same formula (on the underlying sheaf of sets) defines pushforward and pullback for sheaves (for one of our topologies) of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc.

73.5. Computing pushforward

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{F} be a presheaf on \mathcal{X} . Let $y \in \text{Ob}(\mathcal{Y})$. We can compute $f_*\mathcal{F}(y)$ in the following way. Suppose that y lies over the scheme V and using the 2-Yoneda lemma think of y as a 1-morphism. Consider the projection

$$\text{pr} : (Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X}$$

Then we have a canonical identification

$$(73.5.0.1) \quad f_*\mathcal{F}(y) = \Gamma\left((Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{F}\right)$$

Namely, objects of the 2-fibre product are triples $(h : U \rightarrow V, x, f(x) \rightarrow h^*y)$. Dropping the h from the notation we see that this is equivalent to the data of an object x of \mathcal{X} and a morphism $\alpha : f(x) \rightarrow y$ of \mathcal{Y} . Since $f_*\mathcal{F}(y) = \lim_{f(x) \rightarrow y} \mathcal{F}(x)$ by definition the equality follows.

As a consequence we have the following “base change” result for pushforwards. This result is trivial and hinges on the fact that we are using “big” sites.

Lemma 73.5.1. *Let S be a scheme. Let*

$$\begin{array}{ccc} \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \xrightarrow{g} & \mathcal{Y} \end{array}$$

be a 2-cartesian diagram of categories fibred in groupoids over S . Then we have a canonical isomorphism

$$g^{-1}f_*\mathcal{F} \longrightarrow f'_*(g')^{-1}\mathcal{F}$$

functorial in the presheaf \mathcal{F} on \mathcal{X} .

Proof. Given an object y' of \mathcal{Y}' over V there is an equivalence

$$(Sch/V)_{fppf} \times_{g(y'), \mathcal{Y}} \mathcal{X} = (Sch/V)_{fppf} \times_{y', \mathcal{Y}'} (\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X})$$

Hence by (73.5.0.1) a bijection $g^{-1}f_*\mathcal{F}(y') \rightarrow f'_*(g')^{-1}\mathcal{F}(y')$. We omit the verification that this is compatible with restriction mappings. \square

In the case of a representable morphism of categories fibred in groupoids this formula (73.5.0.1) simplifies. We suggest the reader skip the rest of this section.

Lemma 73.5.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The following are equivalent*

- (1) *f is representable, and*
- (2) *for every $y \in \text{Ob}(\mathcal{Y})$ the functor $\mathcal{X}^{opp} \rightarrow \text{Sets}, x \mapsto \text{Mor}_{\mathcal{Y}}(f(x), y)$ is representable.*

Proof. According to the discussion in Algebraic Stacks, Section 71.6 we see that f is representable if and only if for every $y \in \text{Ob}(\mathcal{Y})$ lying over U the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable, i.e., of the form $(Sch/V_y)_{fppf}$ for some scheme V_y over U . Objects in this 2-fibre products are triples $(h : V \rightarrow U, x, \alpha : f(x) \rightarrow h^*y)$ where α lies over id_V . Dropping the h from the notation we see that this is equivalent to the data of an object x of \mathcal{X} and a morphism $f(x) \rightarrow y$. Hence the 2-fibre product is representable by V_y and $f(x_y) \rightarrow y$ where x_y is an object of \mathcal{X} over V_y if and only if the functor in (2) is representable by x_y with universal object a map $f(x_y) \rightarrow y$. \square

Let

$$\begin{array}{ccc}
 \mathcal{X} & \xrightarrow{\quad f \quad} & \mathcal{Y} \\
 & \searrow p \quad \swarrow q & \\
 & (Sch/S)_{fppf} &
 \end{array}$$

be a 1-morphism of categories fibred in groupoids. Assume f is representable. For every $y \in \text{Ob}(\mathcal{Y})$ we choose an object $u(y) \in \text{Ob}(\mathcal{X})$ representing the functor $x \mapsto \text{Mor}_{\mathcal{Y}}(f(x), y)$ of Lemma 73.5.2 (this is possible by the axiom of choice). The objects come with canonical morphisms $f(u(y)) \rightarrow y$ by construction. For every morphism $\beta : y' \rightarrow y$ in \mathcal{Y} we obtain a unique morphism $u(\beta) : u(y') \rightarrow u(y)$ in \mathcal{X} such that the diagram

$$\begin{array}{ccc}
 f(u(y')) & \xrightarrow{\quad f(u(\beta)) \quad} & f(u(y)) \\
 \downarrow & & \downarrow \\
 y' & \xrightarrow{\quad \quad \quad} & y
 \end{array}$$

commutes. In other words, $u : \mathcal{Y} \rightarrow \mathcal{X}$ is a functor. In fact, we can say a little bit more. Namely, suppose that $V' = q(y')$, $V = q(y)$, $U' = p(u(y'))$ and $U = p(u(y))$. Then

$$\begin{array}{ccc}
 U' & \xrightarrow{\quad \quad \quad} & U \\
 \downarrow & \quad p(u(\beta)) \quad & \downarrow \\
 V' & \xrightarrow{\quad q(\beta) \quad} & V
 \end{array}$$

is a fibre product square. This is true because $U' \rightarrow U$ represents the base change $(Sch/V')_{fppf} \times_{y', \mathcal{Y}} \mathcal{X} \rightarrow (Sch/U)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ of $V' \rightarrow V$.

Lemma 73.5.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a representable 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Then the functor $u : \mathcal{Y}_{\tau} \rightarrow \mathcal{X}_{\tau}$ is continuous and defines a morphism of sites $\mathcal{X}_{\tau} \rightarrow \mathcal{Y}_{\tau}$ which induces the same morphism of topoi $Sh(\mathcal{X}_{\tau}) \rightarrow Sh(\mathcal{Y}_{\tau})$ as the*

morphism f constructed in Lemma 73.4.4. Moreover, $f_*\mathcal{F}(y) = \mathcal{F}(u(y))$ for any presheaf \mathcal{F} on \mathcal{X} .

Proof. Let $\{y_i \rightarrow y\}$ be a τ -covering in \mathcal{Y} . By definition this simply means that $\{q(y_i) \rightarrow q(y)\}$ is a τ -covering of schemes. By the final remark above the lemma we see that $\{p(u(y_i)) \rightarrow p(u(y))\}$ is the base change of the τ -covering $\{q(y_i) \rightarrow q(y)\}$ by $p(u(y)) \rightarrow q(y)$, hence is itself a τ -covering by the axioms of a site. Hence $\{u(y_i) \rightarrow u(y)\}$ is a τ -covering of \mathcal{X} . This proves that u is continuous.

Let's use the notation u_p, u_s, u^p, u^s of Sites, Sections 7.5 and 7.14. If we can show the final assertion of the lemma, then we see that $f_* = u^p = u^s$ (by continuity of u seen above) and hence by adjointness $f^{-1} = u_s$ which will prove u_s is exact, hence that u determines a morphism of sites, and the equality will be clear as well. To see that $f_*\mathcal{F}(y) = \mathcal{F}(u(y))$ note that by definition

$$f_*\mathcal{F}(y) = ({}_p f_*\mathcal{F})(y) = \lim_{f(x) \rightarrow y} \mathcal{F}(x).$$

Since $u(y)$ is a final object in the category the limit is taken over we conclude. \square

73.6. The structure sheaf

Let $\tau \in \{\text{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$. Let $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ be a category fibred in groupoids. The 2-category of categories fibred in groupoids over $(\text{Sch}/S)_{\text{fppf}}$ has a final object, namely, $\text{id} : (\text{Sch}/S)_{\text{fppf}} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ and p is a 1-morphism from \mathcal{X} to this final object. Hence any presheaf \mathcal{G} on $(\text{Sch}/S)_{\text{fppf}}$ gives a presheaf $p^{-1}\mathcal{G}$ on \mathcal{X} defined by the rule $p^{-1}\mathcal{G}(x) = \mathcal{G}(p(x))$. Moreover, the discussion in Section 73.4 shows that $p^{-1}\mathcal{G}$ is a τ sheaf whenever \mathcal{G} is a τ -sheaf.

Recall that the site $(\text{Sch}/S)_{\text{fppf}}$ is a ringed site with structure sheaf \mathcal{O} defined by the rule

$$(\text{Sch}/S)^{\text{opp}} \longrightarrow \text{Rings}, \quad U/S \longmapsto \Gamma(U, \mathcal{O}_U)$$

see Descent, Definition 34.7.2.

Definition 73.6.1. Let $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ be a category fibred in groupoids. The *structure sheaf of \mathcal{X}* is the sheaf of rings $\mathcal{O}_{\mathcal{X}} = p^{-1}\mathcal{O}$.

For an object x of \mathcal{X} lying over U we have $\mathcal{O}_{\mathcal{X}}(x) = \mathcal{O}(U) = \Gamma(U, \mathcal{O}_U)$. Needless to say $\mathcal{O}_{\mathcal{X}}$ is also a Zariski, étale, smooth, and syntomic sheaf, and hence each of the sites $\mathcal{X}_{\text{Zar}}, \mathcal{X}_{\text{étale}}, \mathcal{X}_{\text{smooth}}, \mathcal{X}_{\text{syntomic}}$, and $\mathcal{X}_{\text{fppf}}$ is a ringed site. This construction is functorial as well.

Lemma 73.6.2. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. Let $\tau \in \{\text{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$. There is a canonical identification $f^{-1}\mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{Y}}$ which turns $f : \text{Sh}(\mathcal{X}_{\tau}) \rightarrow \text{Sh}(\mathcal{Y}_{\tau})$ into a morphism of ringed topoi.

Proof. Denote $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ and $q : \mathcal{Y} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ the structural functors. Then $q = p \circ f$, hence $q^{-1} = f^{-1} \circ p^{-1}$ by Lemma 73.3.2. The result follows. \square

Remark 73.6.3. In the situation of Lemma 73.6.2 the morphism of ringed topoi $f : \text{Sh}(\mathcal{X}_{\tau}) \rightarrow \text{Sh}(\mathcal{Y}_{\tau})$ is flat as is clear from the equality $f^{-1}\mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{Y}}$. This is a bit counter intuitive, for example because a closed immersion of algebraic stacks is typically not flat (as a morphism of algebraic stacks). However, exactly the same

thing happens when taking a closed immersion $i : X \rightarrow Y$ of schemes: in this case the associated morphism of big τ -sites $i : (Sch/X)_\tau \rightarrow (Sch/Y)_\tau$ also is flat.

73.7. Sheaves of modules

Since we have a structure sheaf we have modules.

Definition 73.7.1. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$.

- (1) A *presheaf of modules on \mathcal{X}* is a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. The category of presheaves of modules is denoted $PMod(\mathcal{O}_{\mathcal{X}})$.
- (2) We say a presheaf of modules \mathcal{F} is an $\mathcal{O}_{\mathcal{X}}$ -*module*, or more precisely a *sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules* if \mathcal{F} is an fppf sheaf. The category of $\mathcal{O}_{\mathcal{X}}$ -modules is denoted $Mod(\mathcal{O}_{\mathcal{X}})$.

These (pre)sheaves of modules occur in the literature as (*pre*)*sheaves of $\mathcal{O}_{\mathcal{X}}$ -modules on the big fppf site of \mathcal{X}* . We will occasionally use this terminology if we want to distinguish these categories from others. We will also encounter presheaves of modules which are sheaves in the Zariski, étale, smooth, or syntomic topologies (without necessarily being sheaves). If need be these will be denoted $Mod(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ and similarly for the other topologies.

Next, we address functoriality – first for presheaves of modules. Let

$$\begin{array}{ccc} \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \\ & \searrow p & \swarrow q \\ & (Sch/S)_{fppf} & \end{array}$$

be a 1-morphism of categories fibred in groupoids. The functors f^{-1}, f_* on abelian presheaves extend to functors

$$(73.7.1.1) \quad f^{-1} : PMod(\mathcal{O}_{\mathcal{Y}}) \longrightarrow PMod(\mathcal{O}_{\mathcal{X}}) \quad \text{and} \quad f_* : PMod(\mathcal{O}_{\mathcal{Y}}) \longrightarrow PMod(\mathcal{O}_{\mathcal{X}})$$

This is immediate for f^{-1} because $f^{-1}\mathcal{G}(x) = \mathcal{G}(f(x))$ which is a module over $\mathcal{O}_{\mathcal{Y}}(f(x)) = \mathcal{O}(q(f(x))) = \mathcal{O}(p(x)) = \mathcal{O}_{\mathcal{X}}(x)$. Alternatively it follows because $f^{-1}\mathcal{O}_{\mathcal{Y}} = \mathcal{O}_{\mathcal{X}}$ and because f^{-1} commutes with limits (on presheaves). Since f_* is a right adjoint it commutes with all limits (on presheaves) in particular products. Hence we can extend f_* to a functor on presheaves of modules as in the proof of Modules on Sites, Lemma 18.12.1. We claim that the functors (73.7.1.1) form an adjoint pair of functors:

$$\text{Mor}_{PMod(\mathcal{O}_{\mathcal{X}})}(f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{PMod(\mathcal{O}_{\mathcal{Y}})}(\mathcal{G}, f_*\mathcal{F}).$$

As $f^{-1}\mathcal{O}_{\mathcal{Y}} = \mathcal{O}_{\mathcal{X}}$ this follows from Modules on Sites, Lemma 18.12.3 by endowing \mathcal{X} and \mathcal{Y} with the chaotic topology.

Next, we discuss functoriality for modules, i.e., for sheaves of modules in the fppf topology. Denote by f also the induced morphism of ringed topoi, see Lemma 73.6.2 (for the fppf topologies right now). Note that the functors f^{-1} and f_* of (73.7.1.1) preserve the subcategories of sheaves of modules, see Lemma 73.4.4. Hence it follows immediately that

$$(73.7.1.2) \quad f^{-1} : Mod(\mathcal{O}_{\mathcal{Y}}) \longrightarrow Mod(\mathcal{O}_{\mathcal{X}}) \quad \text{and} \quad f_* : Mod(\mathcal{O}_{\mathcal{Y}}) \longrightarrow Mod(\mathcal{O}_{\mathcal{X}})$$

form an adjoint pair of functors:

$$\mathrm{Mor}_{\mathrm{Mod}(\mathcal{O}_{\mathcal{X}})}(f^{-1}\mathcal{G}, \mathcal{F}) = \mathrm{Mor}_{\mathrm{Mod}(\mathcal{O}_{\mathcal{Y}})}(\mathcal{G}, f_*\mathcal{F}).$$

By uniqueness of adjoints we conclude that $f^* = f^{-1}$ where f^* is as defined in Modules on Sites, Section 18.13 for the morphism of ringed topoi f above. Of course we could have seen this directly because $f^*(-) = f^{-1}(-) \otimes_{f^{-1}\mathcal{O}_{\mathcal{Y}}} \mathcal{O}_{\mathcal{X}}$ and because $f^{-1}\mathcal{O}_{\mathcal{Y}} = \mathcal{O}_{\mathcal{X}}$.

Similarly for sheaves of modules in the Zariski, étale, smooth, syntomic topology.

73.8. Representable categories

In this short section we compare our definitions with what happens in case the algebraic stacks in question are representable.

Lemma 73.8.1. *Let S be a scheme. Let \mathcal{X} be a category fibred in groupoids over (Sch/S) . Assume \mathcal{X} is representable by a scheme X . For $\tau \in \{\mathrm{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$ there is a canonical equivalence*

$$(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}) = ((\mathrm{Sch}/X)_{\tau}, \mathcal{O}_X)$$

of ringed sites.

Proof. This follows by choosing an equivalence $(\mathrm{Sch}/X)_{\tau} \rightarrow \mathcal{X}$ of categories fibred in groupoids over $(\mathrm{Sch}/S)_{\mathrm{fppf}}$ and using the functoriality of the construction $\mathcal{X} \rightsquigarrow \mathcal{X}_{\tau}$. \square

Lemma 73.8.2. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over S . Assume \mathcal{X}, \mathcal{Y} are representable by schemes X, Y . Let $f : X \rightarrow Y$ be the morphism of schemes corresponding to f . For $\tau \in \{\mathrm{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$ the morphism of ringed topoi $f : (\mathrm{Sh}(\mathcal{X}_{\tau}), \mathcal{O}_{\mathcal{X}}) \rightarrow (\mathrm{Sh}(\mathcal{Y}_{\tau}), \mathcal{O}_{\mathcal{Y}})$ agrees with the morphisms of ringed topoi $f : (\mathrm{Sh}((\mathrm{Sch}/X)_{\tau}), \mathcal{O}_X) \rightarrow (\mathrm{Sh}((\mathrm{Sch}/Y)_{\tau}), \mathcal{O}_Y)$ via the identifications of Lemma 73.8.1.*

Proof. Follows by unwinding the definitions. \square

73.9. Restriction

A trivial but useful observation is that the localization of a category fibred in groupoids at an object is equivalent to the big site of the scheme it lies over.

Lemma 73.9.1. *Let $p : \mathcal{X} \rightarrow (\mathrm{Sch}/S)_{\mathrm{fppf}}$ be a category fibred in groupoids. Let $\tau \in \{\mathrm{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$. Let $x \in \mathrm{Ob}(\mathcal{X})$ lying over $U = p(x)$. The functor p induces an equivalence of sites $\mathcal{X}_{\tau}/x \rightarrow (\mathrm{Sch}/U)_{\tau}$.*

Proof. Note that $(\mathrm{Sch}/U)_{\tau}$ is the localization of the site $(\mathrm{Sch}/S)_{\mathrm{fppf}}$ at the object U . It follows from Categories, Definition 4.33.1 that the rule $x'/x \mapsto p(x')/p(x)$ defines an equivalence of categories $\mathcal{X}_{\tau}/x \rightarrow (\mathrm{Sch}/U)_{\tau}$. Whereupon it follows from Stacks, Definition 8.10.2 that coverings of x' in \mathcal{X}_{τ}/x are in bijective correspondence with coverings of $p(x')$ in $(\mathrm{Sch}/U)_{\tau}$. \square

We use the lemma above to talk about the pullback and the restriction of a (pre)sheaf to a scheme.

Definition 73.9.2. Let $p : \mathcal{X} \rightarrow (\mathrm{Sch}/S)_{\mathrm{fppf}}$ be a category fibred in groupoids. Let $x \in \mathrm{Ob}(\mathcal{X})$ lying over $U = p(x)$. Let \mathcal{F} be a presheaf on \mathcal{X} .

- (1) The *pullback* $x^{-1}\mathcal{F}$ of \mathcal{F} is the restriction $\mathcal{F}|_{(\mathcal{X}/x)}$ viewed as a presheaf on $(Sch/U)_{fppf}$ via the equivalence $\mathcal{X}/x \rightarrow (Sch/U)_{fppf}$ of Lemma 73.9.1.
- (2) The *restriction of \mathcal{F} to $U_{\acute{e}tale}$* is $x^{-1}\mathcal{F}|_{U_{\acute{e}tale}}$, abusively written $\mathcal{F}|_{U_{\acute{e}tale}}$.

This notation makes sense because to the object x the 2-Yoneda lemma, see Algebraic Stacks, Section 71.5 associates a 1-morphism $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}/x$ which is quasi-inverse to $p : \mathcal{X}/x \rightarrow (Sch/U)_{fppf}$. Hence $x^{-1}\mathcal{F}$ truly is the pullback of \mathcal{F} via this 1-morphism. In particular, by the material above, if \mathcal{F} is a sheaf (or a Zariski, étale, smooth, syntomic sheaf), then $x^{-1}\mathcal{F}$ is a sheaf on $(Sch/U)_{fppf}$ (or on $(Sch/U)_{Zar}, (Sch/U)_{\acute{e}tale}, (Sch/U)_{smooth}, (Sch/U)_{syntomic}$).

Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\varphi : x \rightarrow y$ be a morphism of \mathcal{X} lying over the morphism of schemes $a : U \rightarrow V$. Recall that a induces a morphism of small étale sites $a_{small} : U_{\acute{e}tale} \rightarrow V_{\acute{e}tale}$, see Étale Cohomology, Section 44.34. Let \mathcal{F} be a presheaf on \mathcal{X} . Let $\mathcal{F}|_{U_{\acute{e}tale}}$ and $\mathcal{F}|_{V_{\acute{e}tale}}$ be the restrictions of \mathcal{F} via x and y . There is a natural *comparison map*

$$(73.9.2.1) \quad c_\varphi : \mathcal{F}|_{V_{\acute{e}tale}} \longrightarrow a_{small,*}(\mathcal{F}|_{U_{\acute{e}tale}})$$

of presheaves on $U_{\acute{e}tale}$. Namely, if $V' \rightarrow V$ is étale, set $U' = V' \times_V U$ and define c_φ on sections over V' via

$$\begin{array}{ccc} a_{small,*}(\mathcal{F}|_{U_{\acute{e}tale}})(V') & \equiv & \mathcal{F}|_{U_{\acute{e}tale}}(U') \equiv \mathcal{F}(x') \\ \uparrow c_\varphi & & \uparrow \mathcal{F}(\varphi') \\ \mathcal{F}|_{V_{\acute{e}tale}}(V') & \equiv & \mathcal{F}(y') \end{array}$$

Here $\varphi' : x' \rightarrow y'$ is a morphism of \mathcal{X} fitting into a commutative diagram

$$\begin{array}{ccc} x' & \longrightarrow & x \\ \varphi' \downarrow & & \downarrow \varphi \\ y' & \longrightarrow & y \end{array} \quad \text{lying over} \quad \begin{array}{ccc} U' & \longrightarrow & U \\ \downarrow & & \downarrow a \\ V' & \longrightarrow & V \end{array}$$

The existence and uniqueness of φ' follow from the axioms of a category fibred in groupoids. We omit the verification that c_φ so defined is indeed a map of presheaves (i.e., compatible with restriction mappings) and that it is functorial in \mathcal{F} . In case \mathcal{F} is a sheaf for the étale topology we obtain a *comparison map*

$$(73.9.2.2) \quad c_\varphi : a_{small}^{-1}(\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}}$$

which is also denoted c_φ as indicated (this is the customary abuse of notation in not distinguishing between adjoint maps).

Lemma 73.9.3. *Let \mathcal{F} be an étale sheaf on $\mathcal{X} \rightarrow (Sch/S)_{fppf}$.*

- (1) *If $\varphi : x \rightarrow y$ and $\psi : y \rightarrow z$ are morphisms of \mathcal{X} lying over $a : U \rightarrow V$ and $b : V \rightarrow W$, then the composition*

$$a_{small}^{-1}(b_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}})) \xrightarrow{a_{small}^{-1}c_\psi} a_{small}^{-1}(\mathcal{F}|_{V_{\acute{e}tale}}) \xrightarrow{c_\varphi} \mathcal{F}|_{U_{\acute{e}tale}}$$

is equal to $c_{\psi \circ \varphi}$ via the identification

$$(b \circ a)_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}}) = a_{small}^{-1}(b_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}})).$$

- (2) *If $\varphi : x \rightarrow y$ lies over an étale morphism of schemes $a : U \rightarrow V$, then (73.9.2.2) is an isomorphism.*

- (3) Suppose $f : \mathcal{Y} \rightarrow \mathcal{X}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ and y is an object of \mathcal{Y} lying over the scheme U with image $x = f(y)$. Then there is a canonical identification $f^{-1}\mathcal{F}|_{U_{\acute{e}tale}} = \mathcal{F}|_{U_{\acute{e}tale}}$.
- (4) Moreover, given $\psi : y' \rightarrow y$ in \mathcal{Y} lying over $a : U' \rightarrow U$ the comparison map $c_\psi : a_{small}^{-1}(F^{-1}\mathcal{F}|_{U_{\acute{e}tale}}) \rightarrow F^{-1}\mathcal{F}|_{U'_{\acute{e}tale}}$ is equal to the comparison map $c_{f(\psi)} : a_{small}^{-1}\mathcal{F}|_{U_{\acute{e}tale}} \rightarrow \mathcal{F}|_{U'_{\acute{e}tale}}$ via the identifications in (3).

Proof. The verification of these properties is omitted. □

Next, we turn to the restriction of (pre)sheaves of modules.

Lemma 73.9.4. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let $x \in \text{Ob}(\mathcal{X})$ lying over $U = p(x)$. The equivalence of Lemma 73.9.1 extends to an equivalence of ringed sites $(\mathcal{X}_\tau/x, \mathcal{O}_\mathcal{X}|_x) \rightarrow ((Sch/U)_\tau, \mathcal{O})$.*

Proof. This is immediate from the construction of the structure sheaves. □

Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{F} be a (pre)sheaf of modules on \mathcal{X} as in Definition 73.7.1. Let x be an object of \mathcal{X} lying over U . Then Lemma 73.9.4 guarantees that the restriction $x^{-1}\mathcal{F}$ is a (pre)sheaf of modules on $(Sch/U)_{fppf}$. We will sometimes write $x^*\mathcal{F} = x^{-1}\mathcal{F}$ in this case. Similarly, if \mathcal{F} is a sheaf for the Zariski, étale, smooth, or syntomic topology, then $x^{-1}\mathcal{F}$ is as well. Moreover, the restriction $\mathcal{F}|_{U_{\acute{e}tale}} = x^{-1}\mathcal{F}|_{U_{\acute{e}tale}}$ to U is a presheaf of $\mathcal{O}_{U_{\acute{e}tale}}$ -modules. If \mathcal{F} is a sheaf for the étale topology, then $\mathcal{F}|_{U_{\acute{e}tale}}$ is a sheaf of modules. Moreover, if $\varphi : x \rightarrow y$ is a morphism of \mathcal{X} lying over $a : U \rightarrow V$ then the comparison map (73.9.2.2) is compatible with $a_{small}^\#$ (see Descent, Remark 34.7.4) and induces a comparison map

$$(73.9.4.1) \quad c_\varphi : a_{small}^*(\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}}$$

of $\mathcal{O}_{U_{\acute{e}tale}}$ -modules. Note that the properties (1), (2), (3), and (4) of Lemma 73.9.3 hold in the setting of étale sheaves of modules as well. We will use this in the following without further mention.

Lemma 73.9.5. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. The site \mathcal{X}_τ has enough points.*

Proof. By Sites, Lemma 7.37.5 we have to show that there exists a family of objects x of \mathcal{X} such that \mathcal{X}_τ/x has enough points and such that the sheaves $h_x^\#$ cover the final object of the category of sheaves. By Lemma 73.9.1 and Étale Cohomology, Lemma 44.30.1 we see that \mathcal{X}_τ/x has enough points for every object x and we win. □

73.10. Restriction to algebraic spaces

In this section we consider sheaves on categories representable by algebraic spaces. The following lemma is the analogue of Topologies, Lemma 33.4.13 for algebraic spaces.

Lemma 73.10.1. *Let S be a scheme. Let $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Assume \mathcal{X} is representably by an algebraic space F . Then there exists a continuous and cocontinuous functor $F_{\acute{e}tale} \rightarrow \mathcal{X}_{\acute{e}tale}$ which induces a morphism of ringed sites*

$$\pi_F : (\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X}) \longrightarrow (F_{\acute{e}tale}, \mathcal{O}_F)$$

and a morphism of ringed topoi

$$i_F : (Sh(F_{\acute{e}tale}), \mathcal{O}_F) \longrightarrow (Sh(\mathcal{X}_{\acute{e}tale}), \mathcal{O}_{\mathcal{X}})$$

such that $\pi_F \circ i_F = id$. Moreover $\pi_{F,*} = i_F^{-1}$.

Proof. Choose an equivalence $j : \mathcal{S}_F \rightarrow \mathcal{X}$, see Algebraic Stacks, Sections 71.7 and 71.8. An object of $F_{\acute{e}tale}$ is a scheme U together with an étale morphism $\varphi : U \rightarrow F$. Then φ is an object of \mathcal{S}_F over U . Hence $j(\varphi)$ is an object of \mathcal{X} over U . In this way j induces a functor $u : F_{\acute{e}tale} \rightarrow \mathcal{X}$. It is clear that u is continuous and cocontinuous for the étale topology on \mathcal{X} . Since j is an equivalence, the functor u is fully faithful. Also, fibre products and equalizers exist in $F_{\acute{e}tale}$ and u commutes with them because these are computed on the level of underlying schemes in $F_{\acute{e}tale}$. Thus Sites, Lemmas 7.20.5, 7.20.6, and 7.20.7 apply. In particular u defines a morphism of topoi $i_F : Sh(F_{\acute{e}tale}) \rightarrow Sh(\mathcal{X}_{\acute{e}tale})$ and there exists a left adjoint $i_{F,!}$ of i_F^{-1} which commutes with fibre products and equalizers.

We claim that $i_{F,!}$ is exact. If this is true, then we can define π_F by the rules $\pi_F^{-1} = i_{F,!}$ and $\pi_{F,*} = i_F^{-1}$ and everything is clear. To prove the claim, note that we already know that $i_{F,!}$ is right exact and preserves fibre products. Hence it suffices to show that $i_{F,!} * = *$ where $*$ indicates the final object in the category of sheaves of sets. Let U be a scheme and let $\varphi : U \rightarrow F$ be surjective and étale. Set $R = U \times_F U$. Then

$$h_R \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} h_U \longrightarrow *$$

is a coequalizer diagram in $Sh(F_{\acute{e}tale})$. Using the right exactness of $i_{F,!}$, using $i_{F,!} = (u_p)^\#$, and using Sites, Lemma 7.5.6 we see that

$$h_{u(R)} \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} h_{u(U)} \longrightarrow i_{F,!} *$$

is a coequalizer diagram in $Sh(F_{\acute{e}tale})$. Using that j is an equivalence and that $F = U/R$ it follows that the coequalizer in $Sh(\mathcal{X}_{\acute{e}tale})$ of the two maps $h_{u(R)} \rightarrow h_{u(U)}$ is $*$. We omit the proof that these morphisms are compatible with structure sheaves. \square

Assume \mathcal{X} is an algebraic stack represented by the algebraic space F . Let $j : \mathcal{S}_F \rightarrow \mathcal{X}$ be an equivalence and denote $u : F_{\acute{e}tale} \rightarrow \mathcal{X}_{\acute{e}tale}$ the functor of the proof of Lemma 73.10.1 above. Given a sheaf \mathcal{F} on $\mathcal{X}_{\acute{e}tale}$ we have

$$\pi_{F,*} \mathcal{F}(U) = i_F^{-1} \mathcal{F}(U) = \mathcal{F}(u(U)).$$

This is why we often think of i_F^{-1} as a *restriction functor* similarly to Definition 73.9.2 and to the restriction of a sheaf on the big étale site of a scheme to the small étale site of a scheme. We often use the notation

$$(73.10.1.1) \quad \mathcal{F}|_{F_{\acute{e}tale}} = i_F^{-1} \mathcal{F} = \pi_{F,*} \mathcal{F}$$

in this situation.

Lemma 73.10.2. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume \mathcal{X}, \mathcal{Y} are representable by algebraic spaces F, G . Denote $f : F \rightarrow G$ the induced morphism of algebraic spaces, and*

$f_{small} : F_{\acute{e}tale} \rightarrow G_{\acute{e}tale}$ the corresponding morphism of ringed topoi. Then

$$\begin{array}{ccc} (Sh(\mathcal{X}_{\acute{e}tale}), \mathcal{O}_{\mathcal{X}}) & \xrightarrow{f} & (Sh(\mathcal{Y}_{\acute{e}tale}), \mathcal{O}_{\mathcal{Y}}) \\ \pi_F \downarrow & & \downarrow \pi_G \\ (Sh(F_{\acute{e}tale}), \mathcal{O}_F) & \xrightarrow{f_{small}} & (Sh(G_{\acute{e}tale}), \mathcal{O}_G) \end{array}$$

is a commutative diagram of ringed topoi.

Proof. This is similar to Topologies, Lemma 33.4.16 (3) but there is a small snag due to the fact that $F \rightarrow G$ may not be representable by schemes. In particular we don't get a commutative diagram of ringed sites, but only a commutative diagram of ringed topoi.

Before we start the proof proper, we choose equivalences $j : \mathcal{S}_F \rightarrow \mathcal{X}$ and $j' : \mathcal{S}_G \rightarrow \mathcal{Y}$ which induce functors $u : F_{\acute{e}tale} \rightarrow \mathcal{X}$ and $u' : G_{\acute{e}tale} \rightarrow \mathcal{Y}$ as in the proof of Lemma 73.10.1. Because of the 2-functoriality of sheaves on categories fibred in groupoids over Sch_{fppf} (see discussion in Section 73.3) we may assume that $\mathcal{X} = \mathcal{S}_F$ and $\mathcal{Y} = \mathcal{S}_G$ and that $f : \mathcal{S}_F \rightarrow \mathcal{S}_G$ is the functor associated to the morphism $f : F \rightarrow G$. Correspondingly we will omit u and u' from the notation, i.e., given an object $U \rightarrow F$ of $F_{\acute{e}tale}$ we denote U/F the corresponding object of \mathcal{X} . Similarly for G .

Let \mathcal{G} be a sheaf on $\mathcal{X}_{\acute{e}tale}$. To prove (2) we compute $\pi_{G,*}f_*\mathcal{G}$ and $f_{small,*}\pi_{F,*}\mathcal{G}$. To do this let $V \rightarrow G$ be an object of $G_{\acute{e}tale}$. Then

$$\pi_{G,*}f_*\mathcal{G}(V) = f_*\mathcal{G}(V/G) = \Gamma\left((Sch/V)_{fppf} \times_{\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{G}\right)$$

see (73.5.0.1). The fibre product in the formula is

$$(Sch/V)_{fppf} \times_{\mathcal{Y}} \mathcal{X} = (Sch/V)_{fppf} \times_{\mathcal{S}_G} \mathcal{S}_F = \mathcal{S}_{V \times_G F}$$

i.e., it is the split category fibred in groupoids associated to the algebraic space $V \times_G F$. And $\text{pr}^{-1}\mathcal{G}$ is a sheaf on $\mathcal{S}_{V \times_G F}$ for the étale topology.

In particular, if $V \times_G F$ is representable, i.e., if it is a scheme, then $\pi_{G,*}f_*\mathcal{G}(V) = \mathcal{G}(V \times_G F/F)$ and also

$$f_{small,*}\pi_{F,*}\mathcal{G}(V) = \pi_{F,*}\mathcal{G}(V \times_G F) = \mathcal{G}(V \times_G F/F)$$

which proves the desired equality in this special case.

In general, choose a scheme U and a surjective étale morphism $U \rightarrow V \times_G F$. Set $R = U \times_{V \times_G F} U$. Then $U/V \times_G F$ and $R/V \times_G F$ are objects of the fibre product category above. Since $\text{pr}^{-1}\mathcal{G}$ is a sheaf for the étale topology on $\mathcal{S}_{V \times_G F}$ the diagram

$$\Gamma\left((Sch/V)_{fppf} \times_{\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{G}\right) \longrightarrow \text{pr}^{-1}\mathcal{G}(U/V \times_G F) \rightrightarrows \text{pr}^{-1}\mathcal{G}(R/V \times_G F)$$

is an equalizer diagram. Note that $\text{pr}^{-1}\mathcal{G}(U/V \times_G F) = \mathcal{G}(U/F)$ and $\text{pr}^{-1}\mathcal{G}(R/V \times_G F) = \mathcal{G}(R/F)$ by the definition of pullbacks. Moreover, by the material in Properties of Spaces, Section 48.15 (especially, Properties of Spaces, Remark 48.15.4 and Lemma 48.15.7) we see that there is an equalizer diagram

$$f_{small,*}\pi_{F,*}\mathcal{G}(V) \longrightarrow \pi_{F,*}\mathcal{G}(U/F) \rightrightarrows \pi_{F,*}\mathcal{G}(R/F)$$

Since we also have $\pi_{F,*}\mathcal{G}(U/F) = \mathcal{G}(U/F)$ and $\pi_{F,*}\mathcal{G}(U/F) = \mathcal{G}(U/F)$ we obtain a canonical identification $f_{small,*}\pi_{F,*}\mathcal{G}(V) = \pi_{G,*}f_*\mathcal{G}(V)$. We omit the proof that this is compatible with restriction mappings and that it is functorial in \mathcal{G} . \square

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $f : F \rightarrow G$ be as in the second part of the lemma above. A consequence of the lemma, using (73.10.1.1), is that

$$(73.10.2.1) \quad (f_*\mathcal{F})|_{G_{\acute{e}tale}} = f_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$

for any sheaf \mathcal{F} on $\mathcal{X}_{\acute{e}tale}$. Moreover, if \mathcal{F} is a sheaf of \mathcal{O} -modules, then (73.10.2.1) is an isomorphism of \mathcal{O}_G -modules on $G_{\acute{e}tale}$.

Finally, suppose that we have a 2-commutative diagram

$$\begin{array}{ccc} \mathcal{U} & \xrightarrow{a} & \mathcal{V} \\ & \searrow \varphi & \downarrow g \\ & & \mathcal{X} \end{array}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$, that \mathcal{F} is a sheaf on $\mathcal{X}_{\acute{e}tale}$, and that \mathcal{U}, \mathcal{V} are representable by algebraic spaces U, V . Then we obtain a comparison map

$$(73.10.2.2) \quad c_\varphi : a_{small}^{-1}(g^{-1}\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow f^{-1}\mathcal{F}|_{U_{\acute{e}tale}}$$

where $a : U \rightarrow V$ denotes the morphism of algebraic spaces corresponding to a . This is the analogue of (73.9.2.2). We define c_φ as the adjoint to the map

$$g^{-1}\mathcal{F}|_{V_{\acute{e}tale}} \longrightarrow a_{small,*}(f^{-1}\mathcal{F}|_{U_{\acute{e}tale}}) = (a_*f^{-1}\mathcal{F})|_{V_{\acute{e}tale}}$$

(equality by (73.10.2.1)) which is the restriction to V (73.10.1.1) of the map

$$g^{-1}\mathcal{F} \rightarrow a_*a^{-1}g^{-1}\mathcal{F} = a_*f^{-1}\mathcal{F}$$

where the last equality uses the 2-commutativity of the diagram above. In case \mathcal{F} is a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules c_φ induces a *comparison* map

$$(73.10.2.3) \quad c_\varphi : a_{small}^*(g^*\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow f^*\mathcal{F}|_{U_{\acute{e}tale}}$$

of $\mathcal{O}_{U_{\acute{e}tale}}$ -modules. Note that the properties (1), (2), (3), and (4) of Lemma 73.9.3 hold in this setting as well.

73.11. Quasi-coherent modules

At this point we can apply the general definition of a quasi-coherent module to the situation discussed in this chapter.

Definition 73.11.1. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. A *quasi-coherent module* on \mathcal{X} , or a *quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -module* is a quasi-coherent module on the ringed site $(\mathcal{X}_{fppf}, \mathcal{O}_{\mathcal{X}})$ as in Modules on Sites, Definition 18.23.1. The category of quasi-coherent sheaves on \mathcal{X} is denoted $QCoh(\mathcal{O}_{\mathcal{X}})$.

If \mathcal{X} is an algebraic stack, then this definition agrees with all definitions in the literature in the sense that $QCoh(\mathcal{O}_{\mathcal{X}})$ is equivalent (modulo set theoretic issues) to any variant of this category defined in the literature. For example, we will match our definition with the definition in [Ols07b, Definition 6.1] in Cohomology on Stacks, Lemma 73.11.5. We will also see alternative constructions of this category later on.

In general (as is the case for morphisms of schemes) the pushforward of quasi-coherent sheaf along a 1-morphism is not quasi-coherent. Pullback does preserve quasi-coherence.

Lemma 73.11.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The pullback functor $f^* = f^{-1} : Mod(\mathcal{O}_{\mathcal{Y}}) \rightarrow Mod(\mathcal{O}_{\mathcal{X}})$ preserves quasi-coherent sheaves.*

Proof. This is a general fact, see Modules on Sites, Lemma 18.23.4. □

It turns out that quasi-coherent sheaves have a very simple characterization in terms of their pullbacks. See also Lemma 73.11.5 for a characterization in terms of restrictions.

Lemma 73.11.3. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. Then \mathcal{F} is quasi-coherent if and only if $x^*\mathcal{F}$ is a quasi-coherent sheaf on $(Sch/U)_{fppf}$ for every object x of \mathcal{X} with $U = p(x)$.*

Proof. By Lemma 73.11.2 the condition is necessary. Conversely, since $x^*\mathcal{F}$ is just the restriction to \mathcal{X}_{fppf}/x we see that it is sufficient directly from the definition of a quasi-coherent sheaf (and the fact that the notion of being quasi-coherent is an intrinsic property of sheaves of modules, see Modules on Sites, Section 18.18). □

Although there is a variant for the Zariski topology, it seems that the étale topology is the natural topology to use in the following definition.

Definition 73.11.4. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let \mathcal{F} be a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. We say \mathcal{F} is *locally quasi-coherent*² if \mathcal{F} is a sheaf for the étale topology and for every object x of \mathcal{X} the restriction $x^*\mathcal{F}|_{U_{\text{étale}}}$ is a quasi-coherent sheaf. Here $U = p(x)$.

We use $LQCoh(\mathcal{O}_{\mathcal{X}})$ to indicate the category of locally quasi-coherent modules. We now have the following diagram of categories of modules

$$\begin{array}{ccc}
 QCoh(\mathcal{O}_{\mathcal{X}}) & \longrightarrow & Mod(\mathcal{O}_{\mathcal{X}}) \\
 \downarrow & & \downarrow \\
 LQCoh(\mathcal{O}_{\mathcal{X}}) & \longrightarrow & Mod(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})
 \end{array}$$

where the arrows are strictly full embeddings. It turns out that many results for quasi-coherent sheaves have a counter part for locally quasi-coherent modules. Moreover, from many points of view (as we shall see later) this is a natural category to consider. For example the quasi-coherent sheaves are exactly those locally quasi-coherent modules that are “cartesian”, i.e., satisfy the second condition of the lemma below.

Lemma 73.11.5. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let \mathcal{F} be a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. Then \mathcal{F} is quasi-coherent if and only if the following two conditions hold*

- (1) \mathcal{F} is locally quasi-coherent, and
- (2) for any morphism $\varphi : x \rightarrow y$ of \mathcal{X} lying over $f : U \rightarrow V$ the comparison map $c_{\varphi} : f_{small}^*\mathcal{F}|_{V_{\text{étale}}} \rightarrow \mathcal{F}|_{U_{\text{étale}}}$ of (73.9.4.1) is an isomorphism.

²This is nonstandard notation.

Proof. Assume \mathcal{F} is quasi-coherent. Then \mathcal{F} is a sheaf for the fppf topology, hence a sheaf for the étale topology. Moreover, any pullback of \mathcal{F} to a ringed topos is quasi-coherent, hence the restrictions $x^*\mathcal{F}|_{U_{\text{étale}}}$ are quasi-coherent. This proves \mathcal{F} is locally quasi-coherent. Let y be an object of \mathcal{X} with $V = p(y)$. We have seen that $\mathcal{X}/y = (\text{Sch}/V)_{\text{fppf}}$. By Descent, Proposition 34.7.11 it follows that $y^*\mathcal{F}$ is the quasi-coherent module associated to a (usual) quasi-coherent module \mathcal{F}_V on the scheme V . Hence certainly the comparison maps (73.9.4.1) are isomorphisms.

Conversely, suppose that \mathcal{F} satisfies (1) and (2). Let y be an object of \mathcal{X} with $V = p(y)$. Denote \mathcal{F}_V the quasi-coherent module on the scheme V corresponding to the restriction $y^*\mathcal{F}|_{V_{\text{étale}}}$ which is quasi-coherent by assumption (1), see Descent, Proposition 34.7.11. Condition (2) now signifies that the restrictions $x^*\mathcal{F}|_{U_{\text{étale}}}$ for x over y are each isomorphic to the (étale sheaf associated to the) pullback of \mathcal{F}_V via the corresponding morphism of schemes $U \rightarrow V$. Hence $y^*\mathcal{F}$ is the sheaf on $(\text{Sch}/V)_{\text{fppf}}$ associated to \mathcal{F}_V . Hence it is quasi-coherent (by Descent, Proposition 34.7.11 again) and we see that \mathcal{F} is quasi-coherent on \mathcal{X} by Lemma 73.11.3. \square

Lemma 73.11.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. The pullback functor $f^* = f^{-1} : \text{Mod}(\mathcal{Y}_{\text{étale}}, \mathcal{O}_{\mathcal{Y}}) \rightarrow \text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ preserves locally quasi-coherent sheaves.*

Proof. Let \mathcal{G} be locally quasi-coherent on \mathcal{Y} . Choose an object x of \mathcal{X} lying over the scheme U . The restriction $x^*f^*\mathcal{G}|_{U_{\text{étale}}}$ equals $(f \circ x)^*\mathcal{G}|_{U_{\text{étale}}}$ hence is a quasi-coherent sheaf by assumption on \mathcal{G} . \square

Lemma 73.11.7. *Let $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ be a category fibred in groupoids.*

- (1) *The category $LQCoh(\mathcal{O}_{\mathcal{X}})$ has colimits and they agree with colimits in the category $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$.*
- (2) *The category $LQCoh(\mathcal{O}_{\mathcal{X}})$ is abelian with kernels and cokernels computed in $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$, in other words the inclusion functor is exact.*
- (3) *Given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ of $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ if two out of three are locally quasi-coherent so is the third.*
- (4) *Given \mathcal{F}, \mathcal{G} in $LQCoh(\mathcal{O}_{\mathcal{X}})$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}}} \mathcal{G}$ in $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ is an object of $LQCoh(\mathcal{O}_{\mathcal{X}})$.*
- (5) *Given \mathcal{F}, \mathcal{G} in $LQCoh(\mathcal{O}_{\mathcal{X}})$ with \mathcal{F} locally of finite presentation on $\mathcal{X}_{\text{étale}}$ the sheaf $\text{Hom}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ is an object of $LQCoh(\mathcal{O}_{\mathcal{X}})$.*

Proof. Each of these statements follows from the corresponding statement of Descent, Lemma 34.7.13. For example, suppose that $\mathcal{I} \rightarrow LQCoh(\mathcal{O}_{\mathcal{X}})$, $i \mapsto \mathcal{F}_i$ is a diagram. Consider the object $\mathcal{F} = \text{colim}_i \mathcal{F}_i$ of $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$. For any object x of \mathcal{X} with $U = p(x)$ the pullback functor x^* commutes with all colimits as it is a left adjoint. Hence $x^*\mathcal{F} = \text{colim}_i x^*\mathcal{F}_i$. Similarly we have $x^*\mathcal{F}|_{U_{\text{étale}}} = \text{colim}_i x^*\mathcal{F}_i|_{U_{\text{étale}}}$. Now by assumption each $x^*\mathcal{F}_i|_{U_{\text{étale}}}$ is quasi-coherent, hence the colimit is quasi-coherent by the aforementioned Descent, Lemma 34.7.13. This proves (1).

It follows from (1) that cokernels exist in $LQCoh(\mathcal{O}_{\mathcal{X}})$ and agree with the cokernels computed in $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of $LQCoh(\mathcal{O}_{\mathcal{X}})$ and let $\mathcal{K} = \text{Ker}(\varphi)$ computed in $\text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$. If we can show that \mathcal{K} is a locally quasi-coherent module, then the proof of (2) is complete. To see this, note that kernels are computed in the category of presheaves (no sheafification necessary). Hence $\mathcal{K}|_{U_{\text{étale}}}$ is the kernel of the map $\mathcal{F}|_{U_{\text{étale}}} \rightarrow \mathcal{G}|_{U_{\text{étale}}}$, i.e., is the kernel of a

map of quasi-coherent sheaves on $U_{\acute{e}tale}$ whence quasi-coherent by Descent, Lemma 34.7.13. This proves (2).

Parts (3), (4), and (5) follow in exactly the same way. Details omitted. \square

In the generality discussed here the category of quasi-coherent sheaves is not abelian. See Examples, Section 82.12. Here is what we can prove without any further work.

Lemma 73.11.8. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids.*

- (1) *The category $QCoh(\mathcal{O}_{\mathcal{X}})$ has colimits and they agree with colimits in the category $Mod(\mathcal{O}_{\mathcal{X}})$ as well as with colimits in the category $LQCoh(\mathcal{O}_{\mathcal{X}})$.*
- (2) *Given \mathcal{F}, \mathcal{G} in $QCoh(\mathcal{O}_{\mathcal{X}})$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}}} \mathcal{G}$ in $Mod(\mathcal{O}_{\mathcal{X}})$ is an object of $QCoh(\mathcal{O}_{\mathcal{X}})$.*
- (3) *Given \mathcal{F}, \mathcal{G} in $QCoh(\mathcal{O}_{\mathcal{X}})$ with \mathcal{F} locally of finite presentation on \mathcal{X}_{fppf} the sheaf $\mathcal{H}om_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $Mod(\mathcal{O}_{\mathcal{X}})$ is an object of $QCoh(\mathcal{O}_{\mathcal{X}})$.*

Proof. Let $\mathcal{I} \rightarrow QCoh(\mathcal{O}_{\mathcal{X}})$, $i \mapsto \mathcal{F}_i$ be a diagram. Consider the object $\mathcal{F} = \text{colim}_i \mathcal{F}_i$ of $Mod(\mathcal{O}_{\mathcal{X}})$. For any object x of \mathcal{X} with $U = p(x)$ the pullback functor x^* commutes with all colimits as it is a left adjoint. Hence $x^*\mathcal{F} = \text{colim}_i x^*\mathcal{F}_i$ in $Mod((Sch/U)_{fppf}, \mathcal{O})$. We conclude from Descent, Lemma 34.7.13 that $x^*\mathcal{F}$ is quasi-coherent, hence \mathcal{F} is quasi-coherent, see Lemma 73.11.3. Thus we see that $QCoh(\mathcal{O}_{\mathcal{X}})$ has colimits and they agree with colimits in the category $Mod(\mathcal{O}_{\mathcal{X}})$. In particular the (fppf) sheaf \mathcal{F} is also the colimit of the diagram in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$, hence \mathcal{F} is also the colimit in $LQCoh(\mathcal{O}_{\mathcal{X}})$. This proves (1).

Parts (2) and (3) are proved in the same way. Details omitted. \square

73.12. Stackification and sheaves

It turns out that the category of sheaves on a category fibred in groupoids only “knows about” the stackification.

Lemma 73.12.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f induces an equivalence of stackifications, then the morphism of topoi $f : Sh(\mathcal{X}_{fppf}) \rightarrow Sh(\mathcal{Y}_{fppf})$ is an equivalence.*

Proof. We may assume \mathcal{Y} is the stackification of \mathcal{X} . We claim that $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a special cocontinuous functor, see Sites, Definition 7.28.2 which will prove the lemma. By Stacks, Lemma 8.10.3 the functor f is continuous and cocontinuous. By Stacks, Lemma 8.8.1 we see that conditions (3), (4), and (5) of Sites, Lemma 7.28.1 hold. \square

Lemma 73.12.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f induces an equivalence of stackifications, then f^* induces equivalences $Mod(\mathcal{O}_{\mathcal{X}}) \rightarrow Mod(\mathcal{O}_{\mathcal{Y}})$ and $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow QCoh(\mathcal{O}_{\mathcal{Y}})$.*

Proof. We may assume \mathcal{Y} is the stackification of \mathcal{X} . The first assertion is clear from Lemma 73.12.1 and $\mathcal{O}_{\mathcal{X}} = f^{-1}\mathcal{O}_{\mathcal{Y}}$. Pullback of quasi-coherent sheaves are quasi-coherent, see Lemma 73.11.2. Hence it suffices to show that if $f^*\mathcal{G}$ is quasi-coherent, then \mathcal{G} is. To see this, let y be an object of \mathcal{Y} . Translating the condition that \mathcal{Y} is the stackification of \mathcal{X} we see there exists an fppf covering $\{y_i \rightarrow y\}$ in \mathcal{Y} such that $y_i \cong f(x_i)$ for some x_i object of \mathcal{X} . Say x_i and y_i lie over the scheme U_i . Then $f^*\mathcal{G}$ being quasi-coherent, means that $x_i^*f^*\mathcal{G}$ is quasi-coherent. Since $x_i^*f^*\mathcal{G}$ is isomorphic to $y_i^*\mathcal{G}$ (as sheaves on $(Sch/U_i)_{fppf}$ we see that $y_i^*\mathcal{G}$ is quasi-coherent.

It follows from Modules on Sites, Lemma 18.23.3 that the restriction of \mathcal{G} to \mathcal{Y}/y is quasi-coherent. Hence \mathcal{G} is quasi-coherent by Lemma 73.11.3. \square

73.13. Quasi-coherent sheaves and presentations

In Groupoids in Spaces, Definition 60.12.1 we have defined the notion of a quasi-coherent module on an arbitrary groupoid. The following (formal) proposition tells us that we can study quasi-coherent sheaves on quotient stacks in terms of quasi-coherent modules on presentations.

Proposition 73.13.1. *Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . Let $\mathcal{X} = [U/R]$ be the quotient stack. The category of quasi-coherent modules on \mathcal{X} is equivalent to the category of quasi-coherent modules on (U, R, s, t, c) .*

Proof. Denote $QCoh(U, R, s, t, c)$ the category of quasi-coherent modules on the groupoid (U, R, s, t, c) . We will construct quasi-inverse functors

$$QCoh(\mathcal{O}_{\mathcal{X}}) \longleftrightarrow QCoh(U, R, s, t, c).$$

According to Lemma 73.12.2 the stackification map $[U/pR] \rightarrow [U/R]$ (see Groupoids in Spaces, Definition 60.19.1) induces an equivalence of categories of quasi-coherent sheaves. Thus it suffices to prove the lemma with $\mathcal{X} = [U/pR]$.

Recall that an object $x = (T, u)$ of $\mathcal{X} = [U/pR]$ is given by a scheme T and a morphism $u : T \rightarrow U$. A morphism $(T, u) \rightarrow (T', u')$ is given by a pair (f, r) where $f : T \rightarrow T'$ and $r : T \rightarrow R$ with $s \circ r = u$ and $t \circ r = u' \circ f$. Let us call a *special morphism* any morphism of the form $(f, e \circ u' \circ f) : (T, u' \circ f) \rightarrow (T', u')$. The category of (T, u) with special morphisms is just the category of schemes over U .

Let \mathcal{F} be a quasi-coherent sheaf on \mathcal{X} . Then we obtain for every $x = (T, u)$ a quasi-coherent sheaf $\mathcal{F}_{(T,u)} = x^* \mathcal{F}|_{T_{\acute{e}t\acute{a}l\acute{e}}}$ on T . Moreover, for any morphism $(f, r) : x = (T, u) \rightarrow (T', u') = x'$ we obtain a comparison isomorphism

$$c_{(f,r)} : f_{small}^* \mathcal{F}_{(T',u')} \longrightarrow \mathcal{F}_{(T,u)}$$

see Lemma 73.11.5. Moreover, these isomorphisms are compatible with compositions, see Lemma 73.9.3. If U, R are schemes, then we can construct the quasi-coherent sheaf on the groupoid as follows: First the object (U, id) corresponds to a quasi-coherent sheaf $\mathcal{F}_{(U,\text{id})}$ on U . Next, the isomorphism $\alpha : t_{small}^* \mathcal{F}_{(U,\text{id})} \rightarrow s_{small}^* \mathcal{F}_{(U,\text{id})}$ comes from

- (1) the morphism $(R, \text{id}_R) : (R, s) \rightarrow (R, t)$ in the category $[U/pR]$ which produces an isomorphism $\mathcal{F}_{(R,t)} \rightarrow \mathcal{F}_{(R,s)}$,
- (2) the special morphism $(R, s) \rightarrow (U, \text{id})$ which produces an isomorphism $s_{small}^* \mathcal{F}_{(U,\text{id})} \rightarrow \mathcal{F}_{(R,s)}$, and
- (3) the special morphism $(R, t) \rightarrow (U, \text{id})$ which produces an isomorphism $t_{small}^* \mathcal{F}_{(U,\text{id})} \rightarrow \mathcal{F}_{(R,t)}$.

The cocycle condition for α follows from the condition that (U, R, s, t, c) is groupoid, i.e., that composition is associative (details omitted).

To do this in general, i.e., when U and R are algebraic spaces, it suffices to explain how to associate to an algebraic space (W, u) over U a quasi-coherent sheaf $\mathcal{F}_{(W,u)}$ and to construct the comparison maps for morphisms between these. We set $\mathcal{F}_{(W,u)} = x^* \mathcal{F}|_{W_{\acute{e}t\acute{a}l\acute{e}}}$ where x is the 1-morphism $\mathcal{S}_W \rightarrow \mathcal{S}_U \rightarrow [U/pR]$ and the comparison maps are explained in (73.10.2.3).

Conversely, suppose that (\mathcal{G}, α) is a quasi-coherent module on (U, R, s, t, c) . We are going to define a presheaf of modules \mathcal{F} on \mathcal{X} as follows. Given an object (T, u) of $[U/pR]$ we set

$$\mathcal{F}(T, u) := \Gamma(T, u_{small}^* \mathcal{G}).$$

Given a morphism $(f, r) : (T, u) \rightarrow (T', u')$ we get a map

$$\begin{aligned} \mathcal{F}(T', u') &= \Gamma(T', (u')_{small}^* \mathcal{G}) \\ &\rightarrow \Gamma(T, f_{small}^* (u')_{small}^* \mathcal{G}) = \Gamma(T, (u' \circ f)_{small}^* \mathcal{G}) \\ &= \Gamma(T, (t \circ r)_{small}^* \mathcal{G}) = \Gamma(T, r_{small}^* t_{small}^* \mathcal{G}) \\ &\rightarrow \Gamma(T, r_{small}^* s_{small}^* \mathcal{G}) = \Gamma(T, (s \circ r)_{small}^* \mathcal{G}) \\ &= \Gamma(T, u_{small}^* \mathcal{G}) \\ &= \mathcal{F}(T, u) \end{aligned}$$

where the first arrow is pullback along f and the second arrow is α . Note that if (T, r) is a special morphism, then this map is just pullback along f as $e_{small}^* \alpha = \text{id}$ by the axioms of a sheaf of quasi-coherent modules on a groupoid. The cocycle condition implies that \mathcal{F} is a presheaf of modules (details omitted). It is immediate from the definition that \mathcal{F} is quasi-coherent when pulled back to $(Sch/T)_{fppf}$ (by the simple description of the restriction maps of \mathcal{F} in case of a special morphism).

We omit the verification that the functors constructed above are quasi-inverse to each other. □

We finish this section with a technical lemma on maps out of quasi-coherent sheaves. It is an analogue of Schemes, Lemma 25.7.1. We will see later (Criteria for Representability, Theorem 74.17.2) that the assumptions on the groupoid imply that \mathcal{X} is an algebraic stack.

Lemma 73.13.2. *Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . Assume s, t are flat and locally of finite presentation. Let $\mathcal{X} = [U/R]$ be the quotient stack. Denote $\pi : S_U \rightarrow \mathcal{X}$ the quotient map. Let \mathcal{F} be a quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -module, and let \mathcal{H} be any object of $\text{Mod}(\mathcal{O}_{\mathcal{X}})$. The map*

$$\text{Hom}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{H}) \longrightarrow \text{Hom}_{\mathcal{O}_U}(x^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}}, x^* \mathcal{H}|_{U_{\acute{e}t\acute{a}l\acute{e}}}), \quad \phi \longmapsto x^* \phi|_{U_{\acute{e}t\acute{a}l\acute{e}}}$$

is injective and its image consists of exactly those $\varphi : x^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}} \rightarrow x^* \mathcal{H}|_{U_{\acute{e}t\acute{a}l\acute{e}}}$ which give rise to a commutative diagram

$$\begin{array}{ccccc} s_{small}^*(x^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}}) & \longrightarrow & (x \circ s)^* \mathcal{F}|_{R_{\acute{e}t\acute{a}l\acute{e}}} = (x \circ t)^* \mathcal{F}|_{R_{\acute{e}t\acute{a}l\acute{e}}} & \longleftarrow & t_{small}^*(x^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}}) \\ \downarrow s_{small}^* \varphi & & & & \downarrow t_{small}^* \varphi \\ s_{small}^*(x^* \mathcal{H}|_{U_{\acute{e}t\acute{a}l\acute{e}}}) & \longrightarrow & (x \circ s)^* \mathcal{H}|_{R_{\acute{e}t\acute{a}l\acute{e}}} = (x \circ t)^* \mathcal{H}|_{R_{\acute{e}t\acute{a}l\acute{e}}} & \longleftarrow & t_{small}^*(x^* \mathcal{H}|_{U_{\acute{e}t\acute{a}l\acute{e}}}) \end{array}$$

of modules on $R_{\acute{e}t\acute{a}l\acute{e}}$ where the horizontal arrows are the comparison maps (73.10.2.3).

Proof. According to Lemma 73.12.2 the stackification map $[U/pR] \rightarrow [U/R]$ (see Groupoids in Spaces, Definition 60.19.1) induces an equivalence of categories of quasi-coherent sheaves and of fppf \mathcal{O} -modules. Thus it suffices to prove the lemma with $\mathcal{X} = [U/pR]$. By Proposition 73.13.1 and its proof there exists a quasi-coherent module (\mathcal{G}, α) on (U, R, s, t, c) such that \mathcal{F} is given by the rule $\mathcal{F}(T, u) = \Gamma(T, u^* \mathcal{G})$. In particular $x^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}} = \mathcal{G}$ and it is clear that the map of the statement of the

lemma is injective. Moreover, given a map $\varphi : \mathcal{G} \rightarrow x^*\mathcal{H}|_{U_{\acute{e}tale}}$ and given any object $y = (T, u)$ of $[U/pR]$ we can consider the map

$$\mathcal{F}(y) = \Gamma(T, u^*\mathcal{G}) \xrightarrow{u_{small}^*\varphi} \Gamma(T, u_{small}^*x^*\mathcal{H}|_{U_{\acute{e}tale}}) \rightarrow \Gamma(T, y^*\mathcal{H}|_{T_{\acute{e}tale}}) = \mathcal{H}(y)$$

where the second arrow is the comparison map (73.9.4.1) for the sheaf \mathcal{H} . This assignment is compatible with the restriction mappings of the sheaves \mathcal{F} and \mathcal{G} for morphisms of $[U/pR]$ if the cocycle condition of the lemma is satisfied. Proof omitted. Hint: the restriction maps of \mathcal{F} are made explicit in terms of (\mathcal{G}, α) in the proof of Proposition 73.13.1. \square

73.14. Quasi-coherent sheaves on algebraic stacks

Let \mathcal{X} be an algebraic stack over S . By Algebraic Stacks, Lemma 71.16.2 we can find an equivalence $[U/R] \rightarrow \mathcal{X}$ where (U, R, s, t, c) is a smooth groupoid in algebraic spaces. Then

$$QCoh(\mathcal{O}_{\mathcal{X}}) \cong QCoh(\mathcal{O}_{[U/R]}) \cong QCoh(U, R, s, t, c)$$

where the second equivalence is Proposition 73.13.1. Hence the category of quasi-coherent sheaves on an algebraic stack is equivalent to the category of quasi-coherent modules on a smooth groupoid in algebraic spaces. In particular, by Groupoids in Spaces, Lemma 60.12.5 we see that $QCoh(\mathcal{O}_{\mathcal{X}})$ is abelian!

There is something slightly disconcerting about our current setup. It is that the fully faithful embedding

$$QCoh(\mathcal{O}_{\mathcal{X}}) \longrightarrow Mod(\mathcal{O}_{\mathcal{X}})$$

is in general **not** exact. However, exactly the same thing happens for schemes: for most schemes X the embedding

$$QCoh(\mathcal{O}_X) \cong QCoh((Sch/X)_{fppf}, \mathcal{O}_X) \longrightarrow Mod((Sch/X)_{fppf}, \mathcal{O}_X)$$

isn't exact, see Descent, Lemma 34.7.13. Parenthetically, the example in the proof of Descent, Lemma 34.7.13 shows that in general the strictly full embedding $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow LQCoh(\mathcal{O}_{\mathcal{X}})$ isn't exact either.

We collect all the positive results obtained so far in a single statement.

Lemma 73.14.1. *Let \mathcal{X} be an algebraic stack over S .*

- (1) *If $[U/R] \rightarrow \mathcal{X}$ is a presentation of \mathcal{X} then there is a canonical equivalence $QCoh(\mathcal{O}_{\mathcal{X}}) \cong QCoh(U, R, s, t, c)$.*
- (2) *The category $QCoh(\mathcal{O}_{\mathcal{X}})$ is abelian.*
- (3) *The category $QCoh(\mathcal{O}_{\mathcal{X}})$ has colimits and they agree with colimits in the category $Mod(\mathcal{O}_{\mathcal{X}})$.*
- (4) *Given \mathcal{F}, \mathcal{G} in $QCoh(\mathcal{O}_{\mathcal{X}})$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}}} \mathcal{G}$ in $Mod(\mathcal{O}_{\mathcal{X}})$ is an object of $QCoh(\mathcal{O}_{\mathcal{X}})$.*
- (5) *Given \mathcal{F}, \mathcal{G} in $QCoh(\mathcal{O}_{\mathcal{X}})$ with \mathcal{F} locally of finite presentation on \mathcal{X}_{fppf} the sheaf $\mathcal{H}om_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $Mod(\mathcal{O}_{\mathcal{X}})$ is an object of $QCoh(\mathcal{O}_{\mathcal{X}})$.*

Proof. Properties (3), (4), and (5) were proven in Lemma 73.11.8. Part (1) is Proposition 73.13.1. Part (2) follows from Groupoids in Spaces, Lemma 60.12.5 as discussed above. \square

Proposition 73.14.2. *Let \mathcal{X} be an algebraic stack over S .*

- (1) The category $QCoh(\mathcal{O}_{\mathcal{X}})$ is a Grothendieck abelian category. Consequently, $QCoh(\mathcal{O}_{\mathcal{X}})$ has enough injectives and all limits.
- (2) The inclusion functor $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow Mod(\mathcal{O}_{\mathcal{X}})$ has a right adjoint³

$$Q : Mod(\mathcal{O}_{\mathcal{X}}) \longrightarrow QCoh(\mathcal{O}_{\mathcal{X}})$$

such that for every quasi-coherent sheaf \mathcal{F} the adjunction mapping $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism.

Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 27.21.4 and the case of algebraic spaces, see Properties of Spaces, Proposition 48.30.2. We advise the reader to read either of those proofs first.

Part (1) means $QCoh(\mathcal{O}_{\mathcal{X}})$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Lemma 73.14.1 colimits in $QCoh(\mathcal{O}_{\mathcal{X}})$ exist and agree with colimits in $Mod(\mathcal{O}_{\mathcal{X}})$. By Modules on Sites, Lemma 18.14.2 filtered colimits are exact. Hence (a) and (b) hold.

Choose a presentation $\mathcal{X} = [U/R]$ so that (U, R, s, t, c) is a smooth groupoid in algebraic spaces and in particular s and t are flat morphisms of algebraic spaces. By Lemma 73.14.1 above we have $QCoh(\mathcal{O}_{\mathcal{X}}) = QCoh(U, R, s, t, c)$. By Groupoids in Spaces, Lemma 60.13.2 there exists a set T and a family $(\mathcal{F}_t)_{t \in T}$ of quasi-coherent sheaves on \mathcal{X} such that every quasi-coherent sheaf on \mathcal{X} is the directed colimit of its subsheaves which are isomorphic to one of the \mathcal{F}_t . Thus $\bigoplus_t \mathcal{F}_t$ is a generator of $QCoh(\mathcal{O}_{\mathcal{X}})$ and we conclude that (c) holds. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11.6 and Lemma 19.13.2.

Proof of (2). To construct Q we use the following general procedure. Given an object \mathcal{F} of $Mod(\mathcal{O}_{\mathcal{X}})$ we consider the functor

$$QCoh(\mathcal{O}_{\mathcal{X}})^{opp} \longrightarrow Sets, \quad \mathcal{G} \longmapsto \text{Hom}_{\mathcal{X}}(\mathcal{G}, \mathcal{F})$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\text{Hom}_{\mathcal{X}}(\mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{X}}(\mathcal{G}, Q(\mathcal{F}))$ for \mathcal{G} in $QCoh(\mathcal{O}_{\mathcal{X}})$. By the Yoneda lemma (Categories, Lemma 4.3.5) the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in \mathcal{F} . By construction Q is a right adjoint to the inclusion functor. The fact that $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when \mathcal{F} is quasi-coherent is a formal consequence of the fact that the inclusion functor $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow Mod(\mathcal{O}_{\mathcal{X}})$ is fully faithful. \square

73.15. Cohomology

Let S be a scheme and let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. For any $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$ the categories $Ab(\mathcal{X}_{\tau})$ and $Mod(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}})$ have enough injectives, see Injectives, Theorems 19.7.4 and 19.8.4. Thus we can use the machinery of Cohomology on Sites, Section 21.3 to define the cohomology groups

$$H^p(\mathcal{X}_{\tau}, \mathcal{F}) = H^p_{\tau}(\mathcal{X}, \mathcal{F}) \quad \text{and} \quad H^p(x, \mathcal{F}) = H^p_{\tau}(x, \mathcal{F})$$

for any $x \in \text{Ob}(\mathcal{X})$ and any object \mathcal{F} of $Ab(\mathcal{X}_{\tau})$ or $Mod(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}})$. Moreover, if $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$, then we obtain the higher direct images $R^i f_* \mathcal{F}$ in $Ab(\mathcal{Y}_{\tau})$ or $Mod(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}})$. Of

³This functor is sometimes called the *coherator*.

course, as explained in Cohomology on Sites, Section 21.4 there are also derived versions of $H^p(-)$ and $R^i f_*$.

Lemma 73.15.1. *Let S be a scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$. Let $x \in \text{Ob}(\mathcal{X})$ be an object lying over the scheme U . Let \mathcal{F} be an object of $Ab(\mathcal{X}_\tau)$ or $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$. Then*

$$H_\tau^p(x, \mathcal{F}) = H^p((Sch/U)_\tau, x^{-1}\mathcal{F})$$

and if $\tau = \acute{e}tale$, then we also have

$$H_{\acute{e}tale}^p(x, \mathcal{F}) = H^p(U_{\acute{e}tale}, \mathcal{F}|_{U_{\acute{e}tale}}).$$

Proof. The first statement follows from Cohomology on Sites, Lemma 21.8.1 and the equivalence of Lemma 73.9.4. The second statement follows from the first combined with Étale Cohomology, Lemma 44.20.5. \square

73.16. Injective sheaves

The pushforward of an injective abelian sheaf or module is injective.

Lemma 73.16.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$.*

- (1) $f_*\mathcal{I}$ is injective in $Ab(\mathcal{Y}_\tau)$ for \mathcal{I} injective in $Ab(\mathcal{X}_\tau)$, and
- (2) $f_*\mathcal{I}$ is injective in $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$ for \mathcal{I} injective in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$.

Proof. This follows formally from the fact that f^{-1} is an exact left adjoint of f_* , see Homology, Lemma 12.25.1. \square

In the rest of this section we prove that pullback f^{-1} has a left adjoint $f_!$ on abelian sheaves and modules. If f is representable (by schemes or by algebraic spaces), then it will turn out that $f_!$ is exact and f^{-1} will preserve injectives. We first prove a few preliminary lemmas about fibre products and equalizers in categories fibred in groupoids and their behaviour with respect to morphisms.

Lemma 73.16.2. *Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids.*

- (1) *The category \mathcal{X} has fibre products.*
- (2) *If the Isom-presheaves of \mathcal{X} are representable by algebraic spaces, then \mathcal{X} has equalizers.*
- (3) *If \mathcal{X} is an algebraic stack (or more generally a quotient stack), then \mathcal{X} has equalizers.*

Proof. Part (1) follows Categories, Lemma 4.33.14 as $(Sch/S)_{fppf}$ has fibre products.

Let $a, b : x \rightarrow y$ be morphisms of \mathcal{X} . Set $U = p(x)$ and $V = p(y)$. The category of schemes has equalizers hence we can let $W \rightarrow U$ be the equalizer of $p(a)$ and $p(b)$. Denote $c : z \rightarrow x$ a morphism of \mathcal{X} lying over $W \rightarrow U$. The equalizer of a and b , if it exists, is the equalizer of $a \circ c$ and $b \circ c$. Thus we may assume that $p(a) = p(b) = f : U \rightarrow V$. As \mathcal{X} is fibred in groupoids, there exists a unique automorphism $i : x \rightarrow x$ in the fibre category of \mathcal{X} over U such that $a \circ i = b$. Again the equalizer of a and b is the equalizer of id_x and i . Recall that the $Isom_{\mathcal{X}}$ is the presheaf on $(Sch/U)_{fppf}$ which to V/U associates the set of automorphisms of $x|_V$ in the fibre category of \mathcal{X} over V , see Stacks, Definition 8.2.2. If $Isom_{\mathcal{X}}(x)$ is representable by an algebraic space $G \rightarrow U$, then we see that id_x and i define

morphisms $e, i : U \rightarrow G$ over U . Set $V = U \times_{e,G,i} U$, which by Morphisms of Spaces, Lemma 49.4.7 is a scheme. Then it is clear that $x|_V \rightarrow x$ is the equalizer of the maps id_x and i in \mathcal{X} . This proves (2).

If $\mathcal{X} = [U/R]$ for some groupoid in algebraic spaces (U, R, s, t, c) over S , then the hypothesis of (2) holds by Bootstrap, Lemma 62.11.5. If \mathcal{X} is an algebraic stack, then we can choose a presentation $[U/R] \cong \mathcal{X}$ by Algebraic Stacks, Lemma 71.16.2. □

Lemma 73.16.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

- (1) *The functor f transforms fibre products into fibre products.*
- (2) *If f is faithful, then f transforms equalizers into equalizers.*

Proof. By Categories, Lemma 4.33.14 we see that a fibre product in \mathcal{X} is any commutative square lying over a fibre product diagram in $(Sch/S)_{fppf}$. Similarly for \mathcal{Y} . Hence (1) is clear.

Let $x \rightarrow x'$ be the equalizer of two morphisms $a, b : x' \rightarrow x''$ in \mathcal{X} . We will show that $f(x) \rightarrow f(x')$ is the equalizer of $f(a)$ and $f(b)$. Let $y \rightarrow f(x)$ be a morphism of \mathcal{Y} equalizing $f(a)$ and $f(b)$. Say x, x', x'' lie over the schemes U, U', U'' and y lies over V . Denote $h : V \rightarrow U'$ the image of $y \rightarrow f(x)$ in the category of schemes. The morphism $y \rightarrow f(x)$ is isomorphic to $f(h^*x') \rightarrow f(x')$ by the axioms of fibred categories. Hence, as f is faithful, we see that $h^*x' \rightarrow x'$ equalizes a and b . Thus we obtain a unique morphism $h^*x' \rightarrow x$ whose image $y = f(h^*x') \rightarrow f(x)$ is the desired morphism in \mathcal{Y} . □

Lemma 73.16.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}, g : \mathcal{Z} \rightarrow \mathcal{Y}$ be faithful 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

- (1) *the functor $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Y}$ is faithful, and*
- (2) *if \mathcal{X}, \mathcal{Z} have equalizers, so does $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$.*

Proof. We think of objects in $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ as quadruples (U, x, z, α) where $\alpha : f(x) \rightarrow g(z)$ is an isomorphism over U , see Categories, Lemma 4.30.3. A morphism $(U, x, z, \alpha) \rightarrow (U', x', z', \alpha')$ is a pair of morphisms $a : x \rightarrow x'$ and $b : z \rightarrow z'$ compatible with α and α' . Thus it is clear that if f and g are faithful, so is the functor $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Y}$. Now, suppose that $(a, b), (a', b') : (U, x, z, \alpha) \rightarrow (U', x', z', \alpha')$ are two morphisms of the 2-fibre product. Then consider the equalizer $x'' \rightarrow x$ of a and a' and the equalizer $z'' \rightarrow z$ of b and b' . Since f commutes with equalizers (by Lemma 73.16.3) we see that $f(x'') \rightarrow f(x)$ is the equalizer of $f(a)$ and $f(a')$. Similarly, $g(z'') \rightarrow g(z)$ is the equalizer of $g(b)$ and $g(b')$. Picture

$$\begin{array}{ccccc}
 f(x'') & \longrightarrow & f(x) & \begin{array}{c} \xrightarrow{f(a)} \\ \xrightarrow{f(a')} \end{array} & f(x') \\
 \alpha'' \downarrow \dots & & \alpha \downarrow & & \downarrow \alpha' \\
 g(z'') & \longrightarrow & g(z) & \begin{array}{c} \xrightarrow{g(b)} \\ \xrightarrow{g(b')} \end{array} & g(z')
 \end{array}$$

It is clear that the dotted arrow exists and is an isomorphism. However, it is not a priori the case that the image of α'' in the category of schemes is the identity of its source. On the other hand, the existence of α'' means that we can assume that x'' and z'' are defined over the same scheme and that the morphisms $x'' \rightarrow x$

and $z'' \rightarrow z$ have the same image in the category of schemes. Redoing the diagram above we see that the dotted arrow now does project to an identity morphism and we win. Some details omitted. \square

As we are working with big sites we have the following somewhat counter intuitive result (which also holds for morphisms of big sites of schemes). Warning: This result isn't true if we drop the hypothesis that f is faithful.

Lemma 73.16.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. The functor $f^{-1} : Ab(\mathcal{Y}_\tau) \rightarrow Ab(\mathcal{X}_\tau)$ has a left adjoint $f_! : Ab(\mathcal{X}_\tau) \rightarrow Ab(\mathcal{Y}_\tau)$. If f is faithful and \mathcal{X} has equalizers, then*

- (1) $f_!$ is exact, and
- (2) $f^{-1}\mathcal{I}$ is injective in $Ab(\mathcal{X}_\tau)$ for \mathcal{I} injective in $Ab(\mathcal{Y}_\tau)$.

Proof. By Stacks, Lemma 8.10.3 the functor f is continuous and cocontinuous. Hence by Modules on Sites, Lemma 18.16.2 the functor $f^{-1} : Ab(\mathcal{Y}_\tau) \rightarrow Ab(\mathcal{X}_\tau)$ has a left adjoint $f_! : Ab(\mathcal{X}_\tau) \rightarrow Ab(\mathcal{Y}_\tau)$. To see (1) we apply Modules on Sites, Lemma 18.16.3 and to see that the hypotheses of that lemma are satisfied use Lemmas 73.16.2 and 73.16.3 above. Part (2) follows from this formally, see Homology, Lemma 12.25.1. \square

Lemma 73.16.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. The functor $f^* : Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y}) \rightarrow Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ has a left adjoint $f_! : Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X}) \rightarrow Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$ which agrees with the functor $f_!$ of Lemma 73.16.5 on underlying abelian sheaves. If f is faithful and \mathcal{X} has equalizers, then*

- (1) $f_!$ is exact, and
- (2) $f^{-1}\mathcal{I}$ is injective in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ for \mathcal{I} injective in $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$.

Proof. Recall that f is a continuous and cocontinuous functor of sites and that $f^{-1}\mathcal{O}_\mathcal{Y} = \mathcal{O}_\mathcal{X}$. Hence Modules on Sites, Lemma 18.40.1 implies f^* has a left adjoint $f_!^{Mod}$. Let x be an object of \mathcal{X} lying over the scheme U . Then f induces an equivalence of ringed sites

$$\mathcal{X}/x \longrightarrow \mathcal{Y}/f(x)$$

as both sides are equivalent to $(Sch/U)_\tau$, see Lemma 73.9.4. Modules on Sites, Remark 18.40.2 shows that $f_!$ agrees with the functor on abelian sheaves.

Assume now that \mathcal{X} has equalizers and that f is faithful. Lemma 73.16.5 tells us that $f_!$ is exact. Finally, Homology, Lemma 12.25.1 implies the statement on pullbacks of injective modules. \square

73.17. The Čech complex

To compute the cohomology of a sheaf on an algebraic stack we compare it to the cohomology of the sheaf restricted to coverings of the given algebraic stack.

Throughout this section the situation will be as follows. We are given a 1-morphism of categories fibred in groupoids

$$(73.17.0.1) \quad \begin{array}{ccc} \mathcal{U} & \xrightarrow{\quad f \quad} & \mathcal{X} \\ & \searrow q \quad \swarrow p & \\ & (Sch/S)_{fppf} & \end{array}$$

We are going to think about \mathcal{U} as a “covering” of \mathcal{X} . Hence we want to consider the simplicial object

$$\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightrightarrows \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightrightarrows \mathcal{U}$$

in the category of categories fibred in groupoids over $(Sch/S)_{fppf}$. However, since this is a $(2, 1)$ -category and not a category, we should say explicitly what we mean. Namely, we let \mathcal{U}_n be the category with objects $(u_0, \dots, u_n, x, \alpha_0, \dots, \alpha_n)$ where $\alpha_i : f(u_i) \rightarrow x$ is an isomorphism in \mathcal{X} . We denote $f_n : \mathcal{U}_n \rightarrow \mathcal{X}$ the 1-morphism which assigns to $(u_0, \dots, u_n, x, \alpha_0, \dots, \alpha_n)$ the object x . Note that $\mathcal{U}_0 = \mathcal{U}$ and $f_0 = f$. Given a map $\varphi : [m] \rightarrow [n]$ we consider the 1-morphism $\mathcal{U}_\varphi : \mathcal{U}_m \rightarrow \mathcal{U}_n$ given by

$$(u_0, \dots, u_m, x, \alpha_0, \dots, \alpha_m) \longmapsto (u_{\varphi(0)}, \dots, u_{\varphi(m)}, x, \alpha_{\varphi(0)}, \dots, \alpha_{\varphi(m)})$$

on objects. All of these 1-morphisms compose correctly on the nose (no 2-morphisms required) and all of these 1-morphisms are 1-morphisms over \mathcal{X} . We denote \mathcal{U}_\bullet this simplicial object. If \mathcal{F} is a presheaf of sets on \mathcal{X} , then we obtain a cosimplicial set

$$\Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}) \rightrightarrows \Gamma(\mathcal{U}_1, f_1^{-1}\mathcal{F}) \rightrightarrows \Gamma(\mathcal{U}_2, f_2^{-1}\mathcal{F})$$

Here the arrows are the pullback maps along the given morphisms of the simplicial object. If \mathcal{F} is a presheaf of abelian groups, this is a cosimplicial abelian group.

Let $\mathcal{U} \rightarrow \mathcal{X}$ be as above and let \mathcal{F} be an abelian presheaf on \mathcal{X} . The Čech complex associated to the situation is denoted $\check{C}^\bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F})$. It is the cochain complex associated to the cosimplicial abelian group above, see *Simplicial*, Section 14.24. It has terms

$$\check{C}^n(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F}) = \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F}).$$

The boundary maps are the maps

$$d^n = \sum_{i=0}^{n+1} (-1)^i \delta_i^{n+1} : \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F}) \rightarrow \Gamma(\mathcal{U}_{n+1}, f_{n+1}^{-1}\mathcal{F})$$

where δ_i^{n+1} corresponds to the map $[n] \rightarrow [n+1]$ omitting the index i . Note that the map $\Gamma(\mathcal{X}, \mathcal{F}) \rightarrow \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F})$ is in the kernel of the differential d^0 . Hence we define the *extended Čech complex* to be the complex

$$\dots \rightarrow 0 \rightarrow \Gamma(\mathcal{X}, \mathcal{F}) \rightarrow \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}) \rightarrow \Gamma(\mathcal{U}_1, f_1^{-1}\mathcal{F}) \rightarrow \dots$$

with $\Gamma(\mathcal{X}, \mathcal{F})$ placed in degree -1 . The extended Čech complex is acyclic if and only if the canonical map

$$\Gamma(\mathcal{X}, \mathcal{F})[0] \rightarrow \check{C}^\bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F})$$

is a quasi-isomorphism of complexes.

Lemma 73.17.1. *Generalities on Čech complexes.*

(1) If

$$\begin{array}{ccc} \mathcal{V} & \xrightarrow{h} & \mathcal{U} \\ g \downarrow & & \downarrow f \\ \mathcal{Y} & \xrightarrow{e} & \mathcal{X} \end{array}$$

is 2-commutative diagram of categories fibred in groupoids over $(Sch/S)_{fppf}$, then there is a morphism of Čech complexes

$$\check{C}^\bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{V} \rightarrow \mathcal{Y}, e^{-1}\mathcal{F})$$

- (2) if h and e are equivalences, then the map of (1) is an isomorphism,
- (3) if $f, f' : \mathcal{U} \rightarrow \mathcal{X}$ are 2-isomorphic, then the associated Čech complexes are isomorphic,

Proof. In the situation of (1) let $t : f \circ h \rightarrow e \circ g$ be a 2-morphism. The map on complexes is given in degree n by pullback along the 1-morphisms $\mathcal{V}_n \rightarrow \mathcal{U}_n$ given by the rule

$$(v_0, \dots, v_n, y, \beta_0, \dots, \beta_n) \longmapsto (h(v_0), \dots, h(v_n), e(y), e(\beta_0) \circ t_{v_0}, \dots, e(\beta_n) \circ t_{v_n}).$$

For (2), note that pullback on global sections is an isomorphism for any presheaf of sets when the pullback is along an equivalence of categories. Part (3) follows on combining (1) and (2). □

Lemma 73.17.2. *If there exists a 1-morphism $s : \mathcal{X} \rightarrow \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $id_{\mathcal{X}}$ then the extended Čech complex is homotopic to zero.*

Proof. Set $\mathcal{U}' = \mathcal{U} \times_{\mathcal{X}} \mathcal{X}$ equal to the fibre product as described in Categories, Lemma 4.30.3. Set $f' : \mathcal{U}' \rightarrow \mathcal{X}$ equal to the second projection. Then $\mathcal{U} \rightarrow \mathcal{U}'$, $u \mapsto (u, f(x), 1)$ is an equivalence over \mathcal{X} , hence we may replace (\mathcal{U}, f) by (\mathcal{U}', f') by Lemma 73.17.1. The advantage of this is that now f' has a section s' such that $f' \circ s' = id_{\mathcal{X}}$ on the nose. Namely, if $t : s \circ f \rightarrow id_{\mathcal{X}}$ is a 2-isomorphism then we can set $s'(x) = (s(x), x, t_x)$. Thus we may assume that $f \circ s = id_{\mathcal{X}}$.

In the case that $f \circ s = id_{\mathcal{X}}$ the result follows from general principles. We give the homotopy explicitly. Namely, for $n \geq 0$ define $s_n : \mathcal{U}_n \rightarrow \mathcal{U}_{n+1}$ to be the 1-morphism defined by the rule on objects

$$(u_0, \dots, u_n, x, \alpha_0, \dots, \alpha_n) \longmapsto (u_0, \dots, u_n, s(x), x, \alpha_0, \dots, \alpha_n, id_x).$$

Define

$$h^{n+1} : \Gamma(\mathcal{U}_{n+1}, f_{n+1}^{-1}\mathcal{F}) \longrightarrow \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F})$$

as pullback along s_n . We also set $s_{-1} = s$ and $h^0 : \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}) \rightarrow \Gamma(\mathcal{X}, \mathcal{F})$ equal to pullback along s_{-1} . Then the family of maps $\{h^n\}_{n \geq 0}$ is a homotopy between 1 and 0 on the extended Čech complex. □

73.18. The relative Čech complex

Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ as in (73.17.0.1). Consider the associated simplicial object \mathcal{U}_\bullet and the maps $f_n : \mathcal{U}_n \rightarrow \mathcal{X}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Finally, suppose that \mathcal{F} is a sheaf (of sets) on \mathcal{X}_τ . Then

$$f_{0,*}f_0^{-1}\mathcal{F} \rightrightarrows f_{1,*}f_1^{-1}\mathcal{F} \rightrightarrows f_{2,*}f_2^{-1}\mathcal{F}$$

is a cosimplicial sheaf on \mathcal{X}_τ where we use the pullback maps introduced in Sites, Section 7.44. If \mathcal{F} is an abelian sheaf, then $f_{n,*}f_n^{-1}\mathcal{F}$ form a cosimplicial abelian sheaf on \mathcal{X}_τ . The associated complex (see Simplicial, Section 14.24)

$$\dots \rightarrow 0 \rightarrow f_{0,*}f_0^{-1}\mathcal{F} \rightarrow f_{1,*}f_1^{-1}\mathcal{F} \rightarrow f_{2,*}f_2^{-1}\mathcal{F} \rightarrow \dots$$

is called the *relative Čech complex* associated to the situation. We will denote this complex $\mathcal{K}^\bullet(f, \mathcal{F})$. The *extended relative Čech complex* is the complex

$$\dots \rightarrow 0 \rightarrow \mathcal{F} \rightarrow f_{0,*}f_0^{-1}\mathcal{F} \rightarrow f_{1,*}f_1^{-1}\mathcal{F} \rightarrow f_{2,*}f_2^{-1}\mathcal{F} \rightarrow \dots$$

with \mathcal{F} in degree -1 . The extended relative Čech complex is acyclic if and only if the map $\mathcal{F}[0] \rightarrow \mathcal{K}^\bullet(f, \mathcal{F})$ is a quasi-isomorphism of complexes of sheaves.

Remark 73.18.1. We can define the complex $\mathcal{K}^\bullet(f, \mathcal{F})$ also if \mathcal{F} is a presheaf, only we cannot use the reference to Sites, Section 7.44 to define the pullback maps. To explain the pullback maps, suppose given a commutative diagram

$$\begin{array}{ccc} \mathcal{V} & \xrightarrow{h} & \mathcal{U} \\ & \searrow g & \swarrow f \\ & & \mathcal{X} \end{array}$$

of categories fibred in groupoids over $(Sch/S)_{fppf}$ and a presheaf \mathcal{G} on \mathcal{U} we can define the pullback map $f_*\mathcal{G} \rightarrow g_*h^{-1}\mathcal{G}$ as the composition

$$f_*\mathcal{G} \longrightarrow f_*h_*h^{-1}\mathcal{G} = g_*h^{-1}\mathcal{G}$$

where the map comes from the adjunction map $\mathcal{G} \rightarrow h_*h^{-1}\mathcal{G}$. This works because in our situation the functors h_* and h^{-1} are adjoint in presheaves (and agree with their counter parts on sheaves). See Sections 73.3 and 73.4.

Lemma 73.18.2. *Generalities on relative Čech complexes.*

(1) *If*

$$\begin{array}{ccc} \mathcal{V} & \xrightarrow{h} & \mathcal{U} \\ g \downarrow & & \downarrow f \\ \mathcal{Y} & \xrightarrow{e} & \mathcal{X} \end{array}$$

is 2-commutative diagram of categories fibred in groupoids over $(Sch/S)_{fppf}$, then there is a morphism $e^{-1}\mathcal{K}^\bullet(f, \mathcal{F}) \rightarrow \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})$.

- (2) *if h and e are equivalences, then the map of (1) is an isomorphism,*
- (3) *if $f, f' : \mathcal{U} \rightarrow \mathcal{X}$ are 2-isomorphic, then the associated relative Čech complexes are isomorphic,*

Proof. Literally the same as the proof of Lemma 73.17.1 using the pullback maps of Remark 73.18.1. □

Lemma 73.18.3. *If there exists a 1-morphism $s : \mathcal{X} \rightarrow \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $id_{\mathcal{X}}$ then the extended relative Čech complex is homotopic to zero.*

Proof. Literally the same as the proof of Lemma 73.17.2. □

Remark 73.18.4. Let us “compute” the value of the relative Čech complex on an object x of \mathcal{X} . Say $p(x) = U$. Consider the 2-fibre product diagram (which serves to introduce the notation $g : \mathcal{V} \rightarrow \mathcal{Y}$)

$$\begin{array}{ccccc} \mathcal{V} & \xlongequal{\quad} & (Sch/U)_{fppf} \times_{x, \mathcal{X}} \mathcal{U} & \longrightarrow & \mathcal{U} \\ g \downarrow & & \downarrow & & \downarrow f \\ \mathcal{Y} & \xlongequal{\quad} & (Sch/U)_{fppf} & \xrightarrow{x} & \mathcal{X} \end{array}$$

Note that the morphism $\mathcal{V}_n \rightarrow \mathcal{U}_n$ of the proof of Lemma 73.17.1 induces an equivalence $\mathcal{V}_n = (Sch/U)_{fppf} \times_{x, \mathcal{X}} \mathcal{U}_n$. Hence we see from (73.5.0.1) that

$$\Gamma(x, \mathcal{K}^\bullet(f, \mathcal{F})) = \check{\mathcal{C}}^\bullet(\mathcal{V} \rightarrow \mathcal{Y}, x^{-1}\mathcal{F})$$

In words: The value of the relative Čech complex on an object x of \mathcal{X} is the Čech complex of the base change of f to $\mathcal{X}/x \cong (Sch/U)_{fppf}$. This implies for example that Lemma 73.17.2 implies Lemma 73.18.3 and more generally that results on the (usual) Čech complex imply results for the relative Čech complex.

Lemma 73.18.5. *Let*

$$\begin{array}{ccc} \mathcal{V} & \xrightarrow{h} & \mathcal{U} \\ g \downarrow & & \downarrow f \\ \mathcal{Y} & \xrightarrow{e} & \mathcal{X} \end{array}$$

be a 2-fibre product of categories fibred in groupoids over $(Sch/S)_{fppf}$ and let \mathcal{F} be an abelian presheaf on \mathcal{X} . Then the map $e^{-1}\mathcal{K}^\bullet(f, \mathcal{F}) \rightarrow \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})$ of Lemma 73.18.2 is an isomorphism of complexes of abelian presheaves.

Proof. Let y be an object of \mathcal{Y} lying over the scheme T . Set $x = e(y)$. We are going to show that the map induces an isomorphism on sections over y . Note that $\Gamma(y, e^{-1}\mathcal{K}^\bullet(f, \mathcal{F})) = \Gamma(x, \mathcal{K}^\bullet(f, \mathcal{F})) = \check{\mathcal{C}}^\bullet((Sch/T)_{fppf} \times_{x, \mathcal{X}} \mathcal{U} \rightarrow (Sch/T)_{fppf}, x^{-1}\mathcal{F})$ by Remark 73.18.4. On the other hand,

$$\Gamma(y, \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})) = \check{\mathcal{C}}^\bullet((Sch/T)_{fppf} \times_{y, \mathcal{Y}} \mathcal{V} \rightarrow (Sch/T)_{fppf}, y^{-1}e^{-1}\mathcal{F})$$

also by Remark 73.18.4. Note that $y^{-1}e^{-1}\mathcal{F} = x^{-1}\mathcal{F}$ and since the diagram is 2-cartesian the 1-morphism

$$(Sch/T)_{fppf} \times_{y, \mathcal{Y}} \mathcal{V} \rightarrow (Sch/T)_{fppf} \times_{x, \mathcal{X}} \mathcal{U}$$

is an equivalence. Hence the map on sections over y is an isomorphism by Lemma 73.17.1. \square

Exactness can be checked on a “covering”.

Lemma 73.18.6. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let*

$$\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$$

be a complex in $Ab(\mathcal{X}_\tau)$. Assume that

- (1) *for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} , and*
- (2) *$f^{-1}\mathcal{F} \rightarrow f^{-1}\mathcal{G} \rightarrow f^{-1}\mathcal{H}$ is exact.*

Then the sequence $\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$ is exact.

Proof. Let x be an object of \mathcal{X} lying over the scheme T . Consider the sequence $x^{-1}\mathcal{F} \rightarrow x^{-1}\mathcal{G} \rightarrow x^{-1}\mathcal{H}$ of abelian sheaves on $(Sch/T)_\tau$. It suffices to show this sequence is exact. By assumption there exists a τ -covering $\{T_i \rightarrow T\}$ such that $x|_{T_i}$ is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} over T_i and moreover the sequence $u_i^{-1}f^{-1}\mathcal{F} \rightarrow u_i^{-1}f^{-1}\mathcal{G} \rightarrow u_i^{-1}f^{-1}\mathcal{H}$ of abelian sheaves on $(Sch/T_i)_\tau$ is exact. Since $u_i^{-1}f^{-1}\mathcal{F} = x^{-1}\mathcal{F}|_{(Sch/T_i)_\tau}$ we conclude that the sequence $x^{-1}\mathcal{F} \rightarrow x^{-1}\mathcal{G} \rightarrow x^{-1}\mathcal{H}$ become exact after localizing at each of the members of a covering, hence the sequence is exact. \square

Proposition 73.18.7. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. If*

- (1) \mathcal{F} is an abelian sheaf on \mathcal{X}_τ , and
- (2) for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} ,

then the extended relative Čech complex

$$\dots \rightarrow 0 \rightarrow \mathcal{F} \rightarrow f_{0,*}f_0^{-1}\mathcal{F} \rightarrow f_{1,*}f_1^{-1}\mathcal{F} \rightarrow f_{2,*}f_2^{-1}\mathcal{F} \rightarrow \dots$$

is exact in $Ab(\mathcal{X}_\tau)$.

Proof. By Lemma 73.18.6 it suffices to check exactness after pulling back to \mathcal{U} . By Lemma 73.18.5 the pullback of the extended relative Čech complex is isomorphic to the extend relative Čech complex for the morphism $\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{U}$ and an abelian sheaf on \mathcal{U}_τ . Since there is a section $\Delta_{\mathcal{U}/\mathcal{X}} : \mathcal{U} \rightarrow \mathcal{U} \times_{\mathcal{X}} \mathcal{U}$ exactness follows from Lemma 73.18.3. \square

Using this we can construct the Čech-to-cohomology spectral sequence as follows. We first give a technical, precise version. In the next section we give a version that applies only to algebraic stacks.

Lemma 73.18.8. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Assume*

- (1) \mathcal{F} is an abelian sheaf on \mathcal{X}_τ ,
- (2) for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} ,
- (3) the category \mathcal{U} has equalizers, and
- (4) the functor f is faithful.

Then there is a first quadrant spectral sequence of abelian groups

$$E_2^{p,q} = H^q((\mathcal{U}_p)_\tau, f_p^{-1}\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F})$$

converging to the cohomology of \mathcal{F} in the τ -topology.

Proof. Before we start the proof we make some remarks. By Lemma 73.16.4 (and induction) all of the categories fibred in groupoids \mathcal{U}_p have equalizers and all of the morphisms $f_p : \mathcal{U}_p \rightarrow \mathcal{X}$ are faithful. Let \mathcal{I} be an injective object of $Ab(\mathcal{X}_\tau)$. By Lemma 73.16.5 we see $f_p^{-1}\mathcal{I}$ is an injective object of $Ab((\mathcal{U}_p)_\tau)$. Hence $f_{p,*}f_p^{-1}\mathcal{I}$ is an injective object of $Ab(\mathcal{X}_\tau)$ by Lemma 73.16.1. Hence Proposition 73.18.7 shows that the extended relative Čech complex

$$\dots \rightarrow 0 \rightarrow \mathcal{I} \rightarrow f_{0,*}f_0^{-1}\mathcal{I} \rightarrow f_{1,*}f_1^{-1}\mathcal{I} \rightarrow f_{2,*}f_2^{-1}\mathcal{I} \rightarrow \dots$$

is an exact complex in $Ab(\mathcal{X}_\tau)$ all of whose terms are injective. Taking global sections of this complex is exact and we see that the Čech complex $\check{C}^\bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{I})$ is quasi-isomorphic to $\Gamma(\mathcal{X}_\tau, \mathcal{I})[0]$.

With these preliminaries out of the way consider the two spectral sequences associated to the double complex (see Homology, Section 12.22)

$$\check{C}^\bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{I}^\bullet)$$

where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The discussion above shows that Homology, Lemma 12.22.7 applies which shows that $\Gamma(\mathcal{X}_\tau, \mathcal{I}^\bullet)$ is quasi-isomorphic to the total complex associated to the double complex. By our remarks above the complex $f_p^{-1}\mathcal{I}^\bullet$ is an injective resolution of $f_p^{-1}\mathcal{F}$. Hence the other spectral sequence is as indicated in the lemma. \square

To be sure there is a version for modules as well.

Lemma 73.18.9. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Assume*

- (1) \mathcal{F} is an object of $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$,
- (2) for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} ,
- (3) the category \mathcal{U} has equalizers, and
- (4) the functor f is faithful.

Then there is a first quadrant spectral sequence of $\Gamma(\mathcal{O}_\mathcal{X})$ -modules

$$E_2^{p,q} = H^q((\mathcal{U}_p)_\tau, f_p^*\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F})$$

converging to the cohomology of \mathcal{F} in the τ -topology.

Proof. The proof of this lemma is identical to the proof of Lemma 73.18.8 except that it uses an injective resolution in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ and it uses Lemma 73.16.6 instead of Lemma 73.16.5. \square

Here is a lemma that translates a more usual kind of covering in the kinds of coverings we have encountered above.

Lemma 73.18.10. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

- (1) *Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then for any object y of \mathcal{Y} there exists an fppf covering $\{y_i \rightarrow y\}$ and objects x_i of \mathcal{X} such that $f(x_i) \cong y_i$ in \mathcal{Y} .*
- (2) *Assume that f is representable by algebraic spaces, surjective, and smooth. Then for any object y of \mathcal{Y} there exists an étale covering $\{y_i \rightarrow y\}$ and objects x_i of \mathcal{X} such that $f(x_i) \cong y_i$ in \mathcal{Y} .*

Proof. Proof of (1). Suppose that y lies over the scheme V . We may think of y as a morphism $(Sch/V)_{fppf} \rightarrow \mathcal{Y}$. By definition the 2-fibre product $\mathcal{X} \times_{\mathcal{Y}} (Sch/V)_{fppf}$ is representable by an algebraic space W and the morphism $W \rightarrow V$ is surjective, flat, and locally of finite presentation. Choose a scheme U and a surjective étale morphism $U \rightarrow W$. Then $U \rightarrow V$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 49.36.7, 49.36.8, 49.5.4, 49.27.2, and 49.28.3). Hence $\{U \rightarrow V\}$ is an fppf covering. Denote x the object of \mathcal{X} over

U corresponding to the 1-morphism $(Sch/U)_{fppf} \rightarrow \mathcal{X}$. Then $\{f(x) \rightarrow y\}$ is the desired fppf covering of \mathcal{Y} .

Proof of (1). Suppose that y lies over the scheme V . We may think of y as a morphism $(Sch/V)_{fppf} \rightarrow \mathcal{Y}$. By definition the 2-fibre product $\mathcal{X} \times_{\mathcal{Y}} (Sch/V)_{fppf}$ is representable by an algebraic space W and the morphism $W \rightarrow V$ is surjective and smooth. Choose a scheme U and a surjective étale morphism $U \rightarrow W$. Then $U \rightarrow V$ is also surjective and smooth (see Morphisms of Spaces, Lemmas 49.36.6, 49.5.4, and 49.34.2). Hence $\{U \rightarrow V\}$ is a smooth covering. By More on Morphisms, Lemma 36.28.7 there exists an étale covering $\{V_i \rightarrow V\}$ such that each $V_i \rightarrow V$ factors through U . Denote x_i the object of \mathcal{X} over V_i corresponding to the 1-morphism

$$(Sch/V_i)_{fppf} \rightarrow (Sch/U)_{fppf} \rightarrow \mathcal{X}.$$

Then $\{f(x_i) \rightarrow y\}$ is the desired étale covering of \mathcal{Y} . □

Lemma 73.18.11. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ and $g : \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Assume*

- (1) \mathcal{F} is an abelian sheaf on \mathcal{X}_τ ,
- (2) for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} ,
- (3) the category \mathcal{U} has equalizers, and
- (4) the functor f is faithful.

Then there is a first quadrant spectral sequence of abelian sheaves on \mathcal{Y}_τ

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

where all higher direct images are computed in the τ -topology.

Proof. Note that the assumptions on $f : \mathcal{U} \rightarrow \mathcal{X}$ and \mathcal{F} are identical to those in Lemma 73.18.8. Hence the preliminary remarks made in the proof of that lemma hold here also. These remarks imply in particular that

$$0 \rightarrow g_* \mathcal{I} \rightarrow (g \circ f_0)_* f_0^{-1} \mathcal{I} \rightarrow (g \circ f_1)_* f_1^{-1} \mathcal{I} \rightarrow \dots$$

is exact if \mathcal{I} is an injective object of $Ab(\mathcal{X}_\tau)$. Having said this, consider the two spectral sequences of Homology, Section 12.22 associated to the double complex $\mathcal{C}^{\bullet,\bullet}$ with terms

$$\mathcal{C}^{p,q} = (g \circ f_p)_* \mathcal{I}^q$$

where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The first spectral sequence implies, via Homology, Lemma 12.22.7, that $g_* \mathcal{I}^\bullet$ is quasi-isomorphic to the total complex associated to $\mathcal{C}^{\bullet,\bullet}$. Since $f_p^{-1} \mathcal{I}^\bullet$ is an injective resolution of $f_p^{-1} \mathcal{F}$ (see Lemma 73.16.5) the second spectral sequence has terms $E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F}$ as in the statement of the lemma. □

Lemma 73.18.12. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ and $g : \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Assume*

- (1) \mathcal{F} is an object of $Mod(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$,
- (2) for every object x of \mathcal{X} there exists a covering $\{x_i \rightarrow x\}$ in \mathcal{X}_τ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of \mathcal{U} ,
- (3) the category \mathcal{U} has equalizers, and

(4) the functor f is faithful.

Then there is a first quadrant spectral sequence in $\text{Mod}(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

where all higher direct images are computed in the τ -topology.

Proof. The proof is identical to the proof of Lemma 73.18.11 except that it uses an injective resolution in $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ and it uses Lemma 73.16.6 instead of Lemma 73.16.5. \square

73.19. Cohomology on algebraic stacks

Let \mathcal{X} be an algebraic stack over S . In the sections above we have seen how to define sheaves for the étale, ..., fppf topologies on \mathcal{X} . In fact, we have constructed a site \mathcal{X}_τ for each $\tau \in \{\text{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$. There is a notion of an abelian sheaf \mathcal{F} on these sites. In the chapter on cohomology of sites we have explained how to define cohomology. Putting all of this together, let's define the *derived global sections*

$$R\Gamma_{\text{Zar}}(\mathcal{X}, \mathcal{F}), R\Gamma_{\text{étale}}(\mathcal{X}, \mathcal{F}), \dots, R\Gamma_{\text{fppf}}(\mathcal{X}, \mathcal{F})$$

as $\Gamma(\mathcal{X}_\tau, \mathcal{I}^\bullet)$ where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $\text{Ab}(\mathcal{X}_\tau)$. The i th cohomology group is the i th cohomology of the total derived cohomology. We will denote this

$$H_{\text{Zar}}^i(\mathcal{X}, \mathcal{F}), H_{\text{étale}}^i(\mathcal{X}, \mathcal{F}), \dots, H_{\text{fppf}}^i(\mathcal{X}, \mathcal{F}).$$

It will turn out that $H_{\text{étale}}^i = H_{\text{smooth}}^i$ because of More on Morphisms, Lemma 36.28.7. If \mathcal{F} is a presheaf of $\mathcal{O}_\mathcal{X}$ -modules which is a sheaf in the τ -topology, then we use injective resolutions in $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ to compute total derived global sections and cohomology groups; of course the end result is quasi-isomorphic resp. isomorphic by the general fact Cohomology on Sites, Lemma 21.12.4.

So far our only tool to compute cohomology groups is the result on Čech complexes proved above. We rephrase it here in the language of algebraic stacks for the étale and the fppf topology. Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of algebraic stacks. Recall that

$$f_p : \mathcal{U}_p = \mathcal{U} \times_{\mathcal{X}} \dots \times_{\mathcal{X}} \mathcal{U} \longrightarrow \mathcal{X}$$

is the structure morphism where there are $(p+1)$ -factors. Also, recall that a sheaf on \mathcal{X} is a sheaf for the fppf topology. Note that if \mathcal{U} is an algebraic space, then $f : \mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 71.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack \mathcal{X} by a scheme.

Proposition 73.19.1. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of algebraic stacks.*

- (1) *Let \mathcal{F} be an abelian étale sheaf on \mathcal{X} . Assume that f is representable by algebraic spaces, surjective, and smooth. Then there is a spectral sequence*

$$E_2^{p,q} = H_{\text{étale}}^q(\mathcal{U}_p, f_p^{-1} \mathcal{F}) \Rightarrow H_{\text{étale}}^{p+q}(\mathcal{X}, \mathcal{F})$$

- (2) *Let \mathcal{F} be an abelian sheaf on \mathcal{X} . Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then there is a spectral sequence*

$$E_2^{p,q} = H_{\text{fppf}}^q(\mathcal{U}_p, f_p^{-1} \mathcal{F}) \Rightarrow H_{\text{fppf}}^{p+q}(\mathcal{X}, \mathcal{F})$$

Proof. To see this we will check the hypotheses (1) – (4) of Lemma 73.18.8. The 1-morphism f is faithful by Algebraic Stacks, Lemma 71.15.2. This proves (4). Hypothesis (3) follows from the fact that \mathcal{U} is an algebraic stack, see Lemma 73.16.2. To see (2) apply Lemma 73.18.10. Condition (1) is satisfied by fiat. \square

73.20. Higher direct images and algebraic stacks

Let $g : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over S . In the sections above we have constructed a morphism of ringed topoi $g : Sh(\mathcal{X}_\tau) \rightarrow Sh(\mathcal{Y}_\tau)$ for each $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. In the chapter on cohomology of sites we have explained how to define higher direct images. Hence the *derived direct image* $Rg_*\mathcal{F}$ is defined as $g_*\mathcal{I}^\bullet$ where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The i th higher direct image $R^i g_*\mathcal{F}$ is the i th cohomology of the derived direct image. Important: it matters which topology τ is used here!

If \mathcal{F} is a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules which is a sheaf in the τ -topology, then we use injective resolutions in $Mod(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$ to compute derived direct image and higher direct images.

So far our only tool to compute the higher direct images of g_* is the result on Čech complexes proved above. This requires the choice of a “covering” $f : \mathcal{U} \rightarrow \mathcal{X}$. If \mathcal{U} is an algebraic space, then $f : \mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 71.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack \mathcal{X} by a scheme.

Proposition 73.20.1. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ and $g : \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of algebraic stacks.*

- (1) *Assume that f is representable by algebraic spaces, surjective and smooth.*
 (a) *If \mathcal{F} is in $Ab(\mathcal{X}_{\acute{e}tale})$ then there is a spectral sequence*

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

in $Ab(\mathcal{Y}_{\acute{e}tale})$ with higher direct images computed in the étale topology.

- (b) *If \mathcal{F} is in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ then there is a spectral sequence*

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

in $Mod(\mathcal{Y}_{\acute{e}tale}, \mathcal{O}_{\mathcal{Y}})$.

- (2) *Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation.*

- (a) *If \mathcal{F} is in $Ab(\mathcal{X})$ then there is a spectral sequence*

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

in $Ab(\mathcal{Y})$ with higher direct images computed in the fppf topology.

- (b) *If \mathcal{F} is in $Mod(\mathcal{O}_{\mathcal{X}})$ then there is a spectral sequence*

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

in $Mod(\mathcal{O}_{\mathcal{Y}})$.

Proof. To see this we will check the hypotheses (1) – (4) of Lemma 73.18.11 and Lemma 73.18.12. The 1-morphism f is faithful by Algebraic Stacks, Lemma 71.15.2. This proves (4). Hypothesis (3) follows from the fact that \mathcal{U} is an algebraic stack, see Lemma 73.16.2. To see (2) apply Lemma 73.18.10. Condition (1) is satisfied by fiat in all four cases. \square

Here is a description of higher direct images for a morphism of algebraic stacks.

Lemma 73.20.2. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks⁴ over S . Let $\tau \in \{\text{Zariski, étale, smooth, syntomic, fppf}\}$. Let \mathcal{F} be an object of $\text{Ab}(\mathcal{X}_\tau)$ or $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$. Then the sheaf $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf*

$$y \longmapsto H_\tau^i\left((\text{Sch}/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{F}\right)$$

Here y is a typical object of \mathcal{Y} lying over the scheme V .

Proof. Choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$. By the formula for pushforward (73.5.0.1) we see that $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf which associates to y the cohomology of the complex

$$\begin{array}{c} \Gamma\left((\text{Sch}/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{I}^{i-1}\right) \\ \downarrow \\ \Gamma\left((\text{Sch}/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{I}^i\right) \\ \downarrow \\ \Gamma\left((\text{Sch}/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{I}^{i+1}\right) \end{array}$$

Since pr^{-1} is exact, it suffices to show that pr^{-1} preserves injectives. This follows from Lemmas 73.16.5 and 73.16.6 as well as the fact that pr is a representable morphism of algebraic stacks (so that pr is faithful by Algebraic Stacks, Lemma 71.15.2 and that $(\text{Sch}/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ has equalizers by Lemma 73.16.2). \square

Here is a trivial base change result.

Lemma 73.20.3. *Let S be a scheme. Let $\tau \in \{\text{Zariski, étale, smooth, syntomic, fppf}\}$. Let*

$$\begin{array}{ccc} \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \xrightarrow{g} & \mathcal{Y} \end{array}$$

be a 2-cartesian diagram of algebraic stacks over S . Then the base change map is an isomorphism

$$g^{-1} Rf_* \mathcal{F} \longrightarrow Rf'_*(g')^{-1} \mathcal{F}$$

functorial for \mathcal{F} in $\text{Ab}(\mathcal{X}_\tau)$ or \mathcal{F} in $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$.

Proof. The isomorphism $g^{-1} f_* \mathcal{F} = f'_*(g')^{-1} \mathcal{F}$ is Lemma 73.5.1 (and it holds for arbitrary presheaves). For the derived direct images, there is a base change map because the morphisms g and g' are flat, see Cohomology on Sites, Section 21.15. To see that this map is a quasi-isomorphism we can use that for an object y' of \mathcal{Y}' over a scheme V there is an equivalence

$$(\text{Sch}/V)_{fppf} \times_{g(y'), \mathcal{Y}} \mathcal{X} = (\text{Sch}/V)_{fppf} \times_{y', \mathcal{Y}'} (\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X})$$

We conclude that the induced map $g^{-1} R^i f_* \mathcal{F} \rightarrow R^i f'_*(g')^{-1} \mathcal{F}$ is an isomorphism by Lemma 73.20.2. \square

⁴This result should hold for any 1-morphism of categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$.

73.21. Comparison

In this section we collect some results on comparing cohomology defined using stacks and using algebraic spaces.

Lemma 73.21.1. *Let S be a scheme. Let \mathcal{X} be an algebraic stack over S representable by the algebraic space F .*

- (1) $\mathcal{I}|_{F_{\acute{e}tale}}$ is injective in $Ab(F_{\acute{e}tale})$ for \mathcal{I} injective in $Ab(\mathcal{X}_{\acute{e}tale})$, and
- (2) $\mathcal{I}|_{F_{\acute{e}tale}}$ is injective in $Mod(F_{\acute{e}tale}, \mathcal{O}_F)$ for \mathcal{I} injective in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O})$.

Proof. This follows formally from the fact that the restriction functor $\pi_{F,*} = i_F^{-1}$ (see Lemma 73.10.1) is an exact left adjoint of $i_{F,*}$, see Homology, Lemma 12.25.1. □

Lemma 73.21.2. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over S . Assume \mathcal{X}, \mathcal{Y} are representable by algebraic spaces F, G . Denote $f : F \rightarrow G$ the induced morphism of algebraic spaces.*

- (1) For any $\mathcal{F} \in Ab(\mathcal{X}_{\acute{e}tale})$ we have

$$(Rf_*\mathcal{F})|_{G_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$

in $D(G_{\acute{e}tale})$.

- (2) For any object \mathcal{F} of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ we have

$$(Rf_*\mathcal{F})|_{G_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$

in $D(\mathcal{O}_G)$.

Proof. Follows immediately from Lemma 73.21.1 and (73.10.2.1) on choosing an injective resolution of \mathcal{F} . □

Lemma 73.21.3. *Let S be a scheme. Consider a 2-fibre product square*

$$\begin{array}{ccc} \mathcal{X}' & \xrightarrow{g'} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{Y}' & \xrightarrow{g} & \mathcal{Y} \end{array}$$

of algebraic stacks over S . Assume that f is representable by algebraic spaces and that \mathcal{Y}' is representable by an algebraic space G' . Then \mathcal{X}' is representable by an algebraic space F' and denoting $f' : F' \rightarrow G'$ the induced morphism of algebraic spaces we have

$$g^{-1}(Rf_*\mathcal{F})|_{G'_{\acute{e}tale}} = Rf'_{small,*}((g')^{-1}\mathcal{F}|_{F'_{\acute{e}tale}})$$

for any \mathcal{F} in $Ab(\mathcal{X}_{\acute{e}tale})$ or in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$

Proof. Follows formally on combining Lemmas 73.20.3 and 73.21.2. □

73.22. Change of topology

Here is a technical lemma which tells us that the fppf cohomology of a locally quasi-coherent sheaf is equal to its étale cohomology provided the comparison maps are isomorphisms for morphisms of \mathcal{X} lying over flat morphisms.

Lemma 73.22.1. *Let S be a scheme. Let \mathcal{X} be an algebraic stack over S . Let \mathcal{F} be a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. Assume*

- (a) \mathcal{F} is locally quasi-coherent, and

- (b) for any morphism $\varphi : x \rightarrow y$ of \mathcal{X} which lies over a morphism of schemes $f : U \rightarrow V$ which is flat and locally of finite presentation the comparison map $c_\varphi : f_{small}^* \mathcal{F}|_{V_{\acute{e}tale}} \rightarrow \mathcal{F}|_{U_{\acute{e}tale}}$ of (73.9.4.1) is an isomorphism.

Then \mathcal{F} is a sheaf for the fppf topology.

Proof. Let $\{x_i \rightarrow x\}$ be an fppf covering of \mathcal{X} lying over the fppf covering $\{f_i : U_i \rightarrow U\}$ of schemes over S . By assumption the restriction $\mathcal{G} = \mathcal{F}|_{U_{\acute{e}tale}}$ is quasi-coherent and the comparison maps $f_{i,small}^* \mathcal{G} \rightarrow \mathcal{F}|_{U_i, \acute{e}tale}$ are isomorphisms. Hence the sheaf condition for \mathcal{F} and the covering $\{x_i \rightarrow x\}$ is equivalent to the sheaf condition for \mathcal{G}^a on $(Sch/U)_{fppf}$ and the covering $\{U_i \rightarrow U\}$ which holds by Descent, Lemma 34.7.1. \square

Lemma 73.22.2. *Let S be a scheme. Let \mathcal{X} be an algebraic stack over S . Let \mathcal{F} be a presheaf $\mathcal{O}_{\mathcal{X}}$ -module such that*

- (a) \mathcal{F} is locally quasi-coherent, and
 (b) for any morphism $\varphi : x \rightarrow y$ of \mathcal{X} which lies over a morphism of schemes $f : U \rightarrow V$ which is flat and locally of finite presentation, the comparison map $c_\varphi : f_{small}^* \mathcal{F}|_{V_{\acute{e}tale}} \rightarrow \mathcal{F}|_{U_{\acute{e}tale}}$ of (73.9.4.1) is an isomorphism.

Then \mathcal{F} is an $\mathcal{O}_{\mathcal{X}}$ -module and we have the following

- (1) If $\epsilon : \mathcal{X}_{fppf} \rightarrow \mathcal{X}_{\acute{e}tale}$ is the comparison morphism, then $R\epsilon_* \mathcal{F} = \epsilon_* \mathcal{F}$.
 (2) The cohomology groups $H_{fppf}^p(\mathcal{X}, \mathcal{F})$ are equal to the cohomology groups computed in the étale topology on \mathcal{X} . Similarly for the cohomology groups $H_{fppf}^p(x, \mathcal{F})$ and the derived versions $R\Gamma(\mathcal{X}, \mathcal{F})$ and $R\Gamma(x, \mathcal{F})$.
 (3) If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ then $R^i f_* \mathcal{F}$ is equal to the fppf-sheafification of the higher direct image computed in the étale cohomology. Similarly for derived push-forward.

Proof. The assertion that \mathcal{F} is an $\mathcal{O}_{\mathcal{X}}$ -module follows from Lemma 73.22.1. Note that ϵ is a morphism of sites given by the identity functor on \mathcal{X} . The sheaf $R^p \epsilon_* \mathcal{F}$ is therefore the sheaf associated to the presheaf $x \mapsto H_{fppf}^p(x, \mathcal{F})$, see Cohomology on Sites, Lemma 21.8.4. To prove (1) it suffices to show that $H_{fppf}^p(x, \mathcal{F}) = 0$ for $p > 0$ whenever x lies over an affine scheme U . By Lemma 73.15.1 we have $H_{fppf}^p(x, \mathcal{F}) = H^p((Sch/U)_{fppf}, x^{-1} \mathcal{F})$. Combining Descent, Lemma 34.8.4 with Cohomology of Schemes, Lemma 29.2.2 we see that these cohomology groups are zero.

We have seen above that $\epsilon_* \mathcal{F}$ and \mathcal{F} are the sheaves on $\mathcal{X}_{\acute{e}tale}$ and \mathcal{X}_{fppf} corresponding to the same presheaf on \mathcal{X} (and this is true more generally for any sheaf in the fppf topology on \mathcal{X}). We often abusively identify \mathcal{F} and $\epsilon_* \mathcal{F}$ and this is the sense in which parts (2) and (3) of the lemma should be understood. Thus part (2) follows formally from (1) and the Leray spectral sequence, see Cohomology on Sites, Lemma 21.14.6.

Finally we prove (3). The sheaf $R^i f_* \mathcal{F}$ (resp. $Rf_{\acute{e}tale,*} \mathcal{F}$) is the sheaf associated to the presheaf

$$y \longmapsto H_\tau^i \left((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{F} \right)$$

where τ is fppf (resp. étale), see Lemma 73.20.2. Note that $\text{pr}^{-1} \mathcal{F}$ satisfies properties (a) and (b) also (by Lemmas 73.11.6 and 73.9.3), hence these two presheaves are equal by (2). This immediately implies (3). \square

We will use the following lemma to compare étale cohomology of sheaves on algebraic stacks with cohomology on the lisse-étale topos.

Lemma 73.22.3. *Let S be a scheme. Let \mathcal{X} be an algebraic stack over S . Let $\tau = \text{étale}$ (resp. $\tau = \text{fppf}$). Let $\mathcal{X}' \subset \mathcal{X}$ be a full subcategory with the following properties*

- (1) *if $x \rightarrow x'$ is a morphism of \mathcal{X} which lies over a smooth (resp. flat and locally finitely presented) morphism of schemes and $x' \in \text{Ob}(\mathcal{X}')$, then $x \in \text{Ob}(\mathcal{X}')$, and*
- (2) *there exists an object $x \in \text{Ob}(\mathcal{X}')$ lying over a scheme U such that the associated 1-morphism $x : (\text{Sch}/U)_{\text{fppf}} \rightarrow \mathcal{X}$ is smooth and surjective.*

We get a site \mathcal{X}'_τ by declaring a covering of \mathcal{X}' to be any family of morphisms $\{x_i \rightarrow x\}$ in \mathcal{X}' which is a covering in \mathcal{X}_τ . Then the inclusion functor $\mathcal{X}' \rightarrow \mathcal{X}$ is fully faithful, cocontinuous, and continuous, whence defines a morphism of topoi

$$g : \text{Sh}(\mathcal{X}'_\tau) \longrightarrow \text{Sh}(\mathcal{X}_\tau)$$

and $H^p(\mathcal{X}'_\tau, g^{-1}\mathcal{F}) = H^p(\mathcal{X}_\tau, \mathcal{F})$ for all $p \geq 0$ and all $\mathcal{F} \in \text{Ab}(\mathcal{X}_\tau)$.

Proof. Note that assumption (1) implies that if $\{x_i \rightarrow x\}$ is a covering of \mathcal{X}_τ and $x \in \text{Ob}(\mathcal{X}')$, then we have $x_i \in \text{Ob}(\mathcal{X}')$. Hence we see that $\mathcal{X}' \rightarrow \mathcal{X}$ is continuous and cocontinuous as the coverings of objects of \mathcal{X}'_τ agree with their coverings seen as objects of \mathcal{X}_τ . We obtain the morphism g and the functor g^{-1} is identified with the restriction functor, see Sites, Lemma 7.20.5.

In particular, if $\{x_i \rightarrow x\}$ is a covering in \mathcal{X}'_τ , then for any abelian sheaf \mathcal{F} on \mathcal{X} then

$$\check{H}^p(\{x_i \rightarrow x\}, g^{-1}\mathcal{F}) = \check{H}^p(\{x_i \rightarrow x\}, \mathcal{F})$$

Thus if \mathcal{I} is an injective abelian sheaf on \mathcal{X}_τ then we see that the higher Čech cohomology groups are zero (Cohomology on Sites, Lemma 21.11.2). Hence $H^p(x, g^{-1}\mathcal{I}) = 0$ for all objects x of \mathcal{X}' (Cohomology on Sites, Lemma 21.11.9). In other words injective abelian sheaves on \mathcal{X}_τ are right acyclic for the functor $H^0(x, g^{-1}-)$. It follows that $H^p(x, g^{-1}\mathcal{F}) = H^p(x, \mathcal{F})$ for all $\mathcal{F} \in \text{Ab}(\mathcal{X})$ and all $x \in \text{Ob}(\mathcal{X}')$.

Choose an object $x \in \mathcal{X}'$ lying over a scheme U as in assumption (2). In particular $\mathcal{X}/x \rightarrow \mathcal{X}$ is a morphism of algebraic stacks which representable by algebraic spaces, surjective, and smooth. (Note that \mathcal{X}/x is equivalent to $(\text{Sch}/U)_{\text{fppf}}$, see Lemma 73.9.1.) The map of sheaves

$$h_x \longrightarrow *$$

in $\text{Sh}(\mathcal{X}_\tau)$ is surjective. Namely, for any object x' of \mathcal{X} there exists a τ -covering $\{x'_i \rightarrow x'\}$ such that there exist morphisms $x'_i \rightarrow x$, see Lemma 73.18.10. Since g is exact, the map of sheaves

$$g^{-1}h_x \longrightarrow * = g^{-1}*$$

in $\text{Sh}(\mathcal{X}'_\tau)$ is surjective also. Let $h_{x,n}$ be the $(n + 1)$ -fold product $h_x \times \dots \times h_x$. Then we have spectral sequences

$$(73.22.3.1) \quad E_1^{p,q} = H^q(h_{x,p}, \mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F})$$

and

$$(73.22.3.2) \quad E_1^{p,q} = H^q(g^{-1}h_{x,p}, g^{-1}\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}'_\tau, g^{-1}\mathcal{F})$$

see Cohomology on Sites, Lemma 21.13.2.

Case I: \mathcal{X} has a final object x which is also an object of \mathcal{X}' . This case follows immediately from the discussion in the second paragraph above.

Case II: \mathcal{X} is representable by an algebraic space F . In this case the sheaves $h_{x,n}$ are representable by an object x_n in \mathcal{X} . (Namely, if $\mathcal{S}_F = \mathcal{X}$ and $x : U \rightarrow F$ is the given object, then $h_{x,n}$ is representable by the object $U \times_F \dots \times_F U \rightarrow F$ of \mathcal{S}_F .) It follows that $H^q(h_{x,p}, \mathcal{F}) = H^q(x_p, \mathcal{F})$. The morphisms $x_n \rightarrow x$ lie over smooth morphisms of schemes, hence $x_n \in \mathcal{X}'$ for all n . Hence $H^q(g^{-1}h_{x,p}, g^{-1}\mathcal{F}) = H^q(x_p, g^{-1}\mathcal{F})$. Thus in the two spectral sequences (73.22.3.1) and (73.22.3.2) above the $E_1^{p,q}$ terms agree by the discussion in the second paragraph. The lemma follows in Case II as well.

Case III: \mathcal{X} is an algebraic stack. We claim that in this case the cohomology groups $H^q(h_{x,p}, \mathcal{F})$ and $H^q(g^{-1}h_{x,n}, g^{-1}\mathcal{F})$ agree by Case II above. Once we have proved this the result will follow as before.

Namely, consider the category $\mathcal{X}/h_{x,n}$, see Sites, Lemma 7.29.3. Since $h_{x,n}$ is the $(n+1)$ -fold product of h_x an object of this category is an $(n+2)$ -tuple (y, s_0, \dots, s_n) where y is an object of \mathcal{X} and each $s_i : y \rightarrow x$ is a morphism of \mathcal{X} . This is a category over $(Sch/S)_{fppf}$. There is an equivalence

$$\mathcal{X}/h_{x,n} \longrightarrow (Sch/U)_{fppf} \times_{\mathcal{X}} \dots \times_{\mathcal{X}} (Sch/U)_{fppf} =: \mathcal{U}_n$$

over $(Sch/S)_{fppf}$. Namely, if $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ also denotes the 1-morphism associated with x and $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ the structure functor, then we can think of (y, s_0, \dots, s_n) as $(y, f_0, \dots, f_n, \alpha_0, \dots, \alpha_n)$ where y is an object of \mathcal{X} , $f_i : p(y) \rightarrow p(x)$ is a morphism of schemes, and $\alpha_i : y \rightarrow x(f_i)$ an isomorphism. The category of $2n+3$ -tuples $(y, f_0, \dots, f_n, \alpha_0, \dots, \alpha_n)$ is an incarnation of the $(n+1)$ -fold fibred product \mathcal{U}_n of algebraic stacks displayed above, as we discussed in Section 73.17. By Cohomology on Sites, Lemma 21.13.3 we have

$$H^p(\mathcal{U}_n, \mathcal{F}|_{\mathcal{U}_n}) = H^p(\mathcal{X}/h_{x,n}, \mathcal{F}|_{\mathcal{X}/h_{x,n}}) = H^p(h_{x,n}, \mathcal{F}).$$

Finally, we discuss the “primed” analogue of this. Namely, $\mathcal{X}'/h_{x,n}$ corresponds, via the equivalence above to the full subcategory $\mathcal{U}'_n \subset \mathcal{U}_n$ consisting of those tuples $(y, f_0, \dots, f_n, \alpha_0, \dots, \alpha_n)$ with $y \in \mathcal{X}'$. Hence certainly property (1) of the statement of the lemma holds for the inclusion $\mathcal{U}'_n \subset \mathcal{U}_n$. To see property (2) choose an object $\xi = (y, s_0, \dots, s_n)$ which lies over a scheme W such that $(Sch/W)_{fppf} \rightarrow \mathcal{U}_n$ is smooth and surjective (this is possible as \mathcal{U}_n is an algebraic stack). Then $(Sch/W)_{fppf} \rightarrow \mathcal{U}_n \rightarrow (Sch/U)_{fppf}$ is smooth as a composition of base changes of the morphism $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemmas 71.10.6 and 71.10.5. Thus axiom (1) for \mathcal{X} implies that y is an object of \mathcal{X}' whence ξ is an object of \mathcal{U}'_n . Using again

$$H^p(\mathcal{U}'_n, \mathcal{F}|_{\mathcal{U}'_n}) = H^p(\mathcal{X}'/h_{x,n}, \mathcal{F}|_{\mathcal{X}'/h_{x,n}}) = H^p(g^{-1}h_{x,n}, g^{-1}\mathcal{F}).$$

we now can use Case II for $\mathcal{U}'_n \subset \mathcal{U}_n$ to conclude. \square

Criteria for Representability

74.1. Introduction

The purpose of this chapter is to find criteria guaranteeing that a stack in groupoids over the category of schemes with the fppf topology is an algebraic stack. Historically, this often involved proving that certain functors were representable, see Grothendieck’s lectures [Gro95a], [Gro95b], [Gro95e], [Gro95f], [Gro95c], and [Gro95d]. This explains the title of this chapter. Another important source of this material comes from the work of Artin, see [Art69b], [Art70], [Art73], [Art71b], [Art71a], [Art69a], [Art69c], and [Art74].

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 76.1 for an explanation.

74.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 71.2.

74.3. What we already know

The analogue of this chapter for algebraic spaces is the chapter entitled “Bootstrap”, see Bootstrap, Section 62.1. That chapter already contains some representability results. Moreover, some of the preliminary material treated there we already have worked out in the chapter on algebraic stacks. Here is a list:

- (1) We discuss morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 62.3. In Algebraic Stacks, Section 71.9 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
- (2) We discuss properties of morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 62.4. In Algebraic Stacks, Section 71.10 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
- (3) We proved that if F is a sheaf whose diagonal is representable by algebraic spaces and which has an étale covering by an algebraic space, then F is an algebraic space, see Bootstrap, Theorem 62.6.1. (This is a weak version of the result in the next item on the list.)
- (4) We proved that if F is a sheaf and if there exists an algebraic space U and a morphism $U \rightarrow F$ which is representable by algebraic spaces, surjective, flat, and locally of finite presentation, then F is an algebraic space, see Bootstrap, Theorem 62.10.1.

- (5) We have also proved the “smooth” analogue of (4) for algebraic stacks: If \mathcal{X} is a stack in groupoids over $(Sch/S)_{fppf}$ and if there exists a stack in groupoids \mathcal{U} over $(Sch/S)_{fppf}$ which is representable by an algebraic space and a 1-morphism $u : \mathcal{U} \rightarrow \mathcal{X}$ which is representable by algebraic spaces, surjective, and smooth then \mathcal{X} is an algebraic stack, see Algebraic Stacks, Lemma 71.15.3.

Our first task now is to prove the analogue of (4) for algebraic stacks in general; it is Theorem 74.16.1.

74.4. Morphisms of stacks in groupoids

This section is preliminary and should be skipped on a first reading.

Lemma 74.4.1. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If $\mathcal{X} \rightarrow \mathcal{Z}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ are representable by algebraic spaces and étale so is $\mathcal{X} \rightarrow \mathcal{Y}$.*

Proof. Let \mathcal{U} be a representable category fibred in groupoids over S . Let $f : \mathcal{U} \rightarrow \mathcal{Y}$ be a 1-morphism. We have to show that $\mathcal{X} \times_{\mathcal{Y}} \mathcal{U}$ is representable by an algebraic space and étale over \mathcal{U} . Consider the composition $h : \mathcal{U} \rightarrow \mathcal{Z}$. Then

$$\mathcal{X} \times_{\mathcal{Z}} \mathcal{U} \longrightarrow \mathcal{Y} \times_{\mathcal{Z}} \mathcal{U}$$

is a 1-morphism between categories fibres in groupoids which are both representable by algebraic spaces and both étale over \mathcal{U} . Hence by Properties of Spaces, Lemma 48.13.6 this is represented by an étale morphism of algebraic spaces. Finally, we obtain the result we want as the morphism f induces a morphism $\mathcal{U} \rightarrow \mathcal{Y} \times_{\mathcal{Z}} \mathcal{U}$ and we have

$$\mathcal{X} \times_{\mathcal{Y}} \mathcal{U} = (\mathcal{X} \times_{\mathcal{Z}} \mathcal{U}) \times_{(\mathcal{Y} \times_{\mathcal{Z}} \mathcal{U})} \mathcal{U}.$$

□

Lemma 74.4.2. *Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be stacks in groupoids over $(Sch/S)_{fppf}$. Suppose that $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ are 1-morphisms. If*

- (1) \mathcal{Y}, \mathcal{Z} are representable by algebraic spaces Y, Z over S ,
- (2) the associated morphism of algebraic spaces $Y \rightarrow Z$ is surjective, flat and locally of finite presentation, and
- (3) $\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X}$ is a stack in setoids,

then \mathcal{X} is a stack in setoids.

Proof. This is a special case of Stacks, Lemma 8.6.10. □

The following lemma is the analogue of Algebraic Stacks, Lemma 71.15.3 and will be superseded by the stronger Theorem 74.16.1.

Lemma 74.4.3. *Let S be a scheme. Let $u : \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

- (1) \mathcal{U} is representable by an algebraic space, and
- (2) u is representable by algebraic spaces, surjective, flat and locally of finite presentation,

then $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ representable by algebraic spaces.

Proof. Given two schemes T_1, T_2 over S denote $\mathcal{T}_i = (Sch/T_i)_{fppf}$ the associated representable fibre categories. Suppose given 1-morphisms $f_i : \mathcal{T}_i \rightarrow \mathcal{X}$. According to Algebraic Stacks, Lemma 71.10.11 it suffices to prove that the 2-fibered product $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is representable by an algebraic space. By Stacks, Lemma 8.6.8 this is in any case a stack in setoids. Thus $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ corresponds to some sheaf F on $(Sch/S)_{fppf}$, see Stacks, Lemma 8.6.3. Let U be the algebraic space which represents \mathcal{U} . By assumption

$$\mathcal{T}'_i = \mathcal{U} \times_{u, \mathcal{X}, f_i} \mathcal{T}_i$$

is representable by an algebraic space T'_i over S . Hence $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2$ is representable by the algebraic space $T'_1 \times_U T'_2$. Consider the commutative diagram

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 \rightarrow \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is the “base change” of $\mathcal{U} \rightarrow \mathcal{X}$, more precisely the diagram

$$\begin{array}{ccc}
 \mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 & \longrightarrow & \mathcal{U} \\
 \downarrow & & \downarrow \\
 \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 & \longrightarrow & \mathcal{X}
 \end{array}$$

is a 2-fibre square. Hence $\mathcal{T}'_1 \times_{\mathcal{U}} \mathcal{T}'_2 \rightarrow F$ is representable by algebraic spaces, flat, locally of finite presentation and surjective, see Algebraic Stacks, Lemmas 71.9.6, 71.9.7, 71.10.4, and 71.10.6. Therefore F is an algebraic space by Bootstrap, Theorem 62.10.1 and we win. \square

Lemma 74.4.4. *Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. The following are equivalent*

- (1) $\Delta_{\mathcal{X}} : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{X} \times \mathcal{X}} \mathcal{X}$ is representable by algebraic spaces,
- (2) for every 1-morphism $\mathcal{V} \rightarrow \mathcal{X} \times \mathcal{X}$ with \mathcal{V} representable (by a scheme) and the fibre product $\mathcal{Y} = \mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}} \mathcal{V}$ has diagonal representable by algebraic spaces.

Proof. Although this is a bit of a brain twister, it is completely formal. Namely, recall that $\mathcal{X} \times_{\mathcal{X} \times \mathcal{X}} \mathcal{X} = \mathcal{I}_{\mathcal{X}}$ is the inertia of \mathcal{X} and that $\Delta_{\mathcal{X}}$ is the identity section of $\mathcal{I}_{\mathcal{X}}$, see Categories, Section 4.32. Thus condition (1) says the following: Given a scheme V , an object x of \mathcal{X} over V , and a morphism $\alpha : x \rightarrow x$ of \mathcal{X}_V the condition “ $\alpha = \text{id}_x$ ” defines an algebraic space over V . (In other words, there exists a monomorphism of algebraic spaces $W \rightarrow V$ such that a morphism of schemes $f : T \rightarrow V$ factors through W if and only if $f^* \alpha = \text{id}_{f^* x}$.)

On the other hand, let V be a scheme and let x, y be objects of \mathcal{X} over V . Then (x, y) define a morphism $\mathcal{V} = (Sch/V)_{fppf} \rightarrow \mathcal{X} \times \mathcal{X}$. Next, let $h : V' \rightarrow V$ be a morphism of schemes and let $\alpha : h^*x \rightarrow h^*y$ and $\beta : h^*x \rightarrow h^*y$ be morphisms of $\mathcal{X}_{V'}$. Then (α, β) define a morphism $\mathcal{V}' = (Sch/V)_{fppf} \rightarrow \mathcal{V} \times \mathcal{V}$. Condition (2) now says that (with any choices as above) the condition “ $\alpha = \beta$ ” defines an algebraic space over V .

To see the equivalence, given (α, β) as in (2) we see that (1) implies that “ $\alpha^{-1} \circ \beta = \text{id}_{h^*x}$ ” defines an algebraic space. The implication (2) \Rightarrow (1) follows by taking $h = \text{id}_V$ and $\beta = \text{id}_x$. \square

74.5. Limit preserving on objects

Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. We will say that p is *limit preserving on objects* if the following condition holds: Given any data consisting of

- (1) an affine scheme $U = \lim_{i \in I} U_i$ which is written as the directed limit of affine schemes U_i over S ,
- (2) an object y_i of \mathcal{Y} over U_i for some i ,
- (3) an object x of \mathcal{X} over U , and
- (4) an isomorphism $\gamma : p(x) \rightarrow y_i|_U$,

then there exists an $i' \geq i$, an object $x_{i'}$ of \mathcal{X} over $U_{i'}$, an isomorphism $\beta : x_{i'}|_U \rightarrow x$, and an isomorphism $\gamma_{i'} : p(x_{i'}) \rightarrow y_i|_{U_{i'}}$, such that

$$(74.5.0.1) \quad \begin{array}{ccc} p(x_{i'}|_U) & \xrightarrow{\gamma_{i'}|_U} & (y_i|_{U_{i'}})|_U \\ p(\beta) \downarrow & & \parallel \\ p(x) & \xrightarrow{\gamma} & y_i|_U \end{array}$$

commutes. In this situation we say that “ $(i', x_{i'}, \beta, \gamma_{i'})$ is a *solution* to the problem posed by our data (1), (2), (3), (4)”. The motivation for this definition comes from Limits of Spaces, Lemma 52.3.2.

Lemma 74.5.1. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \rightarrow \mathcal{Y}$ is limit preserving on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$ of p by q .*

Proof. This is formal. Let $U = \lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S , let z_i be an object of \mathcal{Z} over U_i for some i , let w be an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U , and let $\delta : p'(w) \rightarrow z_i|_U$ be an isomorphism. We may write $w = (U, x, z, \alpha)$ for some object x of \mathcal{X} over U and object z of \mathcal{Z} over U and isomorphism $\alpha : p(x) \rightarrow q(z)$. Note that $p'(w) = z$ hence $\delta : z \rightarrow z_i|_U$. Set $y_i = q(z_i)$ and $\gamma = q(\delta) \circ \alpha : p(x) \rightarrow y_i|_U$. As p is limit preserving on objects there exists an $i' \geq i$ and an object $x_{i'}$ of \mathcal{X} over $U_{i'}$ as well as isomorphisms $\beta : x_{i'}|_U \rightarrow x$ and $\gamma_{i'} : p(x_{i'}) \rightarrow y_i|_{U_{i'}}$ such that (74.5.0.1) commutes. Then we consider the object $w_{i'} = (U_{i'}, x_{i'}, z_i|_{U_{i'}}, \gamma_{i'})$ of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over $U_{i'}$ and define isomorphisms

$$w_{i'}|_U = (U, x_{i'}|_U, z_i|_U, \gamma_{i'}|_U) \xrightarrow{(\beta, \delta^{-1})} (U, x, z, \alpha) = w$$

and

$$p'(w_{i'}) = z_i|_{U_{i'}} \xrightarrow{\text{id}} z_i|_{U_{i'}}.$$

These combine to give a solution to the problem. \square

Lemma 74.5.2. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p and q are limit preserving on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let $U = \lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S , let z_i be an object of \mathcal{Z} over U_i for some i , let x be an object of \mathcal{X} over U , and let $\gamma : q(p(x)) \rightarrow z_i|_U$ be an isomorphism. As q is limit preserving on objects there exist an $i' \geq i$, an object $y_{i'}$ of \mathcal{Y} over $U_{i'}$, an isomorphism $\beta : y_{i'}|_U \rightarrow p(x)$, and an isomorphism $\gamma_{i'} : q(y_{i'}) \rightarrow z_i|_{U_{i'}}$ such that (74.5.0.1) is commutative. As p is limit preserving on objects there exist an $i'' \geq i'$, an object $x_{i''}$ of \mathcal{X} over $U_{i''}$, an isomorphism $\beta' : x_{i''}|_U \rightarrow x$, and an isomorphism $\gamma_{i''} : p(x_{i''}) \rightarrow y_{i'}|_{U_{i''}}$ such that (74.5.0.1) is commutative. The solution is to take $x_{i''}$ over $U_{i''}$ with isomorphism

$$q(p(x_{i''})) \xrightarrow{q(\gamma_{i''})} q(y_{i'})|_{U_{i''}} \xrightarrow{\gamma_{i'}|_{U_{i''}}} z_i|_{U_{i''}}$$

and isomorphism $\beta' : x_{i''}|_U \rightarrow x$. We omit the verification that (74.5.0.1) is commutative. \square

Lemma 74.5.3. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

- (1) p is limit preserving on objects, and
- (2) p is locally of finite presentation (see Algebraic Stacks, Definition 71.10.1).

Proof. Assume (2). Let $U = \lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S , let y_i be an object of \mathcal{Y} over U_i for some i , let x be an object of \mathcal{X} over U , and let $\gamma : p(x) \rightarrow y_i|_U$ be an isomorphism. Let X_{y_i} denote an algebraic space over U_i representing the 2-fibre product

$$(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, p} \mathcal{X}.$$

Note that $\xi = (U, U \rightarrow U_i, x, \gamma^{-1})$ defines an object of this 2-fibre product over U . Via the 2-Yoneda lemma ξ corresponds to a morphism $f_\xi : U \rightarrow X_{y_i}$ over U_i . By Limits of Spaces, Proposition 52.3.9 there exists an $i' \geq i$ and a morphism $f_{i'} : U_{i'} \rightarrow X_{y_i}$ such that f_ξ is the composition of $f_{i'}$ and the projection morphism $U \rightarrow U_{i'}$. Also, the 2-Yoneda lemma tells us that $f_{i'}$ corresponds to an object $\xi_{i'} = (U_{i'}, U_{i'} \rightarrow U_i, x_{i'}, \alpha)$ of the displayed 2-fibre product over $U_{i'}$ whose restriction to U recovers ξ . In particular we obtain an isomorphism $\gamma : x_{i'}|_U \rightarrow x$. Note that $\alpha : y_i|_{U_{i'}} \rightarrow p(x_{i'})$. Hence we see that taking $x_{i'}$, the isomorphism $\gamma : x_{i'}|_U \rightarrow x$, and the isomorphism $\beta = \alpha^{-1} : p(x_{i'}) \rightarrow y_i|_{U_{i'}}$ is a solution to the problem.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \rightarrow \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y, \mathcal{Y}, p} \mathcal{X}$. We have to show that $X_y \rightarrow T$ is locally of finite presentation. To do this we may use Limits of Spaces, Proposition 52.3.9 in the form described in Limits of Spaces, Remark 52.3.10. Hence it suffices to show that given an affine scheme $U = \lim_{i \in I} U_i$ written as the directed limit of affine schemes over T , then $X_y(U) = \text{colim}_i X_y(U_i)$. Pick any $i \in I$ and set $y_i = y|_{U_i}$. Also denote i' an element of I which is bigger than or equal to i . By the 2-Yoneda lemma morphisms $U \rightarrow X_y$ over T correspond bijectively to isomorphism classes of pairs (x, α) where x is an object of \mathcal{X} over U and $\alpha : y|_U \rightarrow p(x)$ is an isomorphism. Of course giving α is, up to an inverse,

the same thing as giving an isomorphism $\gamma : p(x) \rightarrow y_i|_U$. Similarly for morphisms $U_{i'} \rightarrow X_y$ over T . Hence (1) guarantees that

$$X_y(U) = \operatorname{colim}_{i' \geq i} X_y(U_{i'})$$

in this situation and we win. \square

Lemma 74.5.4. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume p is representable by algebraic spaces and an open immersion. Then p is limit preserving on objects.*

Proof. This follows from Lemma 74.5.3 and (via the general principle Algebraic Stacks, Lemma 71.10.9) from the fact that an open immersion of algebraic spaces is locally of finite presentation, see Morphisms of Spaces, Lemma 49.27.11. \square

Let S be a scheme. In the following lemma we need the notion of the *size* of an algebraic space X over S . Namely, given a cardinal κ we will say X has $\operatorname{size}(X) \leq \kappa$ if and only if there exists a scheme U with $\operatorname{size}(U) \leq \kappa$ (see Sets, Section 3.9) and a surjective étale morphism $U \rightarrow X$.

Lemma 74.5.5. *Let S be a scheme. Let $\kappa = \operatorname{size}(T)$ for some $T \in \operatorname{Ob}((Sch/S)_{fppf})$. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ such that*

- (1) $\mathcal{Y} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects,
- (2) for an affine scheme V locally of finite presentation over S and $y \in \operatorname{Ob}(\mathcal{Y}_V)$ the fibre product $(Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable by an algebraic space of size $\leq \kappa^1$,
- (3) \mathcal{X} and \mathcal{Y} are stacks for the Zariski topology.

Then f is representable by algebraic spaces.

Proof. Let V be a scheme over S and $y \in \mathcal{Y}_V$. We have to prove $(Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable by an algebraic space.

Case I: V is affine and maps into an affine open $\operatorname{Spec}(\Lambda) \subset S$. Then we can write $V = \lim V_i$ with each V_i affine and of finite presentation over $\operatorname{Spec}(\Lambda)$, see Algebra, Lemma 10.123.1. Then y comes from an object y_i over V_i for some i by assumption (1). By assumption (3) the fibre product $(Sch/V_i)_{fppf} \times_{y_i, \mathcal{Y}} \mathcal{X}$ is representable by an algebraic space Z_i . Then $(Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable by $Z \times_{V_i} V$.

Case II: V is general. Choose an affine open covering $V = \bigcup_{i \in I} V_i$ such that each V_i maps into an affine open of S . We first claim that $\mathcal{Z} = (Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ is a stack in setoids for the Zariski topology. Namely, it is a stack in groupoids for the Zariski topology by Stacks, Lemma 8.5.6. Then suppose that z is an object of \mathcal{Z} over a scheme T . Denote $g : T \rightarrow V$ the morphism corresponding to the projection of z in $(Sch/V)_{fppf}$. Consider the Zariski sheaf $I = \operatorname{Isom}_{\mathcal{Z}}(z, z)$. By Case I we see that $I|_{g^{-1}(V_i)} = *$ (the singleton sheaf). Hence $I = *$. Thus \mathcal{Z} is fibred in setoids. To finish the proof we have to show that the Zariski sheaf $Z : T \mapsto \operatorname{Ob}(\mathcal{Z}_T)/\cong$ is an algebraic space, see Algebraic Stacks, Lemma 71.8.2. There is a map $p : Z \rightarrow V$ (transformation of functors) and by Case I we know that $Z_i = p^{-1}(V_i)$ is an algebraic space. The morphisms $Z_i \rightarrow Z$ are representable by open immersions and $\coprod Z_i \rightarrow Z$ is surjective (in the Zariski topology). Hence Z is

¹The condition on size can be dropped by those ignoring set theoretic issues.

a sheaf for the fppf topology by Bootstrap, Lemma 62.3.11. Thus Spaces, Lemma 47.8.4 applies and we conclude that Z is an algebraic space². \square

Lemma 74.5.6. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let \mathcal{P} be a property of morphisms of algebraic spaces as in Algebraic Stacks, Definition 71.10.1. If*

- (1) *f is representable by algebraic spaces,*
- (2) *$\mathcal{Y} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects,*
- (3) *for an affine scheme V locally of finite presentation over S and $y \in \mathcal{Y}_V$ the resulting morphism of algebraic spaces $f_y : F_y \rightarrow V$, see Algebraic Stacks, Equation (71.9.1.1), has property \mathcal{P} .*

Then f has property \mathcal{P} .

Proof. Let V be a scheme over S and $y \in \mathcal{Y}_V$. We have to show that $F_y \rightarrow V$ has property \mathcal{P} . Since \mathcal{P} is fppf local on the base we may assume that V is an affine scheme which maps into an affine open $\text{Spec}(\Lambda) \subset S$. Thus we can write $V = \lim V_i$ with each V_i affine and of finite presentation over $\text{Spec}(\Lambda)$, see Algebra, Lemma 10.123.1. Then y comes from an object y_i over V_i for some i by assumption (2). By assumption (3) the morphism $F_{y_i} \rightarrow V_i$ has property \mathcal{P} . As \mathcal{P} is stable under arbitrary base change and since $F_y = F_{y_i} \times_{V_i} V$ we conclude that $F_y \rightarrow V$ has property \mathcal{P} as desired. \square

74.6. Formally smooth on objects

Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. We will say that p is *formally smooth on objects* if the following condition holds: Given any data consisting of

- (1) a first order thickening $U \subset U'$ of affine schemes over S ,
- (2) an object y' of \mathcal{Y} over U' ,
- (3) an object x of \mathcal{X} over U , and
- (4) an isomorphism $\gamma : p(x) \rightarrow y'|_U$,

then there exists an object x' of \mathcal{X} over U' with an isomorphism $\beta : x'|_U \rightarrow x$ and an isomorphism $\gamma' : p(x') \rightarrow y'$ such that

$$(74.6.0.1) \quad \begin{array}{ccc} p(x'|_U) & \xrightarrow{\gamma'|_U} & y'|_U \\ p(\beta) \downarrow & & \parallel \\ p(x) & \xrightarrow{\gamma} & y'|_U \end{array}$$

commutes. In this situation we say that “ (x', β, γ') is a *solution* to the problem posed by our data (1), (2), (3), (4)”.

Lemma 74.6.1. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \rightarrow \mathcal{Y}$ is formally smooth on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$ of p by q .*

² To see that the set theoretic condition of that lemma is satisfied we argue as follows: First choose the open covering such that $|I| \leq \text{size}(V)$. Next, choose schemes U_i of size $\leq \max(\kappa, \text{size}(V))$ and surjective étale morphisms $U_i \rightarrow Z_i$; we can do this by assumption (2) and Sets, Lemma 3.9.6 (details omitted). Then Sets, Lemma 3.9.9 implies that $\coprod U_i$ is an object of $(Sch/S)_{fppf}$. Hence $\coprod Z_i$ is an algebraic space by Spaces, Lemma 47.8.3.

Proof. This is formal. Let $U \subset U'$ be a first order thickening of affine schemes over S , let z' be an object of \mathcal{Z} over U' , let w be an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U , and let $\delta : p'(w) \rightarrow z'|_U$ be an isomorphism. We may write $w = (U, x, z, \alpha)$ for some object x of \mathcal{X} over U and object z of \mathcal{Z} over U and isomorphism $\alpha : p(x) \rightarrow q(z)$. Note that $p'(w) = z$ hence $\delta : z \rightarrow z|_U$. Set $y' = q(z')$ and $\gamma = q(\delta) \circ \alpha : p(x) \rightarrow y'|_U$. As p is formally smooth on objects there exists an object x' of \mathcal{X} over U' as well as isomorphisms $\beta : x'|_U \rightarrow x$ and $\gamma' : p(x') \rightarrow y'$ such that (74.6.0.1) commutes. Then we consider the object $w' = (U', x', z', \gamma')$ of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U' and define isomorphisms

$$w'|_U = (U, x'|_U, z'|_U, \gamma'|_U) \xrightarrow{(\beta, \delta^{-1})} (U, x, z, \alpha) = w$$

and

$$p'(w') = z' \xrightarrow{\text{id}} z'.$$

These combine to give a solution to the problem. \square

Lemma 74.6.2. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p and q are formally smooth on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let $U \subset U'$ be a first order thickening of affine schemes over S , let z' be an object of \mathcal{Z} over U' , let x be an object of \mathcal{X} over U , and let $\gamma : q(p(x)) \rightarrow z'|_U$ be an isomorphism. As q is formally smooth on objects there exist an object y' of \mathcal{Y} over U' , an isomorphism $\beta : y'|_U \rightarrow p(x)$, and an isomorphism $\gamma' : q(y') \rightarrow z'$ such that (74.6.0.1) is commutative. As p is formally smooth on objects there exist an object x' of \mathcal{X} over U' , an isomorphism $\beta' : x'|_U \rightarrow x$, and an isomorphism $\gamma'' : p(x') \rightarrow y'$ such that (74.6.0.1) is commutative. The solution is to take x' over U' with isomorphism

$$q(p(x')) \xrightarrow{q(\gamma'')} q(y') \xrightarrow{\gamma'} z'$$

and isomorphism $\beta' : x'|_U \rightarrow x$. We omit the verification that (74.6.0.1) is commutative. \square

Note that the class of formally smooth morphisms of algebraic spaces is stable under arbitrary base change and local on the target in the fpqc topology, see More on Morphisms of Spaces, Lemma 58.16.3 and 58.16.10. Hence condition (2) in the lemma below makes sense.

Lemma 74.6.3. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

- (1) p is formally smooth on objects, and
- (2) p is formally smooth (see Algebraic Stacks, Definition 71.10.1).

Proof. Assume (2). Let $U \subset U'$ be a first order thickening of affine schemes over S , let y' be an object of \mathcal{Y} over U' , let x be an object of \mathcal{X} over U , and let $\gamma : p(x) \rightarrow y'|_U$ be an isomorphism. Let $X_{y'}$ denote an algebraic space over U' representing the 2-fibre product

$$(Sch/U')_{fppf} \times_{y', \mathcal{Y}, p} \mathcal{X}.$$

Note that $\xi = (U, U \rightarrow U', x, \gamma^{-1})$ defines an object of this 2-fibre product over U . Via the 2-Yoneda lemma ξ corresponds to a morphism $f_{\xi} : U \rightarrow X_{y'}$ over U' . As

$X_{y'} \rightarrow U'$ is formally smooth by assumption there exists a morphism $f' : U' \rightarrow X_{y'}$ such that f'_ξ is the composition of f' and the morphism $U \rightarrow U'$. Also, the 2-Yoneda lemma tells us that f' corresponds to an object $\xi' = (U', U' \rightarrow U', x', \alpha)$ of the displayed 2-fibre product over U' whose restriction to U recovers ξ . In particular we obtain an isomorphism $\gamma : x'|_U \rightarrow x$. Note that $\alpha : y' \rightarrow p(x')$. Hence we see that taking x' , the isomorphism $\gamma : x'|_U \rightarrow x$, and the isomorphism $\beta = \alpha^{-1} : p(x') \rightarrow y'$ is a solution to the problem.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \rightarrow \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y, \mathcal{Y}, p} \mathcal{X}$. We have to show that $X_y \rightarrow T$ is formally smooth. Hence it suffices to show that given a first order thickening $U \subset U'$ of affine schemes over T , then $X_y(U') \rightarrow X_y(U)$ is surjective (morphisms in the category of algebraic spaces over T). Set $y' = y|_{U'}$. By the 2-Yoneda lemma morphisms $U \rightarrow X_y$ over T correspond bijectively to isomorphism classes of pairs (x, α) where x is an object of \mathcal{X} over U and $\alpha : y|_U \rightarrow p(x)$ is an isomorphism. Of course giving α is, up to an inverse, the same thing as giving an isomorphism $\gamma : p(x) \rightarrow y|_U$. Similarly for morphisms $U' \rightarrow X_y$ over T . Hence (1) guarantees the surjectivity of $X_y(U') \rightarrow X_y(U)$ in this situation and we win. \square

74.7. Surjective on objects

Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. We will say that p is *surjective on objects* if the following condition holds: Given any data consisting of

- (1) a field k over S , and
- (2) an object y of \mathcal{Y} over $\text{Spec}(k)$,

then there exists an extension $k \subset K$ of fields over S , an object x of \mathcal{X} over $\text{Spec}(K)$ such that $p(x) \cong y|_{\text{Spec}(K)}$.

Lemma 74.7.1. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \rightarrow \mathcal{Y}$ is surjective on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$ of p by q .*

Proof. This is formal. Let z be an object of \mathcal{Z} over a field k . As p is surjective on objects there exists an extension $k \subset K$ and an object x of \mathcal{X} over K and an isomorphism $\alpha : p(x) \rightarrow q(z)|_{\text{Spec}(K)}$. Then $w = (\text{Spec}(K), x, z|_{\text{Spec}(K)}, \alpha)$ is an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over K with $p'(w) = z|_{\text{Spec}(K)}$. \square

Lemma 74.7.2. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p and q are surjective on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let z be an object of \mathcal{Z} over a field k . As q is surjective on objects there exists a field extension $k \subset K$ and an object y of \mathcal{Y} over K such that $q(y) \cong z|_{\text{Spec}(K)}$. As p is surjective on objects there exists a field extension $K \subset L$ and an object x of \mathcal{X} over L such that $p(x) \cong y|_{\text{Spec}(L)}$. Then the field extension $k \subset L$ and the object x of \mathcal{X} over L satisfy $q(p(x)) \cong z|_{\text{Spec}(L)}$ as desired. \square

Lemma 74.7.3. *Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

- (1) p is surjective on objects, and
- (2) p is surjective (see *Algebraic Stacks, Definition 71.10.1*).

Proof. Assume (2). Let k be a field and let y be an object of \mathcal{Y} over k . Let X_y denote an algebraic space over k representing the 2-fibre product

$$(Sch/\mathrm{Spec}(k))_{fppf} \times_{y, \mathcal{Y}, p} \mathcal{X}.$$

As we've assumed that p is surjective we see that X_y is not empty. Hence we can find a field extension $k \subset K$ and a K -valued point x of X_y . Via the 2-Yoneda lemma this corresponds to an object x of \mathcal{X} over K together with an isomorphism $p(x) \cong y|_{\mathrm{Spec}(K)}$ and we see that (1) holds.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \rightarrow \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y, \mathcal{Y}, p} \mathcal{X}$. We have to show that $X_y \rightarrow T$ is surjective. By Morphisms of Spaces, Definition 49.5.2 we have to show that $|X_y| \rightarrow |T|$ is surjective. This means exactly that given a field k over T and a morphism $t : \mathrm{Spec}(k) \rightarrow T$ there exists a field extension $k \subset K$ and a morphism $x : \mathrm{Spec}(K) \rightarrow X_y$ such that

$$\begin{array}{ccc} \mathrm{Spec}(K) & \xrightarrow{x} & X_y \\ \downarrow & & \downarrow \\ \mathrm{Spec}(k) & \xrightarrow{t} & T \end{array}$$

commutes. By the 2-Yoneda lemma this means exactly that we have to find $k \subset K$ and an object x of \mathcal{X} over K such that $p(x) \cong t^*y|_{\mathrm{Spec}(K)}$. Hence (1) guarantees that this is the case and we win. \square

74.8. Algebraic morphisms

The following notion is occasionally useful.

Definition 74.8.1. Let S be a scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. We say that F is *algebraic* if for every scheme T and every object ξ of \mathcal{Y} over T the 2-fibre product

$$(Sch/T)_{fppf} \times_{\xi, \mathcal{Y}} \mathcal{X}$$

is an algebraic stack over S .

With this terminology in place we have the following result that generalizes Algebraic Stacks, Lemma 71.15.4.

Lemma 74.8.2. *Let S be a scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

- (1) \mathcal{Y} is an algebraic stack, and
- (2) F is algebraic (see above),

then \mathcal{X} is an algebraic stack.

Proof. By assumption (1) there exists a scheme T and an object ξ of \mathcal{Y} over T such that the corresponding 1-morphism $\xi : (Sch/T)_{fppf} \rightarrow \mathcal{Y}$ is smooth and surjective. Then $\mathcal{U} = (Sch/T)_{fppf} \times_{\xi, \mathcal{Y}} \mathcal{X}$ is an algebraic stack by assumption (2). Choose a scheme U and a surjective smooth 1-morphism $(Sch/U)_{fppf} \rightarrow \mathcal{U}$. The projection $\mathcal{U} \rightarrow \mathcal{X}$ is, as the base change of the morphism $\xi : (Sch/T)_{fppf} \rightarrow \mathcal{Y}$,

surjective and smooth, see Algebraic Stacks, Lemma 71.10.6. Then the composition $(Sch/U)_{fppf} \rightarrow \mathcal{U} \rightarrow \mathcal{X}$ is surjective and smooth as a composition of surjective and smooth morphisms, see Algebraic Stacks, Lemma 71.10.5. Hence \mathcal{X} is an algebraic stack by Algebraic Stacks, Lemma 71.15.3. \square

Lemma 74.8.3. *Let S be a scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If \mathcal{X} is an algebraic stack and $\Delta : \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces, then F is algebraic.*

Proof. Choose a representable stack in groupoids \mathcal{U} and a surjective smooth 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$. Let T be a scheme and let ξ be an object of \mathcal{Y} over T . The morphism of 2-fibre products

$$(Sch/T)_{fppf} \times_{\xi, \mathcal{Y}} \mathcal{U} \longrightarrow (Sch/T)_{fppf} \times_{\xi, \mathcal{Y}} \mathcal{X}$$

is representable by algebraic spaces, surjective, and smooth as a base change of $\mathcal{U} \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemmas 71.9.7 and 71.10.6. By our condition on the diagonal of \mathcal{Y} we see that the source of this morphism is representable by an algebraic space, see Algebraic Stacks, Lemma 71.10.11. Hence the target is an algebraic stack by Algebraic Stacks, Lemma 71.15.3. \square

74.9. Spaces of sections

Given morphisms $W \rightarrow Z \rightarrow U$ we can consider the functor that associates to a scheme U' over U the set of sections $\sigma : Z_{U'} \rightarrow W_{U'}$ of the base change $W_{U'} \rightarrow Z_{U'}$ of the morphism $W \rightarrow Z$. In this section we prove some preliminary lemmas on this functor.

Lemma 74.9.1. *Let $Z \rightarrow U$ be a finite morphism of schemes. Let W be an algebraic space and let $W \rightarrow Z$ be a surjective étale morphism. Then there exists a surjective étale morphism $U' \rightarrow U$ and a section*

$$\sigma : Z_{U'} \rightarrow W_{U'}$$

of the morphism $W_{U'} \rightarrow Z_{U'}$.

Proof. We may choose a separated scheme W' and a surjective étale morphism $W' \rightarrow W$. Hence after replacing W by W' we may assume that W is a separated scheme. Write $f : W \rightarrow Z$ and $\pi : Z \rightarrow U$. Note that $f \circ \pi : W \rightarrow U$ is separated as W is separated (see Schemes, Lemma 25.21.14). Let $u \in U$ be a point. Clearly it suffices to find an étale neighbourhood (U', u') of (U, u) such that a section σ exists over U' . Let z_1, \dots, z_r be the points of Z lying above u . For each i choose a point $w_i \in W$ which maps to z_i . We may pick an étale neighbourhood $(U', u') \rightarrow (U, u)$ such that the conclusions of More on Morphisms, Lemma 36.30.5 hold for both $Z \rightarrow U$ and the points z_1, \dots, z_r and $W \rightarrow U$ and the points w_1, \dots, w_r . Hence, after replacing (U, u) by (U', u') and relabeling, we may assume that all the field extensions $\kappa(u) \subset \kappa(z_i)$ and $\kappa(u) \subset \kappa(w_i)$ are purely inseparable, and moreover that there exist disjoint union decompositions

$$Z = V_1 \amalg \dots \amalg V_r \amalg A, \quad W = W_1 \amalg \dots \amalg W_r \amalg B$$

by open and closed subschemes with $z_i \in V_i$, $w_i \in W_i$ and $V_i \rightarrow U$, $W_i \rightarrow U$ finite. After replacing U by $U \setminus \pi(A)$ we may assume that $A = \emptyset$, i.e., $Z = V_1 \amalg \dots \amalg V_r$. After replacing W_i by $W_i \cap f^{-1}(V_i)$ and B by $B \cup \bigcup W_i \cap f^{-1}(Z \setminus V_i)$ we may assume that f maps W_i into V_i . Then $f_i = f|_{W_i} : W_i \rightarrow V_i$ is a morphism of

schemes finite over U , hence finite (see Morphisms, Lemma 28.44.12). It is also étale (by assumption), $f_i^{-1}(\{z_i\}) = w_i$, and induces an isomorphism of residue fields $\kappa(z_i) = \kappa(w_i)$ (because both are purely inseparable extensions of $\kappa(u)$ and $\kappa(z_i) \subset \kappa(w_i)$ is separable as f is étale). Hence by Étale Morphisms, Lemma 40.14.2 we see that f_i is an isomorphism in a neighbourhood V'_i of z_i . Since $\pi : Z \rightarrow U$ is closed, after shrinking U , we may assume that $W_i \rightarrow V_i$ is an isomorphism. This proves the lemma. \square

Lemma 74.9.2. *Let $Z \rightarrow U$ be a finite locally free morphism of schemes. Let W be an algebraic space and let $W \rightarrow Z$ be an étale morphism. Then the functor*

$$F : (Sch/U)_{fppf}^{opp} \longrightarrow Sets,$$

defined by the rule

$$U' \longmapsto F(U') = \{\sigma : Z_{U'} \rightarrow W_{U'} \text{ section of } W_{U'} \rightarrow Z_{U'}\}$$

is an algebraic space and the morphism $F \rightarrow U$ is étale.

Proof. Assume first that $W \rightarrow Z$ is also separated. Let U' be a scheme over U and let $\sigma \in F(U')$. By Morphisms of Spaces, Lemma 49.4.7 the morphism σ is a closed immersion. Moreover, σ is étale by Properties of Spaces, Lemma 48.13.6. Hence σ is also an open immersion, see Morphisms of Spaces, Lemma 49.45.2. In other words, $Z_\sigma = \sigma(Z_{U'}) \subset W_{U'}$ is an open subspace such that the morphism $Z_\sigma \rightarrow Z_{U'}$ is an isomorphism. In particular, the morphism $Z_\sigma \rightarrow U'$ is finite. Hence we obtain a transformation of functors

$$F \longrightarrow (W/U)_{fin}, \quad \sigma \longmapsto (U' \rightarrow U, Z_\sigma)$$

where $(W/U)_{fin}$ is the finite part of the morphism $W \rightarrow U$ introduced in More on Groupoids in Spaces, Section 61.9. It is clear that this transformation of functors is injective (since we can recover σ from Z_σ as the inverse of the isomorphism $Z_\sigma \rightarrow Z_{U'}$). By More on Groupoids in Spaces, Proposition 61.9.11 we know that $(W/U)_{fin}$ is an algebraic space étale over U . Hence to finish the proof in this case it suffices to show that $F \rightarrow (W/U)_{fin}$ is representable and an open immersion. To see this suppose that we are given a morphism of schemes $U' \rightarrow U$ and an open subspace $Z' \subset W_{U'}$ such that $Z' \rightarrow U'$ is finite. Then it suffices to show that there exists an open subscheme $U'' \subset U'$ such that a morphism $T \rightarrow U'$ factors through U'' if and only if $Z' \times_{U'} T$ maps isomorphically to $Z \times_{U'} T$. This follows from More on Morphisms of Spaces, Lemma 58.37.6 (here we use that $Z \rightarrow B$ is flat and locally of finite presentation as well as finite). Hence we have proved the lemma in case $W \rightarrow Z$ is separated as well as étale.

In the general case we choose a separated scheme W' and a surjective étale morphism $W' \rightarrow W$. Note that the morphisms $W' \rightarrow W$ and $W \rightarrow Z$ are separated as their source is separated. Denote F' the functor associated to $W' \rightarrow Z \rightarrow U$ as in the lemma. In the first paragraph of the proof we showed that F' is representable by an algebraic space étale over U . By Lemma 74.9.1 the map of functors $F' \rightarrow F$ is surjective for the étale topology on Sch/U . Moreover, if U' and $\sigma : Z_{U'} \rightarrow W_{U'}$ define a point $\xi \in F(U')$, then the fibre product

$$F'' = F' \times_{F, \xi} U'$$

is the functor on Sch/U' associated to the morphisms

$$W'_{U'} \times_{W_{U'}, \sigma} Z_{U'} \rightarrow Z_{U'} \rightarrow U'.$$

Since the first morphism is separated as a base change of a separated morphism, we see that F'' is an algebraic space étale over U' by the result of the first paragraph. It follows that $F' \rightarrow F$ is a surjective étale transformation of functors, which is representable by algebraic spaces. Hence F is an algebraic space by Bootstrap, Theorem 62.10.1. Since $F' \rightarrow F$ is an étale surjective morphism of algebraic spaces it follows that $F \rightarrow U$ is étale because $F' \rightarrow U$ is étale. \square

74.10. Relative morphisms

Let S be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over S . Given a scheme T we can consider pairs (a, b) where $a : T \rightarrow B$ is a morphism and $b : T \times_{a,B} Z \rightarrow T \times_{a,B} X$ is a morphism over T . Picture

$$(74.10.0.1) \quad \begin{array}{ccccc} T \times_{a,B} Z & \xrightarrow{b} & T \times_{a,B} X & & Z & & X \\ & \searrow & \swarrow & & \searrow & & \swarrow \\ & & T & \xrightarrow{a} & B & & \end{array}$$

Of course, we can also think of b as a morphism $b : T \times_{a,B} Z \rightarrow X$ such that

$$\begin{array}{ccc} T \times_{a,B} Z & \xrightarrow{\quad} & Z \\ \downarrow & \searrow & \downarrow \\ T & \xrightarrow{a} & B \end{array} \quad \begin{array}{ccc} & \xrightarrow{b} & X \\ & \searrow & \downarrow \\ & & B \end{array}$$

commutes. In this situation we can define a functor

$$(74.10.0.2) \quad \text{Mor}_B(Z, X) : (\text{Sch}/S)^{opp} \rightarrow \text{Sets}, \quad T \mapsto \{(a, b) \text{ as above}\}$$

Sometimes we think of this as a functor defined on the category of schemes over B , in which case we drop a from the notation.

Lemma 74.10.1. *Let S be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over S . Then*

- (1) $\text{Mor}_B(Z, X)$ is a sheaf on $(\text{Sch}/S)_{fppf}$.
- (2) If T is an algebraic space over S , then there is a canonical bijection

$$\text{Mor}_{\text{Sh}((\text{Sch}/S)_{fppf})}(T, \text{Mor}_B(Z, X)) = \{(a, b) \text{ as in (74.10.0.1)}\}$$

Proof. Let T be an algebraic space over S . Let $\{T_i \rightarrow T\}$ be an fppf covering of T (as in Topologies on Spaces, Section 55.4). Suppose that $(a_i, b_i) \in \text{Mor}_B(Z, X)(T_i)$ such that $(a_i, b_i)|_{T_i \times_T T_j} = (a_j, b_j)|_{T_i \times_T T_j}$ for all i, j . Then by Descent on Spaces, Lemma 56.6.2 there exists a unique morphism $a : T \rightarrow B$ such that a_i is the composition of $T_i \rightarrow T$ and a . Then $\{T_i \times_{a_i,B} Z \rightarrow T \times_{a,B} Z\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b : T \times_{a,B} Z \rightarrow T \times_{a,B} X$ such that b_i is the composition of $T_i \times_{a_i,B} Z \rightarrow T \times_{a,B} Z$ and b . Hence $(a, b) \in \text{Mor}_B(Z, X)(T)$ restricts to (a_i, b_i) over T_i for all i .

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S . In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say ‘‘pair’’ we mean a pair (a, b) fitting into (74.10.0.1).

Let $v : T \rightarrow \text{Mor}_B(Z, X)$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \rightarrow T$. Then $v(p) \in \text{Mor}_B(Z, X)(U)$ corresponds

to a pair (a_U, b_U) over U . Let $R = U \times_T U$ with projections $t, s : R \rightarrow U$. As v is a transformation of functors we see that the pullbacks of (a_U, b_U) by s and t agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, b) over T .

Conversely, let (a, b) be a pair over T . Let $U \rightarrow T$, $R = U \times_T U$, and $t, s : R \rightarrow U$ be as above. Then the restriction $(a, b)|_U$ gives rise to a transformation of functors $v : h_U \rightarrow \text{Mor}_B(Z, X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $s^*(a, b)|_U$ and $t^*(a, b)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \rightarrow h_U$. Since $T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 47.9.1 and since $\text{Mor}_B(Z, X)$ is an fppf sheaf by (1) we conclude that v factors through a map $T \rightarrow \text{Mor}_B(Z, X)$.

We omit the verification that the two constructions above are mutually inverse. \square

Lemma 74.10.2. *Let S be a scheme. Let $Z \rightarrow B$, $X \rightarrow B$, and $B' \rightarrow B$ be morphisms of algebraic spaces over S . Set $Z' = B' \times_B Z$ and $X' = B' \times_B X$. Then*

$$\text{Mor}_{B'}(Z', X') = B' \times_B \text{Mor}_B(Z, X)$$

in $\text{Sh}((\text{Sch}/S)_{\text{fppf}})$.

Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 74.10.1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors). \square

Lemma 74.10.3. *Let S be a scheme. Let $Z \rightarrow B$ and $X' \rightarrow X \rightarrow B$ be morphisms of algebraic spaces over S . Assume*

- (1) $X' \rightarrow X$ is étale, and
- (2) $Z \rightarrow B$ is finite locally free.

Then $\text{Mor}_B(Z, X') \rightarrow \text{Mor}_B(Z, X)$ is representable by algebraic spaces and étale. If $X' \rightarrow X$ is also surjective, then $\text{Mor}_B(Z, X') \rightarrow \text{Mor}_B(Z, X)$ is surjective.

Proof. Let U be a scheme and let $\xi = (a, b)$ be an element of $\text{Mor}_B(Z, X)(U)$. We have to prove that the functor

$$h_U \times_{\xi, \text{Mor}_B(Z, X)} \text{Mor}_B(Z, X')$$

is representable by an algebraic space étale over U . Set $Z_U = U \times_{a, B} Z$ and $W = Z_U \times_{b, X} X'$. Then $W \rightarrow Z_U \rightarrow U$ is as in Lemma 74.9.2 and the sheaf F defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 74.9.1 which guarantees that $F \rightarrow U$ is surjective in the situation above. \square

Lemma 74.10.4. *Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of affine schemes. Assume $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$ -module. Then $\text{Mor}_B(Z, X)$ is representable by an affine scheme over B .*

Proof. Write $B = \text{Spec}(R)$. Choose a basis $\{e_1, \dots, e_m\}$ for $\Gamma(Z, \mathcal{O}_Z)$. Finally, choose a presentation

$$\Gamma(X, \mathcal{O}_X) = R[\{x_i\}_{i \in I}] / (\{f_k\}_{k \in K}).$$

We will denote \bar{x}_i the image of x_i in this quotient. Write

$$P = R[\{a_{ij}\}_{i \in I, 1 \leq j \leq m}].$$

Consider the R -algebra map

$$\Psi : R[\{x_i\}_{i \in I}] \longrightarrow P \otimes_R \Gamma(Z, \mathcal{O}_Z), \quad x_i \longmapsto \sum_j a_{ij} \otimes e_j.$$

Write $\Psi(f_k) = \sum c_{kj} \otimes e_j$ with $c_{kj} \in P$. Finally, denote $J \subset P$ the ideal generated by the elements c_{kj} , $k \in K$, $1 \leq j \leq m$. We claim that $W = \text{Spec}(P/J)$ represents the functor $\text{Mor}_B(Z, X)$.

First, note that by construction P/J is an R -algebra, hence a morphism $a_{\text{univ}} : W \rightarrow B$. Second, by construction the map Ψ factors through $\Gamma(X, \mathcal{O}_X)$, hence we obtain an P/J -algebra homomorphism

$$P/J \otimes_R \Gamma(X, \mathcal{O}_X) \longrightarrow P/J \otimes_R \Gamma(Z, \mathcal{O}_Z)$$

which determines a morphism $b_{\text{univ}} : W \times_{a_{\text{univ}}, B} Z \rightarrow W \times_{a_{\text{univ}}, B} X$. By the Yoneda lemma the pair $(a_{\text{univ}}, b_{\text{univ}})$ determines a transformation of functors $W \rightarrow \text{Mor}_B(Z, X)$ which we claim is an isomorphism. To show that it is an isomorphism it suffices to show that it induces a bijection of sets $W(T) \rightarrow \text{Mor}_B(Z, X)(T)$ over any affine scheme T .

Suppose $T = \text{Spec}(R')$ is an affine scheme and $(a, b) \in \text{Mor}_B(Z, X)(T)$, then a defines an R -algebra structure on R' and b defines an R' -algebra map

$$b^\sharp : R' \otimes_R \Gamma(X, \mathcal{O}_X) \longrightarrow R' \otimes_R \Gamma(Z, \mathcal{O}_Z).$$

In particular we can write $b^\sharp(1 \otimes \bar{x}_i) = \sum \alpha_{ij} \otimes e_j$ for some $\alpha_{ij} \in R'$. This corresponds to an R -algebra map $P \rightarrow R'$ determined by the rule $a_{ij} \mapsto \alpha_{ij}$. This map factors through the quotient P/J by the construction of the ideal J to give a map $P/J \rightarrow R'$. This in turn corresponds to a morphism $T \rightarrow W$ such that (a, b) is the pullback of $(a_{\text{univ}}, b_{\text{univ}})$. Some details omitted. \square

Proposition 74.10.5. *Let S be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over S . If $Z \rightarrow B$ is finite locally free then $\text{Mor}_B(Z, X)$ is an algebraic space.*

Proof. Choose a scheme $B' = \coprod B'_i$ which is a disjoint union of affine schemes B'_i and an étale surjective morphism $B' \rightarrow B$. We may also assume that $B'_i \times_B Z$ is the spectrum of a ring which is finite free as a $\Gamma(B'_i, \mathcal{O}_{B'_i})$ -module. By Lemma 74.10.2 and Spaces, Lemma 47.5.5 the morphism $\text{Mor}_{B'}(Z', X') \rightarrow \text{Mor}_B(Z, X)$ is surjective étale. Hence by Bootstrap, Theorem 62.10.1 it suffices to prove the proposition when $B = B'$ is a disjoint union of affine schemes B'_i so that each $B'_i \times_B Z$ is finite free over B'_i . Then it actually suffices to prove the result for the restriction to each B'_i . Thus we may assume that B is affine and that $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$ -module.

Choose a scheme X' which is a disjoint union of affine schemes and a surjective étale morphism $X' \rightarrow X$. By Lemma 74.10.3 the morphism $\text{Mor}_B(Z, X') \rightarrow \text{Mor}_B(Z, X)$ is representable by algebraic spaces, étale, and surjective. Hence by Bootstrap, Theorem 62.10.1 it suffices to prove the proposition when X is a disjoint union of affine schemes. This reduces us to the case discussed in the next paragraph.

Assume $X = \coprod_{i \in I} X_i$ is a disjoint union of affine schemes, B is affine, and that $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$ -module. For any finite subset $E \subset I$ set

$$F_E = \text{Mor}_B(Z, \coprod_{i \in E} X_i).$$

By Lemma 74.10.4 we see that F_E is an algebraic space. Consider the morphism

$$\coprod_{E \subset I \text{ finite}} F_E \longrightarrow \text{Mor}_B(Z, X)$$

Each of the morphisms $F_E \rightarrow \text{Mor}_B(Z, X)$ is an open immersion, because it is simply the locus parametrizing pairs (a, b) where b maps into the open subscheme $\coprod_{i \in E} X_i$ of X . Moreover, if T is quasi-compact, then for any pair (a, b) the image of b is contained in $\coprod_{i \in E} X_i$ for some $E \subset I$ finite. Hence the displayed arrow is in fact an open covering and we win³ by Spaces, Lemma 47.8.4. \square

74.11. Restriction of scalars

Suppose $X \rightarrow Z \rightarrow B$ are morphisms of algebraic spaces over S . Given a scheme T we can consider pairs (a, b) where $a : T \rightarrow B$ is a morphism and $b : T \times_{a,B} Z \rightarrow X$ is a morphism over Z . Picture

(74.11.0.1)
$$\begin{array}{ccc} & & X \\ & \nearrow b & \downarrow \\ T \times_{a,B} Z & \longrightarrow & Z \\ \downarrow & & \downarrow \\ T & \xrightarrow{a} & B \end{array}$$

In this situation we can define a functor

(74.11.0.2)
$$\text{Res}_{Z/B}(X) : (\text{Sch}/S)^{\text{op}} \longrightarrow \text{Sets}, \quad T \longmapsto \{(a, b) \text{ as above}\}$$

Sometimes we think of this as a functor defined on the category of schemes over B , in which case we drop a from the notation.

Lemma 74.11.1. *Let S be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over S . Then*

- (1) $\text{Res}_{Z/B}(X)$ is a sheaf on $(\text{Sch}/S)_{\text{fppf}}$.
- (2) If T is an algebraic space over S , then there is a canonical bijection

$$\text{Mor}_{\text{Sh}((\text{Sch}/S)_{\text{fppf}})}(T, \text{Res}_{Z/B}(X)) = \{(a, b) \text{ as in (74.11.0.1)}\}$$

Proof. Let T be an algebraic space over S . Let $\{T_i \rightarrow T\}$ be an fppf covering of T (as in Topologies on Spaces, Section 55.4). Suppose that $(a_i, b_i) \in \text{Res}_{Z/B}(X)(T_i)$ such that $(a_i, b_i)|_{T_i \times_T T_j} = (a_j, b_j)|_{T_i \times_T T_j}$ for all i, j . Then by Descent on Spaces, Lemma 56.6.2 there exists a unique morphism $a : T \rightarrow B$ such that a_i is the composition of $T_i \rightarrow T$ and a . Then $\{T_i \times_{a_i,B} Z \rightarrow T \times_{a,B} Z\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b : T \times_{a,B} Z \rightarrow X$ such that b_i is the composition of $T_i \times_{a_i,B} Z \rightarrow T \times_{a,B} Z$ and b . Hence $(a, b) \in \text{Res}_{Z/B}(X)(T)$ restricts to (a_i, b_i) over T_i for all i .

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S . In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say ‘‘pair’’ we mean a pair (a, b) fitting into (74.11.0.1).

³Modulo some set theoretic arguments. Namely, we have to show that $\coprod F_E$ is an algebraic space. This follows because $|I| \leq \text{size}(X)$ and $\text{size}(F_E) \leq \text{size}(X)$ as follows from the explicit description of F_E in the proof of Lemma 74.10.4. Some details omitted.

Let $v : T \rightarrow \text{Res}_{Z/B}(X)$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \rightarrow T$. Then $v(p) \in \text{Res}_{Z/B}(X)(U)$ corresponds to a pair (a_U, b_U) over U . Let $R = U \times_T U$ with projections $t, s : R \rightarrow U$. As v is a transformation of functors we see that the pullbacks of (a_U, b_U) by s and t agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, b) over T .

Conversely, let (a, b) be a pair over T . Let $U \rightarrow T$, $R = U \times_T U$, and $t, s : R \rightarrow U$ be as above. Then the restriction $(a, b)|_U$ gives rise to a transformation of functors $v : h_U \rightarrow \text{Res}_{Z/B}(X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $s^*(a, b)|_U$ and $t^*(a, b)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \rightarrow h_U$. Since $T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 47.9.1 and since $\text{Res}_{Z/B}(X)$ is an fppf sheaf by (1) we conclude that v factors through a map $T \rightarrow \text{Res}_{Z/B}(X)$.

We omit the verification that the two constructions above are mutually inverse. \square

Of course the sheaf $\text{Res}_{Z/B}(X)$ comes with a natural transformation of functors $\text{Res}_{Z/B}(X) \rightarrow B$. We will use this without further mention in the following.

Lemma 74.11.2. *Let S be a scheme. Let $X \rightarrow Z \rightarrow B$ and $B' \rightarrow B$ be morphisms of algebraic spaces over S . Set $Z' = B' \times_B Z$ and $X' = B' \times_B X$. Then*

$$\text{Res}_{Z'/B'}(X') = B' \times_B \text{Res}_{Z/B}(X)$$

in $\text{Sh}((\text{Sch}/S)_{\text{fppf}})$.

Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 74.11.1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors). \square

Lemma 74.11.3. *Let S be a scheme. Let $X' \rightarrow X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over S . Assume*

- (1) $X' \rightarrow X$ is étale, and
- (2) $Z \rightarrow B$ is finite locally free.

Then $\text{Res}_{Z/B}(X') \rightarrow \text{Res}_{Z/B}(X)$ is representable by algebraic spaces and étale. If $X' \rightarrow X$ is also surjective, then $\text{Res}_{Z/B}(X') \rightarrow \text{Res}_{Z/B}(X)$ is surjective.

Proof. Let U be a scheme and let $\xi = (a, b)$ be an element of $\text{Res}_{Z/B}(X)(U)$. We have to prove that the functor

$$h_U \times_{\xi, \text{Res}_{Z/B}(X)} \text{Res}_{Z/B}(X')$$

is representable by an algebraic space étale over U . Set $Z_U = U \times_{a, B} Z$ and $W = Z_U \times_{b, X} X'$. Then $W \rightarrow Z_U \rightarrow U$ is as in Lemma 74.9.2 and the sheaf F defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 74.9.1 which guarantees that $F \rightarrow U$ is surjective in the situation above. \square

At this point we can use the lemmas above to prove that $\text{Res}_{Z/B}(X)$ is an algebraic space whenever $Z \rightarrow B$ is finite locally free in almost exactly the same way as in the proof that $\text{Mor}_B(Z, X)$ is an algebraic spaces, see Proposition 74.10.5. Instead we will directly deduce this result from the following lemma and the fact that $\text{Mor}_B(Z, X)$ is an algebraic space.

Lemma 74.11.4. *Let S be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over S . The following diagram*

$$\begin{array}{ccc} \text{Mor}_B(Z, X) & \longrightarrow & \text{Mor}_B(Z, Z) \\ \uparrow & & \uparrow \text{id}_Z \\ \text{Res}_{Z/B}(X) & \longrightarrow & B \end{array}$$

is a cartesian diagram of sheaves on $(\text{Sch}/S)_{\text{fppf}}$.

Proof. Omitted. Hint: Exercise in the functorial point of view in algebraic geometry. □

Proposition 74.11.5. *Let S be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over S . If $Z \rightarrow B$ is finite locally free then $\text{Res}_{Z/B}(X)$ is an algebraic space.*

Proof. By Proposition 74.10.5 the functors $\text{Mor}_B(Z, X)$ and $\text{Mor}_B(Z, Z)$ are algebraic spaces. Hence this follows from the cartesian diagram of Lemma 74.11.4 and the fact that fibre products of algebraic spaces exist and are given by the fibre product in the underlying category of sheaves of sets (see Spaces, Lemma 47.7.2). □

74.12. Finite Hilbert stacks

In this section we prove some results concerning the finite Hilbert stacks $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ introduced in Examples of Stacks, Section 72.17.

Lemma 74.12.1. *Consider a 2-commutative diagram*

$$\begin{array}{ccc} \mathcal{X}' & \xrightarrow{G} & \mathcal{X} \\ F' \downarrow & & \downarrow F \\ \mathcal{Y}' & \xrightarrow{H} & \mathcal{Y} \end{array}$$

of stacks in groupoids over $(\text{Sch}/S)_{\text{fppf}}$ with a given 2-isomorphism $\gamma : H \circ F' \rightarrow F \circ G$. In this situation we obtain a canonical 1-morphism $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. This morphism is compatible with the forgetful 1-morphisms of Examples of Stacks, Equation (72.17.2.1).

Proof. We map the object (U, Z, y', x', α') to the object $(U, Z, H(y'), G(x'), \gamma \star \text{id}_H \star \alpha')$ where \star denotes horizontal composition of 2-morphisms, see Categories, Definition 4.26.1. To a morphism $(f, g, b, a) : (U_1, Z_1, y'_1, x'_1, \alpha'_1) \rightarrow (U_2, Z_2, y'_2, x'_2, \alpha'_2)$ we assign $(f, g, H(b), G(a))$. We omit the verification that this defines a functor between categories over $(\text{Sch}/S)_{\text{fppf}}$. □

Lemma 74.12.2. *In the situation of Lemma 74.12.1 assume that the given square is 2-cartesian. Then the diagram*

$$\begin{array}{ccc} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') & \longrightarrow & \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \\ \downarrow & & \downarrow \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

is 2-cartesian.

Proof. We get a 2-commutative diagram by Lemma 74.12.1 and hence we get a 1-morphism (i.e., a functor)

$$\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \longrightarrow \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

We indicate why this functor is essentially surjective. Namely, an object of the category on the right hand side is given by a scheme U over S , an object y' of \mathcal{Y}'_U , an object (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U and an isomorphism $H(y') \rightarrow y$ in \mathcal{Y}_U . The assumption means exactly that there exists an object x' of \mathcal{X}'_Z such that there exist isomorphisms $G(x') \cong x$ and $\alpha' : y'|_Z \rightarrow F'(x')$ compatible with α . Then we see that (U, Z, y', x', α') is an object of $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}')$ over U . Details omitted. \square

Lemma 74.12.3. *In the situation of Lemma 74.12.1 assume*

- (1) $\mathcal{Y}' = \mathcal{Y}$ and $H = id_{\mathcal{Y}}$,
- (2) G is representable by algebraic spaces and étale.

Then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. If G is also surjective, then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is surjective.

Proof. Let U be a scheme and let $\xi = (U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U . We have to prove that the 2-fibre product

$$(74.12.3.1) \quad (Sch/U)_{fppf} \times_{\xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y})$$

is representable by an algebraic space étale over U . An object of this over U' corresponds to an object x' in the fibre category of \mathcal{X}' over $Z_{U'}$ such that $G(x') \cong x|_{Z_{U'}}$. By assumption the 2-fibre product

$$(Sch/Z)_{fppf} \times_{x, \mathcal{X}} \mathcal{X}'$$

is representable by an algebraic space W such that the projection $W \rightarrow Z$ is étale. Then (74.12.3.1) is representable by the algebraic space F parametrizing sections of $W \rightarrow Z$ over U introduced in Lemma 74.9.2. Since $F \rightarrow U$ is étale we conclude that $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. Finally, if $\mathcal{X}' \rightarrow \mathcal{X}$ is surjective also, then $W \rightarrow Z$ is surjective, and hence $F \rightarrow U$ is surjective by Lemma 74.9.1. Thus in this case $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is also surjective. \square

Lemma 74.12.4. *In the situation of Lemma 74.12.1. Assume that G, H are representable by algebraic spaces and étale. Then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. If also H is surjective and the induced functor $\mathcal{X}' \rightarrow \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ is surjective, then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is surjective.*

Proof. Set $\mathcal{X}'' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$. By Lemma 74.4.1 the 1-morphism $\mathcal{X}' \rightarrow \mathcal{X}''$ is representable by algebraic spaces and étale (in particular the condition in the second statement of the lemma that $\mathcal{X}' \rightarrow \mathcal{X}''$ be surjective makes sense). We obtain a 2-commutative diagram

$$\begin{array}{ccccc} \mathcal{X}' & \longrightarrow & \mathcal{X}'' & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

It follows from Lemma 74.12.2 that $\mathcal{H}_d(\mathcal{X}''/\mathcal{Y}')$ is the base change of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ by $\mathcal{Y}' \rightarrow \mathcal{Y}$. In particular we see that $\mathcal{H}_d(\mathcal{X}''/\mathcal{Y}') \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale, see Algebraic Stacks, Lemma 71.10.6. Moreover, it is also surjective if H is. Hence if we can show that the result holds for the left square

in the diagram, then we're done. In this way we reduce to the case where $\mathcal{Y}' = \mathcal{Y}$ which is the content of Lemma 74.12.3. \square

Lemma 74.12.5. *Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that $\Delta : \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces. Then*

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}$$

see *Examples of Stacks, Equation (72.17.2.1)* is representable by algebraic spaces.

Proof. Let U be a scheme and let $\xi = (U, Z, p, x, 1)$ be an object of $\mathcal{H}_d(\mathcal{X}) = \mathcal{H}_d(\mathcal{X}/S)$ over U . Here p is just the structure morphism of U . The fifth component 1 exists and is unique since everything is over S . Also, let y be an object of \mathcal{Y} over U . We have to show the 2-fibre product

$$(74.12.5.1) \quad (Sch/U)_{fppf} \times_{\xi \times y, \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}} \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is representable by an algebraic space. To explain why this is so we introduce

$$I = Isom_{\mathcal{Y}}(y|_Z, F(x))$$

which is an algebraic space over Z by assumption. Let $a : U' \rightarrow U$ be a scheme over U . What does it mean to give an object of the fibre category of (74.12.5.1) over U' ? Well, it means that we have an object $\xi' = (U', Z', y', x', \alpha')$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U' and isomorphisms $(U', Z', p', x', 1) \cong (U, Z, p, x, 1)|_{U'}$ and $y' \cong y|_{U'}$. Thus ξ' is isomorphic to $(U', U' \times_{a,U} Z, a^*y, x|_{U' \times_{a,U} Z}, \alpha)$ for some morphism

$$\alpha : a^*y|_{U' \times_{a,U} Z} \longrightarrow F(x|_{U' \times_{a,U} Z})$$

in the fibre category of \mathcal{Y} over $U' \times_{a,U} Z$. Hence we can view α as a morphism $b : U' \times_{a,U} Z \rightarrow I$. In this way we see that (74.12.5.1) is representable by $\text{Res}_{Z/U}(I)$ which is an algebraic space by Proposition 74.11.5. \square

The following lemma is a (partial) generalization of Lemma 74.12.3.

Lemma 74.12.6. *Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ and $G : \mathcal{X}' \rightarrow \mathcal{X}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If G is representable by algebraic spaces, then the 1-morphism*

$$\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is representable by algebraic spaces.

Proof. Let U be a scheme and let $\xi = (U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U . We have to prove that the 2-fibre product

$$(74.12.6.1) \quad (Sch/U)_{fppf} \times_{\xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y})$$

is representable by an algebraic space étale over U . An object of this over $a : U' \rightarrow U$ corresponds to an object x' of \mathcal{X}' over $U' \times_{a,U} Z$ such that $G(x') \cong x|_{U' \times_{a,U} Z}$. By assumption the 2-fibre product

$$(Sch/Z)_{fppf} \times_{x, \mathcal{X}} \mathcal{X}'$$

is representable by an algebraic space X over Z . It follows that (74.12.6.1) is representable by $\text{Res}_{Z/U}(X)$, which is an algebraic space by Proposition 74.11.5. \square

Lemma 74.12.7. *Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces and locally of finite presentation. Then*

$$p : \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{Y}$$

is limit preserving on objects.

Proof. This means we have to show the following: Given

- (1) an affine scheme $U = \lim_i U_i$ which is written as the directed limit of affine schemes U_i over S ,
- (2) an object y_i of \mathcal{Y} over U_i for some i , and
- (3) an object $\Xi = (U, Z, y, x, \alpha)$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U such that $y = y_i|_U$,

then there exists an $i' \geq i$ and an object $\Xi_{i'} = (U_{i'}, Z_{i'}, y_{i'}, x_{i'}, \alpha_{i'})$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over $U_{i'}$ with $\Xi_{i'}|_U = \Xi$ and $y_{i'} = y_i|_{U_{i'}}$. Namely, the last two equalities will take care of the commutativity of (74.5.0.1).

Let $X_{y_i} \rightarrow U_i$ be an algebraic space representing the 2-fibre product

$$(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X}.$$

Note that $X_{y_i} \rightarrow U_i$ is locally of finite presentation by our assumption on F . Write Ξ . It is clear that $\xi = (Z, Z \rightarrow U_i, x, \alpha)$ is an object of the 2-fibre product displayed above, hence ξ gives rise to a morphism $f_\xi : Z \rightarrow X_{y_i}$ of algebraic spaces over U_i (since X_{y_i} is the functor of isomorphisms classes of objects of $(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X}$, see Algebraic Stacks, Lemma 71.8.2). By Limits, Lemmas 31.9.1 and 31.7.7 there exists an $i' \geq i$ and a finite locally free morphism $Z_{i'} \rightarrow U_{i'}$ of degree d whose base change to U is Z . By Limits of Spaces, Proposition 52.3.9 we may, after replacing i' by a bigger index, assume there exists a morphism $f_{i'} : Z_{i'} \rightarrow X_{y_i}$ such that

$$\begin{array}{ccccc} & & f_\xi & & \\ & & \curvearrowright & & \\ Z & \longrightarrow & Z_{i'} & \xrightarrow{f_{i'}} & X_{y_i} \\ \downarrow & & \downarrow & & \downarrow \\ U & \longrightarrow & U_{i'} & \longrightarrow & U_i \end{array}$$

is commutative. We set $\Xi_{i'} = (U_{i'}, Z_{i'}, y_{i'}, x_{i'}, \alpha_{i'})$ where

- (1) $y_{i'}$ is the object of \mathcal{Y} over $U_{i'}$ which is the pullback of y_i to $U_{i'}$,
- (2) $x_{i'}$ is the object of \mathcal{X} over $Z_{i'}$ corresponding via the 2-Yoneda lemma to the 1-morphism

$$(Sch/Z_{i'})_{fppf} \rightarrow \mathcal{S}_{X_{y_i}} \rightarrow (Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X} \rightarrow \mathcal{X}$$

where the middle arrow is the equivalence which defines X_{y_i} (notation as in Algebraic Stacks, Sections 71.8 and 71.7).

- (3) $\alpha_{i'} : y_{i'}|_{Z_{i'}} \rightarrow F(x_{i'})$ is the isomorphism coming from the 2-commutativity of the diagram

$$\begin{array}{ccccc} (Sch/Z_{i'})_{fppf} & \longrightarrow & (Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X} & \longrightarrow & \mathcal{X} \\ & \searrow & \downarrow & & \downarrow F \\ & & (Sch/U_{i'})_{fppf} & \longrightarrow & \mathcal{Y} \end{array}$$

Recall that $f_\xi : Z \rightarrow X_{y_i}$ was the morphism corresponding to the object $\xi = (Z, Z \rightarrow U_i, x, \alpha)$ of $(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X}$ over Z . By construction $f_{i'}$ is the morphism corresponding to the object $\xi_{i'} = (Z_{i'}, Z_{i'} \rightarrow U_i, x_{i'}, \alpha_{i'})$. As $f_\xi = f_{i'} \circ (Z \rightarrow Z_{i'})$ we see that the object $\xi_{i'} = (Z_{i'}, Z_{i'} \rightarrow U_i, x_{i'}, \alpha_{i'})$ pulls back to ξ over Z . Thus $x_{i'}$ pulls back to x and $\alpha_{i'}$ pulls back to α . This means that $\Xi_{i'}$ pulls back to Ξ over U and we win. \square

74.13. The finite Hilbert stack of a point

Let $d \geq 1$ be an integer. In Examples of Stacks, Definition 72.17.2 we defined a stack in groupoids \mathcal{H}_d . In this section we prove that \mathcal{H}_d is an algebraic stack. We will throughout assume that $S = \text{Spec}(\mathbf{Z})$. The general case will follow from this by base change. Recall that the fibre category of \mathcal{H}_d over a scheme T is the category of finite locally free morphisms $\pi : Z \rightarrow T$ of degree d . Instead of classifying these directly we first study the quasi-coherent sheaves of algebras $\pi_* \mathcal{O}_Z$.

Let R be a ring. Let us temporarily make the following definition: A *free d -dimensional algebra over R* is given by a commutative R -algebra structure m on $R^{\oplus d}$ such that $e_1 = (1, 0, \dots, 0)$ is a unit⁴. We think of m as an R -linear map

$$m : R^{\oplus d} \otimes_R R^{\oplus d} \longrightarrow R^{\oplus d}$$

such that $m(e_1, x) = m(x, e_1) = x$ and such that m defines a commutative and associative ring structure. If we write $m(e_i, e_j) = \sum a_{ij}^k e_k$ then we see this boils down to the conditions

$$\begin{cases} \sum_l a_{ij}^l a_{lk}^m = \sum_l a_{il}^m a_{jk}^l & \forall i, j, k, m \\ a_{ij}^k = a_{ji}^k & \forall i, j, k \\ a_{i1}^j = \delta_{ij} & \forall i, j \end{cases}$$

where δ_{ij} is the Kronecker δ -function. OK, so let's define

$$R_{univ} = \mathbf{Z}[a_{ij}^k]/J$$

where the ideal J is the ideal generated by the relations displayed above. Denote

$$m_{univ} : R_{univ}^{\oplus d} \otimes_{R_{univ}} R_{univ}^{\oplus d} \longrightarrow R_{univ}^{\oplus d}$$

the free d -dimensional algebra m over R_{univ} whose structure constants are the classes of a_{ij}^k modulo J . Then it is clear that given any free d -dimensional algebra m over a ring R there exists a unique \mathbf{Z} -algebra homomorphism $\psi : R_{univ} \rightarrow R$ such that $\psi_* m_{univ} = m$ (this means that m is what you get by applying the base change functor $-\otimes_{R_{univ}} R$ to m_{univ}). In other words, setting $X = \text{Spec}(R_{univ})$ we obtain a canonical identification

$$X(T) = \{\text{free } d\text{-dimensional algebras } m \text{ over } R\}$$

for varying $T = \text{Spec}(R)$. By Zariski localization we obtain the following seemingly more general identification

$$(74.13.0.1) \quad X(T) = \{\text{free } d\text{-dimensional algebras } m \text{ over } \Gamma(T, \mathcal{O}_T)\}$$

for any scheme T .

⁴It may be better to think of this as a pair consisting of a multiplication map $m : R^{\oplus d} \otimes_R R^{\oplus d} \rightarrow R^{\oplus d}$ and a ring map $\psi : R \rightarrow R^{\oplus d}$ satisfying a bunch of axioms.

Next we talk a little bit about *isomorphisms of free d -dimensional R -algebras*. Namely, suppose that m, m' are two free d -dimensional algebras over a ring R . An *isomorphism from m to m'* is given by an invertible R -linear map

$$\varphi : R^{\oplus d} \longrightarrow R^{\oplus d}$$

such that $\varphi(e_1) = e_1$ and such that

$$m \circ \varphi \otimes \varphi = \varphi \circ m'.$$

Note that we can compose these so that the collection of free d -dimensional algebras over R becomes a category. In this way we obtain a functor

$$(74.13.0.2) \quad FA_d : Sch_{fppf}^{opp} \longrightarrow \text{Groupoids}$$

from the category of schemes to groupoids: to a scheme T we associate the set of free d -dimensional algebras over $\Gamma(T, \mathcal{O}_T)$ endowed with the structure of a category using the notion of isomorphisms just defined.

The above suggests we consider the functor G in groups which associates to any scheme T the group

$$G(T) = \{g \in \text{GL}_d(\Gamma(T, \mathcal{O}_T)) \mid g(e_1) = e_1\}$$

It is clear that $G \subset \text{GL}_d$ (see Groupoids, Example 38.5.4) is the closed subgroup scheme cut out by the equations $x_{11} = 1$ and $x_{i1} = 0$ for $i > 1$. Hence G is a smooth affine group scheme over $\text{Spec}(\mathbf{Z})$. Consider the action

$$a : G \times_{\text{Spec}(\mathbf{Z})} X \longrightarrow X$$

which associates to a T -valued point (g, m) with $T = \text{Spec}(R)$ on the left hand side the free d -dimensional algebra over R given by

$$a(g, m) = g^{-1} \circ m \circ g \otimes g.$$

Note that this means that g defines an isomorphism $m \rightarrow a(g, m)$ of d -dimensional free R -algebras. We omit the verification that a indeed defines an action of the group scheme G on the scheme X .

Lemma 74.13.1. *The functor in groupoids FA_d defined in (74.13.0.2) is isomorphic (!) to the functor in groupoids which associates to a scheme T the category with*

- (1) *set of objects is $X(T)$,*
- (2) *set of morphisms is $G(T) \times X(T)$,*
- (3) *$s : G(T) \times X(T) \rightarrow X(T)$ is the projection map,*
- (4) *$t : G(T) \times X(T) \rightarrow X(T)$ is $a(T)$, and*
- (5) *composition $G(T) \times X(T) \times_{s, X(T), t} G(T) \times X(T) \rightarrow G(T) \times X(T)$ is given by $((g, m), (g', m')) \mapsto (gg', m')$.*

Proof. We have seen the rule on objects in (74.13.0.1). We have also seen above that $g \in G(T)$ can be viewed as a morphism from m to $a(g, m)$ for any free d -dimensional algebra m . Conversely, any morphism $m \rightarrow m'$ is given by an invertible linear map φ which corresponds to an element $g \in G(T)$ such that $m' = a(g, m)$. \square

In fact the groupoid $(X, G \times X, s, t, c)$ described in the lemma above is the groupoid associated to the action $a : G \times X \rightarrow X$ as defined in Groupoids, Lemma 38.14.1. Since G is smooth over $\text{Spec}(\mathbf{Z})$ we see that the two morphisms $s, t : G \times X \rightarrow X$ are smooth: by symmetry it suffices to prove that one of them is, and s is the base

change of $G \rightarrow \text{Spec}(\mathbf{Z})$. Hence $(G \times X, X, s, t, c)$ is a smooth groupoid scheme, and the quotient stack $[X/G]$ is an algebraic stack by Algebraic Stacks, Theorem 71.17.3.

Proposition 74.13.2. *The stack \mathcal{H}_d is equivalent to the quotient stack $[X/G]$ described above. In particular \mathcal{H}_d is an algebraic stack.*

Proof. Note that by Groupoids in Spaces, Definition 60.19.1 the quotient stack $[X/G]$ is the stackification of the category fibred in groupoids associated to the “presheaf in groupoids” which associates to a scheme T the groupoid

$$(X(T), G(T) \times X(T), s, t, c).$$

Since this “presheaf in groupoids” is isomorphic to FA_d by Lemma 74.13.1 it suffices to prove that the \mathcal{H}_d is the stackification of (the category fibred in groupoids associated to the “presheaf in groupoids”) FA_d . To do this we first define a functor

$$\text{Spec} : FA_d \longrightarrow \mathcal{H}_d$$

Recall that the fibre category of \mathcal{H}_d over a scheme T is the category of finite locally free morphisms $Z \rightarrow T$ of degree d . Thus given a scheme T and a free d -dimensional $\Gamma(T, \mathcal{O}_T)$ -algebra m we may assign to this the object

$$Z = \underline{\text{Spec}}_T(\mathcal{A})$$

of $\mathcal{H}_{d,T}$ where $\mathcal{A} = \mathcal{O}_T^{\oplus d}$ endowed with a \mathcal{O}_T -algebra structure via m . Moreover, if m' is a second such free d -dimensional $\Gamma(T, \mathcal{O}_T)$ -algebra and if $\varphi : m \rightarrow m'$ is an isomorphism of these, then the induced \mathcal{O}_T -linear map $\varphi : \mathcal{O}_T^{\oplus d} \rightarrow \mathcal{O}_T^{\oplus d}$ induces an isomorphism

$$\varphi : \mathcal{A}' \longrightarrow \mathcal{A}$$

of quasi-coherent \mathcal{O}_T -algebras. Hence

$$\underline{\text{Spec}}_T(\varphi) : \underline{\text{Spec}}_T(\mathcal{A}) \longrightarrow \underline{\text{Spec}}_T(\mathcal{A}')$$

is a morphism in the fibre category $\mathcal{H}_{d,T}$. We omit the verification that this construction is compatible with base change so we get indeed a functor $\text{Spec} : FA_d \rightarrow \mathcal{H}_d$ as claimed above.

To show that $\text{Spec} : FA_d \rightarrow \mathcal{H}_d$ induces an equivalence between the stackification of FA_d and \mathcal{H}_d it suffices to check that

- (1) $\text{Isom}(m, m') = \text{Isom}(\text{Spec}(m), \text{Spec}(m'))$ for any $m, m' \in FA_d(T)$.
- (2) for any scheme T and any object $Z \rightarrow T$ of $\mathcal{H}_{d,T}$ there exists a covering $\{T_i \rightarrow T\}$ such that $Z|_{T_i}$ is isomorphic to $\text{Spec}(m)$ for some $m \in FA_d(T_i)$, and

see Stacks, Lemma 8.9.1. The first statement follows from the observation that any isomorphism

$$\underline{\text{Spec}}_T(\mathcal{A}) \longrightarrow \underline{\text{Spec}}_T(\mathcal{A}')$$

is necessarily given by a global invertible matrix g when $\mathcal{A} = \mathcal{A}' = \mathcal{O}_T^{\oplus d}$ as modules. To prove the second statement let $\pi : Z \rightarrow T$ be a finite locally free morphism of degree d . Then \mathcal{A} is a locally free sheaf \mathcal{O}_T -modules of rank d . Consider the element $1 \in \Gamma(T, \mathcal{A})$. This element is nonzero in $\mathcal{A} \otimes_{\mathcal{O}_{T,t}} \kappa(t)$ for every $t \in T$ since the scheme $Z_t = \text{Spec}(\mathcal{A} \otimes_{\mathcal{O}_{T,t}} \kappa(t))$ is nonempty being of degree $d > 0$ over $\kappa(t)$. Thus $1 : \mathcal{O}_T \rightarrow \mathcal{A}$ can locally be used as the first basis element (for example you can use Algebra, Lemma 10.76.3 parts (1) and (2) to see this). Thus, after localizing

on T we may assume that there exists an isomorphism $\varphi : \mathcal{A} \rightarrow \mathcal{O}_T^{\oplus d}$ such that $1 \in \Gamma(\mathcal{A})$ corresponds to the first basis element. In this situation the multiplication map $\mathcal{A} \otimes_{\mathcal{O}_T} \mathcal{A} \rightarrow \mathcal{A}$ translates via φ into a free d -dimensional algebra m over $\Gamma(T, \mathcal{O}_T)$. This finishes the proof. \square

74.14. Finite Hilbert stacks of spaces

The finite Hilbert stack of an algebraic space is an algebraic stack.

Lemma 74.14.1. *Let S be a scheme. Let X be an algebraic space over S . Then $\mathcal{H}_d(X)$ is an algebraic stack.*

Proof. The 1-morphism

$$\mathcal{H}_d(X) \longrightarrow \mathcal{H}_d$$

is representable by algebraic spaces according to Lemma 74.12.6. The stack \mathcal{H}_d is an algebraic stack according to Proposition 74.13.2. Hence $\mathcal{H}_d(X)$ is an algebraic stack by Algebraic Stacks, Lemma 71.15.4. \square

This lemma allows us to bootstrap.

Lemma 74.14.2. *Let S be a scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$ such that*

- (1) \mathcal{X} is representable by an algebraic space, and
- (2) F is representable by algebraic spaces, surjective, flat, and locally of finite presentation.

Then $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is an algebraic stack.

Proof. Choose a representable stack in groupoids \mathcal{U} over S and a 1-morphism $f : \mathcal{U} \rightarrow \mathcal{H}_d(\mathcal{X})$ which is representable by algebraic spaces, smooth, and surjective. This is possible because $\mathcal{H}_d(\mathcal{X})$ is an algebraic stack by Lemma 74.14.1. Consider the 2-fibre product

$$\mathcal{W} = \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{\mathcal{H}_d(\mathcal{X}), f} \mathcal{U}.$$

Since \mathcal{U} is representable (in particular a stack in setoids) it follows from Examples of Stacks, Lemma 72.17.3 and Stacks, Lemma 8.6.7 that \mathcal{W} is a stack in setoids. The 1-morphism $\mathcal{W} \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces, smooth, and surjective as a base change of the morphism f (see Algebraic Stacks, Lemmas 71.9.7 and 71.10.6). Thus, if we can show that \mathcal{W} is representable by an algebraic space, then the lemma follows from Algebraic Stacks, Lemma 71.15.3.

The diagonal of \mathcal{Y} is representable by algebraic spaces according to Lemma 74.4.3. We may apply Lemma 74.12.5 to see that the 1-morphism

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}$$

is representable by algebraic spaces. Consider the 2-fibre product

$$\mathcal{V} = \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{(\mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}), f \times F} (\mathcal{U} \times \mathcal{X}).$$

The projection morphism $\mathcal{V} \rightarrow \mathcal{U} \times \mathcal{X}$ is representable by algebraic spaces as a base change of the last displayed morphism. Hence \mathcal{V} is an algebraic space (see

Bootstrap, Lemma 62.3.6 or Algebraic Stacks, Lemma 71.9.8). The 1-morphism $\mathcal{V} \rightarrow \mathcal{U}$ fits into the following 2-cartesian diagram

$$\begin{array}{ccc} \mathcal{V} & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow F \\ \mathcal{W} & \longrightarrow & \mathcal{Y} \end{array}$$

because

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{(\mathcal{H}_d(\mathcal{X}) \times_{\mathcal{Y}}, f \times F)} (\mathcal{U} \times \mathcal{X}) = (\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{\mathcal{H}_d(\mathcal{X}), f} \mathcal{U}) \times_{\mathcal{Y}, F} \mathcal{X}.$$

Hence $\mathcal{V} \rightarrow \mathcal{W}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation as a base change of F . It follows that the same thing is true for the corresponding sheaves of sets associated to \mathcal{V} and \mathcal{W} , see Algebraic Stacks, Lemma 71.10.4. Thus we conclude that the sheaf associated to \mathcal{W} is an algebraic space by Bootstrap, Theorem 62.10.1. \square

74.15. LCI locus in the Hilbert stack

Please consult Examples of Stacks, Section 72.17 for notation. Fix a 1-morphism $F : \mathcal{X} \rightarrow \mathcal{Y}$ of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that F is representable by algebraic spaces. Fix $d \geq 1$. Consider an object (U, Z, y, x, α) of \mathcal{H}_d . There is an induced 1-morphism

$$(Sch/Z)_{fppf} \longrightarrow (Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$$

(by the universal property of 2-fibre products) which is representable by a morphism of algebraic spaces over U . Namely, since F is representable by algebraic spaces, we may choose an algebraic space X_y over U which represents the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$. Since $\alpha : y|_Z \rightarrow F(x)$ is an isomorphism we see that $\xi = (Z, Z \rightarrow U, x, \alpha)$ is an object of the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$ over Z . Hence ξ gives rise to a morphism $x_\alpha : Z \rightarrow X_y$ of algebraic spaces over U as X_y is the functor of isomorphisms classes of objects of $(Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$, see Algebraic Stacks, Lemma 71.8.2. Here is a picture

(74.15.0.1)

$$\begin{array}{ccccc} Z & \xrightarrow{x_\alpha} & X_y & & (Sch/Z)_{fppf} \xrightarrow{x, \alpha} (Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X} \longrightarrow \mathcal{X} \\ & \searrow & \downarrow & & \downarrow \\ & & U & & (Sch/U)_{fppf} \xrightarrow{y} \mathcal{Y} \\ & & & & \downarrow F \end{array}$$

We remark that if $(f, g, b, a) : (U, Z, y, x, \alpha) \rightarrow (U', Z', y', x', \alpha')$ is a morphism between objects of \mathcal{H}_d , then the morphism $x'_{\alpha'} : Z' \rightarrow X'_{y'}$ is the base change of the morphism x_α by the morphism $g : U' \rightarrow U$ (details omitted).

Now assume moreover that F is flat and locally of finite presentation. In this situation we define a full subcategory

$$\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \subset \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

consisting of those objects (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ such that the corresponding morphism $x_\alpha : Z \rightarrow X_y$ is unramified and a local complete intersection morphism (see Morphisms of Spaces, Definition 49.35.1 and More on Morphisms of Spaces, Definition 58.36.1 for definitions).

Lemma 74.15.1. *Let S be a scheme. Fix a 1-morphism $F : \mathcal{X} \rightarrow \mathcal{Y}$ of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, and locally of finite presentation. Then $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ is a stack in groupoids and the inclusion functor*

$$\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is representable and an open immersion.

Proof. Let $\Xi = (U, Z, y, x, \alpha)$ be an object of \mathcal{H}_d . It follows from the remark following (74.15.0.1) that the pullback of Ξ by $U' \rightarrow U$ belongs to $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ if and only if the base change of x_α is unramified and a local complete intersection morphism. Note that $Z \rightarrow U$ is finite locally free (hence flat, locally of finite presentation and universally closed) and that $X_y \rightarrow U$ is flat and locally of finite presentation by our assumption on F . Then More on Morphisms of Spaces, Lemmas 58.37.1 and 58.37.7 imply exists an open subscheme $W \subset U$ such that a morphism $U' \rightarrow U$ factors through W if and only if the base change of x_α via $U' \rightarrow U$ is unramified and a local complete intersection morphism. This implies that

$$(Sch/U)_{fppf} \times_{\Xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$$

is representable by W . Hence the final statement of the lemma holds. The first statement (that $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ is a stack in groupoids) follows from this an Algebraic Stacks, Lemma 71.15.5. \square

Local complete intersection morphisms are “locally unobstructed”. This holds in much greater generality than the special case that we need in this chapter here.

Lemma 74.15.2. *Let $U \subset U'$ be a first order thickening of affine schemes. Let X' be an algebraic space flat over U' . Set $X = U \times_{U'} X'$. Let $Z \rightarrow U$ be finite locally free of degree d . Finally, let $f : Z \rightarrow X$ be unramified and a local complete intersection morphism. Then there exists a commutative diagram*

$$\begin{array}{ccc} (Z \subset Z') & \xrightarrow{(f, f')} & (X \subset X') \\ & \searrow & \swarrow \\ & (U \subset U') & \end{array}$$

of algebraic spaces over U' such that $Z' \rightarrow U'$ is finite locally free of degree d and $Z = U \times_{U'} Z'$.

Proof. By More on Morphisms of Spaces, Lemma 58.36.8 the conormal sheaf $\mathcal{C}_{Z/X}$ of the unramified morphism $Z \rightarrow X$ is a finite locally free \mathcal{O}_Z -module and by More on Morphisms of Spaces, Lemma 58.36.9 we have an exact sequence

$$0 \rightarrow i^* \mathcal{C}_{X/X'} \rightarrow \mathcal{C}_{Z/X'} \rightarrow \mathcal{C}_{Z/X} \rightarrow 0$$

of conormal sheaves. Since Z is affine this sequence is split. Choose a splitting

$$\mathcal{C}_{Z/X'} = i^* \mathcal{C}_{X/X'} \oplus \mathcal{C}_{Z/X}$$

Let $Z \subset Z''$ be the universal first order thickening of Z over X' (see More on Morphisms of Spaces, Section 58.12). Denote $\mathcal{I} \subset \mathcal{O}_{Z''}$ the quasi-coherent sheaf of ideals corresponding to $Z \subset Z''$. By definition we have $\mathcal{C}_{Z/X'}$ is \mathcal{I} viewed as a sheaf on Z . Hence the splitting above determines a splitting

$$\mathcal{I} = i^* \mathcal{C}_{X/X'} \oplus \mathcal{C}_{Z/X}$$

Let $Z' \subset Z''$ be the closed subscheme cut out by $\mathcal{C}_{Z/X} \subset \mathcal{I}$ viewed as a quasi-coherent sheaf of ideals on Z'' . It is clear that Z' is a first order thickening of Z and that we obtain a commutative diagram of first order thickenings as in the statement of the lemma.

Since $X' \rightarrow U'$ is flat and since $X = U \times_{U'} X'$ we see that $\mathcal{C}_{X/X'}$ is the pullback of $\mathcal{C}_{U/U'}$ to X , see More on Morphisms of Spaces, Lemma 58.15.1. Note that by construction $\mathcal{C}_{Z/Z'} = i^* \mathcal{C}_{X/X'}$ hence we conclude that $\mathcal{C}_{Z/Z'}$ is isomorphic to the pullback of $\mathcal{C}_{U/U'}$ to Z . Applying More on Morphisms of Spaces, Lemma 58.15.1 once again (or its analogue for schemes, see More on Morphisms, Lemma 36.8.1) we conclude that $Z' \rightarrow U'$ is flat and that $Z = U \times_{U'} Z'$. Finally, More on Morphisms, Lemma 36.8.3 shows that $Z' \rightarrow U'$ is finite locally free of degree d . \square

Lemma 74.15.3. *Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, and locally of finite presentation. Then*

$$p : \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{Y}$$

is formally smooth on objects.

Proof. We have to show the following: Given

- (1) an object (U, Z, y, x, α) of $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ over an affine scheme U ,
- (2) a first order thickening $U \subset U'$, and
- (3) an object y' of \mathcal{Y} over U' such that $y'|_U = y$,

then there exists an object $(U', Z', y', x', \alpha')$ of $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ over U' with $Z = U \times_{U'} Z'$, with $x = x'|_Z$, and with $\alpha = \alpha'|_U$. Namely, the last two equalities will take care of the commutativity of (74.6.0.1).

Consider the morphism $x_\alpha : Z \rightarrow X_y$ constructed in Equation (74.15.0.1). Denote similarly $X'_{y'}$ the algebraic space over U' representing the 2-fibre product $(Sch/U')_{fppf} \times_{y', \mathcal{Y}, F} \mathcal{X}$. By assumption the morphism $X'_{y'} \rightarrow U'$ is flat (and locally of finite presentation). As $y'|_U = y$ we see that $X_y = U \times_{U'} X'_{y'}$. Hence we may apply Lemma 74.15.2 to find $Z' \rightarrow U'$ finite locally free of degree d with $Z = U \times_{U'} Z'$ and with $Z' \rightarrow X'_{y'}$ extending x_α . By construction the morphism $Z' \rightarrow X'_{y'}$ corresponds to a pair (x', α') . It is clear that $(U', Z', y', x', \alpha')$ is an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U' with $Z = U \times_{U'} Z'$, with $x = x'|_Z$, and with $\alpha = \alpha'|_U$. As we've seen in Lemma 74.15.1 that $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \subset \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is an “open substack” it follows that $(U', Z', y', x', \alpha')$ is an object of $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ as desired. \square

Lemma 74.15.4. *Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, surjective, and locally of finite presentation. Then*

$$\coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{Y}$$

is surjective on objects.

Proof. It suffices to prove the following: For any field k and object y of \mathcal{Y} over $\text{Spec}(k)$ there exists an integer $d \geq 1$ and an object (U, Z, y, x, α) of $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ with $U = \text{Spec}(k)$. Namely, in this case we see that p is surjective on objects in the strong sense that an extension of the field is not needed.

Denote X_y the algebraic space over $U = \text{Spec}(k)$ representing the 2-fibre product $(Sch/U')_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$. By assumption the morphism $X_y \rightarrow \text{Spec}(k)$ is surjective

and locally of finite presentation (and flat). In particular X_y is nonempty. Choose a nonempty affine scheme V and an étale morphism $V \rightarrow X_y$. Note that $V \rightarrow \text{Spec}(k)$ is (flat), surjective, and locally of finite presentation (by Morphisms of Spaces, Definition 49.27.1). Pick a closed point $v \in V$ where $V \rightarrow \text{Spec}(k)$ is Cohen-Macaulay (i.e., V is Cohen-Macaulay at v), see More on Morphisms, Lemma 36.17.5. Applying More on Morphisms, Lemma 36.18.4 we find a regular immersion $Z \rightarrow V$ with $Z = \{v\}$. This implies $Z \rightarrow V$ is a closed immersion. Moreover, it follows that $Z \rightarrow \text{Spec}(k)$ is finite (for example by Algebra, Lemma 10.118.1). Hence $Z \rightarrow \text{Spec}(k)$ is finite locally free of some degree d . Now $Z \rightarrow X_y$ is unramified as the composition of a closed immersion followed by an étale morphism (see Morphisms of Spaces, Lemmas 49.35.3, 49.36.10, and 49.35.8). Finally, $Z \rightarrow X_y$ is a local complete intersection morphism as a composition of a regular immersion of schemes and an étale morphism of algebraic spaces (see More on Morphisms, Lemma 36.42.9 and Morphisms of Spaces, Lemmas 49.36.6 and 49.34.8 and More on Morphisms of Spaces, Lemmas 58.36.6 and 58.36.5). The morphism $Z \rightarrow X_y$ corresponds to an object x of \mathcal{X} over Z together with an isomorphism $\alpha : y|_Z \rightarrow F(x)$. We obtain an object (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. By what was said above about the morphism $Z \rightarrow X_y$ we see that it actually is an object of the subcategory $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ and we win. \square

74.16. Bootstrapping algebraic stacks

The following theorem is one of the main results of this chapter.

Theorem 74.16.1. *Let S be a scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

- (1) \mathcal{X} is representable by an algebraic space, and
- (2) F is representable by algebraic spaces, surjective, flat and locally of finite presentation,

then \mathcal{Y} is an algebraic stack.

Proof. By Lemma 74.4.3 we see that the diagonal of \mathcal{Y} is representable by algebraic spaces. Hence we only need to verify the existence of a 1-morphism $f : \mathcal{V} \rightarrow \mathcal{Y}$ of stacks in groupoids over $(Sch/S)_{fppf}$ with \mathcal{V} representable and f surjective and smooth. By Lemma 74.14.2 we know that

$$\coprod_{d \geq 1} \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is an algebraic stack. It follows from Lemma 74.15.1 and Algebraic Stacks, Lemma 71.15.5 that

$$\coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$$

is an algebraic stack as well. Choose a representable stack in groupoids \mathcal{V} over $(Sch/S)_{fppf}$ and a surjective and smooth 1-morphism

$$\mathcal{V} \longrightarrow \coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}).$$

We claim that the composition

$$\mathcal{V} \longrightarrow \coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{Y}$$

is smooth and surjective which finishes the proof of the theorem. In fact, the smoothness will be a consequence of Lemmas 74.12.7 and 74.15.3 and the surjectivity a consequence of Lemma 74.15.4. We spell out the details in the following paragraph.

By construction $\mathcal{V} \rightarrow \coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces, surjective, and smooth (and hence also locally of finite presentation and formally smooth by the general principle Algebraic Stacks, Lemma 71.10.9 and More on Morphisms of Spaces, Lemma 58.16.6). Applying Lemmas 74.5.3, 74.6.3, and 74.7.3 we see that $\mathcal{V} \rightarrow \coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y})$ is limit preserving on objects, formally smooth on objects, and surjective on objects. The 1-morphism $\coprod_{d \geq 1} \mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{Y}$ is

- (1) limit preserving on objects: this is Lemma 74.12.7 for $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{Y}$ and we combine it with Lemmas 74.15.1, 74.5.4, and 74.5.2 to get it for $\mathcal{H}_{d, lci}(\mathcal{X}/\mathcal{Y}) \rightarrow \mathcal{Y}$,
- (2) formally smooth on objects by Lemma 74.15.3, and
- (3) surjective on objects by Lemma 74.15.4.

Using Lemmas 74.5.2, 74.6.2, and 74.7.2 we conclude that the composition $\mathcal{V} \rightarrow \mathcal{Y}$ is limit preserving on objects, formally smooth on objects, and surjective on objects. Using Lemmas 74.5.3, 74.6.3, and 74.7.3 we see that $\mathcal{V} \rightarrow \mathcal{Y}$ is locally of finite presentation, formally smooth, and surjective. Finally, using (via the general principle Algebraic Stacks, Lemma 71.10.9) the infinitesimal lifting criterion (More on Morphisms of Spaces, Lemma 58.16.6) we see that $\mathcal{V} \rightarrow \mathcal{Y}$ is smooth and we win. \square

74.17. Applications

Our first task is to show that the quotient stack $[U/R]$ associated to a “flat and locally finitely presented groupoid” is an algebraic stack. See Groupoids in Spaces, Definition 60.19.1 for the definition of the quotient stack. The following lemma is preliminary and is the analogue of Algebraic Stacks, Lemma 71.17.2.

Lemma 74.17.1. *Let S be a scheme contained in Sch_{fppf} . Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . Assume s, t are flat and locally of finite presentation. Then the morphism $\mathcal{S}_U \rightarrow [U/R]$ is flat, locally of finite presentation, and surjective.*

Proof. Let T be a scheme and let $x : (Sch/T)_{fppf} \rightarrow [U/R]$ be a 1-morphism. We have to show that the projection

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} \longrightarrow (Sch/T)_{fppf}$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space F , see Algebraic Stacks, Lemmas 71.17.1 and 71.10.11. Hence we have to show the corresponding morphism $F \rightarrow T$ of algebraic spaces is surjective, locally of finite presentation, and flat. Since we are working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on T . By construction, there exists an fppf covering $\{T_i \rightarrow T\}$ of T such that $x|_{(Sch/T_i)_{fppf}}$ comes from a morphism $x_i : T_i \rightarrow U$. (Note that $F \times_T T_i$ represents the 2-fibre product $\mathcal{S}_U \times_{[U/R]} (Sch/T_i)_{fppf}$ so everything is compatible with the base change via $T_i \rightarrow T$.) Hence we may assume that x comes from $x : T \rightarrow U$. In this case we see that

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} = (\mathcal{S}_U \times_{[U/R]} \mathcal{S}_U) \times_{\mathcal{S}_U} (Sch/T)_{fppf} = \mathcal{S}_R \times_{\mathcal{S}_U} (Sch/T)_{fppf}$$

The first equality by Categories, Lemma 4.29.10 and the second equality by Groupoids in Spaces, Lemma 60.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F = R \times_{s,U,x} T$ and the projection $R \times_{s,U,x} T \rightarrow T$ is flat and locally of finite presentation as the base change of the flat locally finitely presented morphism of algebraic spaces $s : R \rightarrow U$. It is also surjective as s has a section (namely the identity $e : U \rightarrow R$ of the groupoid). This proves the lemma. \square

Here is the first main result of this section.

Theorem 74.17.2. *Let S be a scheme contained in Sch_{fppf} . Let (U, R, s, t, c) be a groupoid in algebraic spaces over S . Assume s, t are flat and locally of finite presentation. Then the quotient stack $[U/R]$ is an algebraic stack over S .*

Proof. We check the two conditions of Theorem 74.16.1 for the morphism

$$(Sch/U)_{fppf} \longrightarrow [U/R].$$

The first is trivial (as U is an algebraic space). The second is Lemma 74.17.1. \square

74.18. When is a quotient stack algebraic?

In Groupoids in Spaces, Section 60.19 we have defined the quotient stack $[U/R]$ associated to a groupoid (U, R, s, t, c) in algebraic spaces. Note that $[U/R]$ is a stack in groupoids whose diagonal is representable by algebraic spaces (see Bootstrap, Lemma 62.11.5 and Algebraic Stacks, Lemma 71.10.11) and such that there exists an algebraic space U and a 1-morphism $(Sch/U)_{fppf} \rightarrow [U/R]$ which is an “fppf surjection” in the sense that it induces a map on presheaves of isomorphism classes of objects which becomes surjective after sheafification. However, it is not the case that $[U/R]$ is an algebraic stack in general. This is not a contradiction with Theorem 74.16.1 as the 1-morphism $(Sch/U)_{fppf} \rightarrow [U/R]$ is not representable by algebraic spaces in general, and if it is it may not be flat and locally of finite presentation.

The easiest way to make examples of non-algebraic quotient stacks is to look at quotients of the form $[S/G]$ where S is a scheme and G is a group scheme over S acting trivially on S . Namely, we will see below (Lemma 74.18.3) that if $[S/G]$ is algebraic, then $G \rightarrow S$ has to be flat and locally of finite presentation. An explicit example can be found in Examples, Section 82.44.

Lemma 74.18.1. *Let S be a scheme and let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . The quotient stack $[U/R]$ is an algebraic stack if and only if there exists a morphism of algebraic spaces $g : U' \rightarrow U$ such that*

- (1) *the composition $U' \times_{g,U,t} R \rightarrow R \xrightarrow{s} U$ is a surjection of sheaves, and*
- (2) *the morphisms $s', t' : R' \rightarrow U'$ are flat and locally of finite presentation where (U', R', s', t', c') is the restriction of (U, R, s, t, c) via g .*

Proof. First, assume that $g : U' \rightarrow U$ satisfies (1) and (2). Property (1) implies that $[U'/R'] \rightarrow [U/R]$ is an equivalence, see Groupoids in Spaces, Lemma 60.24.2. By Theorem 74.17.2 the quotient stack $[U'/R']$ is an algebraic stack. Hence $[U/R]$ is an algebraic stack too, see Algebraic Stacks, Lemma 71.12.4.

Conversely, assume that $[U/R]$ is an algebraic stack. We may choose a scheme W and a surjective smooth 1-morphism

$$f : (Sch/W)_{fppf} \longrightarrow [U/R].$$

By the 2-Yoneda lemma (Algebraic Stacks, Section 71.5) this corresponds to an object ξ of $[U/R]$ over W . By the description of $[U/R]$ in Groupoids in Spaces, Lemma 60.23.1 we can find a surjective, flat, locally finitely presented morphism $b : U' \rightarrow W$ of schemes such that $\xi' = b^*\xi$ corresponds to a morphism $g : U' \rightarrow U$. Note that the 1-morphism

$$f' : (Sch/U')_{fppf} \longrightarrow [U/R].$$

corresponding to ξ' is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Lemma 71.10.5. Hence $(Sch/U')_{fppf} \times_{[U/R]} (Sch/U')_{fppf}$ which is represented by the algebraic space

$$Isom_{[U/R]}(\mathrm{pr}_0^*\xi', \mathrm{pr}_1^*\xi') = (U' \times_S U') \times_{(g \circ \mathrm{pr}_0, g \circ \mathrm{pr}_1), U \times_S U} R = R'$$

(see Groupoids in Spaces, Lemma 60.21.1 for the first equality; the second is the definition of restriction) is flat and locally of finite presentation over U' via both s' and t' (by base change, see Algebraic Stacks, Lemma 71.10.6). By this description of R' and by Algebraic Stacks, Lemma 71.16.1 we obtain a canonical fully faithful 1-morphism $[U'/R'] \rightarrow [U/R]$. This 1-morphism is essentially surjective because f' is flat, locally of finite presentation, and surjective (see Stacks, Lemma 8.4.8); another way to prove this is to use Algebraic Stacks, Remark 71.16.3. Finally, we can use Groupoids in Spaces, Lemma 60.24.2 to conclude that the composition $U' \times_{g, U, t} R \rightarrow R \xrightarrow{s} U$ is a surjection of sheaves. \square

Lemma 74.18.2. *Let S be a scheme and let B be an algebraic space over S . Let G be a group algebraic space over B . Let X be an algebraic space over B and let $a : G \times_B X \rightarrow X$ be an action of G on X over B . The quotient stack $[X/G]$ is an algebraic stack if and only if there exists a morphism of algebraic spaces $\varphi : X' \rightarrow X$ such that*

- (1) $G \times_B X' \rightarrow X$, $(g, x') \mapsto a(g, \varphi(x'))$ is a surjection of sheaves, and
- (2) the two projections $X'' \rightarrow X'$ of the algebraic space X'' given by the rule

$$T \longmapsto \{(x'_1, g, x'_2) \in (X' \times_B G \times_B X')(T) \mid \varphi(x'_1) = a(g, \varphi(x'_2))\}$$

are flat and locally of finite presentation.

Proof. This lemma is a special case of Lemma 74.18.1. Namely, the quotient stack $[X/G]$ is by Groupoids in Spaces, Definition 60.19.1 equal to the quotient stack $[X/G \times_B X]$ of the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$ associated to the group action in Groupoids in Spaces, Lemma 60.14.1. There is one small observation that is needed to get condition (1). Namely, the morphism $s : G \times_B X \rightarrow X$ is the second projection and the morphism $t : G \times_B X \rightarrow X$ is the action morphism a . Hence the morphism $h : U' \times_{g, U, t} R \rightarrow R \xrightarrow{s} U$ from Lemma 74.18.1 corresponds to the morphism

$$X' \times_{\varphi, X, a} (G \times_B X) \xrightarrow{\mathrm{pr}_1} X$$

in the current setting. However, because of the symmetry given by the inverse of G this morphism is isomorphic to the morphism

$$(G \times_B X) \times_{\mathrm{pr}_1, X, \varphi} X' \xrightarrow{a} X$$

of the statement of the lemma. Details omitted. \square

Lemma 74.18.3. *Let S be a scheme and let B be an algebraic space over S . Let G be a group algebraic space over B . Endow B with the trivial action of G . Then the quotient stack $[B/G]$ is an algebraic stack if and only if G is flat and locally of finite presentation over B .*

Proof. If G is flat and locally of finite presentation over B , then $[B/G]$ is an algebraic stack by Theorem 74.17.2.

Conversely, assume that $[B/G]$ is an algebraic stack. By Lemma 74.18.2 and because the action is trivial, we see there exists an algebraic space B' and a morphism $B' \rightarrow B$ such that (1) $B' \rightarrow B$ is a surjection of sheaves and (2) the projections

$$B' \times_B G \times_B B' \rightarrow B'$$

are flat and locally of finite presentation. Note that the base change $B' \times_B G \times_B B' \rightarrow G \times_B B'$ of $B' \rightarrow B$ is a surjection of sheaves also. Thus it follows from Descent on Spaces, Lemma 56.7.1 that the projection $G \times_B B' \rightarrow B'$ is flat and locally of finite presentation. By (1) we can find an fppf covering $\{B_i \rightarrow B\}$ such that $B_i \rightarrow B$ factors through $B' \rightarrow B$. Hence $G \times_B B_i \rightarrow B_i$ is flat and locally of finite presentation by base change. By Descent on Spaces, Lemmas 56.10.11 and 56.10.8 we conclude that $G \rightarrow B$ is flat and locally of finite presentation. \square

74.19. Algebraic stacks in the étale topology

Let S be a scheme. Instead of working with stacks in groupoids over the big fppf site $(Sch/S)_{fppf}$ we could work with stacks in groupoids over the big étale site $(Sch/S)_{\acute{e}tale}$. All of the material in Algebraic Stacks, Sections 71.4, 71.5, 71.6, 71.7, 71.8, 71.9, 71.10, and 71.11 makes sense for categories fibred in groupoids over $(Sch/S)_{\acute{e}tale}$. Thus we get a second notion of an algebraic stack by working in the étale topology. This notion is (a priori) weaker than the notion introduced in Algebraic Stacks, Definition 71.12.1 since a stack in the fppf topology is certainly a stack in the étale topology. However, the notions are equivalent as is shown by the following lemma.

Lemma 74.19.1. *Denote the common underlying category of Sch_{fppf} and $Sch_{\acute{e}tale}$ by Sch_α (see Sheaves on Stacks, Section 73.4 and Topologies, Remark 33.9.1). Let S be an object of Sch_α . Let*

$$p : \mathcal{X} \rightarrow Sch_\alpha/S$$

be a category fibred in groupoids with the following properties:

- (1) \mathcal{X} is a stack in groupoids over $(Sch/S)_{\acute{e}tale}$,
- (2) the diagonal $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces⁵, and
- (3) there exists $U \in \text{Ob}(Sch_\alpha/S)$ and a 1-morphism $(Sch/U)_{\acute{e}tale} \rightarrow \mathcal{X}$ which is surjective and smooth.

Then \mathcal{X} is an algebraic stack in the sense of Algebraic Stacks, Definition 71.12.1.

⁵Here we can either mean sheaves in the étale topology whose diagonal is representable and which have an étale surjective covering by a scheme or algebraic spaces as defined in Algebraic Spaces, Definition 47.6.1. Namely, by Bootstrap, Lemma 62.12.1 there is no difference.

Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Stacks, Definition 71.12.1 are independent of the topology. This is true because these properties involve only the notion of a 2-fibre product of categories fibred in groupoids, 1- and 2-morphisms of categories fibred in groupoids, the notion of a 1-morphism of categories fibred in groupoids representable by algebraic spaces, and what it means for such a 1-morphism to be surjective and smooth. Thus all we have to prove is that an étale stack in groupoids \mathcal{X} with properties (2) and (3) is also an fppf stack in groupoids.

Using (2) let R be an algebraic space representing

$$(Sch_{\alpha}/U) \times_{\mathcal{X}} (Sch_{\alpha}/U)$$

By (3) the projections $s, t : R \rightarrow U$ are smooth. Exactly as in the proof of Algebraic Stacks, Lemma 71.16.1 there exists a groupoid in spaces (U, R, s, t, c) and a canonical fully faithful 1-morphism $[U/R]_{\acute{e}tale} \rightarrow \mathcal{X}$ where $[U/R]_{\acute{e}tale}$ is the étale stackification of presheaf in groupoids

$$T \longmapsto (U(T), R(T), s(T), t(T), c(T))$$

Claim: If $V \rightarrow T$ is a surjective smooth morphism from an algebraic space V to a scheme T , then there exists an étale covering $\{T_i \rightarrow T\}$ refining the covering $\{V \rightarrow T\}$. This follows from More on Morphisms, Lemma 36.28.7 or the more general Sheaves on Stacks, Lemma 73.18.10. Using the claim and arguing exactly as in Algebraic Stacks, Lemma 71.16.2 it follows that $[U/R]_{\acute{e}tale} \rightarrow \mathcal{X}$ is an equivalence.

Next, let $[U/R]$ denote the quotient stack in the fppf topology which is an algebraic stack by Algebraic Stacks, Theorem 71.17.3. Thus we have 1-morphisms

$$U \rightarrow [U/R]_{\acute{e}tale} \rightarrow [U/R].$$

Both $U \rightarrow [U/R]_{\acute{e}tale} \cong \mathcal{X}$ and $U \rightarrow [U/R]$ are surjective and smooth (the first by assumption and the second by the theorem) and in both cases the fibre product $U \times_{\mathcal{X}} U$ and $U \times_{[U/R]} U$ is representable by R . Hence the 1-morphism $[U/R]_{\acute{e}tale} \rightarrow [U/R]$ is fully faithful (since morphisms in the quotient stacks are given by morphisms into R , see Groupoids in Spaces, Section 60.23).

Finally, for any scheme T and morphism $t : T \rightarrow [U/R]$ the fibre product $V = T \times_{[U/R]} U$ is an algebraic space surjective and smooth over T . By the claim above there exists an étale covering $\{T_i \rightarrow T\}_{i \in I}$ and morphisms $T_i \rightarrow V$ over T . This proves that the object t of $[U/R]$ over T comes étale locally from U . We conclude that $[U/R]_{\acute{e}tale} \rightarrow [U/R]$ is an equivalence of stacks in groupoids over $(Sch/S)_{\acute{e}tale}$ by Stacks, Lemma 8.4.8. This concludes the proof. \square

Artin's axioms

75.1. Introduction

In this chapter we discuss Artin's axioms for the representability of functors by algebraic spaces. As references we suggest the papers [Art69b], [Art70], [Art74].

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 76.1 for an explanation.

75.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 71.2. In this chapter the base scheme S will often be locally Noetherian (although we will always reiterate this condition when stating results).

75.3. Predeformation categories

Let S be a locally Noetherian base scheme. Let

$$p : \mathcal{X} \longrightarrow (\text{Sch}/S)_{fppf}$$

be a category fibred in groupoids. Let k be a field and let $\text{Spec}(k) \rightarrow S$ be a morphism of finite type (see Morphisms, Lemma 28.17.1). We will sometimes simply say that k is a field of finite type over S . Let x_0 be an object of \mathcal{X} lying over $\text{Spec}(k)$. Given S , \mathcal{X} , k , and x_0 we will construct a predeformation category, as defined in Formal Deformation Theory, Definition 68.6.2. The construction will resemble to construction of Formal Deformation Theory, Remark 68.6.4.

First, by Morphisms, Lemma 28.17.1 we may pick an affine open $\text{Spec}(\Lambda) \subset S$ such that $\text{Spec}(k) \rightarrow S$ factors through $\text{Spec}(\Lambda)$ and the associated ring map $\Lambda \rightarrow k$ is finite. This provides us with the category \mathcal{C}_Λ , see Formal Deformation Theory, Definition 68.3.1. The category \mathcal{C}_Λ , up to canonical equivalence, does not depend on the choice of the affine open $\text{Spec}(\Lambda)$ of S . Namely, \mathcal{C}_Λ is equivalent to the opposite of the category of factorizations

$$(75.3.0.1) \quad \text{Spec}(k) \rightarrow \text{Spec}(A) \rightarrow S$$

of the structure morphism such that A is an Artinian local ring and such that $\text{Spec}(k) \rightarrow \text{Spec}(A)$ corresponds to a ring map $A \rightarrow k$ which identifies k with the residue field of A .

We let $\mathcal{F} = \mathcal{F}_{\mathcal{X},k,x_0}$ be the category whose

- (1) objects are morphisms $x_0 \rightarrow x$ of \mathcal{X} where $p(x) = \text{Spec}(A)$ with A an Artinian local ring and $p(x_0) \rightarrow p(x) \rightarrow S$ a factorization as in (75.3.0.1), and
- (2) morphisms $(x_0 \rightarrow x) \rightarrow (x_0 \rightarrow x')$ are commutative diagrams

$$\begin{array}{ccc} x & \longleftarrow & x' \\ & \nearrow & \nwarrow \\ & x_0 & \end{array}$$

in \mathcal{X} . (Note the reversal of arrows.)

If $x_0 \rightarrow x$ is an object of \mathcal{F} then writing $p(x) = \text{Spec}(A)$ we obtain an object A of \mathcal{C}_Λ . We often say that $x_0 \rightarrow x$ or x lies over A . A morphism of \mathcal{F} between objects $x_0 \rightarrow x$ lying over A and $x_0 \rightarrow x'$ lying over A' corresponds to a morphism $x' \rightarrow x$ of \mathcal{X} , hence a morphism $p(x' \rightarrow x) : \text{Spec}(A') \rightarrow \text{Spec}(A)$ which in turn corresponds to a ring map $A \rightarrow A'$. As \mathcal{X} is a category over the category of schemes over S we see that $A \rightarrow A'$ is Λ -algebra homomorphism. Thus we obtain a functor

$$(75.3.0.2) \quad p : \mathcal{F} = \mathcal{F}_{\mathcal{X}, k, x_0} \longrightarrow \mathcal{C}_\Lambda.$$

We will use the notation $\mathcal{F}(A)$ to denote the fibre category over an object A of \mathcal{C}_Λ . An object of $\mathcal{F}(A)$ is simply a morphism $x_0 \rightarrow x$ of \mathcal{X} such that x lies over $\text{Spec}(A)$ and $x_0 \rightarrow x$ lies over $\text{Spec}(k) \rightarrow \text{Spec}(A)$.

Lemma 75.3.1. *The functor $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ defined above is a predeformation category.*

Proof. We have to show that \mathcal{F} is (a) cofibred in groupoids over \mathcal{C}_Λ and (b) that $\mathcal{F}(k)$ is a category equivalent to a category with a single object and a single morphism.

Proof of (a). The fibre categories of \mathcal{F} over \mathcal{C}_Λ are groupoids as the fibre categories of \mathcal{X} are groupoids. Let $A \rightarrow A'$ be a morphism of \mathcal{C}_Λ and let $x_0 \rightarrow x$ be an object of $\mathcal{F}(A)$. Because \mathcal{X} is fibred in groupoids, we can find a morphism $x' \rightarrow x$ lying over $\text{Spec}(A') \rightarrow \text{Spec}(A)$. Since the composition $A \rightarrow A' \rightarrow k$ is equal the given map $A \rightarrow k$ we see (by uniqueness of pullbacks up to isomorphism) that the pullback via $\text{Spec}(k) \rightarrow \text{Spec}(A')$ of x' is x_0 , i.e., that there exists a morphism $x_0 \rightarrow x'$ lying over $\text{Spec}(k) \rightarrow \text{Spec}(A')$ compatible with $x_0 \rightarrow x$ and $x' \rightarrow x$. This proves that \mathcal{F} has pushforwards. We conclude by (the dual of) Categories, Lemma 4.33.2.

Proof of (b). If $A = k$, then $\text{Spec}(k) = \text{Spec}(A)$ and since \mathcal{X} is fibred in groupoids over $(\text{Sch}/S)_{fppf}$ we see that given any object $x_0 \rightarrow x$ in $\mathcal{F}(k)$ the morphism $x_0 \rightarrow x$ is an isomorphism. Hence every object of $\mathcal{F}(k)$ is isomorphic to $x_0 \rightarrow x_0$. Clearly the only self morphism of $x_0 \rightarrow x_0$ in \mathcal{F} is the identity. \square

Let S be a locally Noetherian base scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism between categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Let k be a field of finite type over S . Let x_0 be an object of \mathcal{X} lying over $\text{Spec}(k)$. Set $y_0 = F(x_0)$ which is an object of \mathcal{Y} lying over $\text{Spec}(k)$. Then F induces a functor

$$(75.3.1.1) \quad F : \mathcal{F}_{\mathcal{X}, k, x_0} \longrightarrow \mathcal{F}_{\mathcal{Y}, k, y_0}$$

of categories cofibred over \mathcal{C}_Λ . Namely, to the object $x_0 \rightarrow x$ of $\mathcal{F}_{\mathcal{X}, k, x_0}(A)$ we associate the object $F(x_0) \rightarrow F(x)$ of $\mathcal{F}_{\mathcal{Y}, k, y_0}(A)$.

Lemma 75.3.2. *Let S be a locally Noetherian scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ which is formally smooth on objects (see Criteria for Representability, Section 74.6). Then for every finite type field k over S and for every object x_0 of \mathcal{X} over k the functor (75.3.1.1) is smooth in the sense of Formal Deformation Theory, Definition 68.8.1.*

Proof. This is a matter of unwinding the definitions. Details omitted. \square

Lemma 75.3.3. *Let S be a locally Noetherian scheme. Let*

$$\begin{array}{ccc} \mathcal{W} & \longrightarrow & \mathcal{Z} \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} \end{array}$$

be a 2-fibre product of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let k be a finite type field over S and w_0 an object of \mathcal{W} over k . Let x_0, z_0, y_0 be the images of w_0 under the morphisms in the diagram. Then

$$\begin{array}{ccc} \mathcal{F}_{\mathcal{W},k,w_0} & \longrightarrow & \mathcal{F}_{\mathcal{Z},k,z_0} \\ \downarrow & & \downarrow \\ \mathcal{F}_{\mathcal{X},k,x_0} & \longrightarrow & \mathcal{F}_{\mathcal{Y},k,y_0} \end{array}$$

is a fibre product of predeformation categories.

Proof. This is a matter of unwinding the definitions. Details omitted. \square

75.4. Pushouts and stacks

In this section we show that algebraic stacks behave well with respect to certain pushouts. The results in this section hold over any base scheme.

The following lemma is also correct when Y, X', X, Y' are algebraic spaces, see (insert future reference here).

Lemma 75.4.1. *Let S be a scheme. Let*

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y' \end{array}$$

be a pushout in the category of schemes over S where $X \rightarrow X'$ is a thickening and $X \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.1. Let \mathcal{Z} be an algebraic stack over S . Then the functor of fibre categories

$$\mathcal{Z}_{Y'} \longrightarrow \mathcal{Z}_Y \times_{\mathcal{Z}_X} \mathcal{Z}_{X'}$$

is an equivalence of categories.

Proof. Let y' be an object of left hand side. The sheaf $Isom(y', y')$ on the category of schemes over Y' is representable by an algebraic space I over Y' , see Algebraic Stacks, Lemma 71.10.11. We conclude that the functor of the lemma is fully faithful as Y' is the pushout in the category of algebraic spaces as well as the category of schemes, see Pushouts of Spaces, Lemma 59.2.2.

Let (y, x', f) be an object of the right hand side. Here $f : y|_X \rightarrow x'|_X$ is an isomorphism. To finish the proof we have to construct an object y' of $\mathcal{Z}_{Y'}$ whose restrictions to Y and X' agree with y and x' in a manner compatible with φ . In fact, it suffices to construct y' fppf locally on Y' , see Stacks, Lemma 8.4.8. Choose a representable algebraic stack \mathcal{W} and a surjective smooth morphism $\mathcal{W} \rightarrow \mathcal{Z}$. Then

$$(Sch/Y)_{fppf} \times_{y, \mathcal{Z}} \mathcal{W} \quad \text{and} \quad (Sch/X')_{fppf} \times_{x', \mathcal{Z}} \mathcal{W}$$

are algebraic stacks representable by algebraic spaces V and U' smooth over Y and X' . The isomorphism f induces an isomorphism $\varphi : V \times_Y X \rightarrow U' \times_{X'} X$ over X . By Pushouts of Spaces, Lemmas 59.2.3 and 59.2.8 we see that the pushout $V' = V \amalg_{V \times_Y X} U'$ is an algebraic space smooth over Y' whose base change to Y and X' recovers V and U' in a manner compatible with φ .

Let W be the algebraic space representing \mathcal{W} . The projections $V \rightarrow W$ and $U' \rightarrow W$ agree as morphisms over $V \times_Y X \cong U' \times_{X'} X$ hence the universal property of the pushout determines a morphism of algebraic spaces $V' \rightarrow W$. Choose a scheme Y'_1 and a surjective étale morphism $Y'_1 \rightarrow V'$. Set $Y_1 = Y \times_{Y'} Y'_1$, $X'_1 = X' \times_{Y'} Y'_1$, $X_1 = X \times_{Y'} Y'_1$. The composition

$$(Sch/Y'_1) \rightarrow (Sch/V') \rightarrow (Sch/W) = \mathcal{W} \rightarrow \mathcal{Z}$$

corresponds by the 2-Yoneda lemma to an object y'_1 of \mathcal{Z} over Y'_1 whose restriction to Y_1 and X'_1 agrees with $y|_{Y_1}$ and $x'|_{X'_1}$ in a manner compatible with $f|_{X_1}$. Thus we have constructed our desired object smooth locally over Y' and we win. \square

75.5. The Rim-Schlessinger condition

The motivation for the following definition comes from Lemma 75.4.1 and Formal Deformation Theory, Definition 68.15.1 and Lemma 68.15.4.

Definition 75.5.1. Let S be a locally Noetherian scheme. Let \mathcal{Z} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We say \mathcal{Z} satisfies *condition (RS)* if for every pushout

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y' = Y \amalg_X X' \end{array}$$

in the category of schemes over S where

- (1) X, X', Y, Y' are spectra of local Artinian rings,
- (2) X, X', Y, Y' are of finite type over S , and
- (3) $X \rightarrow X'$ (and hence $Y \rightarrow Y'$) is a closed immersion

the functor of fibre categories

$$\mathcal{Z}_{Y'} \longrightarrow \mathcal{Z}_Y \times_{\mathcal{Z}_X} \mathcal{Z}_{X'}$$

is an equivalence of categories.

If A is an Artinian local ring with residue field k , then any morphism $\text{Spec}(A) \rightarrow S$ is affine and of finite type if and only if the induced morphism $\text{Spec}(k) \rightarrow S$ is of finite type, see Morphisms, Lemmas 28.13.13 and 28.17.2.

Lemma 75.5.2. *Let \mathcal{X} be an algebraic stack over a locally Noetherian base S . Then \mathcal{X} satisfies (RS).*

Proof. Immediate from the definitions and Lemma 75.4.1. □

Lemma 75.5.3. *Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If \mathcal{X} , \mathcal{Y} , and \mathcal{Z} satisfy (RS), then so does $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$.*

Proof. This is formal. Let

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y' = Y \amalg_X X' \end{array}$$

be a diagram as in Definition 75.5.1. We have to show that

$$(\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_{Y'} \longrightarrow (\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_Y \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_X} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_{X'}$$

is an equivalence. Using the definition of the 2-fibre product this becomes

$$(75.5.3.1) \quad \mathcal{X}_{Y'} \times_{\mathcal{Y}_{Y'}} \mathcal{Z}_{Y'} \longrightarrow (\mathcal{X}_Y \times_{\mathcal{Y}_Y} \mathcal{Z}_Y) \times_{(\mathcal{X}_X \times_{\mathcal{Y}_X} \mathcal{Z}_X)} (\mathcal{X}_{X'} \times_{\mathcal{Y}_{X'}} \mathcal{Z}_{X'}).$$

We are given that each of the functors

$$\mathcal{X}_{Y'} \rightarrow \mathcal{X}_Y \times_{\mathcal{Y}_Y} \mathcal{Z}_Y, \quad \mathcal{Y}_{Y'} \rightarrow \mathcal{X}_X \times_{\mathcal{Y}_X} \mathcal{Z}_X, \quad \mathcal{Z}_{Y'} \rightarrow \mathcal{X}_{X'} \times_{\mathcal{Y}_{X'}} \mathcal{Z}_{X'}$$

are equivalences. An object of the right hand side of (75.5.3.1) is a system

$$((x_Y, z_Y, \phi_Y), (x_{X'}, z_{X'}, \phi_{X'}), (\alpha, \beta)).$$

Then (x_Y, z_Y, α) is isomorphic to the image of an object $x_{Y'}$ in $\mathcal{X}_{Y'}$ and $(z_Y, z_{Y'}, \beta)$ is isomorphic to the image of an object $z_{Y'}$ of $\mathcal{Z}_{Y'}$. The pair of morphisms $(\phi_Y, \phi_{X'})$ corresponds to a morphism ψ between the images of $x_{Y'}$ and $z_{Y'}$ in $\mathcal{Y}_{Y'}$. Then $(x_{Y'}, z_{Y'}, \psi)$ is an object of the left hand side of (75.5.3.1) mapping to the given object of the right hand side. This proves that (75.5.3.1) is essentially surjective. We omit the proof that it is fully faithful. □

75.6. Deformation categories

We match the notation introduced above with the notation from the chapter “Formal Deformation Theory”.

Lemma 75.6.1. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$ satisfying (RS). For any field k of finite type over S and any object x_0 of \mathcal{X} lying over k the predeformation category $p : \mathcal{F}_{\mathcal{X}, k, x_0} \rightarrow \mathcal{C}_{\Lambda}$ (75.3.0.2) is a deformation category, see Formal Deformation Theory, Definition 68.15.8.*

Proof. Set $\mathcal{F} = \mathcal{F}_{\mathcal{X}, k, x_0}$. Let $f_1 : A_1 \rightarrow A$ and $f_2 : A_2 \rightarrow A$ be ring maps in \mathcal{C}_{Λ} with f_2 surjective. We have to show that the functor

$$\mathcal{F}(A_1 \times_A A_2) \longrightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$$

is an equivalence, see Formal Deformation Theory, Lemma 68.15.4. Set $X = \text{Spec}(A)$, $X' = \text{Spec}(A_2)$, $Y = \text{Spec}(A_1)$ and $Y' = \text{Spec}(A_1 \times_A A_2)$. Note that

$Y' = Y \amalg_X X'$ in the category of schemes, see More on Morphisms, Lemma 36.11.1. We know that in the diagram of functors of fibre categories

$$\begin{array}{ccc} \mathcal{X}_{Y'} & \longrightarrow & \mathcal{X}_Y \times_{\mathcal{X}_X} \mathcal{X}_{X'} \\ \downarrow & & \downarrow \\ \mathcal{X}_{\mathrm{Spec}(k)} & \xlongequal{\quad} & \mathcal{X}_{\mathrm{Spec}(k)} \end{array}$$

the top horizontal arrow is an equivalence by Definition 75.5.1. Since $\mathcal{F}(B)$ is the category of objects of $\mathcal{X}_{\mathrm{Spec}(B)}$ with an identification with x_0 over k we win. \square

Remark 75.6.2. Let S be a locally Noetherian scheme. Let \mathcal{X} be fibred in groupoids over $(Sch/S)_{fppf}$. Let k be a field of finite type over S and x_0 an object of \mathcal{X} over k . Let $p : \mathcal{F} \rightarrow \mathcal{C}_\Lambda$ be as in (75.3.0.2). If \mathcal{F} is a deformation category, i.e., if \mathcal{F} satisfies the Rim-Schlessinger condition (RS), then we see that \mathcal{F} satisfies Schlessingers conditions (S1) and (S2) by Formal Deformation Theory, Lemma 68.15.6. Let $\bar{\mathcal{F}}$ be the functor of isomorphism classes, see Formal Deformation Theory, Remarks 68.5.2 (10). Then $\bar{\mathcal{F}}$ satisfies (S1) and (S2) as well, see Formal Deformation Theory, Lemma 68.9.5. This holds in particular in the situation of Lemma 75.6.1.

75.7. Change of field

This section is the analogue of Formal Deformation Theory, Section 68.26. As pointed out there, to discuss what happens under change of field we need to write $\mathcal{C}_{\Lambda,k}$ instead of \mathcal{C}_Λ . In the following lemma we use the notation $\mathcal{F}_{l/k}$ introduced in Formal Deformation Theory, Situation 68.26.1.

Lemma 75.7.1. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let k be a field of finite type over S and let $k \subset l$ be a finite extension. Let x_0 be an object of \mathcal{F} lying over $\mathrm{Spec}(k)$. Denote $x_{l,0}$ the restriction of x_0 to $\mathrm{Spec}(l)$. Then there is a canonical functor*

$$(\mathcal{F}_{\mathcal{X},k,x_0})_{l/k} \longrightarrow \mathcal{F}_{\mathcal{X},l,x_{l,0}}$$

of categories cofibred in groupoids over $\mathcal{C}_{\Lambda,l}$. If \mathcal{X} satisfies (RS), then this functor is an equivalence.

Proof. Consider a factorization

$$\mathrm{Spec}(l) \rightarrow \mathrm{Spec}(B) \rightarrow S$$

as in (75.3.0.1). By definition we have

$$(\mathcal{F}_{\mathcal{X},k,x_0})_{l/k}(B) = \mathcal{F}_{\mathcal{X},k,x_0}(B \times_l k)$$

see Formal Deformation Theory, Situation 68.26.1. Thus an object of this is a morphism $x_0 \rightarrow x$ of \mathcal{X} lying over the morphism $\mathrm{Spec}(k) \rightarrow \mathrm{Spec}(B \times_l k)$. Choosing pullback functor for \mathcal{X} we can associate to $x_0 \rightarrow x$ the morphism $x_{l,0} \rightarrow x_B$ where x_B is the restriction of x to $\mathrm{Spec}(B)$ (via the morphism $\mathrm{Spec}(B) \rightarrow \mathrm{Spec}(B \times_l k)$ coming from $B \times_l k \subset B$). This construction is functorial in B and compatible with morphisms.

Next, assume \mathcal{X} satisfies (RS). Consider the diagrams

$$\begin{array}{ccc}
 l \longleftarrow B & & \text{Spec}(l) \longrightarrow \text{Spec}(B) \\
 \uparrow & & \downarrow \\
 k \longleftarrow B \times_l k & \text{and} & \text{Spec}(k) \longrightarrow \text{Spec}(B \times_l k) \\
 \uparrow & & \downarrow
 \end{array}$$

The diagram on the left is a fibre product of rings. The diagram on the right is a pushout in the category of schemes, see More on Morphisms, Lemma 36.11.1. These schemes are all of finite type over S (see remarks following Definition 75.5.1). Hence (RS) kicks in to give an equivalence of fibre categories

$$\mathcal{X}_{\text{Spec}(B \times_l k)} \longrightarrow \mathcal{X}_{\text{Spec}(k)} \times_{\mathcal{X}_{\text{Spec}(l)}} \mathcal{X}_{\text{Spec}(B)}$$

This implies that the functor defined above gives an equivalence of fibre categories. Hence the functor is an equivalence on categories cofibred in groupoids by (the dual of) Categories, Lemma 4.33.8. \square

75.8. Tangent spaces

Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Let k be a field of finite type over S and let x_0 be an object of \mathcal{X} over k . In Formal Deformation Theory, Section 68.11 we have defined the *tangent space*

$$(75.8.0.1) \quad T\mathcal{F}_{\mathcal{X},k,x_0} = \left\{ \begin{array}{l} \text{isomorphism classes of morphisms} \\ x_0 \rightarrow x \text{ over } \text{Spec}(k) \rightarrow \text{Spec}(k[\epsilon]) \end{array} \right\}$$

of the predeformation category $\mathcal{F}_{\mathcal{X},k,x_0}$. In Formal Deformation Theory, Section 68.18 we have defined

$$(75.8.0.2) \quad \text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X},k,x_0}) = \text{Ker}(\text{Aut}_{\text{Spec}(k[\epsilon])}(x'_0) \rightarrow \text{Aut}_{\text{Spec}(k)}(x_0))$$

where x'_0 is the pullback of x_0 to $\text{Spec}(k[\epsilon])$. If \mathcal{X} satisfies the Rim-Schlessinger condition (RS), then $T\mathcal{F}_{\mathcal{X},k,x_0}$ comes equipped with a natural k -vector space structure by Formal Deformation Theory, Lemma 68.11.2 (assumptions hold by Lemma 75.6.1 and Remark 75.6.2). Moreover, Formal Deformation Theory, Lemma 68.18.9 shows that $\text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X},k,x_0})$ has a natural k -vector space structure such that addition agrees with composition of automorphisms. A natural condition is to ask these vector spaces to have finite dimension.

The following lemma tells us this is true if \mathcal{X} is locally of finite type over S (see Morphisms of Stacks, Section 78.13).

Lemma 75.8.1. *Let S be a locally Noetherian scheme. Assume*

- (1) \mathcal{X} is an algebraic stack,
- (2) U is a scheme locally of finite type over S , and
- (3) $(\text{Sch}/U)_{fppf} \rightarrow \mathcal{X}$ is a smooth surjective morphism.

Then, for any $\mathcal{F} = \mathcal{F}_{\mathcal{X},k,x_0}$ as in Section 75.3 the tangent space $T\mathcal{F}$ and infinitesimal automorphism space $\text{Inf}_{x_0}(\mathcal{F})$ have finite dimension over k

Proof. Let us write $\mathcal{U} = (\text{Sch}/U)_{fppf}$. By our definition of algebraic stacks the 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces. Hence in particular the 2-fibre product

$$\mathcal{U}_{x_0} = (\text{Sch}/\text{Spec}(k))_{fppf} \times_{\mathcal{X}} \mathcal{U}$$

is representable by an algebraic space U_{x_0} over $\text{Spec}(k)$. Then $U_{x_0} \rightarrow \text{Spec}(k)$ is smooth and surjective (in particular U_{x_0} is nonempty). By Spaces over Fields, Lemma 54.9.2 we can find a finite extension $l \supset k$ and a point $\text{Spec}(l) \rightarrow U_{x_0}$ over k . We have

$$(\mathcal{F}_{\mathcal{X},k,x_0})_{l/k} = \mathcal{F}_{\mathcal{X},l,x_{l,0}}$$

by Lemma 75.7.1 and the fact that \mathcal{X} satisfies (RS). Thus we see that

$$T\mathcal{F} \otimes_k l \cong T\mathcal{F}_{\mathcal{X},l,x_{l,0}} \quad \text{and} \quad \text{Inf}_{x_0}(\mathcal{F}) \otimes_k l \cong \text{Inf}_{x_{l,0}}(\mathcal{F}_{\mathcal{X},l,x_{l,0}})$$

by Formal Deformation Theory, Lemmas 68.26.3 and 68.26.4 (these are applicable by Lemmas 75.5.2 and 75.6.1 and Remark 75.6.2). Hence it suffices to prove that $T\mathcal{F}_{\mathcal{X},l,x_{l,0}}$ and $\text{Inf}_{x_{l,0}}(\mathcal{F}_{\mathcal{X},l,x_{l,0}})$ have finite dimension over l . Note that $x_{l,0}$ comes from a point u_0 of \mathcal{U} over l .

We interrupt the flow of the argument to show that the lemma for infinitesimal automorphisms follows from the lemma for tangent spaces. Namely, let $\mathcal{R} = \mathcal{U} \times_{\mathcal{X}} \mathcal{U}$. Let r_0 be the l -valued point $(u_0, u_0, \text{id}_{x_0})$ of \mathcal{R} . Combining Lemma 75.3.3 and Formal Deformation Theory, Lemma 68.24.2 we see that

$$\text{Inf}_{x_{l,0}}(\mathcal{F}_{\mathcal{X},l,x_{l,0}}) \subset T\mathcal{F}_{\mathcal{R},k,r_0}$$

Note that \mathcal{R} is an algebraic stack, see Algebraic Stacks, Lemma 71.14.2. Also, \mathcal{R} is representably by an algebraic space R smooth over U (via either projection, see Algebraic Stacks, Lemma 71.16.2). Hence, choose an scheme U' and a surjective étale morphism $U' \rightarrow R$ we see that U' is smooth over U , hence locally of finite type over S . As $(\text{Sch}/U')_{fppf} \rightarrow \mathcal{R}$ is surjective and smooth, we have reduced the question to the case of tangent spaces.

The functor (75.3.1.1)

$$\mathcal{F}_{\mathcal{U},l,u_0} \longrightarrow \mathcal{F}_{\mathcal{X},l,x_{l,0}}$$

is smooth by Lemma 75.3.2 and Criteria for Representability, Lemma 74.6.3. The induced map on tangent spaces

$$T\mathcal{F}_{\mathcal{U},l,u_0} \longrightarrow T\mathcal{F}_{\mathcal{X},l,x_{l,0}}$$

is l -linear (by Formal Deformation Theory, Lemma 68.11.4) and surjective (as smooth maps of predeformation categories induce surjective maps on tangent spaces by Formal Deformation Theory, Lemma 68.8.8). Hence it suffices to prove that the tangent space of the deformation space associated to the representable algebraic stack \mathcal{U} at the point u_0 is finite dimensional. Let $\text{Spec}(R) \subset U$ be an affine open such that $u_0 : \text{Spec}(l) \rightarrow U$ factors through $\text{Spec}(R)$ and such that $\text{Spec}(R) \rightarrow S$ factors through $\text{Spec}(\Lambda) \subset S$. Let $\mathfrak{m}_R \subset R$ be the kernel of the Λ -algebra map $\varphi_0 : R \rightarrow l$ corresponding to u_0 . Note that R , being of finite type over the Noetherian ring Λ , is a Noetherian ring. Hence $\mathfrak{m}_R = (f_1, \dots, f_n)$ is a finitely generated ideal. We have

$$T\mathcal{F}_{\mathcal{U},l,u_0} = \{ \varphi : R \rightarrow l[\epsilon] \mid \varphi \text{ is a } \Lambda\text{-algebra map and } \varphi \bmod \epsilon = \varphi_0 \}$$

An element of the right hand side is determined by its values on f_1, \dots, f_n hence the dimension is at most n and we win. Some details omitted. \square

Lemma 75.8.2. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Assume $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ satisfy (RS). Let k be a field of finite type over S and let w_0 be*

an object of $\mathcal{W} = \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over k . Denote x_0, y_0, z_0 the objects of $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ you get from w_0 . Then there is a 6-term exact sequence

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \text{Inf}_{w_0}(\mathcal{F}_{\mathcal{W},k,w_0}) & \longrightarrow & \text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X},k,x_0}) \oplus \text{Inf}_{z_0}(\mathcal{F}_{\mathcal{Z},k,z_0}) & \longrightarrow & \text{Inf}_{y_0}(\mathcal{F}_{\mathcal{Y},k,y_0}) \\
 & & & & & \nearrow & \\
 & & T\mathcal{F}_{\mathcal{W},k,w_0} & \longrightarrow & T\mathcal{F}_{\mathcal{X},k,x_0} \oplus T\mathcal{F}_{\mathcal{Z},k,z_0} & \longrightarrow & T\mathcal{F}_{\mathcal{Y},k,y_0}
 \end{array}$$

of k -vector spaces.

Proof. Apply Lemmas 75.3.3 and 75.6.1 and Formal Deformation Theory, Lemma 68.18.14. □

75.9. Formal objects

In this section we transfer some of the notions already defined in the chapter “Formal Deformation Theory” to the current setting. In the following we will say “ R is an S -algebra” to indicate that R is a ring endowed with a morphism of schemes $\text{Spec}(R) \rightarrow S$.

Definition 75.9.1. Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids.

- (1) A *formal object* $\xi = (R, \xi_n, f_n)$ of \mathcal{X} consists of a Noetherian complete local S -algebra R , objects ξ_n of \mathcal{X} lying over $\text{Spec}(R/\mathfrak{m}_R^n)$, and morphisms $\xi_n \rightarrow \xi_{n+1}$ of \mathcal{X} lying over $\text{Spec}(R/\mathfrak{m}^n) \rightarrow \text{Spec}(R/\mathfrak{m}^{n+1})$ such that R/\mathfrak{m} is a field of finite type over S .
- (2) A *morphism of formal objects* $a : \xi = (R, \xi_n, f_n) \rightarrow \eta = (T, \eta_n, g_n)$ is given by morphisms $a_n : \xi_n \rightarrow \eta_n$ such that for every n the diagram

$$\begin{array}{ccc}
 \xi_{n+1} & \xrightarrow{f_n} & \xi_n \\
 a_{n+1} \downarrow & & \downarrow a_n \\
 \eta_{n+1} & \xrightarrow{g_n} & \eta_n
 \end{array}$$

is commutative. Applying the functor p we obtain a compatible collection of morphisms $\text{Spec}(R/\mathfrak{m}_R^n) \rightarrow \text{Spec}(T/\mathfrak{m}_T^n)$ and hence a morphism $a_0 : \text{Spec}(R) \rightarrow \text{Spec}(T)$ over S . We say that a lies over a_0 .

Thus we obtain a category of formal object of \mathcal{X} . If $F : \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$, then F induces a functor between categories of formal objects as well.

Given a formal object $\xi = (R, \xi_n, f_n)$, set $k = R/\mathfrak{m}$ and $x_0 = \xi_1$. Then the formal object ξ defines a formal object ξ of $\mathcal{F}_{\mathcal{X},k,x_0}$ as defined in Formal Deformation Theory, Definition 68.7.1. We will use the terminology introduced in that chapter. In particular, we will say that ξ is *versal* if ξ (as a formal object of \mathcal{F}) is versal in the sense of Formal Deformation Theory, Definition 68.8.13. We briefly spell out here what this means. Suppose given a morphism $x_0 \rightarrow y$ lying over a closed immersion $\text{Spec}(k) \rightarrow \text{Spec}(A)$ where A is an Artinian local ring with residue field

k. Then versality implies there exists an $n \geq 1$ and a commutative diagram

$$\begin{array}{ccc}
 & y & \\
 & \swarrow & \uparrow \\
 \xi_n & \longleftarrow \xi_1 = x_0 & \\
 & & \text{lying over} \\
 & & \begin{array}{ccc}
 & \text{Spec}(A) & \\
 & \swarrow & \uparrow \\
 \text{Spec}(R/\mathfrak{m}^n) & \longleftarrow & \text{Spec}(k)
 \end{array}
 \end{array}$$

Please compare with Formal Deformation Theory, Remark 68.8.14.

Lemma 75.9.2. *Let S be a locally Noetherian scheme. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\eta = (R, \eta_n, g_n)$ be a formal object of \mathcal{Y} and let ξ_1 be an object of \mathcal{X} with $F(\xi_1) \cong \eta_1$. If F is formally smooth on objects (see Criteria for Representability, Section 74.6), then there exists a formal object $\xi = (R, \xi_n, f_n)$ of \mathcal{X} such that $F(\xi) \cong \eta$.*

Proof. Note that each of the morphisms $\text{Spec}(R/\mathfrak{m}^n) \rightarrow \text{Spec}(R/\mathfrak{m}^{n+1})$ is a first order thickening of affine schemes over S . Hence the assumption on F means that we can successively lift ξ_1 to objects ξ_2, ξ_3, \dots of \mathcal{X} endowed with compatible isomorphisms $\eta_n|_{\text{Spec}(R/\mathfrak{m}^{n-1})} \cong \eta_{n-1}$ and $F(\eta_n) \cong \xi_n$. \square

Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Suppose that x is an object of \mathcal{X} over R , where R is a Noetherian complete local S -algebra with residue field of finite type over S . Then we can consider the system of restrictions $\xi_n = x|_{\text{Spec}(R/\mathfrak{m}^n)}$ endowed with the natural morphisms $\xi_1 \rightarrow \xi_2 \rightarrow \dots$ coming from transitivity of restriction. Thus $\xi = (R, \xi_n, \xi_n \rightarrow \xi_{n+1})$ is a formal object of \mathcal{X} . This construction is functorial in the object x . Thus we obtain a functor

$$(75.9.2.1) \quad \left\{ \begin{array}{l} \text{objects } x \text{ of } \mathcal{X} \text{ such that } p(x) = \text{Spec}(R) \\ \text{where } R \text{ is Noetherian complete local} \\ \text{with } R/\mathfrak{m} \text{ of finite type over } S \end{array} \right\} \longrightarrow \{ \text{formal objects of } \mathcal{X} \}$$

To be precise the left hand side is the full subcategory of \mathcal{X} consisting of objects as indicated and the right hand side is the category of formal objects of \mathcal{X} as in Definition 75.9.1.

Definition 75.9.3. Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. A formal object $\xi = (R, \xi_n, f_n)$ of \mathcal{X} is called *effective* if it is in the essential image of the functor (75.9.2.1).

If the category fibred in groupoids is an algebraic stack, then every formal object is effective as follows from the next lemma.

Lemma 75.9.4. *Let S be a locally Noetherian scheme. Let \mathcal{X} be an algebraic stack over S . The functor (75.9.2.1) is an equivalence.*

Proof. Case I: \mathcal{X} is representable (by a scheme). Say $\mathcal{X} = (Sch/X)_{fppf}$ for some scheme X over S . Unwinding the definitions we have to prove the following: Given a Noetherian complete local S -algebra R with R/\mathfrak{m} of finite type over S we have

$$\text{Mor}_S(\text{Spec}(R), X) \longrightarrow \lim \text{Mor}_S(\text{Spec}(R/\mathfrak{m}^n), X)$$

is bijective. This follows from Formal Spaces, Lemma 65.24.2.

Case II. \mathcal{X} is representable by an algebraic space. Say \mathcal{X} is representable by X . Again we have to show that

$$\text{Mor}_S(\text{Spec}(R), X) \longrightarrow \lim \text{Mor}_S(\text{Spec}(R/\mathfrak{m}^n), X)$$

is bijective for R as above. This is Formal Spaces, Lemma 65.24.3.

Case III: General case of an algebraic stack. A general remark is that the left and right hand side of (75.9.2.1) are categories fibred in groupoids over the category of affine schemes over S which are spectra of Noetherian complete local rings with residue field of finite type over S . We will also see in the proof below that they form stacks for a certain topology on this category.

We first prove fully faithfulness. Let R be a Noetherian complete local S -algebra with $k = R/\mathfrak{m}$ of finite type over S . Let x, x' be objects of \mathcal{X} over R . As \mathcal{X} is an algebraic stack $\text{Isom}(x, x')$ is representable by an algebraic space I over $\text{Spec}(R)$, see Algebraic Stacks, Lemma 71.10.11. Applying Case II to I over $\text{Spec}(R)$ implies immediately that (75.9.2.1) is fully faithful on fibre categories over $\text{Spec}(R)$. Hence the functor is fully faithful by Categories, Lemma 4.33.8.

Essential surjectivity. Let $\xi = (R, \xi_n, f_n)$ be a formal object of \mathcal{X} . Choose a scheme U over S and a surjective smooth morphism $f : (\text{Sch}/U)_{fppf} \rightarrow \mathcal{X}$. For every n consider the fibre product

$$(\text{Sch}/\text{Spec}(R/\mathfrak{m}^n))_{fppf} \times_{\xi_n, \mathcal{X}, f} (\text{Sch}/U)_{fppf}$$

By assumption this is representable by an algebraic space V_n surjective and smooth over $\text{Spec}(R/\mathfrak{m}^n)$. The morphisms $f_n : \xi_n \rightarrow \xi_{n+1}$ induce cartesian squares

$$\begin{array}{ccc} V_{n+1} & \longleftarrow & V_n \\ \downarrow & & \downarrow \\ \text{Spec}(R/\mathfrak{m}^{n+1}) & \longleftarrow & \text{Spec}(R/\mathfrak{m}^n) \end{array}$$

of algebraic spaces. By Spaces over Fields, Lemma 54.9.2 we can find a finite separable extension $k \subset k'$ and a point $v'_1 : \text{Spec}(k') \rightarrow V_1$ over k . Let $R \subset R'$ be the finite étale extension whose residue field extension is $k \subset k'$ (exists and is unique by Algebra, Lemmas 10.145.8 and 10.145.10). By the infinitesimal lifting criterion of smoothness (see More on Morphisms of Spaces, Lemma 58.16.6) applied to $V_n \rightarrow \text{Spec}(R/\mathfrak{m}^n)$ for $n = 2, 3, 4, \dots$ we can successively find morphisms $v'_n : \text{Spec}(R'/(\mathfrak{m}')^n) \rightarrow V_n$ over $\text{Spec}(R/\mathfrak{m}^n)$ fitting into commutative diagrams

$$\begin{array}{ccc} \text{Spec}(R'/(\mathfrak{m}')^{n+1}) & \longleftarrow & \text{Spec}(R'/(\mathfrak{m}')^n) \\ \downarrow v'_{n+1} & & \downarrow v'_n \\ V_{n+1} & \longleftarrow & V_n \end{array}$$

Composing with the projection morphisms $V_n \rightarrow U$ we obtain a compatible system of morphisms $u'_n : \text{Spec}(R'/(\mathfrak{m}')^n) \rightarrow U$. By Case I the family (u'_n) comes from a unique morphism $u' : \text{Spec}(R') \rightarrow U$. Denote x' the object of \mathcal{X} over $\text{Spec}(R')$ we get by applying the 1-morphism f to u' . By construction, there exists a morphism of formal objects

$$(75.9.2.1)(x') = (R', x' |_{\text{Spec}(R'/(\mathfrak{m}')^n)}, \dots) \longrightarrow (R, \xi_n, f_n)$$

lying over $\text{Spec}(R') \rightarrow \text{Spec}(R)$. Note that $R' \otimes_R R'$ is a finite product of spectra of Noetherian complete local rings to which our current discussion applies. Denote $p_0, p_1 : \text{Spec}(R' \otimes_R R') \rightarrow \text{Spec}(R')$ the two projections. By the fully faithfulness shown above there exists a canonical isomorphism $\varphi : p_0^* x' \rightarrow p_1^* x'$ because we have such isomorphisms over $\text{Spec}((R' \otimes_R R')/\mathfrak{m}^n(R' \otimes_R R'))$. We omit the proof that the isomorphism φ satisfies the cocycle condition (see Stacks, Definition 8.3.1). Since $\{\text{Spec}(R') \rightarrow \text{Spec}(R)\}$ is an fppf covering we conclude that x' descends to an object x of \mathcal{X} over $\text{Spec}(R)$. We omit the proof that x_n is the restriction of x to $\text{Spec}(R/\mathfrak{m}^n)$. \square

Lemma 75.9.5. *Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. If the functor (75.9.2.1) is an equivalence for \mathcal{X} , \mathcal{Y} , and \mathcal{Z} , then it is and equivalence for $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$.*

Proof. The left and the right hand side of (75.9.2.1) for $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ are simply the 2-fibre products of the left and the right hand side of (75.9.2.1) for \mathcal{X} , \mathcal{Z} over \mathcal{Y} . Hence the result follows as taking 2-fibre products is compatible with equivalences of categories, see Categories, Lemma 4.29.7. \square

75.10. Approximation

A fundamental insight of Michael Artin is that you can approximate objects of a limit preserving stack. Namely, given an object x of the stack over a Noetherian complete local ring, you can find an object x_A over an algebraic ring which is “close to” x . Here an algebraic ring means a finite type S -algebra and close means adically close. In this section we present this in a simple, yet general form.

To formulate the result we need to pull together some definitions from different places in the stacks project. First, in Criteria for Representability, Section 74.5 we introduced *limit preserving on objects* for 1-morphisms of categories fibred in groupoids over the category of schemes. In More on Algebra, Definition 15.39.1 we defined the notion of a *G-ring*. Let S be a locally Noetherian scheme. Let A be an S -algebra. We say that A is *of finite type over S* or is a *finite type S -algebra* if $\text{Spec}(A) \rightarrow S$ is of finite type. In this case A is a Noetherian ring. Finally, given a ring A and ideal I we denote $\text{Gr}_I(A) = \bigoplus I^n/I^{n+1}$.

Lemma 75.10.1. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}$ be a category fibred in groupoids. Let x be an object of \mathcal{X} lying over $\text{Spec}(R)$ where R is a Noetherian complete local ring with residue field k of finite type over S . Let $s \in S$ be the image of $\text{Spec}(k) \rightarrow S$. Assume that (a) $\mathcal{O}_{S,s}$ is a G -ring and (b) p is limit preserving on objects. Then for every integer $N \geq 1$ there exist*

- (1) a finite type S -algebra A ,
- (2) a maximal ideal $\mathfrak{m}_A \subset A$,
- (3) an object x_A of \mathcal{X} over $\text{Spec}(A)$,
- (4) an S -isomorphism $R/\mathfrak{m}_R^N \cong A/\mathfrak{m}_A^N$,
- (5) an isomorphism $x|_{\text{Spec}(R/\mathfrak{m}_R^N)} \cong x_A|_{\text{Spec}(A/\mathfrak{m}_A^N)}$ compatible with (4), and
- (6) an isomorphism $\text{Gr}_{\mathfrak{m}_R}(R) \cong \text{Gr}_{\mathfrak{m}_A}(A)$ of graded k -algebras.

Proof. Choose an affine open $\text{Spec}(\Lambda) \subset S$ such that k is a finite Λ -algebra, see Morphisms, Lemma 28.17.1. We may and do replace S by $\text{Spec}(\Lambda)$.

We may write R as a directed colimit $R = \text{colim } C_j$ where each C_j is a finite type Λ -algebra (see Algebra, Lemma 10.123.1). By assumption (b) the object x is

isomorphic to the restriction of an object over one of the C_j . Hence we may choose a finite type Λ -algebra C , a Λ -algebra map $C \rightarrow R$, and an object x_C of \mathcal{X} over $\text{Spec}(C)$ such that $x = x_C|_{\text{Spec}(R)}$. The choice of C is a bookkeeping device and could be avoided. For later use, let us write $C = \Lambda[y_1, \dots, y_u]/(f_1, \dots, f_v)$ and we denote $\bar{a}_i \in R$ the image of y_i under the map $C \rightarrow R$. Set $\mathfrak{m}_C = C \cap \mathfrak{m}_R$.

Choose a Λ -algebra surjection $\Lambda[x_1, \dots, x_s] \rightarrow k$ and denote \mathfrak{m}' the kernel. By the universal property of polynomial rings we may lift this to a Λ -algebra map $\Lambda[x_1, \dots, x_s] \rightarrow R$. We add some variables (i.e., we increase s a bit) mapping to generators of \mathfrak{m}_R . Having done this we see that $\Lambda[x_1, \dots, x_s] \rightarrow R/\mathfrak{m}_R^2$ is surjective. Then we see that

$$(75.10.1.1) \quad P = \Lambda[x_1, \dots, x_s]_{\mathfrak{m}'}^{\wedge} \longrightarrow R$$

is a surjective map of Noetherian complete local rings, see for example Formal Deformation Theory, Lemma 68.4.2.

Choose lifts $a_i \in P$ of \bar{a}_i we found above. Choose generators $b_1, \dots, b_r \in P$ for the kernel of (75.10.1.1). Choose $c_{ji} \in P$ such that

$$f_j(a_1, \dots, a_u) = \sum c_{ji} b_i$$

in P which is possible by the choices made so far. Choose generators

$$k_1, \dots, k_t \in \text{Ker}(P^{\oplus r} \xrightarrow{(b_1, \dots, b_r)} P)$$

and write $k_i = (k_{i1}, \dots, k_{ir})$ and $K = (k_{ij})$ so that

$$P^{\oplus t} \xrightarrow{K} P^{\oplus r} \xrightarrow{(b_1, \dots, b_r)} P \rightarrow R \rightarrow 0$$

is an exact sequence of P -modules. In particular we have $\sum k_{ij} b_j = 0$. After possibly increasing N we may assume $N - 1$ works in the Artin-Rees lemma for the first two maps of this exact sequence (see More on Algebra, Section 15.3 for terminology).

By assumption $\mathcal{O}_{S,s} = \Lambda_{\Lambda \cap \mathfrak{m}'}$ is a G -ring. Hence by More on Algebra, Proposition 15.39.10 the ring $\Lambda[x_1, \dots, x_s]_{\mathfrak{m}'}$ is a G -ring. Hence by Smoothing Ring Maps, Theorem 16.13.2 there exist an étale ring map

$$\Lambda[x_1, \dots, x_s]_{\mathfrak{m}'} \rightarrow B,$$

a maximal ideal \mathfrak{m}_B of B lying over \mathfrak{m}' , and elements $a'_i, b'_i, c'_{ij}, k'_{ij} \in B'$ such that

- (1) $\kappa(\mathfrak{m}') = \kappa(\mathfrak{m}_B)$ which implies that $\Lambda[x_1, \dots, x_s]_{\mathfrak{m}'} \subset B_{\mathfrak{m}_B} \subset P$ and P is identified with the completion of B at \mathfrak{m}_B , see remark preceding Smoothing Ring Maps, Theorem 16.13.2,
- (2) $a_i - a'_i, b_i - b'_i, c_{ij} - c'_{ij}, k_{ij} - k'_{ij} \in (\mathfrak{m}')^N P$, and
- (3) $f_j(a'_1, \dots, a'_u) = \sum c'_{ji} b'_i$ and $\sum k'_{ij} b'_j = 0$.

Set $A = B/(b'_1, \dots, b'_r)$ and denote \mathfrak{m}_A the image of \mathfrak{m}_B in A . (Note that A is essentially of finite type over Λ ; at the end of the proof we will show how to obtain an A which is of finite type over Λ .) There is a ring map $C \rightarrow A$ sending $y_i \mapsto a'_i$ because the a'_i satisfy the desired equations modulo (b'_1, \dots, b'_r) . Note that $A/\mathfrak{m}_A^N = R/\mathfrak{m}_R^N$ as quotients of $P = B^{\wedge}$ by property (2) above. Set $x_A = x_C|_{\text{Spec}(A)}$. Since the maps

$$C \rightarrow A \rightarrow A/\mathfrak{m}_A^N \cong R/\mathfrak{m}_R^N \quad \text{and} \quad C \rightarrow R \rightarrow R/\mathfrak{m}_R^N$$

are equal we see that x_A and x agree modulo \mathfrak{m}_R^N via the isomorphism $A/\mathfrak{m}_A^N = R/\mathfrak{m}_R^N$. At this point we have shown properties (1) – (5) of the statement of the lemma. To see (6) note that

$$P^{\oplus t} \xrightarrow{K} P^{\oplus r} \xrightarrow{(b_1, \dots, b_r)} P \quad \text{and} \quad P^{\oplus t} \xrightarrow{K'} P^{\oplus r} \xrightarrow{(b'_1, \dots, b'_r)} P$$

are two complexes of P -modules which are congruent modulo $(\mathfrak{m}')^N$ with the first one being exact. By our choice of N above we see from More on Algebra, Lemma 15.3.2 that $R = P/(b_1, \dots, b_r)$ and $P/(b'_1, \dots, b'_r) = B^\wedge/(b'_1, \dots, b'_r) = A^\wedge$ have isomorphic associated graded algebras, which is what we wanted to show.

This last paragraph of the proof serves to clean up the issue that A is essentially of finite type over S and not yet of finite type. The construction above gives $A = B/(b'_1, \dots, b'_r)$ and $\mathfrak{m}_A \subset A$ with B étale over $\Lambda[x_1, \dots, x_s]_{\mathfrak{m}'}$. Hence A is of finite type over the Noetherian ring $\Lambda[x_1, \dots, x_s]_{\mathfrak{m}'}$. Thus we can write $A = (A_0)_{\mathfrak{m}'}$ for some finite type $\Lambda[x_1, \dots, x_n]$ algebra A_0 . Then $A = \text{colim}(A_0)_f$ where $f \in \Lambda[x_1, \dots, x_n] \setminus \mathfrak{m}'$, see Algebra, Lemma 10.9.9. Because $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects, we see that x_A comes from some object $x_{(A_0)_f}$ over $\text{Spec}((A_0)_f)$ for an f as above. After replacing A by $(A_0)_f$ and x_A by $x_{(A_0)_f}$ and \mathfrak{m}_A by $(A_0)_f \cap \mathfrak{m}_A$ the proof is finished. \square

75.11. Versality

In the previous section we explained how to approximate objects over complete local rings by algebraic objects. But in order to show that a stack \mathcal{X} is an algebraic stack, we need to find smooth 1-morphisms from schemes towards \mathcal{X} . Since we are not going to assume a priori that \mathcal{X} has a representable diagonal, we cannot even speak about smooth morphisms towards \mathcal{X} . Instead, borrowing terminology from deformation theory, we will introduce versal objects.

Let S be a locally Noetherian scheme. Let U be a scheme over S with structure morphism $U \rightarrow S$ locally of finite type. Let $u_0 \in U$ be a finite type point of U , see Morphisms, Definition 28.17.3. Set $k = \kappa(u_0)$. Note that the composition $\text{Spec}(k) \rightarrow S$ is also of finite type, see Morphisms, Lemma 28.16.3. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let x be an object of \mathcal{X} which lies over U . Denote x_0 the pullback of x by u_0 . By the 2-Yoneda lemma x corresponds to a 1-morphism

$$x : (Sch/U)_{fppf} \longrightarrow \mathcal{X},$$

see Algebraic Stacks, Section 71.5. We obtain a morphism of predeformation categories

$$(75.11.0.2) \quad \hat{x} : \mathcal{F}_{(Sch/U)_{fppf}, k, u_0} \longrightarrow \mathcal{F}_{\mathcal{X}, k, x_0},$$

over \mathcal{C}_Λ see (75.3.1.1).

Definition 75.11.1. Let S be a locally Noetherian scheme. Let \mathcal{X} be fibred in groupoids over $(Sch/S)_{fppf}$. Let U be a scheme locally of finite type over S . Let x be an object of \mathcal{X} lying over U . Let u_0 be finite type point of U . We say x is *versal* at u_0 if the morphism \hat{x} (75.11.0.2) is smooth, see Formal Deformation Theory, Definition 68.8.1.

This definition matches our notion of versality for formal objects of \mathcal{X} in the following way. Observe that \mathcal{O}_{U, u_0} is a Noetherian local S -algebra with residue field

k . Hence $R = \mathcal{O}_{U, u_0}^\wedge$ is an object of $\mathcal{C}_\Lambda^\wedge$, see Formal Deformation Theory, Definition 68.4.1. There is an identification of predeformation categories

$$\underline{R}|_{\mathcal{C}_\Lambda} = \mathcal{F}_{(Sch/U)_{fppf, k, u_0}},$$

see Formal Deformation Theory, Remark 68.7.12 for notation. Namely, given an Artinian local S -algebra A with residue field identified with k we have

$$\text{Mor}_{\mathcal{C}_\Lambda^\wedge}(R, A) = \{\varphi \in \text{Mor}_S(\text{Spec}(A), U) \mid \varphi|_{\text{Spec}(k)} = u_0\}$$

Let ξ be the formal object of \mathcal{X} over R associated to $x|_{\text{Spec}(R)}$, see (75.9.2.1). Then

$$\underline{R}|_{\mathcal{C}_\Lambda} = \mathcal{F}_{(Sch/U)_{fppf, k, u_0}} \xrightarrow{\hat{x}} \mathcal{F}_{\mathcal{X}, k, x_0},$$

corresponds to ξ via the correspondence between formal objects and morphisms of Formal Deformation Theory, Equation (68.7.12.1). In other words, we see that

$$x \text{ is versal at } u_0 \Leftrightarrow \xi \text{ is versal}$$

It turns out that this notion is well behaved with respect to field extensions.

Lemma 75.11.2. *Let $S, \mathcal{X}, U, x, u_0$ be as in Definition 75.11.1. Let l be a field and let $u_{l,0} : \text{Spec}(l) \rightarrow U$ be a morphism with image u_0 such that $k = \kappa(u_0) \subset l$ is finite. Set $x_{l,0} = x_0|_{\text{Spec}(l)}$. If \mathcal{X} satisfies (RS) and x is versal at u_0 , then*

$$\mathcal{F}_{(Sch/U)_{fppf, l, u_{l,0}}} \longrightarrow \mathcal{F}_{\mathcal{X}, l, x_{l,0}}$$

is smooth.

Proof. Note that $(Sch/U)_{fppf}$ satisfies (RS) by Lemma 75.5.2. Hence the functor of the lemma is the functor

$$(\mathcal{F}_{(Sch/U)_{fppf, k, u_0}})_{l/k} \longrightarrow (\mathcal{F}_{\mathcal{X}, k, x_0})_{l/k}$$

associated to \hat{x} , see Lemma 75.7.1. Hence the lemma follows from Formal Deformation Theory, Lemma 68.26.5. \square

We restate the approximation result in terms of versal objects.

Lemma 75.11.3. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\xi = (R, \xi_n, f_n)$ be a formal object of \mathcal{X} with ξ_1 lying over $\text{Spec}(k) \rightarrow S$ with image $s \in S$. Assume*

- (1) ξ is versal,
- (2) ξ is effective,
- (3) $\mathcal{O}_{S, s}$ is a G -ring, and
- (4) $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects.

Then there exist a morphism of finite type $U \rightarrow S$, a finite type point $u_0 \in U$ with residue field k , and an object x of \mathcal{X} over U such that x is versal at u_0 and such that $x|_{\text{Spec}(k)} \cong \xi_1$.

Proof. Choose an object x_R of \mathcal{X} lying over $\text{Spec}(R)$ whose associated formal object is ξ . Let $N = 2$ and apply Lemma 75.10.1. We obtain $A, \mathfrak{m}_A, \xi_A, \dots$. Let $\eta = (A^\wedge, \eta_n, g_n)$ be the formal object associated to $\xi_A|_{\text{Spec}(A^\wedge)}$. We have a diagram

$$\begin{array}{ccc} & \eta & \\ & \nearrow & \downarrow \\ \xi & \longrightarrow & \xi_2 = \eta_2 \end{array} \quad \text{lying over} \quad \begin{array}{ccc} & A^\wedge & \\ & \nearrow & \downarrow \\ R & \longrightarrow & R/\mathfrak{m}_R^2 = A/\mathfrak{m}_A^2 \end{array}$$

The versality of ξ means exactly that we can find the dotted arrows in the diagrams, because we can successively find morphisms $\xi \rightarrow \eta_3, \xi \rightarrow \eta_4$, and so on by Formal Deformation Theory, Remark 68.8.14. The corresponding ring map $R \rightarrow A^\wedge$ is surjective by Formal Deformation Theory, Lemma 68.4.2. On the other hand, we have $\dim_k \mathfrak{m}_R^n / \mathfrak{m}_R^{n+1} = \dim_k \mathfrak{m}_A^n / \mathfrak{m}_A^{n+1}$ for all n by construction. Hence R/\mathfrak{m}_R^n and A/\mathfrak{m}_A^n have the same (finite) length as Λ -modules by additivity of length and Formal Deformation Theory, Lemma 68.3.4. It follows that $R/\mathfrak{m}_R^n \rightarrow A/\mathfrak{m}_A^n$ is an isomorphism for all n , hence $R \rightarrow A^\wedge$ is an isomorphism. Thus η is isomorphic to a versal object, hence versal itself. \square

Example 75.11.4. In this example we show that the local ring $\mathcal{O}_{S,s}$ has to be a G-ring in order for the result of Lemma 75.11.3 to be true. Namely, let Λ be a Noetherian ring and let \mathfrak{m} be a maximal ideal of Λ . Set $R = \Lambda_\mathfrak{m}^\wedge$. Let $\Lambda \rightarrow C \rightarrow R$ be a factorization with C of finite type over Λ . Set $S = \text{Spec}(\Lambda)$, $U = S \setminus \{\mathfrak{m}\}$, and $S' = U \amalg \text{Spec}(C)$. Consider the functor $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ defined by the rule

$$F(T) = \begin{cases} * & \text{if } T \rightarrow S \text{ factors through } S' \\ \emptyset & \text{else} \end{cases}$$

Let $\mathcal{X} = \mathcal{S}_F$ is the category fibred in sets associated to F , see Algebraic Stacks, Section 71.7. Then $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects and there exists an effective, versal formal object ξ over R . Hence if the conclusion of Lemma 75.11.3 holds for \mathcal{X} , then there exists a finite type ring map $\Lambda \rightarrow A$ and a maximal ideal \mathfrak{m}_A lying over \mathfrak{m} such that

- (1) $\kappa(\mathfrak{m}) = \kappa(\mathfrak{m}_A)$,
- (2) $\Lambda \rightarrow A$ and \mathfrak{m}_A satisfy condition (4) of Algebra, Lemma 10.136.2, and
- (3) there exists a Λ -algebra map $C \rightarrow A$.

Thus $\Lambda \rightarrow A$ is smooth at \mathfrak{m}_A by the lemma cited. Slicing A we may assume that $\Lambda \rightarrow A$ is étale at \mathfrak{m}_A , see for example More on Morphisms, Lemma 36.28.5 or argue directly. Write $C = \Lambda[y_1, \dots, y_n]/(f_1, \dots, f_m)$. Then $C \rightarrow R$ corresponds to a solution in R of the system of equations $f_1 = \dots = f_m = 0$, see Smoothing Ring Maps, Section 16.13. Thus if the conclusion of Lemma 75.11.3 holds for every \mathcal{X} as above, then a system of equations which has a solution in R has a solution in the henselization of $\Lambda_\mathfrak{m}$. In other words, the approximation property holds for $\Lambda_\mathfrak{m}^h$. This implies that $\Lambda_\mathfrak{m}^h$ is a G-ring (insert future reference here; see also discussion in Smoothing Ring Maps, Section 16.1) which in turn implies that $\Lambda_\mathfrak{m}$ is a G-ring.

75.12. Axioms

Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Here are the axioms we will consider on \mathcal{X} .

- [-1] a set theoretic condition¹ to be ignored by readers who are not interested in set theoretical issues,
- [0] \mathcal{X} is a stack in groupoids for the étale topology,
- [1] \mathcal{X} is limit preserving,
- [2] \mathcal{X} satisfies the Rim-Schlessinger condition (RS),

¹The condition is the following: the supremum of all the cardinalities $|\text{Ob}(\mathcal{X}_{\text{Spec}(k)})| \cong |\text{Arrows}(\mathcal{X}_{\text{Spec}(k)})|$ where k runs over the finite type fields over S is \leq than the size of some object of $(Sch/S)_{fppf}$.

- [3] the spaces $T\mathcal{F}_{\mathcal{X},k,x_0}$ and $\text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X},k,x_0})$ are finite dimensional for every k and x_0 , see (75.8.0.1) and (75.8.0.2),
- [4] the functor (75.9.2.1) is an equivalence,
- [5] \mathcal{X} and $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ satisfy openness of versality.

We still have to define the meaning of “limit preserving” and “openness of versality”.

75.13. Limit preserving

The morphism $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects, as defined in Criteria for Representability, Section 74.5, if the functor of the definition below is essentially surjective. However, the example in Examples, Section 82.45 shows that this isn’t equivalent to being limit preserving.

Definition 75.13.1. Let S be a scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We say \mathcal{X} is *limit preserving* if for every affine scheme T over S which is a limit $T = \lim T_i$ of a directed inverse system of affine schemes T_i over S , we have an equivalence

$$\text{colim } \mathcal{X}_{T_i} \longrightarrow \mathcal{X}_T$$

of fibre categories.

We spell out what this means. First, given objects x, y of \mathcal{X} over T_i we should have

$$\text{Mor}_{\mathcal{X}_T}(x|_T, y|_T) = \text{colim}_{i' \geq i} \text{Mor}_{\mathcal{X}_{T_{i'}}}(x|_{T_{i'}}, y|_{T_{i'}})$$

and second every object of \mathcal{X}_T is isomorphic to the restriction of an object over T_i for some i . Note that the first condition means that the presheaves $\text{Isom}_{\mathcal{X}}(x, y)$ (see Stacks, Definition 8.2.2) are limit preserving.

Lemma 75.13.2. *Let S be a scheme. Let $p : \mathcal{X} \rightarrow \mathcal{Y}$ and $q : \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

- (1) *If $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ and $\mathcal{Z} \rightarrow (Sch/S)_{fppf}$ are limit preserving on objects and \mathcal{Y} is limit preserving, then $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects.*
- (2) *If \mathcal{X}, \mathcal{Y} , and \mathcal{Z} are limit preserving, then so is $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$.*

Proof. This is formal. Proof of (1). Let $T = \lim_{i \in I} T_i$ be the directed limit of affine schemes T_i over S . We will prove that the functor $\text{colim } \mathcal{X}_{T_i} \rightarrow \mathcal{X}_T$ is essentially surjective. Recall that an object of the fibre product over T is a quadruple (T, x, z, α) where x is an object of \mathcal{X} lying over T , z is an object of \mathcal{Z} lying over T , and $\alpha : p(x) \rightarrow q(z)$ is a morphism in the fibre category of \mathcal{Y} over T . By assumption on \mathcal{X} and \mathcal{Z} we can find an i and objects x_i and z_i over T_i such that $x_i|_T \cong x$ and $z_i|_T \cong z$. Then α corresponds to an isomorphism $p(x_i)|_T \rightarrow q(z_i)|_T$ which comes from an isomorphism $\alpha_{i'} : p(x_i)|_{T_{i'}} \rightarrow q(z_i)|_{T_{i'}}$ by our assumption on \mathcal{Y} . After replacing i by i' , x_i by $x_i|_{T_{i'}}$, and z_i by $z_i|_{T_{i'}}$, we see that $(T_i, x_i, z_i, \alpha_i)$ is an object of the fibre product over T_i which restricts to an object isomorphic to (T, x, z, α) over T as desired.

We omit the arguments showing that $\text{colim } \mathcal{X}_{T_i} \rightarrow \mathcal{X}_T$ is fully faithful in (2). \square

Lemma 75.13.3. *Let S be a scheme. Let \mathcal{X} be an algebraic stack over S . Then the following are equivalent*

- (1) *\mathcal{X} is a stack in setoids and $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects,*
- (2) *\mathcal{X} is a stack in setoids and limit preserving,*

(3) \mathcal{X} is representable by an algebraic space locally of finite presentation.

Proof. Under each of the three assumptions \mathcal{X} is representable by an algebraic space X over S , see Algebraic Stacks, Proposition 71.13.3. It is clear that (1) and (2) are equivalent as a functor between setoids is an equivalence if and only if it is surjective on isomorphism classes. Finally, (1) and (3) are equivalent by Limits of Spaces, Proposition 52.3.9. \square

75.14. Openness of versality

Next, we come to openness of versality.

Definition 75.14.1. Let S be a locally Noetherian scheme.

- (1) Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We say \mathcal{X} satisfies *openness of versality* if given a scheme U locally of finite type over S , an object x of \mathcal{X} over U , and a finite type point $u_0 \in U$ such that x is versal at u_0 , then there exists an open neighbourhood $u_0 \in U' \subset U$ such that x is versal at every finite type point of U' .
- (2) Let $f : \mathcal{Y} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids. We say f satisfies *openness of versality* if given a morphism of schemes $V \rightarrow U$ locally of finite type over S , an object x of \mathcal{X} over U , an object y of \mathcal{Y} over V , a morphism $\alpha : f(y) \rightarrow x$ of \mathcal{X} over $V \rightarrow U$, and a finite type point v_0 of V such that (y, α) is versal at v_0 as an object of $\mathcal{Y} \times_{\mathcal{X}} (Sch/U)_{fppf}$, then there exists an open neighbourhood $v_0 \in V' \subset V$ such that (y, α) is versal at every finite type point of V' .

Openness of versality is often the hardest to check. The following example shows that requiring this is necessary however.

Example 75.14.2. Let k be a field and set $\Lambda = k[s, t]$. Consider the functor $F : \Lambda\text{-algebras} \rightarrow Sets$ defined by the rule

$$F(A) = \begin{cases} * & \text{if there exist } f_1, \dots, f_n \in A \text{ such that} \\ & A = (s, t, f_1, \dots, f_n) \text{ and } f_i s = 0 \ \forall i \\ \emptyset & \text{else} \end{cases}$$

Geometrically $F(A) = *$ means there exists a quasi-compact open neighbourhood W of $V(s, t) \subset \text{Spec}(A)$ such that $s|_W = 0$. Let $\mathcal{X} \subset (Sch/\text{Spec}(\Lambda))_{fppf}$ be the full subcategory consisting of schemes T which have an affine open covering $T = \bigcup \text{Spec}(A_j)$ with $F(A_j) = *$ for all j . Then \mathcal{X} satisfies [0], [1], [2], [3], and [4] but not [5]. Namely, over $U = \text{Spec}(k[s, t]/(s))$ there exists an object x which is versal at $u_0 = (s, t)$ but not at any other point. Details omitted.

Let S be a locally Noetherian scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. In the following two lemmas we will use the following property

(75.14.2.1) for all fields k of finite type over S and all $x_0 \in \text{Ob}(\mathcal{X}_{\text{Spec}(k)})$ the map $\mathcal{F}_{\mathcal{X}, k, x_0} \rightarrow \mathcal{F}_{\mathcal{Y}, k, f(x_0)}$ of predeformation categories is smooth

We formulate some lemmas around this concept. First we link it with (openness of) versality.

Lemma 75.14.3. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let U be a scheme locally of finite type over S . Let x be an object of \mathcal{X} over U . Assume that x is versal at every finite type point of U and that \mathcal{X} satisfies (RS). Then $x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$ satisfies (75.14.2.1).*

Proof. Let $\text{Spec}(l) \rightarrow U$ be a morphism with l of finite type over S . Then the image $u_0 \in U$ is a finite type point of U and $\kappa(u_0) \subset l$ is a finite extension, see discussion in Morphisms, Section 28.17. Hence we see that $\mathcal{F}_{\mathcal{X},k,u_0} \rightarrow \mathcal{F}_{\mathcal{Y},k,x_1,0}$ is smooth by Lemma 75.11.2. \square

Lemma 75.14.4. *Let S be a locally Noetherian scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be composable 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f and g satisfy (75.14.2.1) so does $g \circ f$.*

Proof. This is formal. \square

Lemma 75.14.5. *Let S be a locally Noetherian scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f satisfies (75.14.2.1) so does the projection $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$.*

Proof. Follows immediately from Lemma 75.3.3 and Formal Deformation Theory, Lemma 68.8.7. \square

Lemma 75.14.6. *Let S be a locally Noetherian scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f is formally smooth on objects, then f satisfies (75.14.2.1). If f is representable by algebraic spaces and smooth, then f satisfies (75.14.2.1).*

Proof. The first statement is equivalent to Lemma 75.3.2. The second follows from this and Criteria for Representability, Lemma 74.6.3. \square

Lemma 75.14.7. *Let S be a locally Noetherian scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume*

- (1) f is representable by algebraic spaces,
- (2) f satisfies (75.14.2.1),
- (3) $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ is limit preserving on objects, and
- (4) \mathcal{Y} is limit preserving.

Then f is smooth.

Proof. The key ingredient of the proof is More on Morphisms, Lemma 36.10.1 which (almost) says that a morphism of schemes of finite type over S satisfying (75.14.2.1) is a smooth morphism. The other arguments of the proof are essentially bookkeeping.

Let V be a scheme over S and let y be an object of \mathcal{Y} over V . Let Z be an algebraic space representing the 2-fibre product $Z = \mathcal{X} \times_{f,\mathcal{X},y} (Sch/V)_{fppf}$. We have to show that the projection morphism $Z \rightarrow V$ is smooth, see Algebraic Stacks, Definition 71.10.1. In fact, it suffices to do this when V is an affine scheme locally of finite presentation over S , see Criteria for Representability, Lemma 74.5.6. Then $(Sch/V)_{fppf}$ is limit preserving by Lemma 75.13.3. Hence $Z \rightarrow S$ is locally of finite presentation by Lemmas 75.13.2 and 75.13.3. Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Then W is locally of finite presentation over S .

Since f satisfies (75.14.2.1) we see that so does $\mathcal{Z} \rightarrow (Sch/V)_{fppf}$, see Lemma 75.14.5. Next, we see that $(Sch/W)_{fppf} \rightarrow \mathcal{Z}$ satisfies (75.14.2.1) by Lemma 75.14.6. Thus the composition

$$(Sch/W)_{fppf} \rightarrow \mathcal{Z} \rightarrow (Sch/V)_{fppf}$$

satisfies (75.14.2.1) by Lemma 75.14.4. More on Morphisms, Lemma 36.10.1 shows that the composition $W \rightarrow Z \rightarrow V$ is smooth at every finite type point w_0 of W . Since the smooth locus is open we conclude that $W \rightarrow V$ is a smooth morphism of schemes by Morphisms, Lemma 28.17.7. Thus we conclude that $Z \rightarrow V$ is a smooth morphism of algebraic spaces by definition. \square

The lemma below is how we will use openness of versality.

Lemma 75.14.8. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ be a category fibred in groupoids. Let k be a finite type field over S and let x_0 be an object of \mathcal{X} over $\text{Spec}(k)$ with image $s \in S$. Assume*

- (1) $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,
- (2) \mathcal{X} satisfies axioms [1], [2], [3], [4], and openness of versality, and
- (3) $\mathcal{O}_{S,s}$ is a G -ring.

Then there exist a morphism of finite type $U \rightarrow S$ and an object x of \mathcal{X} over U such that

$$x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$$

is smooth and such that there exists a finite type point $u_0 \in U$ whose residue field is k and such that $x|_{u_0} \cong x_0$.

Proof. By axiom [2], Lemma 75.6.1, and Remark 75.6.2 we see that $\mathcal{F}_{\mathcal{X},k,x_0}$ satisfies (S1) and (S2). Since also the tangent space has finite dimension by axiom [3] we deduce from Formal Deformation Theory, Lemma 68.12.4 that $\mathcal{F}_{\mathcal{X},k,x_0}$ has a versal formal object ξ . By axiom [4] ξ is effective. By axiom [1] and Lemma 75.11.3 there exists a morphism of finite type $U \rightarrow S$, an object x of \mathcal{X} over U , and a finite type point u_0 of U with residue field k such that x is versal at u_0 and such that $x|_{\text{Spec}(k)} \cong x_0$. By openness of versality we may shrink U and assume that x is versal at every finite type point u_0 of U . We claim that

$$x : (Sch/U)_{fppf} \rightarrow \mathcal{X}$$

is smooth which proves the lemma. Namely, by Lemma 75.14.3 x satisfies (75.14.2.1) whereupon Lemma 75.14.7 finishes the proof. \square

75.15. Axioms for functors

Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Denote $\mathcal{X} = \mathcal{S}_F$ the category fibred in sets associated to F , see Algebraic Stacks, Section 71.7. In this section we provide a translation between the material above as it applies to \mathcal{X} , to statements about F .

Let S be a locally Noetherian scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Let k be a field of finite type over S . Let $x_0 \in F(\text{Spec}(k))$. The associated predeformation category (75.3.0.2) corresponds to the functor

$$F_{k,x_0} : \mathcal{C}_\Lambda \rightarrow Sets, \quad A \mapsto \{x \in F(\text{Spec}(A)) \mid x|_{\text{Spec}(k)} = x_0\}.$$

Recall that we do not distinguish between categories cofibred in sets over \mathcal{C}_Λ and functor $\mathcal{C}_\Lambda \rightarrow \text{Sets}$, see Formal Deformation Theory, Remarks 68.5.2 (11). Given a transformation of functors $a : F \rightarrow G$, setting $y_0 = a(x_0)$ we obtain a morphism

$$F_{k,x_0} \longrightarrow G_{k,y_0}$$

see (75.3.1.1). Lemma 75.3.2 tells us that if $a : F \rightarrow G$ is formally smooth (in the sense of More on Morphisms of Spaces, Definition 58.10.1), then $F_{k,x_0} \longrightarrow G_{k,y_0}$ is smooth as in Formal Deformation Theory, Remark 68.8.4.

Lemma 75.4.1 says that if $Y' = Y \amalg_X X'$ in the category of schemes over S where $X \rightarrow X'$ is a thickening and $X \rightarrow Y$ is affine, then the map

$$F(Y \amalg_X X') \rightarrow F(Y) \times_{F(X)} F(X')$$

is a bijection, provided that F is an algebraic space. We say a general functor F satisfies the *Rim-Schlessinger condition* or we say F satisfies (RS) if given any pushout $Y' = Y \amalg_X X'$ where Y, X, X' are spectra of Artinian local rings of finite type over S , then

$$F(Y \amalg_X X') \rightarrow F(Y) \times_{F(X)} F(X')$$

is a bijection. Thus every algebraic space satisfies (RS).

Lemma 75.6.1 says that given a functor F which satisfies (RS), then all F_{k,x_0} are deformation functors as in Formal Deformation Theory, Definition 68.15.8, i.e., they satisfy (RS) as in Formal Deformation Theory, Remark 68.15.5. In particular the tangent space

$$TF_{k,x_0} = \{x \in F(\text{Spec}(k[\epsilon])) \mid x|_{\text{Spec}(k)} = x_0\}$$

has the structure of a k -vector space by Formal Deformation Theory, Lemma 68.11.2.

Lemma 75.8.1 says that an algebraic space F locally of finite type over S gives rise to deformation functors F_{k,x_0} with finite dimensional tangent spaces TF_{k,x_0} .

A *formal object*² $\xi = (R, \xi_n)$ of F consists of a Noetherian complete local S -algebra R whose residue field is of finite type over S , together with elements $\xi_n \in F(\text{Spec}(R/\mathfrak{m}^n))$ such that $\xi_{n+1}|_{\text{Spec}(R/\mathfrak{m}^n)} = \xi_n$. A formal object ξ defines a formal object ξ of $F_{R/\mathfrak{m}, \xi_1}$. We say ξ is *versal* if and only if it is versal in the sense of Formal Deformation Theory, Definition 68.8.13. A formal object $\xi = (R, \xi_n)$ is called *effective* if there exists an $x \in F(\text{Spec}(R))$ such that $\xi_n = x|_{\text{Spec}(R/\mathfrak{m}^n)}$ for all $n \geq 1$. Lemma 75.9.4 says that if F is an algebraic space, then every formal object is effective.

Let U be a scheme locally of finite type over S and let $x \in F(U)$. Let $u_0 \in U$ be a finite type point. We say that x is versal at u_0 if and only if $\xi = (\mathcal{O}_{U, u_0}^\wedge, x|_{\text{Spec}(\mathcal{O}_{U, u_0}/\mathfrak{m}_{u_0}^n)})$ is a versal formal object in the sense described above.

Let S be a locally Noetherian scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sch$ be a functor. Here are the axioms we will consider on F .

- [-1] a set theoretic condition³ to be ignored by readers who are not interested in set theoretical issues,
- [0] F is a sheaf for the étale topology,

²This is what Artin calls a formal deformation.

³The condition is the following: the supremum of all the cardinalities $|F(\text{Spec}(k))|$ where k runs over the finite type fields over S is \leq than the size of some object of $(Sch/S)_{fppf}$.

- [1] F is limit preserving,
- [2] F satisfies the Rim-Schlessinger condition (RS),
- [3] every tangent space TF_{k,x_0} is finite dimensional,
- [4] every formal object is effective,
- [5] F satisfies openness of versality.

Here *limit preserving* is the notion defined in Limits of Spaces, Definition 52.3.1 and *openness of versality* means the following: Given a scheme U locally of finite type over S , given $x \in F(U)$, and given a finite type point $u_0 \in U$ such that x is versal at u_0 , then there exists an open neighbourhood $u_0 \in U' \subset U$ such that x is versal at every finite type point of U' .

75.16. Algebraic spaces

The following is our first main result on algebraic spaces.

Proposition 75.16.1. *Let S be a locally Noetherian scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Assume that*

- (1) $\Delta : F \rightarrow F \times F$ is representable by algebraic spaces,
- (2) F satisfies axioms [-1], [0], [1], [2], [3], [4], and [5],
- (3) $\mathcal{O}_{S,s}$ is a G -ring for all finite type points s of S .

Then F is an algebraic space.

Proof. Lemma 75.14.8 applies to F . Using this we choose, for every finite type field k over S and $x_0 \in F(\text{Spec}(k))$, an affine scheme U_{k,x_0} of finite type over S and a smooth morphism $U_{k,x_0} \rightarrow F$ such that there exists a finite type point $u_{k,x_0} \in U_{k,x_0}$ with residue field k such that x_0 is the image of u_{k,x_0} . Then

$$U = \coprod_{k,x_0} U_{k,x_0} \longrightarrow F$$

is smooth⁴. To finish the proof it suffices to show this map is surjective, see Bootstrap, Lemma 62.12.2 (this is where we use axiom [0]). By Criteria for Representability, Lemma 74.5.6 it suffices to show that $U \times_F V \rightarrow V$ is surjective for those $V \rightarrow F$ where V is an affine scheme locally of finite presentation over S . Since $U \times_F V \rightarrow V$ is smooth the image is open. Hence it suffices to show that the image of $U \times_F V \rightarrow V$ contains all finite type points of V , see Morphisms, Lemma 28.17.7. Let $v_0 \in V$ be a finite type point. Then $k = \kappa(v_0)$ is a finite type field over S . Denote x_0 the composition $\text{Spec}(k) \xrightarrow{v_0} V \rightarrow F$. Then $(u_{k,x_0}, v_0) : \text{Spec}(k) \rightarrow U \times_F V$ is a point mapping to v_0 and we win. \square

Lemma 75.16.2. *Let S be a locally Noetherian scheme. Let $a : F \rightarrow G$ be a transformation of functors $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Assume that*

- (1) a is injective,
- (2) F satisfies axioms [0], [1], [2], [4], and [5],
- (3) $\mathcal{O}_{S,s}$ is a G -ring for all finite type points s of S ,
- (4) G is an algebraic space locally of finite type over S ,

Then F is an algebraic space.

⁴Set theoretical remark: This coproduct is (isomorphic) to an object of $(Sch/S)_{fppf}$ as we have a bound on the index set by axiom [-1], see Sets, Lemma 3.9.9.

Proof. By Lemma 75.8.1 the functor G satisfies [3]. As $F \rightarrow G$ is injective, we conclude that F also satisfies [3]. Moreover, as $F \rightarrow G$ is injective, we see that given schemes U, V and morphisms $U \rightarrow F$ and $V \rightarrow F$, then $U \times_F V = U \times_G V$. Hence $\Delta : F \rightarrow F \times F$ is representable (by schemes) as this holds for G by assumption. Thus Proposition 75.16.1 applies⁵. \square

75.17. Algebraic stacks

Proposition 75.17.2 is our first main result on algebraic stacks.

Lemma 75.17.1. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}^{opp}$ be a category fibred in groupoids. Assume that*

- (1) $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,
- (2) \mathcal{X} satisfies axioms [-1], [0], [1], [2], [3], [4] (see Section 75.12),
- (3) \mathcal{X} satisfies openness of versality, and
- (4) $\mathcal{O}_{S,s}$ is a G -ring for all finite type points s of S .

Then \mathcal{X} is an algebraic stack.

Proof. Lemma 75.14.8 applies to \mathcal{X} . Using this we choose, for every finite type field k over S and every isomorphism class of object $x_0 \in \text{Ob}(\mathcal{X}_{\text{Spec}(k)})$, an affine scheme U_{k,x_0} of finite type over S and a smooth morphism $(Sch/U_{k,x_0})_{fppf} \rightarrow \mathcal{X}$ such that there exists a finite type point $u_{k,x_0} \in U_{k,x_0}$ with residue field k such that x_0 is the image of u_{k,x_0} . Then

$$(Sch/U)_{fppf} \rightarrow \mathcal{X}, \quad \text{with } U = \coprod_{k,x_0} U_{k,x_0}$$

is smooth⁶. To finish the proof it suffices to show this map is surjective, see Criteria for Representability, Lemma 74.19.1 (this is where we use axiom [0]). By Criteria for Representability, Lemma 74.5.6 it suffices to show that $(Sch/U)_{fppf} \times_{\mathcal{X}} (Sch/V)_{fppf} \rightarrow (Sch/V)_{fppf}$ is surjective for those $y : (Sch/V)_{fppf} \rightarrow \mathcal{X}$ where V is an affine scheme locally of finite presentation over S . By assumption (1) the fibre product $(Sch/U)_{fppf} \times_{\mathcal{X}} (Sch/V)_{fppf}$ is representable by an algebraic space W . Then $W \rightarrow V$ is smooth, hence the image is open. Hence it suffices to show that the image of $W \rightarrow V$ contains all finite type points of V , see Morphisms, Lemma 28.17.7. Let $v_0 \in V$ be a finite type point. Then $k = \kappa(v_0)$ is a finite type field over S . Denote $x_0 = y|_{\text{Spec}(k)}$ the pullback of y by v_0 . Then (u_{k,x_0}, v_0) will give a morphism $\text{Spec}(k) \rightarrow W$ whose composition with $W \rightarrow V$ is v_0 and we win. \square

Proposition 75.17.2. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}^{opp}$ be a category fibred in groupoids. Assume that*

- (1) $\Delta_{\Delta} : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{X} \times \mathcal{X}} \mathcal{X}$ is representable by algebraic spaces,
- (2) \mathcal{X} satisfies axioms [-1], [0], [1], [2], [3], [4], and [5] (see Section 75.12),
- (3) $\mathcal{O}_{S,s}$ is a G -ring for all finite type points s of S .

Then \mathcal{X} is an algebraic stack.

Proof. We first prove that $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces. To do this it suffices to show that

$$\mathcal{Y} = \mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, y} (Sch/V)_{fppf}$$

⁵The set theoretic condition [-1] holds for F as it holds for G . Details omitted.

⁶Set theoretical remark: This coproduct is (isomorphic) to an object of $(Sch/S)_{fppf}$ as we have a bound on the index set by axiom [-1], see Sets, Lemma 3.9.9.

is representable by an algebraic space for any affine scheme V locally of finite presentation over S and object y of $\mathcal{X} \times \mathcal{X}$ over V , see Criteria for Representability, Lemma 74.5.5⁷. Observe that \mathcal{Y} is fibred in setoids (Stacks, Lemma 8.2.5) and let $Y : (Sch/S)_{fppf}^{opp} \rightarrow Sets$, $T \mapsto \text{Ob}(\mathcal{Y}_T)/\cong$ be the functor of isomorphism classes. We will apply Proposition 75.16.1 to see that Y is an algebraic space.

Note that $\Delta_{\mathcal{Y}} : \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ (and hence also $Y \rightarrow Y \times Y$) is representably by algebraic spaces by condition (1) and Criteria for Representability, Lemma 74.4.4. Observe that Y is a sheaf for the étale topology by Stacks, Lemmas 8.6.3 and 8.6.7, i.e., property [0] holds. Also Y is limit preserving by Lemma 75.13.2, i.e., we have [1]. Note that Y has (RS), i.e., axiom [2] holds, by Lemmas 75.5.2 and 75.5.3. Axiom [3] for Y follows from Lemmas 75.8.1 and 75.8.2. Axiom [4] follows from Lemmas 75.9.4 and 75.9.5. Axiom [5] for Y follows directly from openness of versality for $\Delta_{\mathcal{X}}$ which is part of axiom [5] for \mathcal{X} . Thus all the assumptions of Proposition 75.16.1 are satisfied and Y is an algebraic space.

At this point it follows from Lemma 75.17.1 that \mathcal{X} is an algebraic stack. \square

75.18. Infinitesimal deformations

In this section we discuss a generalization of the notion of the tangent space introduced in Section 75.8. To do this intelligently, we borrow some notation from Formal Deformation Theory, Sections 68.10, 68.16, and 68.18.

Let S be a scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Given a homomorphism $A' \rightarrow A$ of S -algebras and an object x of \mathcal{X} over $\text{Spec}(A)$ we write $Lift(x, A')$ for the category of lifts of x to $\text{Spec}(A')$. An object of $Lift(x, A')$ is a morphism $x \rightarrow x'$ of \mathcal{X} lying over $\text{Spec}(A) \rightarrow \text{Spec}(A')$ and morphisms of $Lift(x, A')$ are defined as commutative diagrams. The set of isomorphism classes of $Lift(x, A')$ is denoted $\text{Lift}(x, A')$. See Formal Deformation Theory, Definition 68.16.1 and Remark 68.16.2. If $A' \rightarrow A$ is surjective with locally nilpotent kernel we call an element x' of $\text{Lift}(x, A')$ a (*infinitesimal*) *deformation* of x . In this case the *group of infinitesimal automorphisms of x' over x* is the kernel

$$\text{Inf}(x'/x) = \text{Ker} \left(\text{Aut}_{\mathcal{X}_{\text{Spec}(A')}}(x') \rightarrow \text{Aut}_{\mathcal{X}_{\text{Spec}(A)}}(x) \right)$$

Note that an element of $\text{Inf}(x'/x)$ is the same thing as a lift of id_x over $\text{Spec}(A')$ for (the category fibred in sets associated to) $\text{Aut}_{\mathcal{X}}(x')$. Compare with Formal Deformation Theory, Definition 68.18.1 and Formal Deformation Theory, Remark 68.18.8.

If M is an A -module we denote $A[M]$ the A -algebra whose underlying A -module is $A \oplus M$ and whose multiplication is given by $(a, m) \cdot (a', m') = (aa', am' + a'm)$. When $M = A$ this is the ring of dual numbers over A , which we denote $A[\epsilon]$ as is customary. There is an A -algebra map $A[M] \rightarrow A$. The pullback of x to $\text{Spec}(A[M])$ is called the *trivial deformation* of x to $\text{Spec}(A[M])$.

⁷The set theoretic condition in Criteria for Representability, Lemma 74.5.5 will hold: the size of the algebraic space Y representing \mathcal{Y} is suitably bounded. Namely, $Y \rightarrow S$ will be locally of finite type and Y will satisfy axiom [-1]. Details omitted.

Lemma 75.18.1. *Let S be a scheme. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let*

$$\begin{array}{ccc} B' & \longrightarrow & B \\ \uparrow & & \uparrow \\ A' & \longrightarrow & A \end{array}$$

be a commutative diagram of S -algebras. Let x be an object of \mathcal{X} over $\text{Spec}(A)$, let y be an object of \mathcal{Y} over $\text{Spec}(B)$, and let $\phi : f(x)|_{\text{Spec}(B)} \rightarrow y$ be a morphism of \mathcal{Y} over $\text{Spec}(B)$. Then there is a canonical functor

$$\text{Lift}(x, A') \longrightarrow \text{Lift}(y, B')$$

of categories of lifts induced by f and ϕ . The construction is compatible with compositions of 1-morphisms of categories fibred in groupoids in an obvious manner.

Proof. This lemma proves itself. □

In the rest of this chapter the following strictly stronger version of the Rim-Schlessinger conditions will play an important role.

Definition 75.18.2. Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We say \mathcal{X} satisfies *condition (RS*)* if given an affine open $\text{Spec}(\Lambda) \subset S$ and a fibre product diagram

$$\begin{array}{ccc} B' & \longrightarrow & B \\ \uparrow & & \uparrow \\ A' = A \times_B B' & \longrightarrow & A \end{array}$$

of Λ -algebras, with $B' \rightarrow B$ surjective with square zero kernel, the functor of fibre categories

$$\mathcal{X}_{\text{Spec}(A')} \longrightarrow \mathcal{X}_{\text{Spec}(A)} \times_{\mathcal{X}_{\text{Spec}(B)}} \mathcal{X}_{\text{Spec}(B')}$$

is an equivalence of categories.

We make some observations: with $A \rightarrow B \leftarrow B'$ as in Definition 75.18.2

- (1) if A, B, B' are of finite type over Λ and B is finite over A , then A' is of finite type over Λ , see More on Algebra, Lemma 15.4.1,
- (2) we have $\text{Spec}(A') = \text{Spec}(A) \amalg_{\text{Spec}(B)} \text{Spec}(B')$ in the category of schemes, see More on Morphisms, Lemma 36.11.1,
- (3) if \mathcal{X} is an algebraic stack, then \mathcal{X} satisfies (RS*) by Lemma 75.4.1, and
- (4) if \mathcal{X} satisfies (RS*), then \mathcal{X} satisfies (RS) because (RS) covers exactly those cases of (RS*) where A, B, B' are Artinian local.

Let S be a locally Noetherian base. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. We define a category whose objects are pairs $(x, A' \rightarrow A)$ where

- (1) $A' \rightarrow A$ is a surjection of S -algebras whose kernel is an ideal of square zero such that $\text{Spec}(A)$ maps into an affine open of S , and
- (2) x is an object of \mathcal{X} lying over $\text{Spec}(A)$.

A morphism $(y, B' \rightarrow B) \rightarrow (x, A' \rightarrow A)$ is given by a commutative diagram

$$\begin{array}{ccc} B' & \longrightarrow & B \\ \uparrow & & \uparrow \\ A' & \longrightarrow & A \end{array}$$

of S -algebras together with a morphism $x|_{\text{Spec}(B)} \rightarrow y$ over $\text{Spec}(B)$. Let us call this the category of *deformation situations*.

Lemma 75.18.3. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. Assume \mathcal{X} satisfies condition (RS^*) . Let A be an S -algebra such that $\text{Spec}(A) \rightarrow S$ maps into an affine open and let x be an object of \mathcal{X} over $\text{Spec}(A)$.*

- (1) *There exists an A -linear functor $\text{Inf}_x : \text{Mod}_A \rightarrow \text{Mod}_A$ such that given a deformation situation $(x, A' \rightarrow A)$ and a lift x' there is an isomorphism $\text{Inf}_x(I) \rightarrow \text{Inf}(x'/x)$ where $I = \text{Ker}(A' \rightarrow A)$.*
- (2) *There exists an A -linear functor $T_x : \text{Mod}_A \rightarrow \text{Mod}_A$ such that*
 - (a) *given M in Mod_A there is a bijection $T_x(M) \rightarrow \text{Lift}(x, A[M])$,*
 - (b) *given a deformation situation $(x, A' \rightarrow A)$ there is an action*

$$T_x(I) \times \text{Lift}(x, A') \rightarrow \text{Lift}(x, A')$$

where $I = \text{Ker}(A' \rightarrow A)$. It is simply transitive if $\text{Lift}(x, A') \neq \emptyset$.

Proof. To define Inf_x , resp. T_x we consider the functors

$$\text{Mod}_A \longrightarrow \text{Sets}, \quad M \longrightarrow \text{Lift}(\text{id}_x, A[M]), \quad \text{resp.} \quad M \longrightarrow \text{Lift}(x, A[M])$$

(for the first consider lifts of id_x as automorphisms of the trivial deformation of x to $A[M]$) and we apply Formal Deformation Theory, Lemma 68.10.4. This lemma is applicable, since (RS^*) tells us that

$$\text{Lift}(x, A[M \times N]) = \text{Lift}(x, A[M]) \times \text{Lift}(x, A[N])$$

as categories (and trivial deformations match up too).

Let $(x, A' \rightarrow A)$ be a deformation situation. Consider the ring map $g : A' \times_A A' \rightarrow A[I]$ defined by the rule $g(a_1, a_2) = \bar{a}_1 \oplus a_2 - a_1$. There is an isomorphism

$$A' \times_A A' \longrightarrow A' \times_A A[I]$$

given by $(a_1, a_2) \mapsto (a_1, g(a_1, a_2))$. This isomorphism commutes with the projections to A' on the first factor, and hence with the projections to A . Thus applying (RS^*) twice we find equivalences of categories

$$\begin{aligned} \text{Lift}(x, A') \times \text{Lift}(x, A') &= \text{Lift}(x, A' \times_A A') \\ &= \text{Lift}(x, A' \times_A A[I]) \\ &= \text{Lift}(x, A') \times \text{Lift}(x, A[I]) \end{aligned}$$

Using these maps and projection onto the last factor of the last product we see that we obtain “difference maps”

$$\text{Inf}(x'/x) \times \text{Inf}(x'/x) \longrightarrow \text{Inf}_x(I) \quad \text{and} \quad \text{Lift}(x, A') \times \text{Lift}(x, A') \longrightarrow T_x(I)$$

These difference maps satisfy the transitivity rule “ $(x'_1 - x'_2) + (x'_2 - x'_3) = x'_1 - x'_3$ ” because

$$\begin{array}{ccc}
 A' \times_A A' \times_A A' & \xrightarrow{(a_1, a_2, a_3) \mapsto (g(a_1, a_2), g(a_2, a_3))} & A[I] \times_A A[I] = A[I \times I] \\
 & \searrow_{(a_1, a_2, a_3) \mapsto g(a_1, a_3)} & \downarrow + \\
 & & A[I]
 \end{array}$$

is commutative. Inverting the string of equivalences above we obtain an action which is free and transitive provided $\text{Inf}(x'/x)$, resp. $\text{Lift}(x, A')$ is nonempty. Note that $\text{Inf}(x'/x)$ is always nonempty as it is a group. \square

Remark 75.18.4 (Functoriality). Assumptions and notation as in Lemma 75.18.3. Suppose $A \rightarrow B$ is a ring map and $y = x|_{\text{Spec}(B)}$. Let $M \in \text{Mod}_A$, $N \in \text{Mod}_B$ and let $M \rightarrow N$ an A -linear map. Then there are canonical maps $\text{Inf}_x(M) \rightarrow \text{Inf}_y(N)$ and $T_x(M) \rightarrow T_y(N)$ simply because there is a pullback functor

$$\text{Lift}(x, A[M]) \rightarrow \text{Lift}(y, B[N])$$

coming from the ring map $A[M] \rightarrow B[N]$. Similarly, given a morphism of deformation situations $(y, B' \rightarrow B) \rightarrow (x, A' \rightarrow A)$ we obtain a pullback functor $\text{Lift}(x, A') \rightarrow \text{Lift}(y, B')$. Since the construction of the action, the addition, and the scalar multiplication on Inf_x and T_x use only morphisms in the categories of lifts (see proof of Formal Deformation Theory, Lemma 68.10.4) we see that the constructions above are functorial. In other words we obtain A -linear maps

$$\text{Inf}_x(M) \rightarrow \text{Inf}_y(N) \quad \text{and} \quad T_x(M) \rightarrow T_y(N)$$

such that the diagrams

$$\begin{array}{ccc}
 \text{Inf}_y(J) \longrightarrow \text{Inf}(y'/y) & & T_y(J) \times \text{Lift}(y, B') \longrightarrow \text{Lift}(y, B') \\
 \uparrow & & \uparrow \\
 \text{Inf}_x(I) \longrightarrow \text{Inf}(x'/x) & \text{and} & T_x(I) \times \text{Lift}(x, A') \longrightarrow \text{Lift}(x, A') \\
 \uparrow & & \uparrow
 \end{array}$$

commute. Here $I = \text{Ker}(A' \rightarrow A)$, $J = \text{Ker}(B' \rightarrow B)$, x' is a lift of x to A' (which may not always exist) and $y' = x'|_{\text{Spec}(B')}$.

Remark 75.18.5 (Automorphisms). Assumptions and notation as in Lemma 75.18.3. Let x', x'' be lifts of x to A' . Then we have a composition map

$$\text{Inf}(x''/x) \times \text{Mor}_{\text{Lift}(x, A')}(x', x'') \times \text{Inf}(x'/x) \longrightarrow \text{Mor}_{\text{Lift}(x, A')}(x', x'')$$

Since $\text{Lift}(x, A')$ is a groupoid, if $\text{Mor}_{\text{Lift}(x, A')}(x', x'')$ is nonempty, then this defines a simply transitive left action of $\text{Inf}(x'/x)$ on $\text{Mor}_{\text{Lift}(x, A')}(x', x'')$ and a simply transitive right action by $\text{Inf}(x'/x)$. Now the lemma says that $\text{Inf}(x'/x) = \text{Inf}_x(I) = \text{Inf}(x''/x)$. We claim that the two actions described above agree via these identifications. Namely, either $x' \not\cong x''$ in which the claim is clear, or $x' \cong x''$ and in that case we may assume that $x'' = x'$ in which case the result follows from the fact that $\text{Inf}(x'/x)$ is commutative. In particular, we obtain a well defined action

$$\text{Inf}_x(I) \times \text{Mor}_{\text{Lift}(x, A')}(x', x'') \longrightarrow \text{Mor}_{\text{Lift}(x, A')}(x', x'')$$

which is simply transitive as soon as $\text{Mor}_{\text{Lift}(x, A')}(x', x'')$ is nonempty.

Remark 75.18.6 (Canonical element). Assumptions and notation as in Lemma 75.18.3. Choose an affine open $\text{Spec}(\Lambda) \subset S$ such that $\text{Spec}(A) \rightarrow S$ corresponds to a ring map $\Lambda \rightarrow A$. Consider the ring map

$$A \longrightarrow A[\Omega_{A/\Lambda}], \quad a \longmapsto (a, d_{A/\Lambda}(a))$$

Pulling back x along the corresponding morphism $\text{Spec}(A[\Omega_{A/\Lambda}]) \rightarrow \text{Spec}(A)$ we obtain a deformation x_{can} of x over $A[\Omega_{A/\Lambda}]$. We call this the *canonical element*

$$x_{can} \in T_x(\Omega_{A/\Lambda}) = \text{Lift}(x, A[\Omega_{A/\Lambda}]).$$

Next, assume that $\Lambda \rightarrow A$ is of finite type and let $k = \kappa(\mathfrak{p})$ be a residue field at a finite type point u_0 of $U = \text{Spec}(A)$. Let $x_0 = x|_{u_0}$. By (RS*) and the fact that $A[k] = A \times_k k[k]$ the space $T_x(k)$ is the tangent space to the deformation functor $\mathcal{F}_{\mathcal{X}, k, x_0}$. Via

$$T\mathcal{F}_{U, k, u_0} = \text{Der}_{\Lambda}(A, k) = \text{Hom}_A(\Omega_{A/\Lambda}, k)$$

(see Formal Deformation Theory, Example 68.10.11) and functoriality of T_x the canonical element produces the map on tangent spaces induced by the object x over U . Namely, $\theta \in T\mathcal{F}_{U, k, u_0}$ maps to $T_x(\theta)(x_{can})$ in $T_x(k) = T\mathcal{F}_{\mathcal{X}, k, x_0}$.

Remark 75.18.7 (Canonical automorphism). Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Assume \mathcal{X} satisfies condition (RS*). Let A be an S -algebra such that $\text{Spec}(A) \rightarrow S$ maps into an affine open and let x, y be objects of \mathcal{X} over $\text{Spec}(A)$. Further, let $A \rightarrow B$ be a ring map and let $\alpha : x|_{\text{Spec}(B)} \rightarrow y|_{\text{Spec}(B)}$ be a morphism of \mathcal{X} over $\text{Spec}(B)$. Consider the ring map

$$B \longrightarrow B[\Omega_{B/A}], \quad b \longmapsto (b, d_{B/A}(b))$$

Pulling back α along the corresponding morphism $\text{Spec}(B[\Omega_{B/A}]) \rightarrow \text{Spec}(B)$ we obtain a morphism α_{can} between the pullbacks of x and y over $B[\Omega_{B/A}]$. On the other hand, we can pullback α by the morphism $\text{Spec}(B[\Omega_{B/A}]) \rightarrow \text{Spec}(B)$ corresponding to the injection of B into the first summand of $B[\Omega_{B/A}]$. By the discussion of Remark 75.18.5 we can take the difference

$$\varphi(x, y, \alpha) = \alpha_{can} - \alpha|_{\text{Spec}(B[\Omega_{B/A}])} \in \text{Inf}_{x|_{\text{Spec}(B)}}(\Omega_{B/A}).$$

We will call this the *canonical automorphism*. It depends on all the ingredients $A, x, y, A \rightarrow B$ and α .

Remark 75.18.8. Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let A be an S -algebra such that $\text{Spec}(A) \rightarrow S$ maps into an affine open. There is a notion of a *short exact sequence*

$$(x, A'_1 \rightarrow A) \rightarrow (x, A'_2 \rightarrow A) \rightarrow (x, A'_3 \rightarrow A)$$

of deformation situations: we ask the corresponding maps between the kernels $I_i = \text{Ker}(A'_i \rightarrow A)$ give a short exact sequence

$$0 \rightarrow I_3 \rightarrow I_2 \rightarrow I_1 \rightarrow 0$$

of A -modules. Note that in this case the map $A'_3 \rightarrow A'_1$ factors through A , hence there is a canonical isomorphism $A'_1 = A[I_1]$.

75.19. Obstruction theories

In this section we describe what an obstruction theory is. Contrary to the spaces of infinitesimal deformations and infinitesimal automorphisms, an obstruction theory is an additional piece of data. The formulation is motivated by the results of Lemma 75.18.3 and Remark 75.18.4.

Definition 75.19.1. Let S be a locally Noetherian base. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. An *obstruction theory* is given by the following data

- (1) for every S -algebra A such that $\text{Spec}(A) \rightarrow S$ maps into an affine open and every object x of \mathcal{X} over $\text{Spec}(A)$ an A -linear functor

$$\mathcal{O}_x : \text{Mod}_A \rightarrow \text{Mod}_A$$

of *obstruction modules*,

- (2) for (x, A) as in (1), a ring map $A \rightarrow B$, $M \in \text{Mod}_A$, $N \in \text{Mod}_B$, and an A -linear map $M \rightarrow N$ an induced A -linear map $\mathcal{O}_x(M) \rightarrow \mathcal{O}_y(N)$ where $y = x|_{\text{Spec}(B)}$, and
- (3) for every deformation situation $(x, A' \rightarrow A)$ an *obstruction element* $o_x(A') \in \mathcal{O}_x(I)$ where $I = \text{Ker}(A' \rightarrow A)$.

These data are subject to the following conditions

- (i) the functoriality maps turn the obstruction modules into a functor from the category of triples (x, A, M) to sets,
- (ii) for every morphism of deformation situations $(y, B' \rightarrow B) \rightarrow (x, A' \rightarrow A)$ the element $o_x(A')$ maps to $o_y(B')$, and
- (iii) we have

$$\text{Lift}(x, A') \neq \emptyset \Leftrightarrow o_x(A') = 0$$

for every deformation situation $(x, A' \rightarrow A)$.

This last condition explains the terminology. The module $\mathcal{O}_x(A')$ is called the *obstruction module*. The element $o_x(A')$ is the *obstruction*. Most obstruction theories have additional properties, and in order to make them useful additional conditions are needed. Moreover, this is just a sample definition, for example in the definition we could consider only deformation situations of finite type over S .

One of the main reasons for introducing obstruction theories is to check openness of versality. The initial idea to do this is due to Artin, see the papers of Artin mentioned in the introduction. It has been taken up for example in the work by Flenner [Fle81], Hall [Hal12], Hall and Rydh [HR12], Olsson [Ols06a], Olsson and Starr [OS03], and Lieblich [Lie06a] (random order of references). Moreover, for particular categories fibred in groupoids, often authors develop a little bit of theory adapted to the problem at hand. We will develop this theory later (insert future reference here).

Example 75.19.2. Let $S = \text{Spec}(\Lambda)$ for some Noetherian ring Λ . Let $W \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_W -module flat over S . Consider the functor

$$F : (Sch/S)_{fppf}^{opp} \longrightarrow \text{Sets}, \quad T/S \longrightarrow H^0(W_T, \mathcal{F}_T)$$

where $W_T = T \times_S W$ is the base change and \mathcal{F}_T is the pullback of \mathcal{F} to W_T . If $T = \text{Spec}(A)$ we will write $W_T = W_A$, etc. Let $\mathcal{X} \rightarrow (Sch/S)_{fppf}$ be the category fibred in groupoids associated to F . Then \mathcal{X} has an obstruction theory. Namely,

- (1) given A over Λ and $x \in H^0(W_A, \mathcal{F}_A)$ we set $\mathcal{O}_x(M) = H^1(W_A, \mathcal{F}_A \otimes_A M)$,
 (2) given a deformation situation $(x, A' \rightarrow A)$ we let $o_x(A') \in \mathcal{O}_x(A)$ be the image of x under the boundary map

$$H^0(W_A, \mathcal{F}_A) \longrightarrow H^1(W_A, \mathcal{F}_A \otimes_A I)$$

coming from the short exact sequence of modules

$$0 \rightarrow \mathcal{F}_A \otimes_A I \rightarrow \mathcal{F}_{A'} \rightarrow \mathcal{F}_A \rightarrow 0.$$

We have omitted some details, in particular the construction of the short exact sequence above (it uses that W_A and $W_{A'}$ have the same underlying topological space) and the explanation for why flatness of \mathcal{F} over S implies that the sequence above is short exact.

Example 75.19.3 (Key example). Let $S = \text{Spec}(\Lambda)$ for some Noetherian ring Λ . Say $\mathcal{X} = (Sch/X)_{fppf}$ with $X = \text{Spec}(R)$ and $R = \Lambda[x_1, \dots, x_n]/J$. The naive cotangent complex $NL_{R/\Lambda}$ is (canonically) homotopy equivalent to

$$J/J^2 \longrightarrow \bigoplus_{i=1, \dots, n} R dx_i,$$

see Algebra, Lemma 10.129.2. Consider a deformation situation $(x, A' \rightarrow A)$. Denote I the kernel of $A' \rightarrow A$. The object x corresponds to (a_1, \dots, a_n) with $a_i \in A$ such that $f(a_1, \dots, a_n) = 0$ in A for all $f \in J$. Set

$$\begin{aligned} \mathcal{O}_x(A') &= \text{Hom}_R(J/J^2, I) / \text{Hom}_R(R^{\oplus n}, I) \\ &= \text{Ext}_R^1(NL_{R/\Lambda}, I) \\ &= \text{Ext}_A^1(NL_{R/\Lambda} \otimes_R A, I). \end{aligned}$$

Choose lifts $a'_i \in A'$ of a_i in A . Then $o_x(A')$ is the class of the map $J/J^2 \rightarrow I$ defined by sending $f \in J$ to $f(a'_1, \dots, a'_n) \in I$. We omit the verification that $o_x(A')$ is independent of choices. It is clear that if $o_x(A') = 0$ then the map lifts. Finally, functoriality is straightforward. Thus we obtain an obstruction theory. We observe that $o_x(A')$ can be described a bit more canonically as the composition

$$NL_{R/\Lambda} \rightarrow NL_{A/\Lambda} \rightarrow NL_{A/A'} = I[1]$$

in $D(A)$, see Algebra, Lemma 10.129.6 for the last identification.

75.20. Naive obstruction theories

The title of this section refers to the fact that we will use the naive cotangent complex in this section. Let $(x, A' \rightarrow A)$ be a deformation situation for a given category fibred in groupoids over a locally Noetherian scheme S . The key Example 75.19.3 suggests that any obstruction theory should be closely related to maps in $D(A)$ with target the naive cotangent complex of A . Working this out we find a criterion for versality in Lemma 75.20.3 which leads to a criterion for openness of versality in Lemma 75.20.4. We introduce a notion of a naive obstruction theory in Definition 75.20.5 to try to formalize the notion a bit further.

In the following we will use the naive cotangent complex as defined in Algebra, Section 10.129. In particular, if $A' \rightarrow A$ is a surjection of Λ -algebras with square zero kernel I , then there are maps

$$NL_{A'/\Lambda} \rightarrow NL_{A/\Lambda} \rightarrow NL_{A/A'}$$

whose composition is homotopy equivalent to zero (see Algebra, Remark 10.129.5). This doesn't form a distinguished triangle in general as we are using the naive cotangent complex and not the full one. There is a homotopy equivalence $NL_{A/A'} \rightarrow I[1]$ (the complex consisting of I placed in degree -1 , see Algebra, Lemma 10.129.6). Finally, note that there is a canonical map $NL_{A/\Lambda} \rightarrow \Omega_{A/\Lambda}$.

Lemma 75.20.1. *Let $A \rightarrow k$ be a ring map with k a field. Let $E \in D^-(A)$. Then $\text{Ext}_A^i(E, k) = \text{Hom}_k(H^{-i}(E \otimes^{\mathbf{L}} k), k)$.*

Proof. Omitted. Hint: Replace E by a bounded above complex of free A -modules and compute both sides. \square

Lemma 75.20.2. *Let $\Lambda \rightarrow A \rightarrow k$ be finite type ring maps of Noetherian rings with $k = \kappa(\mathfrak{p})$ for some prime \mathfrak{p} of A . Let $\xi : E \rightarrow NL_{A/\Lambda}$ be morphism of $D^-(A)$ such that $H^{-1}(\xi \otimes^{\mathbf{L}} k)$ is not surjective. Then there exists a surjection $A' \rightarrow A$ of Λ -algebras such that*

- (a) $I = \text{Ker}(A' \rightarrow A)$ has square zero and is isomorphic to k as an A -module,
- (b) $\Omega_{A'/\Lambda} \otimes k = \Omega_{A/\Lambda} \otimes k$, and
- (c) $E \rightarrow NL_{A/A'}$ is zero.

Proof. Let $f \in A$, $f \notin \mathfrak{p}$. Suppose that $A'' \rightarrow A_f$ satisfies (a), (b), (c) for the induced map $E \otimes_A A_f \rightarrow NL_{A_f/\Lambda}$, see Algebra, Lemma 10.129.13. Then we can set $A' = A'' \times_{A_f} A$ and get a solution. Namely, it is clear that $A' \rightarrow A$ satisfies (a) because $\text{Ker}(A' \rightarrow A) = \text{Ker}(A'' \rightarrow A) = I$. Pick $f'' \in A''$ lifting f . Then the localization of A' at (f'', f) is isomorphic to A'' (for example by More on Algebra, Lemma 15.4.3). Thus (b) and (c) are clear for A' too. In this way we see that we may replace A by the localization A_f (finitely many times). In particular (after such a replacement) we may assume that \mathfrak{p} is a maximal ideal of A , see Morphisms, Lemma 28.17.1.

Choose a presentation $A = \Lambda[x_1, \dots, x_n]/J$. Then $NL_{A/\Lambda}$ is (canonically) homotopy equivalent to

$$J/J^2 \rightarrow \bigoplus_{i=1, \dots, n} \text{Ad}x_i,$$

see Algebra, Lemma 10.129.2. After localizing if necessary (using Nakayama's lemma) we can choose generators f_1, \dots, f_m of J such that $f_j \otimes 1$ form a basis for $J/J^2 \otimes_A k$. Moreover, after renumbering, we can assume that the images of df_1, \dots, df_r form a basis for the image of $J/J^2 \otimes k \rightarrow \bigoplus kdx_i$ and that df_{r+1}, \dots, df_m map to zero in $\bigoplus kdx_i$. With these choices the space

$$H^{-1}(NL_{A/\Lambda} \otimes_A^{\mathbf{L}} k) = H^{-1}(NL_{A/\Lambda} \otimes_A k)$$

has basis $f_{r+1} \otimes 1, \dots, f_m \otimes 1$. Changing basis once again we may assume that the image of $H^{-1}(\xi \otimes^{\mathbf{L}} k)$ is contained in the k -span of $f_{r+1} \otimes 1, \dots, f_{m-1} \otimes 1$. Set

$$A' = \Lambda[x_1, \dots, x_n]/(f_1, \dots, f_{m-1}, \mathfrak{p}f_m)$$

By construction $A' \rightarrow A$ satisfies (a). Since df_m maps to zero in $\bigoplus kdx_i$ we see that (b) holds. Finally, by construction the induced map $E \rightarrow NL_{A/A'} = I[1]$ induces the zero map $H^{-1}(E \otimes_A^{\mathbf{L}} k) \rightarrow I \otimes_A k$. By Lemma 75.20.1 we see that the composition is zero. \square

The following lemma is our key technical result.

Lemma 75.20.3. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$ satisfying (RS^*) . Let $U = \text{Spec}(A)$ be an affine scheme of finite type over S which maps into an affine open $\text{Spec}(\Lambda)$. Let x be an object of \mathcal{X} over U . Let $\xi : E \rightarrow NL_{A/\Lambda}$ be a morphism of $D^-(A)$. Assume*

- (i) *for every deformation situation $(x, A' \rightarrow A)$ we have: x lifts to $\text{Spec}(A')$ if and only if $E \rightarrow NL_{A/\Lambda} \rightarrow NL_{A/A'}$ is zero, and*
- (ii) *there is an isomorphism of functors $T_x(-) \rightarrow \text{Ext}_A^0(E, -)$ such that $E \rightarrow NL_{A/\Lambda} \rightarrow \Omega_{A/\Lambda}^1$ corresponds to the canonical element (see Remark 75.18.6).*

Let $u_0 \in U$ be a finite type point with residue field $k = \kappa(u_0)$. Consider the following statements

- (1) *x is versal at u_0 , and*
- (2) *$\xi : E \rightarrow NL_{A/\Lambda}$ induces a surjection $H^{-1}(E \otimes_A^L k) \rightarrow H^{-1}(NL_{A/\Lambda} \otimes_A^L k)$ and an injection $H^0(E \otimes_A^L k) \rightarrow H^0(NL_{A/\Lambda} \otimes_A^L k)$.*

Then we always have (2) \Rightarrow (1) and we have (1) \Rightarrow (2) if u_0 is a closed point.

Proof. Let $\mathfrak{p} = \text{Ker}(A \rightarrow k)$ be the prime corresponding to u_0 .

Assume that x versal at u_0 and that u_0 is a closed point of U . If $H^{-1}(\xi \otimes_A^L k)$ is not surjective, then let $A' \rightarrow A$ be an extension with kernel I as in Lemma 75.20.2. Because u_0 is a closed point, we see that I is a finite A -module, hence that A' is a finite type Λ -algebra (this fails if u_0 is not closed). In particular A' is Noetherian. By property (c) for A' and (i) for ξ we see that x lifts to an object x' over A' . Let $\mathfrak{p}' \subset A'$ be kernel of the surjective map to k . By Artin-Rees (Algebra, Lemma 10.49.2) there exists an $n > 1$ such that $(\mathfrak{p}')^n \cap I = 0$. Then we see that

$$B' = A'/(\mathfrak{p}')^n \longrightarrow A/\mathfrak{p}^n = B$$

is a small, essential extension of local Artinian rings, see Formal Deformation Theory, Lemma 68.3.12. On the other hand, as x is versal at u_0 and as $x'|_{\text{Spec}(B')}$ is a lift of $x|_{\text{Spec}(B)}$, there exists an integer $m \geq n$ and a map $q : A/\mathfrak{p}^m \rightarrow B'$ such that the composition $A/\mathfrak{p}^m \rightarrow B' \rightarrow B$ is the quotient map. Since the maximal ideal of B' has n th power equal to zero, this q factors through B which contradicts the fact that $B' \rightarrow B$ is an essential surjection. This contradiction shows that $H^{-1}(\xi \otimes_A^L k)$ is surjective.

Assume that x versal at u_0 . By Lemma 75.20.1 the map $H^0(\xi \otimes_A^L k)$ is dual to the map $\text{Ext}_A^0(NL_{A/\Lambda}, k) \rightarrow \text{Ext}_A^0(E, k)$. Note that

$$\text{Ext}_A^0(NL_{A/\Lambda}, k) = \text{Der}_\Lambda(A, k) \quad \text{and} \quad T_x(k) = \text{Ext}_A^0(E, k)$$

Condition (ii) assures us the map $\text{Ext}_A^0(NL_{A/\Lambda}, k) \rightarrow \text{Ext}_A^0(E, k)$ sends a tangent vector θ to U at u_0 to the corresponding infinitesimal deformation of x_0 , see Remark 75.18.6. Hence if x is versal, then this map is surjective, see Formal Deformation Theory, Lemma 68.12.2. Hence $H^0(\xi \otimes_A^L k)$ is injective. This finishes the proof of (1) \Rightarrow (2) in case u_0 is a closed point.

For the rest of the proof assume $H^{-1}(E \otimes_A^L k) \rightarrow H^{-1}(NL_{A/\Lambda} \otimes_A^L k)$ is surjective and $H^0(E \otimes_A^L k) \rightarrow H^0(NL_{A/\Lambda} \otimes_A^L k)$ injective. Set $R = A_{\mathfrak{p}}^\wedge$ and let η be the formal object over R associated to $x|_{\text{Spec}(R)}$. The map $d\eta$ on tangent spaces is surjective because it is identified with the dual of the injective map $H^0(E \otimes_A^L k) \rightarrow H^0(NL_{A/\Lambda} \otimes_A^L k)$ (see previous paragraph). According to Formal Deformation Theory, Lemma 68.12.2 it suffices to prove the following: Let $C' \rightarrow C$ be a small

extension of finite type Artinian local Λ -algebras with residue field k . Let $R \rightarrow C$ be a Λ -algebra map compatible with identifications of residue fields. Let $y = x|_{\text{Spec}(C)}$ and let y' be a lift of y to C' . To show: we can lift the Λ -algebra map $R \rightarrow C$ to $R \rightarrow C'$.

Observe that it suffices to lift the Λ -algebra map $A \rightarrow C$. Let $I = \text{Ker}(C' \rightarrow C)$. Note that I is a 1-dimensional k -vector space. The obstruction ob to lifting $A \rightarrow C$ is an element of $\text{Ext}_A^1(NL_{A/\Lambda}, I)$, see Example 75.19.3. By Lemma 75.20.1 and our assumption the map ξ induces an injection

$$\text{Ext}_A^1(NL_{A/\Lambda}, I) \longrightarrow \text{Ext}_A^1(E, I)$$

By the construction of ob and (i) the image of ob in $\text{Ext}_A^1(E, I)$ is the obstruction to lifting x to $A \times_C C'$. By (RS*) the fact that y/C lifts to y'/C' implies that x lifts to $A \times_C C'$. Hence $ob = 0$ and we are done. \square

The key lemma above allows us to conclude that we have openness of versality in some cases.

Lemma 75.20.4. *Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(\text{Sch}/S)_{fppf}$ satisfying (RS*). Let $U = \text{Spec}(A)$ be an affine scheme of finite type over S which maps into an affine open $\text{Spec}(\Lambda)$. Let x be an object of \mathcal{X} over U . Let $\xi : E \rightarrow NL_{A/\Lambda}$ be a morphism of $D^-(A)$. Assume*

- (i) *for every deformation situation $(x, A' \rightarrow A)$ we have: x lifts to $\text{Spec}(A')$ if and only if $E \rightarrow NL_{A/\Lambda} \rightarrow NL_{A/A'}$ is zero,*
- (ii) *there is an isomorphism of functors $T_x(-) \rightarrow \text{Ext}_A^0(E, -)$ such that $E \rightarrow NL_{A/\Lambda} \rightarrow \Omega_{A/\Lambda}^1$ corresponds to the canonical element (see Remark 75.18.6),*
- (iii) *the cohomology groups of E are finite A -modules.*

If x is versal at a closed point $u_0 \in U$, then there exists an open neighbourhood $u_0 \in U' \subset U$ such that x is versal at every finite type point of U' .

Proof. Let C be the cone of ξ so that we have a distinguished triangle

$$E \rightarrow NL_{A/\Lambda} \rightarrow C \rightarrow E[1]$$

in $D^-(A)$. By Lemma 75.20.3 the assumption that x is versal at u_0 implies that $H^{-1}(C \otimes_A^L k) = 0$. By More on Algebra, Lemma 15.56.16 there exists an $f \in A$ not contained in the prime corresponding to u_0 such that $H^{-1}(C \otimes_A^L M) = 0$ for any A_f -module M . Using Lemma 75.20.3 again we see that we have versality for all finite type points of the open $D(f) \subset U$. \square

The technical lemmas above suggest the following definition.

Definition 75.20.5. Let S be a locally Noetherian base. Let \mathcal{X} be a category fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Assume that \mathcal{X} satisfies (RS*). A *naive obstruction theory* is given by the following data

- (1) for every S -algebra A such that $\text{Spec}(A) \rightarrow S$ maps into an affine open $\text{Spec}(\Lambda) \subset S$ and every object x of \mathcal{X} over $\text{Spec}(A)$ we are given an object $E_x \in D^-(A)$ and a map $\xi_x : E \rightarrow NL_{A/\Lambda}$,
- (2) given (x, A) as in (1) there are transformations of functors
$$\text{Inf}_x(-) \rightarrow \text{Ext}_A^{-1}(E_x, -) \quad \text{and} \quad T_x(-) \rightarrow \text{Ext}_A^0(E_x, -)$$
- (3) for (x, A) as in (1) and a ring map $A \rightarrow B$ setting $y = x|_{\text{Spec}(B)}$ there is a functoriality map $E_x \rightarrow E_y$ in $D(A)$.

These data are subject to the following conditions

- (i) in the situation of (3) the diagram

$$\begin{array}{ccc}
 E_y & \xrightarrow{\xi_y} & NL_{B/\Lambda} \\
 \uparrow & & \uparrow \\
 E_x & \xrightarrow{\xi_x} & NL_{A/\Lambda}
 \end{array}$$

- is commutative in $D(A)$,
- (ii) given (x, A) as in (1) and $A \rightarrow B \rightarrow C$ setting $y = x|_{\text{Spec}(B)}$ and $z = x|_{\text{Spec}(C)}$ the composition of the functoriality maps $E_x \rightarrow E_y$ and $E_y \rightarrow E_z$ is the functoriality map $E_x \rightarrow E_z$,
- (iii) the maps of (2) are isomorphisms compatible with the functoriality maps and the maps of Remark 75.18.4,
- (iv) the composition $E_x \rightarrow NL_{A/\Lambda} \rightarrow \Omega_{A/\Lambda}$ corresponds to the canonical element of $T_x(\Omega_{A/\Lambda}) = \text{Ext}^0(E_x, \Omega_{A/\Lambda})$, see Remark 75.18.6,
- (v) given a deformation situation $(x, A' \rightarrow A)$ with $I = \text{Ker}(A' \rightarrow A)$ the composition $E_x \rightarrow NL_{A/\Lambda} \rightarrow NL_{A/A'}$ is zero in

$$\text{Hom}_A(E_x, NL_{A/\Lambda}) = \text{Ext}_A^0(E_x, NL_{A/A'}) = \text{Ext}_A^1(E_x, I)$$

if and only if x lifts to A' .

Thus we see in particular that we obtain an obstruction theory as in Section 75.19 by setting $\mathcal{O}_x(-) = \text{Ext}_A^1(E_x, -)$.

Lemma 75.20.6. *Let S and \mathcal{X} be as in Definition 75.20.5 and let \mathcal{X} be endowed with a naive obstruction theory. Let $A \rightarrow B$ and $y \rightarrow x$ be as in (3). Let k be a B -algebra which is a field. Then the functoriality map $E_x \rightarrow E_y$ induces bijections*

$$H^i(E_x \otimes_A^{\mathbf{L}} k) \rightarrow H^i(E_y \otimes_A^{\mathbf{L}} k)$$

for $i = 0, 1$.

Proof. Let $z = x|_{\text{Spec}(k)}$. Then (RS*) implies that

$$\text{Lift}(x, A[k]) = \text{Lift}(z, k[k]) \quad \text{and} \quad \text{Lift}(y, B[k]) = \text{Lift}(z, k[k])$$

because $A[k] = A \times_k k[k]$ and $B[k] = B \times_k k[k]$. Hence the properties of a naive obstruction theory imply that the functoriality map $E_x \rightarrow E_y$ induces bijections $\text{Ext}_A^i(E_x, k) \rightarrow \text{Ext}_B^i(E_y, k)$ for $i = -1, 0$. By Lemma 75.20.1 our maps $H^i(E_x \otimes_A^{\mathbf{L}} k) \rightarrow H^i(E_y \otimes_A^{\mathbf{L}} k)$, $i = 0, 1$ induce isomorphisms on dual vector spaces hence are isomorphisms. \square

Lemma 75.20.7. *Let S be a locally Noetherian scheme. Let $p : \mathcal{X} \rightarrow (\text{Sch}/S)_{\text{fppf}}^{\text{opp}}$ be a category fibred in groupoids. Assume that \mathcal{X} satisfies (RS*) and that \mathcal{X} has a naive obstruction theory. Then openness of versality holds for \mathcal{X} provided the complexes E_x of Definition 75.20.5 have finitely generated cohomology groups for pairs (A, x) where A is of finite type over S .*

Proof. Let U be a scheme locally of finite type over S , let x be an object of \mathcal{X} over U , and let u_0 be a finite type point of U such that x is versal at u_0 . We may first shrink U to an affine scheme such that u_0 is a closed point and such that $U \rightarrow S$ maps into an affine open $\text{Spec}(\Lambda)$. Say $U = \text{Spec}(A)$. Let $\xi_x : E_x \rightarrow NL_{A/\Lambda}$ be the obstruction map. At this point we may apply Lemma 75.20.4 to conclude. \square

75.21. A dual notion

Let $(x, A' \rightarrow A)$ be a deformation situation for a given category \mathcal{X} fibred in groupoids over a locally Noetherian scheme S . Assume \mathcal{X} has an obstruction theory, see Definition 75.19.1. In practice one often has a complex K^\bullet of A -modules and isomorphisms of functors

$$\mathrm{Inf}_x(-) \rightarrow H^0(K^\bullet \otimes_A^{\mathbf{L}} -), \quad T_x(-) \rightarrow H^1(K^\bullet \otimes_A^{\mathbf{L}} -), \quad \mathcal{O}_x(-) \rightarrow H^2(K^\bullet \otimes_A^{\mathbf{L}} -)$$

In this section we formalize this a little bit and show how this leads to a verification of openness of versality in some cases.

Example 75.21.1. Let $\Lambda, S, W, \mathcal{F}$ be as in Example 75.19.2. Assume that $W \rightarrow S$ is proper and \mathcal{F} coherent. By Cohomology of Schemes, Remark 29.20.2 there exists a finite complex of finite projective Λ -modules N^\bullet which universally computes the cohomology of \mathcal{F} . In particular the obstruction spaces from Example 75.19.2 are $\mathcal{O}_x(M) = H^1(N^\bullet \otimes_\Lambda M)$. Hence with $K^\bullet = N^\bullet \otimes_\Lambda A[-1]$ we see that $\mathcal{O}_x(M) = H^2(K^\bullet \otimes_A^{\mathbf{L}} M)$.

Situation 75.21.2. Let S be a locally Noetherian scheme. Let \mathcal{X} be a category fibred in groupoids over $(Sch/S)_{fppf}$. Assume that \mathcal{X} has (RS*) so that we can speak of the functor $T_x(-)$, see Lemma 75.18.3. Let $U = \mathrm{Spec}(A)$ be an affine scheme of finite type over S which maps into an affine open $\mathrm{Spec}(\Lambda)$. Let x be an object of \mathcal{X} over U . Assume we are given

- (1) a complex of A -modules K^\bullet ,
- (2) a transformation of functors $T_x(-) \rightarrow H^1(K^\bullet \otimes_A^{\mathbf{L}} -)$,
- (3) for every deformation situation $(x, A' \rightarrow A)$ with kernel $I = \mathrm{Ker}(A' \rightarrow A)$ an element $o_x(A') \in H^2(K^\bullet \otimes_A^{\mathbf{L}} I)$

satisfying the following (minimal) conditions

- (i) the transformation $T_x(-) \rightarrow H^1(K^\bullet \otimes_A^{\mathbf{L}} -)$ is an isomorphism,
- (ii) given a morphism $(x, A'' \rightarrow A) \rightarrow (x, A' \rightarrow A)$ of deformation situations the element $o_x(A')$ maps to the element $o_x(A'')$ via the map $H^2(K^\bullet \otimes_A^{\mathbf{L}} I) \rightarrow H^2(K^\bullet \otimes_A^{\mathbf{L}} I')$ where $I' = \mathrm{Ker}(A'' \rightarrow A)$, and
- (iii) x lifts to an object over $\mathrm{Spec}(A')$ if and only if $o_x(A') = 0$.

It is possible to incorporate infinitesimal automorphisms as well, but we refrain from doing so in order to get the sharpest possible result.

In Situation 75.21.2 an important role will be played by $K^\bullet \otimes_A^{\mathbf{L}} NL_{A/\Lambda}$. Suppose we are given an element $\xi \in H^1(K^\bullet \otimes_A^{\mathbf{L}} NL_{A/\Lambda})$. Then (1) for any surjection $A' \rightarrow A$ of Λ -algebras with kernel I of square zero the canonical map $NL_{A/\Lambda} \rightarrow NL_{A/A'} = I[1]$ sends ξ to an element $\xi_{A'} \in H^2(K^\bullet \otimes_A^{\mathbf{L}} I)$ and (2) the map $NL_{A/\Lambda} \rightarrow \Omega_{A/\Lambda}$ sends ξ to an element ξ_{can} of $H^1(K^\bullet \otimes_A^{\mathbf{L}} \Omega_{A/\Lambda})$.

Lemma 75.21.3. *In Situation 75.21.2. Assume furthermore that*

- (iv) *given a short exact sequence of deformation situations as in Remark 75.18.8 and a lift $x'_2 \in \mathrm{Lift}(x, A'_2)$ then $o_x(A'_3) \in H^2(K^\bullet \otimes_A^{\mathbf{L}} I_3)$ equals $\partial\theta$ where $\theta \in H^1(K^\bullet \otimes_A^{\mathbf{L}} I_1)$ is the element corresponding to $x'_2|_{\mathrm{Spec}(A'_1)}$ via $A'_1 = A[I_1]$ and the given map $T_x(-) \rightarrow H^1(K^\bullet \otimes_A^{\mathbf{L}} -)$.*

In this case there exists an element $\xi \in H^1(K^\bullet \otimes_A^{\mathbf{L}} NL_{A/\Lambda})$ such that

- (1) *for every deformation situation $(x, A' \rightarrow A)$ we have $\xi_{A'} = o_x(A')$, and*

- (2) ξ_{can} matches the canonical element of Remark 75.18.6 via the given transformation $T_x(-) \rightarrow H^1(K^\bullet \otimes_A^L -)$.

Proof. Choose a $\alpha : \Lambda[x_1, \dots, x_n] \rightarrow A$ with kernel J . Write $P = \Lambda[x_1, \dots, x_n]$. In the rest of this proof we work with

$$NL(\alpha) = (J/J^2 \longrightarrow \bigoplus Adx_i)$$

which is permissible by Algebra, Lemma 10.129.2 and More on Algebra, Lemma 15.45.1. Consider the element $o_x(P/J^2) \in H^2(K^\bullet \otimes_A^L J/J^2)$ and consider the quotient

$$C = (P/J^2 \times \bigoplus Adx_i)/(J/J^2)$$

where J/J^2 is embedded diagonally. Note that $C \rightarrow A$ is a surjection with kernel $\bigoplus Adx_i$. Moreover there is a section $A \rightarrow C$ to $C \rightarrow A$ given by mapping the class of $f \in P$ to the class of (f, df) in the pushout. For later use, denote x_C the pullback of x along the corresponding morphism $\text{Spec}(C) \rightarrow \text{Spec}(A)$. Thus we see that $o_x(C) = 0$. We conclude that $o_x(P/J^2)$ maps to zero in $H^2(K^\bullet \otimes_A^L \bigoplus Adx_i)$. It follows that there exists some element $\xi \in H^1(K^\bullet \otimes_A^L NL(\alpha))$ mapping to $o_x(P/J^2)$.

Note that for any deformation situation $(x, A' \rightarrow A)$ there exists a Λ -algebra map $P/J^2 \rightarrow A'$ compatible with the augmentations to A . Hence the element ξ satisfies the first property of the lemma by construction and property (ii) of Situation 75.21.2.

Note that our choice of ξ was well defined up to the choice of an element of $H^1(K^\bullet \otimes_A^L \bigoplus Adx_i)$. We will show that after modifying ξ by an element of the aforementioned group we can arrange it so that the second assertion of the lemma is true. Let $C' \subset C$ be the image of P/J^2 under the Λ -algebra map $P/J^2 \rightarrow C$ (inclusion of first factor). Observe that $\text{Ker}(C' \rightarrow A) = \text{Im}(J/J^2 \rightarrow \bigoplus Adx_i)$. Set $\overline{C} = A[\Omega_{A/\Lambda}]$. The map $P/J^2 \times \bigoplus Adx_i \rightarrow \overline{C}$, $(f, \sum f_i dx_i) \mapsto (f \bmod J, \sum f_i dx_i)$ factors through a surjective map $C \rightarrow \overline{C}$. Then

$$(x, \overline{C} \rightarrow A) \rightarrow (x, C \rightarrow A) \rightarrow (x, C' \rightarrow A)$$

is a short exact sequence of deformation situations. The associated splitting $\overline{C} = A[\Omega_{A/\Lambda}]$ (from Remark 75.18.8) equals the given splitting above. Moreover, the section $A \rightarrow C$ composed with the map $C \rightarrow \overline{C}$ is the map $(1, d) : A \rightarrow A[\Omega_{A/\Lambda}]$ of Remark 75.18.6. Thus x_C restricts to the canonical element x_{can} of $T_x(\Omega_{A/\Lambda}) = \text{Lift}(x, A[\Omega_{A/\Lambda}])$. By condition (iv) we conclude that $o_x(P/J^2)$ maps to ∂x_{can} in

$$H^1(K^\bullet \otimes_A^L \text{Im}(J/J^2 \rightarrow \bigoplus Adx_i))$$

By construction ξ maps to $o_x(P/J^2)$. It follows that x_{can} and ξ_{can} map to the same element in the displayed group which means (by the long exact cohomology sequence) that they differ by an element of $H^1(K^\bullet \otimes_A^L \bigoplus Adx_i)$ as desired. \square

Lemma 75.21.4. *In Situation 75.21.2 assume that (iv) of Lemma 75.21.3 holds and that K^\bullet is a perfect object of $D(A)$. In this case, if x is versal at a closed point $u_0 \in U$ then there exists an open neighbourhood $u_0 \in U' \subset U$ such that x is versal at every finite type point of U' .*

Proof. We may assume that K^\bullet is a finite complex of finite projective A -modules. Thus the derived tensor product with K^\bullet is the same as simply tensoring with K^\bullet . Let E^\bullet be the dual perfect complex to K^\bullet , see More on Algebra, Lemma 15.56.21. (So $E^n = \text{Hom}_A(K^{-n}, A)$ with differentials the transpose of the differentials of K^\bullet .) Let $E \in D^-(A)$ denote the object represented by the complex $E^\bullet[-1]$. Let $\xi \in H^1(\text{Tot}(K^\bullet \otimes_A NL_{A/\Lambda}))$ be the element constructed in Lemma 75.21.3 and denote $\xi : E = E^\bullet[-1] \rightarrow NL_{A/\Lambda}$ the corresponding map (loc.cit.). We claim that the pair (E, ξ) satisfies all the assumptions of Lemma 75.20.4 which finishes the proof.

Namely, assumption (i) of Lemma 75.20.4 follows from conclusion (1) of Lemma 75.21.3 and the fact that $H^2(K^\bullet \otimes_A^L -) = \text{Ext}^1(E, -)$ by loc.cit. Assumption (ii) of Lemma 75.20.4 follows from conclusion (2) of Lemma 75.21.3 and the fact that $H^1(K^\bullet \otimes_A^L -) = \text{Ext}^0(E, -)$ by loc.cit. Assumption (iii) of Lemma 75.20.4 is clear. \square

Quot and Hilbert Spaces

76.1. Introduction

The purpose of this chapter is to write about Quot and Hilbert functors and to prove that these are algebraic spaces provided certain technical conditions are satisfied. In this chapter we will discuss this in the setting of algebraic space. A reference is Grothendieck’s lectures, see [Gro95a], [Gro95b], [Gro95e], [Gro95f], [Gro95c], and [Gro95d]. Another reference is the paper [OS03]; this paper discusses the more general case of Quot and Hilbert spaces associated to a morphism of algebraic stacks which we will discuss in another chapter, see (insert future reference here).

In the case of Hilbert spaces there is a more general notion of “Hilbert stacks” which we will discuss in a separate chapter, see (insert future reference here).

We have intentionally placed this chapter, as well as the chapters “Examples of Stacks”, “Sheaves on Algebraic Stacks”, “Criteria for Representability”, and “Artin’s Axioms” before the general development of the theory of algebraic stacks. The reason for this is that starting with the next chapter (see Properties of Stacks, Section 77.2) we will no longer distinguish between a scheme and the algebraic stack it gives rise to. Thus our language will become more flexible and easier for a human to parse, but also less precise. These first few chapters, including the initial chapter “Algebraic Stacks”, lay the groundwork that later allow us to ignore some of the very technical distinctions between different ways of thinking about algebraic stacks. But especially in the chapters “Artin’s Axioms” and “Criteria of Representability” we need to be very precise about what objects exactly we are working with, as we are trying to show that certain constructions produce algebraic stacks or algebraic spaces.

Unfortunately, this means that some of the notation, conventions and terminology is awkward and may seem backwards to the more experienced reader. We hope the reader will forgive us!

76.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

76.3. The Hom functor

In this section we study the functor of homomorphisms defined below.

Situation 76.3.1. Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let \mathcal{F}, \mathcal{G} be quasi-coherent \mathcal{O}_X -modules. For any scheme T over B we will denote \mathcal{F}_T and \mathcal{G}_T the base changes of \mathcal{F} and \mathcal{G} to T , in other words, the pullbacks via the projection morphism $X_T = X \times_B T \rightarrow X$. We consider the functor

$$(76.3.1.1) \quad \text{Hom}(\mathcal{F}, \mathcal{G}) : (\text{Sch}/B)^{\text{opp}} \rightarrow \text{Sets}, \quad T \rightarrow \text{Hom}_{\mathcal{O}_{X_T}}(\mathcal{F}_T, \mathcal{G}_T)$$

In Situation 76.3.1 we sometimes think of the functor $\text{Hom}(\mathcal{F}, \mathcal{G})$ as a functor

$$\text{Hom}(\mathcal{F}, \mathcal{G}) : (\text{Sch}/S)^{\text{opp}} \rightarrow \text{Sets}$$

endowed with a morphism $\text{Hom}(\mathcal{F}, \mathcal{G}) \rightarrow B$. Namely, if T is a scheme over S , then an element of $\text{Hom}(\mathcal{F}, \mathcal{G})(T)$ consists of a pair (h, u) , where h is a morphism $h : T \rightarrow B$ and $u : \mathcal{F}_T \rightarrow \mathcal{G}_T$ is an \mathcal{O}_{X_T} -module map where $X_T = T \times_{h, B} X$ and \mathcal{F}_T and \mathcal{G}_T are the pullbacks to X_T . In particular, when we say that $\text{Hom}(\mathcal{F}, \mathcal{G})$ is an algebraic space, we mean that the corresponding functor $(\text{Sch}/S)^{\text{opp}} \rightarrow \text{Sets}$ is an algebraic space.

Lemma 76.3.2. *In Situation 76.3.1 the functor $\text{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for the fpqc topology.*

Proof. Let $\{T_i \rightarrow T\}_{i \in I}$ be an fpqc covering of schemes over B . Set $X_i = X_{T_i} = X \times_S T_i$ and $\mathcal{F}_i = u_{T_i}$ and $\mathcal{G}_i = \mathcal{G}_{T_i}$. Note that $\{X_i \rightarrow X_T\}_{i \in I}$ is an fpqc covering of X_T , see Topologies on Spaces, Lemma 55.3.2. Thus a family of maps $u_i : \mathcal{F}_i \rightarrow \mathcal{G}_i$ such that u_i and u_j restrict to the same map on $X_{T_i \times_T T_j}$ comes from a unique map $u : \mathcal{F}_T \rightarrow \mathcal{G}_T$ by descent (Descent on Spaces, Proposition 56.4.1). \square

Remark 76.3.3. In Situation 76.3.1 let $B' \rightarrow B$ be a morphism of algebraic spaces over S . Set $X' = X \times_B B'$ and denote $\mathcal{F}', \mathcal{G}'$ the pullback of \mathcal{F}, \mathcal{G} to X' . Then we obtain a functor $\text{Hom}(\mathcal{F}', \mathcal{G}') : (\text{Sch}/B')^{\text{opp}} \rightarrow \text{Sets}$ associated to the base change $f' : X' \rightarrow B'$. For a scheme T over B' it is clear that we have

$$\text{Hom}(\mathcal{F}', \mathcal{G}')(T) = \text{Hom}(\mathcal{F}, \mathcal{G})(T)$$

where on the right hand side we think of T as a scheme over B via the composition $T \rightarrow B' \rightarrow B$. This trivial remark will occasionally be useful to change the base algebraic space.

Lemma 76.3.4. *In Situation 76.3.1 let $\{X_i \rightarrow X\}_{i \in I}$ be an fppf covering and for each $i, j \in I$ let $\{X_{ijk} \rightarrow X_i \times_X X_j\}$ be an fppf covering. Denote \mathcal{F}_i , resp. \mathcal{F}_{ijk} the pullback of \mathcal{F} to X_i , resp. X_{ijk} . Similarly define \mathcal{G}_i and \mathcal{G}_{ijk} . For every scheme T over B the diagram*

$$\text{Hom}(\mathcal{F}, \mathcal{G})(T) \longrightarrow \prod_i \text{Hom}(\mathcal{F}_i, \mathcal{G}_i)(T) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{i,j,k} \text{Hom}(\mathcal{F}_{ijk}, \mathcal{G}_{ijk})(T)$$

presents the first arrow as the equalizer of the other two.

Proof. Let $u_i : \mathcal{F}_{i,T} \rightarrow \mathcal{G}_{i,T}$ be an element in the equalizer of pr_0^* and pr_1^* . Since the base change of an fppf covering is an fppf covering (Topologies on Spaces, Lemma 55.4.2) we see that $\{X_{i,T} \rightarrow X_T\}_{i \in I}$ and $\{X_{ijk,T} \rightarrow X_{i,T} \times_{X_T} X_{j,T}\}$ are

fppf coverings. Applying Descent on Spaces, Proposition 56.4.1 we first conclude that u_i and u_j restrict to the same morphism over $X_{i,T} \times_{X_T} X_{j,T}$, whereupon a second application shows that there is a unique morphism $u : \mathcal{F}_T \rightarrow \mathcal{G}_T$ restricting to u_i for each i . This finishes the proof. \square

Lemma 76.3.5. *In Situation 76.3.1. If \mathcal{F} is of finite presentation and f is quasi-compact and quasi-separated, then $\text{Hom}(\mathcal{F}, \mathcal{G})$ is limit preserving.*

Proof. Let $T = \lim_{i \in I} T_i$ be a directed limit of affine B -schemes. We have to show that

$$\text{Hom}(\mathcal{F}, \mathcal{G})(T) = \text{colim } \text{Hom}(\mathcal{F}, \mathcal{G})(T_i)$$

Pick $0 \in I$. We may replace B by T_0 , X by X_{T_0} , \mathcal{F} by \mathcal{F}_{T_0} , \mathcal{G} by \mathcal{G}_{T_0} , and I by $\{i \in I \mid i \geq 0\}$. See Remark 76.3.3. Thus we may assume $B = \text{Spec}(R)$ is affine.

When B is affine, then X is quasi-compact and quasi-separated. Choose a surjective étale morphism $U \rightarrow X$ where U is an affine scheme (Properties of Spaces, Lemma 48.6.3). Since X is quasi-separated, the scheme $U \times_X U$ is quasi-compact and we may choose a surjective étale morphism $V \rightarrow U \times_X U$ where V is an affine scheme. Applying Lemma 76.3.4 we see that $\text{Hom}(\mathcal{F}, \mathcal{G})$ is the equalizer of two maps between

$$\text{Hom}(\mathcal{F}|_U, \mathcal{G}|_U) \quad \text{and} \quad \text{Hom}(\mathcal{F}|_V, \mathcal{G}|_V)$$

This reduces us to the case that X is affine.

In the affine case the statement of the lemma reduces to the following problem: Given a ring map $R \rightarrow A$, two A -modules M, N and a directed system of R -algebras $C = \text{colim } C_i$. When is it true that the map

$$\text{colim } \text{Hom}_{A \otimes_R C_i}(M \otimes_R C_i, N \otimes_R C_i) \longrightarrow \text{Hom}_{A \otimes_R C}(M \otimes_R C, N \otimes_R C)$$

is bijective? By Algebra, Lemma 10.123.3 this holds if $M \otimes_R C$ is of finite presentation over $A \otimes_R C$, i.e., when M is of finite presentation over A . \square

Lemma 76.3.6. *Let S be a scheme. Let B be an algebraic space over S . Let $i : X' \rightarrow X$ be a closed immersion of algebraic spaces over B . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module and let \mathcal{G}' be a quasi-coherent $\mathcal{O}_{X'}$ -module. Then*

$$\text{Hom}(\mathcal{F}, i_* \mathcal{G}') = \text{Hom}(i^* \mathcal{F}, \mathcal{G}')$$

as functors on (Sch/B) .

Proof. Let $g : T \rightarrow B$ be a morphism where T is a scheme. Denote $i_T : X'_T \rightarrow X_T$ the base change of i . Denote $h : X_T \rightarrow X$ and $h' : X'_T \rightarrow X'$ the projections. Observe that $(h')^* i^* \mathcal{F} = i_T^* h^* \mathcal{F}$. As a closed immersion is affine (Morphisms of Spaces, Lemma 49.20.6) we have $h^* i_* \mathcal{G}' = i_{T,*} (h')^* \mathcal{G}'$ by Cohomology of Spaces, Lemma 51.10.2. Thus we have

$$\begin{aligned} \text{Hom}(\mathcal{F}, i_* \mathcal{G}')(T) &= \text{Hom}_{\mathcal{O}_{X_T}}(h^* \mathcal{F}, h^* i_* \mathcal{G}') \\ &= \text{Hom}_{\mathcal{O}_{X_T}}(h^* \mathcal{F}, i_{T,*} (h')^* \mathcal{G}') \\ &= \text{Hom}_{\mathcal{O}_{X'_T}}(i_T^* h^* \mathcal{F}, (h')^* \mathcal{G}') \\ &= \text{Hom}_{\mathcal{O}_{X'_T}}((h')^* i^* \mathcal{F}, (h')^* \mathcal{G}') \\ &= \text{Hom}(i^* \mathcal{F}, \mathcal{G}')(T) \end{aligned}$$

as desired. The middle equality follows from the adjointness of the functors $i_{T,*}$ and i_T^* . \square

Lemma 76.3.7. *Let S be a scheme. Let B be an algebraic space over S . Let K be a pseudo-coherent object of $D(\mathcal{O}_B)$.*

- (1) *If for all $g : T \rightarrow B$ in (Sch/B) the cohomology sheaf $H^{-1}(Lg^*K)$ is zero, then the functor*

$$(Sch/B)^{opp} \longrightarrow Sets, \quad (g : T \rightarrow B) \longmapsto H^0(T, H^0(Lg^*K))$$

is an algebraic space affine and of finite presentation over B .

- (2) *If for all $g : T \rightarrow B$ in (Sch/B) the cohomology sheaves $H^i(Lg^*K)$ are zero for $i < 0$, then K is perfect with tor amplitude in $[0, b]$ for some $b \geq 0$ and the functor*

$$(Sch/B)^{opp} \longrightarrow Sets, \quad (g : T \rightarrow B) \longmapsto H^0(T, Lg^*K)$$

is an algebraic space affine and of finite presentation over B .

Proof. Under the assumptions of (2) we have $H^0(T, Lg^*K) = H^0(T, H^0(Lg^*K))$. Let us prove that the rule $T \mapsto H^0(T, H^0(Lg^*K))$ satisfies the sheaf property for the fppf topology. To do this assume we have an fppf covering $\{h_i : T_i \rightarrow T\}$ of a scheme $g : T \rightarrow B$ over B . Set $g_i = g \circ h_i$. Note that since h_i is flat, we have $Lh_i^* = h_i^*$ and h_i^* commutes with taking cohomology. Hence

$$H^0(T_i, H^0(Lg_i^*K)) = H^0(T_i, H^0(h_i^*Lg^*K)) = H^0(T, h_i^*H^0(Lg^*K))$$

Similarly for the pullback to $T_i \times_T T_j$. Since Lg^*K is a pseudo-coherent complex on T (Cohomology on Sites, Lemma 21.34.3) the cohomology sheaf $\mathcal{F} = H^0(Lg^*K)$ is quasi-coherent (Derived Categories of Spaces, Lemma 57.12.5). Hence by Descent on Spaces, Proposition 56.4.1 we see that

$$H^0(T, \mathcal{F}) = \text{Ker}(\prod H^0(T_i, h_i^*\mathcal{F}) \rightarrow \prod H^0(T_i, h_i^*\mathcal{F}))$$

In this way we see that the rules in (1) and (2) satisfy the sheaf property for fppf coverings. This mean we may apply Bootstrap, Lemma 62.11.4 it suffices to prove the representability étale locally on B . Moreover, we may check whether the end result is affine and of finite presentation étale locally on B , see Morphisms of Spaces, Lemmas 49.20.3 and 49.27.4. Hence we may assume that B is an affine scheme.

Assume $B = \text{Spec}(A)$ is an affine scheme. By the results of Derived Categories of Spaces, Lemmas 57.12.5, 57.4.2, and 57.12.2 we deduce that in the rest of the proof we may think of K as a perfect object of the derived category of complexes of modules on B in the Zariski topology. By Derived Categories of Schemes, Lemmas 35.9.1, 35.3.4, and 35.9.3 we can find a pseudo-coherent complex M^\bullet of A -modules such that K is the corresponding object of $D(\mathcal{O}_B)$. Our assumption on pullbacks implies that $M^\bullet \otimes_A^L \kappa(\mathfrak{p})$ has vanishing H^{-1} for all primes $\mathfrak{p} \subset A$. By More on Algebra, Lemma 15.56.16 we can write

$$M^\bullet = \tau_{\geq 0}M^\bullet \oplus \tau_{\leq -1}M^\bullet$$

with $\tau_{\geq 0}M^\bullet$ perfect with Tor amplitude in $[0, b]$ for some $b \geq 0$ (here we also have used More on Algebra, Lemmas 15.56.11 and 15.51.13). Note that in case (2) we also see that $\tau_{\leq -1}M^\bullet = 0$ in $D(A)$ whence M^\bullet and K are perfect with tor amplitude in $[0, b]$. For any B -scheme $g : T \rightarrow B$ we have

$$H^0(T, H^0(Lg^*K)) = H^0(T, H^0(Lg^*\tau_{\geq 0}K))$$

(by the dual of Derived Categories, Lemma 13.17.1) hence we may replace K by $\tau_{\geq 0}K$ and correspondingly M^\bullet by $\tau_{\geq 0}M^\bullet$. In other words, we may assume M^\bullet has tor amplitude in $[0, b]$.

Assume M^\bullet has tor amplitude in $[0, b]$. We may assume M^\bullet is a bounded above complex of finite free A -modules (by our definition of pseudo-coherent complexes, see More on Algebra, Definition 15.50.1 and the discussion following the definition). By More on Algebra, Lemma 15.51.2 we see that $M = \text{Coker}(M^{-1} \rightarrow M^0)$ is flat. By Algebra, Lemma 10.75.2 we see that M is finite locally free. Hence M^\bullet is quasi-isomorphic to

$$M \rightarrow M^1 \rightarrow M^2 \rightarrow \dots \rightarrow M^d \rightarrow 0 \dots$$

Note that this is a K-flat complex (Cohomology, Lemma 20.27.8), hence derived pullback of K via a morphism $T \rightarrow B$ is computed by the complex

$$g^*\widetilde{M} \rightarrow g^*\widetilde{M}^1 \rightarrow \dots$$

Thus it suffices to show that the functor

$$(g : T \rightarrow B) \mapsto \text{Ker}(\Gamma(T, g^*\widetilde{M}) \rightarrow \Gamma(T, g^*(\widetilde{M}^1)))$$

is representable by an affine scheme of finite presentation over B .

We may still replace B by the members of an affine open covering in order to prove this last statement. Hence we may assume that M is finite free (recall that M^1 is finite free to begin with). Write $M = A^{\oplus n}$ and $M^1 = A^{\oplus m}$. Let the map $M \rightarrow M^1$ be given by the $m \times n$ matrix (a_{ij}) with coefficients in A . Then $\widetilde{M} = \mathcal{O}_B^{\oplus n}$ and $\widetilde{M}^1 = \mathcal{O}_B^{\oplus m}$. Thus the functor above is equal to the functor

$$(g : T \rightarrow B) \mapsto \{(f_1, \dots, f_n) \in \Gamma(T, \mathcal{O}_T) \mid \sum g^\#(a_{ij}f_i) = 0, j = 1, \dots, m\}$$

Clearly this is representable by the affine scheme

$$\text{Spec} \left(A[x_1, \dots, x_n] / \left(\sum a_{ij}x_i; j = 1, \dots, m \right) \right)$$

and the lemma has been proved. \square

The functor $\text{Hom}(\mathcal{F}, \mathcal{G})$ is representable in a number of situations. All of our results will be based on the following basic case. The proof of this lemma as given below is in some sense the natural generalization to the proof of [DG67, III, Cor 7.7.8].

Lemma 76.3.8. *In Situation 76.3.1 assume that*

- (1) B is a Noetherian algebraic space,
- (2) f is locally of finite type and quasi-separated,
- (3) \mathcal{F} is a finite type \mathcal{O}_X -module, and
- (4) \mathcal{G} is a finite type \mathcal{O}_X -module, flat over B , with scheme theoretic support proper over B .

Then the functor $\text{Hom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine and of finite presentation over B .

Proof. We may replace X by a quasi-compact open neighbourhood of the support of \mathcal{G} , hence we may assume X is Noetherian. In this case X and f are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow \mathcal{F}$ by a perfect complex P

of the triple $(X, \mathcal{F}, 0)$, see Derived Categories of Spaces, Definition 57.13.1 and Theorem 57.13.7). Then the induced map

$$\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathrm{Hom}_{D(\mathcal{O}_X)}(P, \mathcal{G})$$

is an isomorphism because $P \rightarrow \mathcal{F}$ induces an isomorphism $H^0(P) \rightarrow \mathcal{F}$ and $H^i(P) = 0$ for $i > 0$. Moreover, for any morphism $g : T \rightarrow B$ denote $h : X_T = T \times_B X \rightarrow X$ the projection and set $P_T = Lh^*P$. Then it is equally true that

$$\mathrm{Hom}_{\mathcal{O}_{X_T}}(\mathcal{F}_T, \mathcal{G}_T) \longrightarrow \mathrm{Hom}_{D(\mathcal{O}_{X_T})}(P_T, \mathcal{G}_T)$$

is an isomorphism, as $P_T = Lh^*P \rightarrow Lh^*\mathcal{F} \rightarrow \mathcal{F}_T$ induces an isomorphism $H^0(P_T) \rightarrow \mathcal{F}_T$ (because h^* is right exact and $H^i(P) = 0$ for $i > 0$). Thus it suffices to prove the result for the functor

$$T \longmapsto \mathrm{Hom}_{D(\mathcal{O}_{X_T})}(P_T, \mathcal{G}_T).$$

By the Leray spectral sequence (see Cohomology on Sites, Remark 21.14.4) we have

$$\mathrm{Hom}_{D(\mathcal{O}_{X_T})}(P_T, \mathcal{G}_T) = H^0(X_T, R\mathcal{H}om(P_T, \mathcal{G}_T)) = H^0(T, Rf_{T,*}R\mathcal{H}om(P_T, \mathcal{G}_T))$$

where $f_T : X_T \rightarrow T$ is the base change of f . By Derived Categories of Spaces, Lemma 57.17.6 we have

$$Rf_{T,*}R\mathcal{H}om(P_T, \mathcal{G}_T) = Lg^*Rf_*R\mathcal{H}om(P, \mathcal{G}).$$

By Derived Categories of Spaces, Lemma 57.19.2 the object $K = Rf_*R\mathcal{H}om(P, \mathcal{G})$ of $D(\mathcal{O}_B)$ is perfect. This means we can apply Lemma 76.3.7 as long as we can prove that the cohomology sheaf $H^i(Lg^*K)$ is 0 for all $i < 0$ and $g : T \rightarrow B$ as above. This is clear from the last displayed formula as the cohomology sheaves of $Rf_{T,*}R\mathcal{H}om(P_T, \mathcal{G}_T)$ are zero in negative degrees due to the fact that $R\mathcal{H}om(P_T, \mathcal{G}_T)$ has vanishing cohomology sheaves in negative degrees as P_T is perfect with vanishing cohomology sheaves in positive degrees. \square

Here is a cheap consequence of Lemma 76.3.8.

Proposition 76.3.9. *In Situation 76.3.1 assume that*

- (1) *f is of finite presentation, and*
- (2) *\mathcal{G} is a finitely presented \mathcal{O}_X -module, flat over B , with scheme theoretic support proper over B .*

Then the functor $\mathrm{Hom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine over B . If \mathcal{F} is of finite presentation, then $\mathrm{Hom}(\mathcal{F}, \mathcal{G})$ is of finite presentation over B .

Proof. By Lemma 76.3.2 the functor $\mathrm{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for fppf coverings. This mean we may¹ apply Bootstrap, Lemma 62.11.1 to check the representability étale locally on B . Moreover, we may check whether the end result is affine or of finite presentation étale locally on B , see Morphisms of Spaces, Lemmas 49.20.3 and 49.27.4. Hence we may assume that B is an affine scheme.

Assume B is an affine scheme. As f is of finite presentation, it follows X is quasi-compact and quasi-separated. Thus we can write $\mathcal{F} = \mathrm{colim} \mathcal{F}_i$ as a filtered colimit of \mathcal{O}_X -modules of finite presentation (Limits of Spaces, Lemma 52.9.1). It is clear that

$$\mathrm{Hom}(\mathcal{F}, \mathcal{G}) = \lim \mathrm{Hom}(\mathcal{F}_i, \mathcal{G})$$

¹We omit the verification of the set theoretical condition (3) of the referenced lemma.

Hence if we can show that each $\text{Hom}(\mathcal{F}_i, \mathcal{G})$ is representable by an affine scheme, then we see that the same thing holds for $\text{Hom}(\mathcal{F}, \mathcal{G})$. Use the material in Limits, Section 31.2 and Limits of Spaces, Section 52.4. Thus we may assume that \mathcal{F} is of finite presentation.

Say $B = \text{Spec}(R)$. Write $R = \text{colim } R_i$ with each R_i a finite type \mathbf{Z} -algebra. Set $B_i = \text{Spec}(R_i)$. By the results of Limits of Spaces, Lemmas 52.7.1 and 52.7.2 we can find an i , a morphism of algebraic spaces $X_i \rightarrow B_i$, and finitely presented \mathcal{O}_{X_i} -modules \mathcal{F}_i and \mathcal{G}_i such that the base change of $(X_i, \mathcal{F}_i, \mathcal{G}_i)$ to B recovers $(X, \mathcal{F}, \mathcal{G})$. By Limits of Spaces, Lemma 52.6.11 we may, after increasing i , assume that \mathcal{G}_i is flat over B_i . By Limits of Spaces, Lemma 52.12.3 we may similarly assume the scheme theoretic support of \mathcal{G}_i is proper over B_i . At this point we can apply Lemma 76.3.8 to see that $H_i = \text{Hom}(\mathcal{F}_i, \mathcal{G}_i)$ is an algebraic space affine of finite presentation over B_i . Pulling back to B (using Remark 76.3.3) we see that $H_i \times_{B_i} B = \text{Hom}(\mathcal{F}, \mathcal{G})$ and we win. \square

76.4. The Isom functor

In Situation 76.3.1 we can consider the subfunctor

$$\text{Isom}(\mathcal{F}, \mathcal{G}) \subset \text{Hom}(\mathcal{F}, \mathcal{G})$$

whose value on a scheme T over B is the set of *invertible* \mathcal{O}_{X_T} -homomorphisms $u : \mathcal{F}_T \rightarrow \mathcal{G}_T$. In this brief section we quickly point out some properties of this functor.

Lemma 76.4.1. *In Situation 76.3.1 the functor $\text{Isom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for the fpqc topology.*

Proof. We have already seen that $\text{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property. Hence it remains to show the following: Given an fpqc covering $\{T_i \rightarrow T\}_{i \in I}$ of schemes over B and an \mathcal{O}_{X_T} -linear map $u : \mathcal{F}_T \rightarrow \mathcal{G}_T$ such that u_{T_i} is an isomorphism for all i , then u is an isomorphism. Since $\{X_i \rightarrow X_T\}_{i \in I}$ is an fpqc covering of X_T , see Topologies on Spaces, Lemma 55.3.2, this follows from Descent on Spaces, Proposition 56.4.1. \square

Proposition 76.4.2. *In Situation 76.3.1 assume that*

- (1) *f is of finite presentation, and*
- (2) *\mathcal{F} and \mathcal{G} are finitely presented \mathcal{O}_X -modules, flat over B , with scheme theoretic support proper over B .*

Then the functor $\text{Isom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine of finite presentation over B .

Proof. We will use the abbreviations $H = \text{Hom}(\mathcal{F}, \mathcal{G})$, $I = \text{Hom}(\mathcal{F}, \mathcal{F})$, $H' = \text{Hom}(\mathcal{G}, \mathcal{F})$, and $I' = \text{Hom}(\mathcal{G}, \mathcal{G})$. By Proposition 76.3.9 the functors H, I, H', I' are algebraic spaces and the morphisms $H \rightarrow B, I \rightarrow B, H' \rightarrow B$, and $I' \rightarrow B$ are affine and of finite presentation. The composition of maps gives a morphism

$$c : H' \times_B H \longrightarrow I \times_B I', \quad (u', u) \longmapsto (u \circ u', u' \circ u)$$

of algebraic spaces over B . Since $I \times_B I' \rightarrow B$ is separated, the section $\sigma : B \rightarrow I \times_B I'$ corresponding to $(\text{id}_{\mathcal{F}}, \text{id}_{\mathcal{G}})$ is a closed immersion (Morphisms of Spaces,

Lemma 49.4.7). Moreover, σ is of finite presentation (Morphisms of Spaces, Lemma 49.27.9). Hence

$$\text{Isom}(\mathcal{F}, \mathcal{G}) = (H' \times_B H) \times_{c, I \times_B I', \sigma} B$$

is an algebraic space affine of finite presentation over B as well. Some details omitted. \square

76.5. The stack of coherent sheaves

In this section we prove that the stack of coherent sheaves on X/B is algebraic under suitable hypotheses. This is a special case of [Lie06b, Theorem 2.1.1] which treats the case of the stack of coherent sheaves on an Artin stack over a base.

Situation 76.5.1. Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Assume that f is of finite presentation. We denote $\text{Coh}_{X/B}$ the category whose objects are triples (T, g, \mathcal{F}) where

- (1) T is a scheme over S ,
- (2) $g : T \rightarrow B$ is a morphism over S , and setting $X_T = T \times_{g, B} X$
- (3) \mathcal{F} is a quasi-coherent \mathcal{O}_{X_T} -module of finite presentation, flat over T , with scheme theoretic support proper over T .

A morphism $(T, g, \mathcal{F}) \rightarrow (T', g', \mathcal{F}')$ is given by a pair (h, φ) where

- (1) $h : T \rightarrow T'$ is a morphism of schemes over B (i.e., $g' \circ h = g$), and
- (2) $\varphi : (h')^* \mathcal{F}' \rightarrow \mathcal{F}$ is an isomorphism of \mathcal{O}_{X_T} -modules where $h' : X_T \rightarrow X_{T'}$ is the base change of h .

Thus $\text{Coh}_{X/B}$ is a category and the rule

$$p : \text{Coh}_{X/B} \longrightarrow (\text{Sch}/S)_{\text{fppf}}, \quad (T, g, \mathcal{F}) \longmapsto T$$

is a functor. For a scheme T over S we denote $\text{Coh}_{X/B, T}$ the fibre category of p over T . These fibre categories are groupoids.

Lemma 76.5.2. *In Situation 76.5.1 the functor $p : \text{Coh}_{X/B} \longrightarrow (\text{Sch}/S)_{\text{fppf}}$ is fibred in groupoids.*

Proof. We show that p is fibred in groupoids by checking conditions (1) and (2) of Categories, Definition 4.33.1. Given an object (T', g', \mathcal{F}') of $\text{Coh}_{X/B}$ and a morphism $h : T \rightarrow T'$ of schemes over S we can set $g = h \circ g'$ and $\mathcal{F} = (h')^* \mathcal{F}'$ where $h' : X_T \rightarrow X_{T'}$ is the base change of h . Then it is clear that we obtain a morphism $(T, g, \mathcal{F}) \rightarrow (T', g', \mathcal{F}')$ of $\text{Coh}_{X/B}$ lying over h . This proves (1). For (2) suppose we are given morphisms

$$(h_1, \varphi_1) : (T_1, g_1, \mathcal{F}_1) \rightarrow (T, g, \mathcal{F}) \quad \text{and} \quad (h_2, \varphi_2) : (T_2, g_2, \mathcal{F}_2) \rightarrow (T, g, \mathcal{F})$$

of $\text{Coh}_{X/B}$ and a morphism $h : T_1 \rightarrow T_2$ such that $h_2 \circ h = h_1$. Then we can let φ be the composition

$$(h')^* \mathcal{F}_2 \xrightarrow{(h')^* \varphi_2^{-1}} (h')^* (h_2)^* \mathcal{F} = (h_1)^* \mathcal{F} \xrightarrow{\varphi_1} \mathcal{F}_1$$

to obtain the morphism $(h, \varphi) : (T_1, g_1, \mathcal{F}_1) \rightarrow (T_2, g_2, \mathcal{F}_2)$ that witnesses the truth of condition (2). \square

Lemma 76.5.3. *In Situation 76.5.1. Denote $\mathcal{X} = \text{Coh}_{X/B}$. Then $\Delta : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces.*

Proof. Consider two objects $x = (T, g, \mathcal{F})$ and $y = (T, h, \mathcal{G})$ of \mathcal{X} over a scheme T . We have to show that $Isom_{\mathcal{X}}(x, y)$ is representable by an algebraic space over T , see Algebraic Stacks, Lemma 71.10.11. If for $a : T' \rightarrow T$ the restrictions $x|_{T'}$ and $y|_{T'}$ are isomorphic in the fibre category $\mathcal{X}_{T'}$, then $g \circ a = h \circ a$. Hence there is a transformation of presheaves

$$Isom_{\mathcal{X}}(x, y) \longrightarrow \text{Equalizer}(g, h)$$

Since the diagonal of B is representable by schemes this equalizer is a scheme. Thus we may replace T by this equalizer and the sheaves \mathcal{F} and \mathcal{G} by their pullbacks. Thus we may assume $g = h$. In this case we have $Isom_{\mathcal{X}}(x, y) = Isom(\mathcal{F}, \mathcal{G})$ and the result follows from Proposition 76.4.2. \square

Lemma 76.5.4. *In Situation 76.5.1 the functor $p : Coh_{X/B} \rightarrow (Sch/S)_{fppf}$ is a stack in groupoids.*

Proof. To prove that $Coh_{X/B}$ is a stack in groupoids, we have to show that the presheaves $Isom$ are sheaves and that descent data are effective. The statement on $Isom$ follows from Lemma 76.5.3, see Algebraic Stacks, Lemma 71.10.11. Let us prove the statement on descent data. Suppose that $\{a_i : T_i \rightarrow T\}$ is an fppf covering of schemes over S . Let (ξ_i, φ_{ij}) be a descent datum for $\{T_i \rightarrow T\}$ with values in $Coh_{X/B}$. For each i we can write $\xi_i = (T_i, g_i, \mathcal{F}_i)$. Denote $\text{pr}_0 : T_i \times_T T_j \rightarrow T_i$ and $\text{pr}_1 : T_i \times_T T_j \rightarrow T_j$ the projections. The condition that $\xi_i|_{T_i \times_T T_j} = \xi_j|_{T_i \times_T T_j}$ implies in particular that $g_i \circ \text{pr}_0 = g_j \circ \text{pr}_1$. Thus there exists a unique morphism $g : T \rightarrow B$ such that $g_i = g \circ a_i$, see Descent on Spaces, Lemma 56.6.2. Denote $X_T = T \times_{g,B} X$. Set $X_i = X_{T_i} = T_i \times_{g_i,B} X = T_i \times_{a_i,T} X_T$ and

$$X_{ij} = X_{T_i} \times_{X_T} X_{T_j} = X_i \times_{X_T} X_j$$

with projections pr_i and pr_j to X_i and X_j . Observe that the pullback of $(T_i, g_i, \mathcal{F}_i)$ by $\text{pr}_0 : T_i \times_T T_j \rightarrow T_i$ is given by $(T_i \times_T T_j, g_i \circ \text{pr}_0, \text{pr}_i^* \mathcal{F}_i)$. Hence a descent datum for $\{T_i \rightarrow T\}$ in $Coh_{X/B}$ is given by the objects $(T_i, g \circ a_i, \mathcal{F}_i)$ and for each pair i, j an isomorphism of $\mathcal{O}_{X_{ij}}$ -modules

$$\varphi_{ij} : \text{pr}_i^* \mathcal{F}_i \longrightarrow \text{pr}_j^* \mathcal{F}_j$$

satisfying the cocycle condition over (the pullback of X to) $T_i \times_T T_j \times_T T_k$. Ok, and now we simply use that $\{X_i \rightarrow X_T\}$ is an fppf covering so that we can view $(\mathcal{F}_i, \varphi_{ij})$ as a descent datum for this covering. By Descent on Spaces, Proposition 56.4.1 this descent datum is effective and we obtain a quasi-coherent sheaf \mathcal{F} over X_T restricting to \mathcal{F}_i on X_i . By Morphisms of Spaces, Lemma 49.29.5 we see that \mathcal{F} is flat over T and Descent on Spaces, Lemma 56.5.2 guarantees that \mathcal{Q} is of finite presentation as an \mathcal{O}_{X_T} -module. Finally, by Descent on Spaces, Lemma 56.10.17 we see that the scheme theoretic support of \mathcal{F} is proper over T as we've assume the scheme theoretic support of \mathcal{F}_i is proper over T_i (note that taking scheme theoretic support commutes with flat base change by Morphisms of Spaces, Lemma 49.28.10). In this way and we obtain our desired object over T . \square

Remark 76.5.5. In Situation 76.5.1 the rule $(T, g, \mathcal{F}) \mapsto (T, g)$ defines a 1-morphism

$$Coh_{X/B} \longrightarrow \mathcal{S}_B$$

of categories fibred in groupoids (see Lemma 76.5.4, Algebraic Stacks, Section 71.7, and Examples of Stacks, Section 72.9). Let $B' \rightarrow B$ be a morphism of algebraic spaces over S . Let $\mathcal{S}_{B'} \rightarrow \mathcal{S}_B$ be the associated 1-morphism of stacks fibred in

sets. Set $X' = X \times_B B'$. We obtain a stack in groupoids $Coh_{X'/B'} \rightarrow (Sch/S)_{fppf}$ associated to the base change $f' : X' \rightarrow B'$. In this situation the diagram

$$\begin{array}{ccc} Coh_{X'/B'} & \longrightarrow & Coh_{X/B} \\ \downarrow & & \downarrow \\ \mathcal{S}_{B'} & \longrightarrow & \mathcal{S}_B \end{array}$$

is 2-fibre product square. This trivial remark will occasionally be useful to change the base algebraic space.

Lemma 76.5.6. *In Situation 76.5.1 assume that $B \rightarrow S$ is locally of finite presentation. Then $p : Coh_{X/B} \rightarrow (Sch/S)_{fppf}$ is limit preserving (Artin's Axioms, Definition 75.13.1).*

Proof. Write $B(T)$ for the discrete category whose objects are the S -morphisms $T \rightarrow B$. Let $T = \lim T_i$ be a filtered limit of affine schemes over S . Assigning to an object (T, h, \mathcal{F}) of $Coh_{X/B,T}$ the object h of $B(T)$ gives us a commutative diagram of fibre categories

$$\begin{array}{ccc} \operatorname{colim} Coh_{X/B,T_i} & \longrightarrow & Coh_{X/B,T} \\ \downarrow & & \downarrow \\ \operatorname{colim} B(T_i) & \longrightarrow & B(T) \end{array}$$

We have to show the top horizontal arrow is an equivalence. Since we have assume that B is locally of finite presentation over S we see from Limits of Spaces, Remark 52.3.10 that the bottom horizontal arrow is an equivalence. This means that we may assume $T = \lim T_i$ be a filtered limit of affine schemes over B . Denote $g_i : T_i \rightarrow B$ and $g : T \rightarrow B$ the corresponding morphisms. Set $X_i = T_i \times_{g_i, B} X$ and $X_T = T \times_{g, B} X$. Observe that $X_T = \operatorname{colim} X_i$ and that the algebraic spaces X_i and X_T are quasi-separated and quasi-compact (as they are of finite presentation over the affines T_i and T). By Limits of Spaces, Lemma 52.7.2 we see that

$$\operatorname{colim} FP(X_i) = FP(X_T).$$

where $FP(W)$ is short hand for the category of finitely presented \mathcal{O}_W -modules. The results of Limits of Spaces, Lemmas 52.6.11 and 52.12.3 tell us the same thing is true if we replace $FP(X_i)$ and $FP(X_T)$ by the full subcategory of objects flat over T_i and T with scheme theoretic support proper over T_i and T . This proves the lemma. \square

Lemma 76.5.7. *In Situation 76.5.1. Let*

$$\begin{array}{ccc} Z & \longrightarrow & Z' \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y' \end{array}$$

be a pushout in the category of schemes over S where $Z \rightarrow Z'$ is a thickening and $Z \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.1. Then the functor on fibre categories

$$Coh_{X/B,Y'} \longrightarrow Coh_{X/B,Y} \times_{Coh_{X/B,Z}} Coh_{X/B,Z'}$$

is an equivalence.

Proof. Observe that the corresponding map

$$B(Y') \longrightarrow B(Y) \times_{B(Z)} B(Z')$$

is a bijection, see Pushouts of Spaces, Lemma 59.2.2. Thus using the commutative diagram

$$\begin{array}{ccc} \text{Coh}_{X/B, Y'} & \longrightarrow & \text{Coh}_{X/B, Y} \times_{\text{Coh}_{X/B, Z}} \text{Coh}_{X/B, Z'} \\ \downarrow & & \downarrow \\ B(Y') & \longrightarrow & B(Y) \times_{B(Z)} B(Z') \end{array}$$

we see that we may assume that Y' is a scheme over B' . By Remark 76.5.5 we may replace B by Y' and X by $X \times_B Y'$. Thus we may assume $B = Y'$. In this case the statement follows from Pushouts of Spaces, Lemma 59.2.7. \square

Lemma 76.5.8. *Let*

$$\begin{array}{ccc} X & \xrightarrow{i} & X' \\ \downarrow & & \downarrow \\ T & \longrightarrow & T' \end{array}$$

be a cartesian square of algebraic spaces where $T \rightarrow T'$ is a first order thickening. Let \mathcal{F}' be an $\mathcal{O}_{X'}$ -module flat over T' . Set $\mathcal{F} = i^ \mathcal{F}'$. The following are equivalent*

- (1) \mathcal{F} is a quasi-coherent $\mathcal{O}_{X'}$ -module of finite presentation,
- (2) \mathcal{F} is an $\mathcal{O}_{X'}$ -module of finite presentation,
- (3) \mathcal{F} is a quasi-coherent \mathcal{O}_X -module of finite presentation,
- (4) \mathcal{F} is an \mathcal{O}_X -module of finite presentation,

Proof. Recall that a finitely presented module is quasi-coherent hence the equivalence of (1) and (2) and (3) and (4). The equivalence of (2) and (4) is a special case of Deformation Theory, Lemma 69.10.3. \square

Lemma 76.5.9. *In Situation 76.5.1 assume that S is a locally Noetherian scheme and $B \rightarrow S$ is locally of finite presentation. Let k be a finite type field over S and let $x_0 = (\text{Spec}(k), g_0, \mathcal{G}_0)$ be an object of $\mathcal{X} = \text{Coh}_{X/B}$ over k . Then the spaces $T\mathcal{F}_{\mathcal{X}, k, x_0}$ and $\text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X}, k, x_0})$ (Artin's Axioms, Section 75.8) are finite dimensional.*

Proof. Observe that by Lemma 76.5.7 our stack in groupoids \mathcal{X} satisfies property (RS*) defined in Artin's Axioms, Section 75.18. In particular \mathcal{X} satisfies (RS). Hence all associated predeformation categories are deformation categories (Artin's Axioms, Lemma 75.6.1) and the statement makes sense.

In this paragraph we show that we can reduce to the case $B = \text{Spec}(k)$. Set $X_0 = \text{Spec}(k) \times_{g_0, B} X$ and denote $\mathcal{X}_0 = \text{Coh}_{X_0/k}$. In Remark 76.5.5 we have seen that \mathcal{X}_0 is the 2-fibre product of \mathcal{X} with $\text{Spec}(k)$ over B as categories fibred in groupoids over $(\text{Sch}/S)_{fppf}$. Thus by Artin's Axioms, Lemma 75.8.2 we reduce to proving that B , $\text{Spec}(k)$, and \mathcal{X}_0 have finite dimensional tangent spaces and infinitesimal automorphism spaces. The tangent space of B and $\text{Spec}(k)$ are finite dimensional by Artin's Axioms, Lemma 75.8.1 and of course these have vanishing Inf. Thus it suffices to deal with \mathcal{X}_0 .

Let $k[\epsilon]$ be the dual numbers over k . Let $\text{Spec}(k[\epsilon]) \rightarrow B$ be the composition of $g_0 : \text{Spec}(k) \rightarrow B$ and the morphism $\text{Spec}(k[\epsilon]) \rightarrow \text{Spec}(k)$ coming from the inclusion $k \rightarrow k[\epsilon]$. Set $X_0 = \text{Spec}(k) \times_B X$ and $X_\epsilon = \text{Spec}(k[\epsilon]) \times_B X$. Observe that X_ϵ is a

first order thickening of X_0 flat over the first order thickening $\text{Spec}(k) \rightarrow \text{Spec}(k[\epsilon])$. Unwinding the definitions and using Lemma 76.5.8 we see that $T\mathcal{F}_{\mathcal{X}_0, k, x_0}$ is the set of lifts of \mathcal{G}_0 to a flat module on X_ϵ . By Deformation Theory, Lemma 69.11.1 we conclude that

$$T\mathcal{F}_{\mathcal{X}_0, k, x_0} = \text{Ext}_{\mathcal{O}_{X_0}}^1(\mathcal{G}_0, \mathcal{G}_0)$$

Here we have used the identification $\epsilon k[\epsilon] \cong k$ of $k[\epsilon]$ -modules. Using Deformation Theory, Lemma 69.11.1 once more we see that

$$\text{Inf}_{x_0}(\mathcal{F}_{\mathcal{X}, k, x_0}) = \text{Ext}_{\mathcal{O}_{X_0}}^0(\mathcal{G}_0, \mathcal{G}_0)$$

These spaces are finite dimensional over k as \mathcal{G}_0 has support proper over $\text{Spec}(k)$. Namely, X_0 is of finite presentation over $\text{Spec}(k)$, hence Noetherian. Since \mathcal{G}_0 is of finite presentation it is a coherent \mathcal{O}_{X_0} -module. Thus we may apply Derived Categories of Spaces, Lemma 57.19.3 to conclude the desired finiteness. \square

Lemma 76.5.10. *In Situation 76.5.1 assume that S is a locally Noetherian scheme and that $f : X \rightarrow B$ is separated. Let $\mathcal{X} = \text{Coh}_{X/B}$. Then the functor Artin’s Axioms, Equation (75.9.2.1) is an equivalence.*

Proof. Let A be an S -algebra which is a complete local Noetherian ring with maximal ideal \mathfrak{m} whose residue field k is of finite type over S . We have to show that the category of objects over A is equivalent to the category of formal objects over A . Since we know this holds for the category \mathcal{S}_B fibred in sets associated to B by Artin’s Axioms, Lemma 75.9.4, it suffices to prove this for those objects lying over a given morphism $\text{Spec}(A) \rightarrow B$.

Set $X_A = \text{Spec}(A) \times_B X$ and $X_n = \text{Spec}(A/\mathfrak{m}^n) \times_B X$. By Grothendieck’s existence theorem (More on Morphisms of Spaces, Theorem 58.31.11) we see that the category of coherent modules \mathcal{F} on X_A with support proper over $\text{Spec}(A)$ is equivalent to the category of systems (\mathcal{F}_n) of coherent modules \mathcal{F}_n on X_n with support proper over $\text{Spec}(A/\mathfrak{m}^n)$. The equivalence sends \mathcal{F} to the system $(\mathcal{F} \otimes_A A/\mathfrak{m}^n)$. See discussion in More on Morphisms of Spaces, Remark 58.31.12. To finish the proof of the lemma, it suffices to show that \mathcal{F} is flat over A if and only if all $\mathcal{F} \otimes_A A/\mathfrak{m}^n$ are flat over A/\mathfrak{m}^n . This follows from More on Morphisms of Spaces, Lemma 58.20.3. \square

Lemma 76.5.11. *In Situation 76.5.1 assume that S is a locally Noetherian scheme, $S = B$, and $f : X \rightarrow B$ is flat. Let $\mathcal{X} = \text{Coh}_{X/B}$. Then we have openness of versality for \mathcal{X} (see Artin’s Axioms, Definition 75.14.1).*

Proof. Let $U \rightarrow S$ be of finite type morphism of schemes, x an object of \mathcal{X} over U and $u_0 \in U$ a finite type point such that x is versal at u_0 . After shrinking U we may assume that u_0 is a closed point (Morphisms, Lemma 28.17.1) and $U = \text{Spec}(A)$ with $U \rightarrow S$ mapping into an affine open $\text{Spec}(\Lambda)$ of S . We will use Artin’s Axioms, Lemma 75.21.4 to prove the lemma. Let \mathcal{F} be the coherent module on $X_A = \text{Spec}(A) \times_S X$ flat over A corresponding to the given object x .

According to Deformation Theory, Lemma 69.11.1 we have an isomorphism of functors

$$T_x(M) = \text{Ext}_{X_A}^1(\mathcal{F}, \mathcal{F} \otimes_A M)$$

and given any surjection $A' \rightarrow A$ of Λ -algebras with square zero kernel I we have an obstruction class

$$\xi_{A'} \in \text{Ext}_{X_A}^2(\mathcal{F}, \mathcal{F} \otimes_A I)$$

This uses that for any $A' \rightarrow A$ as above the base change $X_{A'} = \text{Spec}(A') \times_B X$ is flat over A' . Apply Derived Categories of Spaces, Lemma 57.19.3 to the computation of the Ext groups $\text{Ext}_{X_A}^i(\mathcal{F}, \mathcal{F} \otimes_A M)$ for $i \leq m$ with $m = 2$. We find a perfect object $K \in D(A)$ and functorial isomorphisms

$$H^i(K \otimes_A^{\mathbf{L}} M) \longrightarrow \text{Ext}_{X_A}^i(\mathcal{F}, \mathcal{F} \otimes_A M)$$

for $i \leq m$ compatible with boundary maps. This object K , together with the displayed identifications above gives us a datum as in Artin's Axioms, Situation 75.21.2. Finally, condition (iv) of Artin's Axioms, Lemma 75.21.3 holds by Deformation Theory, Lemma 69.11.3. Thus Artin's Axioms, Lemma 75.21.4 does indeed apply and the lemma is proved. \square

Theorem 76.5.12 (Algebraicity of stack coherent sheaves). *Let S be a scheme. Let $f : X \rightarrow B$ be morphism of algebraic spaces over S . Assume that f is of finite presentation, separated, and flat². Then $\text{Coh}_{X/B}$ is an algebraic stack over S .*

Proof. Set $\mathcal{X} = \text{Coh}_{X/B}$. We have seen that \mathcal{X} is a stack in groupoids over $(\text{Sch}/S)_{fppf}$ with diagonal representable by algebraic spaces (Lemmas 76.5.4 and 76.5.3). Hence it suffices to find a scheme W and a surjective and smooth morphism $W \rightarrow \mathcal{X}$.

Let B' be a scheme and let $B' \rightarrow B$ be a surjective étale morphism. Set $X' = B' \times_B X$ and denote $f' : X' \rightarrow B'$ the projection. Then $\mathcal{X}' = \text{Coh}_{X'/B'}$ is equal to the 2-fibre product of \mathcal{X} with the category fibred in sets associated to B' over the category fibred in sets associated to B (Remark 76.5.5). By the material in Algebraic Stacks, Section 71.10 the morphism $\mathcal{X}' \rightarrow \mathcal{X}$ is surjective and étale. Hence it suffices to prove the result for \mathcal{X}' . In other words, we may assume B is a scheme.

Assume B is a scheme. In this case we may replace S by B , see Algebraic Stacks, Section 71.19. Thus we may assume $S = B$.

Assume $S = B$. Choose an affine open covering $S = \bigcup U_i$. Denote \mathcal{X}_i the restriction of \mathcal{X} to $(\text{Sch}/U_i)_{fppf}$. If we can find schemes W_i over U_i and surjective smooth morphisms $W_i \rightarrow \mathcal{X}_i$, then we set $W = \coprod W_i$ and we obtain a surjective smooth morphism $W \rightarrow \mathcal{X}$. Thus we may assume $S = B$ is affine.

Assume $S = B$ is affine, say $S = \text{Spec}(\Lambda)$. Write $\Lambda = \text{colim } \Lambda_i$ as a filtered colimit with each Λ_i of finite type over \mathbf{Z} . For some i we can find a morphism of algebraic spaces $X_i \rightarrow \text{Spec}(\Lambda_i)$ which is of finite presentation and flat and whose base change to Λ is X . See Limits of Spaces, Lemmas 52.7.1 and 52.6.11. If we show that $\text{Coh}_{X_i/\text{Spec}(\Lambda_i)}$ is an algebraic stack, then it follows by base change (Remark 76.5.5 and Algebraic Stacks, Section 71.19) that \mathcal{X} is an algebraic stack. Thus we may assume that Λ is a finite type \mathbf{Z} -algebra.

Assume $S = B = \text{Spec}(\Lambda)$ is affine of finite type over \mathbf{Z} . In this case we will verify conditions (1), (2), (3), and (4) of Artin's Axioms, Lemma 75.17.1 to conclude that \mathcal{X} is an algebraic stack. Note that Λ is a G-ring, see More on Algebra, Proposition 15.39.12. Hence all local rings of S are G-rings. Thus (4) holds. By Lemma 76.5.11 we have that \mathcal{X} satisfies openness of versality, hence (3) holds. To check (2) we have to verify axioms [-1], [0], [1], [2], [3], and [4] of Artin's Axioms, Section 75.12. We

²This assumption is not necessary. See discussion in Section 76.6.

omit the verification of [-1] and axioms [0], [1], [2], [3], [4] correspond respectively to Lemmas 76.5.4, 76.5.6, 76.5.7, 76.5.9, and 76.5.10. Finally, condition (1) is Lemma 76.5.3. This finishes the proof of the theorem. \square

76.6. The stack of coherent sheaves in the non-flat case

In Theorem 76.5.12 the assumption that $f : X \rightarrow B$ is flat is not necessary. In this section we explain where this assumption is used in the proof and one way to get around it.

For a different approach to this problem the reader may wish to consult [Art69b] and follow the method discussed in the papers [OS03], [Lie06b], [Ols05], [HR13], [HR10], [Ryd11]. Some of these papers deal with the more general case of the stack of coherent sheaves on an algebraic stack over an algebraic stack and others deal with similar problems in the case of Hilbert stacks or Quot functors. Our strategy will be to show algebraicity of some cases of Hilbert stacks and Quot functors as a consequence of the algebraicity of the stack of coherent sheaves.

The only step in the proof of Theorem 76.5.12 which uses flatness is in the application of Lemma 76.5.11. The lemma is used to construct an obstruction theory as in Artin's Axioms, Section 75.21. The proof of the lemma relies on Deformation Theory, Lemmas 69.11.1 and 69.11.3 from Deformation Theory, Section 69.11. This is how the assumption that f is flat comes about. Before we go on, note that results (2) and (3) of Deformation Theory, Lemmas 69.11.1 do hold without the assumption that f is flat as they rely on Deformation Theory, Lemmas 69.10.7. and 69.10.4 which do not have any flatness assumptions.

Before we give the details we give some motivation for the construction from derived algebraic geometry, since we think it will clarify what follows. Let A be a finite type algebra over the locally Noetherian base S . Denote $X \otimes^{\mathbf{L}} A$ a "derived base change" of X to A and denote $i : X_A \rightarrow X \otimes^{\mathbf{L}} A$ the canonical inclusion morphism. The object $X \otimes^{\mathbf{L}} A$ does not (yet) have a definition in the Stacks project; we may think of it as the algebraic space X_A endowed with a simplicial sheaf of rings $\mathcal{O}_{X \otimes^{\mathbf{L}} A}$ whose homology sheaves are

$$H_i(\mathcal{O}_{X \otimes^{\mathbf{L}} A}) = \mathrm{Tor}_i^{\mathcal{O}_S}(\mathcal{O}_X, A).$$

The morphism $X \otimes^{\mathbf{L}} A \rightarrow \mathrm{Spec}(A)$ is flat (the terms of the simplicial sheaf of rings being A -flat), so the usual material for deformations of flat modules applies to it. Thus we see that we get an obstruction theory using the groups

$$\mathrm{Ext}_{X \otimes^{\mathbf{L}} A}^i(i_*\mathcal{F}, i_*\mathcal{F} \otimes_A M)$$

where $i = 0, 1, 2$ for inf auts, inf defs, obstructions. Note that a flat deformation of $i_*\mathcal{F}$ to $X \otimes^{\mathbf{L}} A'$ is automatically of the form $i'_*\mathcal{F}'$ where \mathcal{F}' is a flat deformation of \mathcal{F} . By adjunction of the functors Li^* and $i_* = Ri_*$ these ext groups are equal to

$$\mathrm{Ext}_{X_A}^i(Li^*(i_*\mathcal{F}), \mathcal{F} \otimes_A M)$$

Thus we obtain obstruction groups of exactly the same form as in the proof of Lemma 76.5.11 with the only change being that one replaces the first occurrence of \mathcal{F} by the complex $Li^*(i_*\mathcal{F})$.

Below we prove the non-flat version of the lemma by a "direct" construction of $E(\mathcal{F}) = Li^*(i_*\mathcal{F})$ and direct proof of its relationship to the deformation theory of \mathcal{F} . In fact, it suffices to construct $\tau_{\geq -2}E(\mathcal{F})$, as we are only interested in the

ext groups $\text{Ext}_{X_A}^i(Li^*(i_*\mathcal{F}), \mathcal{F} \otimes_A M)$ for $i = 0, 1, 2$. We can even identify the cohomology sheaves

$$H^i(E(\mathcal{F})) = \begin{cases} 0 & \text{if } i > 0 \\ \mathcal{F} & \text{if } i = 0 \\ 0 & \text{if } i = -1 \\ \text{Tor}_1^{\mathcal{O}_S}(\mathcal{O}_X, A) \otimes_{\mathcal{O}_X} \mathcal{F} & \text{if } i = -2 \end{cases}$$

This observation will guide our construction of $E(\mathcal{F})$ in the remarks below.

Remark 76.6.1 (Direct construction). Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let U be another algebraic space over B . Denote $q : X \times_B U \rightarrow U$ the second projection. Consider the distinguished triangle

$$Lq^*L_{U/B} \rightarrow L_{X \times_B U/B} \rightarrow E \rightarrow Lq^*L_{U/B}[1]$$

of Cotangent, Section 70.27. For any sheaf \mathcal{F} of $\mathcal{O}_{X \times_B U}$ -modules we have the Atiyah class

$$\mathcal{F} \rightarrow L_{X \times_B U/B} \otimes_{\mathcal{O}_{X \times_B U}}^{\mathbf{L}} \mathcal{F}[1]$$

see Cotangent, Section 70.18. We can compose this with the map to E and choose a distinguished triangle

$$E(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X \times_B U}}^{\mathbf{L}} E[1] \rightarrow E(\mathcal{F})[1]$$

in $D(\mathcal{O}_{X \times_B U})$. By construction the Atiyah class lifts to a map

$$e_{\mathcal{F}} : E(\mathcal{F}) \longrightarrow Lq^*L_{U/B} \otimes_{\mathcal{O}_{X \times_B U}}^{\mathbf{L}} \mathcal{F}[1]$$

fitting into a morphism of distinguished triangles

$$\begin{array}{ccccc} \mathcal{F} \otimes^{\mathbf{L}} Lq^*L_{U/B}[1] & \longrightarrow & \mathcal{F} \otimes^{\mathbf{L}} L_{X \times_B U/B}[1] & \longrightarrow & \mathcal{F} \otimes^{\mathbf{L}} E[1] \\ e_{\mathcal{F}} \uparrow & & \text{Atiyah} \uparrow & & = \uparrow \\ E(\mathcal{F}) & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{F} \otimes^{\mathbf{L}} E[1] \end{array}$$

Given $S, B, X, f, U, \mathcal{F}$ we fix a choice of $E(\mathcal{F})$ and $e_{\mathcal{F}}$.

Remark 76.6.2 (Construction of obstruction class). With notation as in Remark 76.6.1 let $i : U \rightarrow U'$ be a first order thickening of U over B . Let $\mathcal{I} \subset \mathcal{O}_{U'}$ be the quasi-coherent sheaf of ideals cutting out B in B' . The fundamental triangle

$$Li^*L_{U'/B} \rightarrow L_{U/B} \rightarrow L_{U/U'} \rightarrow Li^*L_{U'/B}[1]$$

together with the map $L_{U/U'} \rightarrow \mathcal{I}[1]$ determine a map $e_{U'} : L_{U/B} \rightarrow \mathcal{I}[1]$. Combined with the map $e_{\mathcal{F}}$ of the previous remark we obtain

$$(\text{id}_{\mathcal{F}} \otimes Lq^*e_{U'}) \cup e_{\mathcal{F}} : E(\mathcal{F}) \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X \times_B U}} q^*\mathcal{I}[2]$$

(we have also composed with the map from the derived tensor product to the usual tensor product). In other words, we obtain an element

$$\xi_{U'} \in \text{Ext}_{\mathcal{O}_{X \times_B U}}^2(E(\mathcal{F}), \mathcal{F} \otimes_{\mathcal{O}_{X \times_B U}} q^*\mathcal{I})$$

Lemma 76.6.3. *In the situation of Remark 76.6.2 assume that \mathcal{F} is flat over U . Then the vanishing of the class $\xi_{U'}$ is a necessary and sufficient condition for the existence of a $\mathcal{O}_{X \times_B U'}$ -module \mathcal{F}' flat over U' with $i^*\mathcal{F}' \cong \mathcal{F}$.*

Proof (sketch). We will use the criterion of Deformation Theory, Lemma 69.10.8. We will abbreviate $\mathcal{O} = \mathcal{O}_{X \times_B U}$ and $\mathcal{O}' = \mathcal{O}_{X \times_B U'}$. Consider the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{U'} \rightarrow \mathcal{O}_U \rightarrow 0.$$

Let $\mathcal{J} \subset \mathcal{O}'$ be the quasi-coherent sheaf of ideals cutting out $X \times_B U$. By the above we obtain an exact sequence

$$\mathrm{Tor}_1^{\mathcal{O}_B}(\mathcal{O}_X, \mathcal{O}_U) \rightarrow q^* \mathcal{I} \rightarrow \mathcal{J} \rightarrow 0$$

where the $\mathrm{Tor}_1^{\mathcal{O}_B}(\mathcal{O}_X, \mathcal{O}_U)$ is an abbreviation for

$$\mathrm{Tor}_1^{h^{-1}\mathcal{O}_B}(p^{-1}\mathcal{O}_X, q^{-1}\mathcal{O}_U) \otimes_{(p^{-1}\mathcal{O}_X \otimes_{h^{-1}\mathcal{O}_B} q^{-1}\mathcal{O}_U)} \mathcal{O}.$$

Tensoring with \mathcal{F} we obtain the exact sequence

$$\mathcal{F} \otimes_{\mathcal{O}} \mathrm{Tor}_1^{\mathcal{O}_B}(\mathcal{O}_X, \mathcal{O}_U) \rightarrow \mathcal{F} \otimes_{\mathcal{O}} q^* \mathcal{I} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{J} \rightarrow 0$$

(Note that the roles of the letters \mathcal{I} and \mathcal{J} are reversed relative to the notation in Deformation Theory, Lemma 69.10.8.) Condition (1) of the lemma is that the last map above is an isomorphism, i.e., that the first map is zero. The vanishing of this map may be checked on stalks at geometric points $\bar{z} = (\bar{x}, \bar{u}) : \mathrm{Spec}(k) \rightarrow X \times_B U$. Set $R = \mathcal{O}_{B, \bar{b}}$, $A = \mathcal{O}_{X, \bar{x}}$, $B = \mathcal{O}_{U, \bar{u}}$, and $C = \mathcal{O}_{\bar{z}}$. By Cotangent, Lemma 70.27.2 and the defining triangle for $E(\mathcal{F})$ we see that

$$H^{-2}(E(\mathcal{F}))_{\bar{z}} = \mathcal{F}_{\bar{z}} \otimes \mathrm{Tor}_1^R(A, B)$$

The map $\xi_{U'}$ therefore induces a map

$$\mathcal{F}_{\bar{z}} \otimes \mathrm{Tor}_1^R(A, B) \longrightarrow \mathcal{F}_{\bar{z}} \otimes_B \mathcal{I}_{\bar{u}}$$

We claim this map is the same as the stalk of the map described above (proof omitted; this is a purely ring theoretic statement). Thus we see that condition (1) of Deformation Theory, Lemma 69.10.8 is equivalent to the vanishing $H^{-2}(\xi_{U'}) : H^{-2}(E(\mathcal{F})) \rightarrow \mathcal{F} \otimes \mathcal{I}$.

To finish the proof we show that, assuming that condition (1) is satisfied, condition (2) is equivalent to the vanishing of $\xi_{U'}$. In the rest of the proof we write $\mathcal{F} \otimes \mathcal{I}$ to denote $\mathcal{F} \otimes_{\mathcal{O}} q^* \mathcal{I} = \mathcal{F} \otimes_{\mathcal{O}} \mathcal{J}$. A consideration of the spectral sequence

$$\mathrm{Ext}^i(H^{-j}(E(\mathcal{F})), \mathcal{F} \otimes \mathcal{I}) \Rightarrow \mathrm{Ext}^{i+j}(E(\mathcal{F}), \mathcal{F} \otimes \mathcal{I})$$

using that $H^0(E(\mathcal{F})) = \mathcal{F}$ and $H^{-1}(E(\mathcal{F})) = 0$ shows that there is an exact sequence

$$0 \rightarrow \mathrm{Ext}^2(\mathcal{F}, \mathcal{F} \otimes \mathcal{I}) \rightarrow \mathrm{Ext}^2(E(\mathcal{F}), \mathcal{F} \otimes \mathcal{I}) \rightarrow \mathrm{Hom}(H^{-2}(E(\mathcal{F})), \mathcal{F} \otimes \mathcal{I})$$

Thus our element $\xi_{U'}$ is an element of $\mathrm{Ext}^2(\mathcal{F}, \mathcal{F} \otimes \mathcal{I})$. The proof is finished by showing this element agrees with the element of Deformation Theory, Lemma 69.10.8 a verification we omit. \square

Lemma 76.6.4. *In Situation 76.5.1 assume that S is a locally Noetherian scheme and $S = B$. Let $\mathcal{X} = \mathrm{Coh}_{X/B}$. Then we have openness of versality for \mathcal{X} (see Artin's Axioms, Definition 75.14.1).*

Proof (sketch). Let $U \rightarrow S$ be of finite type morphism of schemes, x an object of \mathcal{X} over U and $u_0 \in U$ a finite type point such that x is versal at u_0 . After shrinking U we may assume that u_0 is a closed point (Morphisms, Lemma 28.17.1) and $U = \text{Spec}(A)$ with $U \rightarrow S$ mapping into an affine open $\text{Spec}(\Lambda)$ of S . We will use Artin's Axioms, Lemma 75.21.4 to prove the lemma. Let \mathcal{F} be the coherent module on $X_A = \text{Spec}(A) \times_S X$ flat over A corresponding to the given object x .

Choose $E(\mathcal{F})$ and $e_{\mathcal{F}}$ as in Remark 76.6.1. The description of the cohomology sheaves of $E(\mathcal{F})$ shows that

$$\text{Ext}^1(E(\mathcal{F}), \mathcal{F} \otimes_A M) = \text{Ext}^1(\mathcal{F}, \mathcal{F} \otimes_A M)$$

for any A -module M . Using this and using Deformation Theory, Lemma 69.10.7 we have an isomorphism of functors

$$T_x(M) = \text{Ext}_{X_A}^1(E(\mathcal{F}), \mathcal{F} \otimes_A M)$$

By Lemma 76.6.3 given any surjection $A' \rightarrow A$ of Λ -algebras with square zero kernel I we have an obstruction class

$$\xi_{A'} \in \text{Ext}_{X_A}^2(E(\mathcal{F}), \mathcal{F} \otimes_A I)$$

Apply Derived Categories of Spaces, Lemma 57.19.3 to the computation of the Ext groups $\text{Ext}_{X_A}^i(E(\mathcal{F}), \mathcal{F} \otimes_A M)$ for $i \leq m$ with $m = 2$. We omit the verification that $E(\mathcal{F})$ is in D_{Coh}^- ; hint: use Cotangent, Lemma 70.5.4. We find a perfect object $K \in D(A)$ and functorial isomorphisms

$$H^i(K \otimes_A^{\mathbf{L}} M) \longrightarrow \text{Ext}_{X_A}^i(E(\mathcal{F}), \mathcal{F} \otimes_A M)$$

for $i \leq m$ compatible with boundary maps. This object K , together with the displayed identifications above gives us a datum as in Artin's Axioms, Situation 75.21.2. Finally, condition (iv) of Artin's Axioms, Lemma 75.21.3 holds by a variant of Deformation Theory, Lemma 69.11.3 whose formulation and proof we omit. Thus Artin's Axioms, Lemma 75.21.4 applies and the lemma is proved. \square

Theorem 76.6.5 (Algebraicity of stack coherent sheaves; general case). *Let S be a scheme. Let $f : X \rightarrow B$ be morphism of algebraic spaces over S . Assume that f is of finite presentation and separated. Then $\text{Coh}_{X/B}$ is an algebraic stack over S .*

Proof. Identical to the proof of Theorem 76.5.12 except that we substitute Lemma 76.6.4 for Lemma 76.5.11. \square

76.7. Flattening functors

This section is the analogue of More on Flatness, Section 37.19. We urge the reader to skip this section on a first reading.

Situation 76.7.1. Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let $u : \mathcal{F} \rightarrow \mathcal{G}$ be a homomorphism of quasi-coherent \mathcal{O}_X -modules. For any scheme T over B we will denote $u_T : \mathcal{F}_T \rightarrow \mathcal{G}_T$ the base change of u to T , in other words, u_T is the pullback of u via the projection morphism $X_T = X \times_B T \rightarrow X$. In this situation we can consider the functor

$$(76.7.1.1) \quad F_{iso} : (\text{Sch}/B)^{opp} \longrightarrow \text{Sets}, \quad T \longrightarrow \begin{cases} \{*\} & \text{if } u_T \text{ is an isomorphism,} \\ \emptyset & \text{else.} \end{cases}$$

There are variants F_{inj} , F_{surj} , F_{zero} where we ask that u_T is injective, surjective, or zero.

In Situation 76.7.1 we sometimes think of the functors F_{iso} , F_{inj} , F_{surj} , and F_{zero} as functors $(Sch/S)^{opp} \rightarrow Sets$ endowed with a morphism $F_{iso} \rightarrow B$, $F_{inj} \rightarrow B$, $F_{surj} \rightarrow B$, and $F_{zero} \rightarrow B$. Namely, if T is a scheme over S , then an element $h \in F_{iso}(T)$ is just a morphism $h : T \rightarrow B$, i.e., an element $h \in B(T)$, such that the base change of u via h is an isomorphism. In particular, when we say that F_{iso} is an algebraic space, we mean that the corresponding functor $(Sch/S)^{opp} \rightarrow Sets$ is an algebraic space.

Lemma 76.7.2. *In Situation 76.7.1. Each of the functors F_{iso} , F_{inj} , F_{surj} , F_{zero} satisfies the sheaf property for the fpqc topology.*

Proof. Let $\{T_i \rightarrow T\}_{i \in I}$ be an fpqc covering of schemes over B . Set $X_i = X_{T_i} = X \times_S T_i$ and $u_i = u_{T_i}$. Note that $\{X_i \rightarrow X_T\}_{i \in I}$ is an fpqc covering of X_T , see Topologies on Spaces, Lemma 55.3.2. In particular, for every $x \in |X_T|$ there exists an $i \in I$ and an $x_i \in |X_i|$ mapping to x . Since $\mathcal{O}_{X_T, \bar{x}} \rightarrow \mathcal{O}_{X_i, \bar{x}_i}$ is flat, hence faithfully flat (see Morphisms of Spaces, Section 49.28). we conclude that $(u_i)_{x_i}$ is injective, surjective, bijective, or zero if and only if $(u_T)_x$ is injective, surjective, bijective, or zero. The lemma follows. \square

Lemma 76.7.3. *In Situation 76.7.1 let $X' \rightarrow X$ be a flat morphism of algebraic spaces. Denote $u' : \mathcal{F}' \rightarrow \mathcal{G}'$ the pullback of u to X' . Denote F'_{iso} , F'_{inj} , F'_{surj} , F'_{zero} the functors on Sch/B associated to u' .*

- (1) *If \mathcal{G} is of finite type and the image of $|X'| \rightarrow |X|$ contains the support of \mathcal{G} , then $F_{surj} = F'_{surj}$ and $F_{zero} = F'_{zero}$.*
- (2) *If \mathcal{F} is of finite type and the image of $|X'| \rightarrow |X|$ contains the support of \mathcal{F} , then $F_{inj} = F'_{inj}$ and $F_{zero} = F'_{zero}$.*
- (3) *If \mathcal{F} and \mathcal{G} are of finite type and the image of $|X'| \rightarrow |X|$ contains the supports of \mathcal{F} and \mathcal{G} , then $F_{iso} = F'_{iso}$.*

Proof. let $v : \mathcal{H} \rightarrow \mathcal{E}$ be a map of quasi-coherent modules on an algebraic space Y and let $\varphi : Y' \rightarrow Y$ be a surjective flat morphism of algebraic spaces, then v is an isomorphism, injective, surjective, or zero if and only if φ^*v is an isomorphism, injective, surjective, or zero. Namely, for every $y \in |Y|$ there exists a $y' \in |Y'|$ and the map of local rings $\mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{Y', \bar{y}'}$ is faithfully flat (see Morphisms of Spaces, Section 49.28). Of course, to check for injectivity or being zero it suffices to look at the points in the support of \mathcal{H} , and to check for surjectivity it suffices to look at points in the support of \mathcal{E} . Moreover, under the finite type assumptions as in the statement of the lemma, taking the supports commutes with base change, see Morphisms of Spaces, Lemma 49.15.2. Thus the lemma is clear. \square

Recall that we've defined the scheme theoretic support of a finite type quasi-coherent module in Morphisms of Spaces, Definition 49.15.4.

Lemma 76.7.4. *In Situation 76.7.1.*

- (1) *If \mathcal{G} is of finite type and the scheme theoretic support of \mathcal{G} is quasi-compact over B , then F_{surj} is limit preserving.*
- (2) *If \mathcal{F} of finite type and the scheme theoretic support of \mathcal{F} is quasi-compact over B , then F_{zero} is limit preserving.*
- (3) *If \mathcal{F} is of finite type, \mathcal{G} is of finite presentation, and the scheme theoretic supports of \mathcal{F} and \mathcal{G} are quasi-compact over B , then F_{iso} is limit preserving.*

Proof. Proof of (1). Let $i : Z \rightarrow X$ be the scheme theoretic support of \mathcal{G} and think of \mathcal{G} as a finite type quasi-coherent module on Z . We may replace X by Z and u by the map $i^*\mathcal{F} \rightarrow \mathcal{G}$ (details omitted). Hence we may assume f is quasi-compact and \mathcal{G} of finite type. Let $T = \lim_{i \in I} T_i$ be a directed limit of affine B -schemes and assume that u_T is surjective. Set $X_i = X_{T_i} = X \times_S T_i$ and $u_i = u_{T_i} : \mathcal{F}_i = \mathcal{F}_{T_i} \rightarrow \mathcal{G}_i = \mathcal{G}_{T_i}$. To prove (1) we have to show that u_i is surjective for some i . Pick $0 \in I$ and replace I by $\{i \mid i \geq 0\}$. Since f is quasi-compact we see X_0 is quasi-compact. Hence we may choose a surjective étale morphism $\varphi_0 : W_0 \rightarrow X_0$ where W_0 is an affine scheme. Set $W = W_0 \times_{T_0} T$ and $W_i = W_0 \times_{T_0} T_i$ for $i \geq 0$. These are affine schemes endowed with a surjective étale morphisms $\varphi : W \rightarrow X_T$ and $\varphi_i : W_i \rightarrow X_i$. Note that $W = \lim W_i$. Hence φ^*u_T is surjective and it suffices to prove that $\varphi_i^*u_i$ is surjective for some i . Thus we have reduced the problem to the affine case which is Algebra, Lemma 10.123.3 part (2).

Proof of (2). Assume \mathcal{F} is of finite type with scheme theoretic support $Z \subset B$ quasi-compact over B . Let $T = \lim_{i \in I} T_i$ be a directed limit of affine B -schemes and assume that u_T is zero. Set $X_i = T_i \times_B X$ and denote $u_i : \mathcal{F}_i \rightarrow \mathcal{G}_i$ the pullback. Choose $0 \in I$ and replace I by $\{i \mid i \geq 0\}$. Set $Z_0 = Z \times_X X_0$. By Morphisms of Spaces, Lemma 49.15.2 the support of \mathcal{F}_i is $|Z_0|$. Since $|Z_0|$ is quasi-compact we can find an affine scheme W_0 and an étale morphism $W_0 \rightarrow X_0$ such that $|Z_0| \subset \text{Im}(|W_0| \rightarrow |X_0|)$. Set $W = W_0 \times_{T_0} T$ and $W_i = W_0 \times_{T_0} T_i$ for $i \geq 0$. These are affine schemes endowed with étale morphisms $\varphi : W \rightarrow X_T$ and $\varphi_i : W_i \rightarrow X_i$. Note that $W = \lim W_i$ and that the support of \mathcal{F}_T and \mathcal{F}_i is contained in the image of $|W| \rightarrow |X_T|$ and $|W_i| \rightarrow |X_i|$. Now φ^*u_T is injective and it suffices to prove that $\varphi_i^*u_i$ is injective for some i . Thus we have reduced the problem to the affine case which is Algebra, Lemma 10.123.3 part (1).

Proof of (3). This can be proven in exactly the same manner as in the previous two paragraphs using Algebra, Lemma 10.123.3 part (3). We can also deduce it from (1) and (2) as follows. Let $T = \lim_{i \in I} T_i$ be a directed limit of affine B -schemes and assume that u_T is an isomorphism. By part (1) there exists an $0 \in I$ such that u_{T_0} is surjective. Set $\mathcal{K} = \text{Ker}(u_{T_0})$ and consider the map of quasi-coherent modules $v : \mathcal{K} \rightarrow \mathcal{F}_{T_0}$. For $i \geq 0$ the base change v_{T_i} is zero if and only if u_i is an isomorphism. Moreover, v_T is zero. Since \mathcal{G}_{T_0} is of finite presentation, \mathcal{F}_{T_0} is of finite type, and u_{T_0} is surjective we conclude that \mathcal{K} is of finite type (Modules on Sites, Lemma 18.24.1). It is clear that the support of \mathcal{K} is contained in the support of \mathcal{F}_{T_0} which is quasi-compact over T_0 . Hence we can apply part (2) to see that v_{T_i} is zero for some i . \square

Lemma 76.7.5. *Let $S = \text{Spec}(R)$ be an affine scheme. Let X be an algebraic space over S . Let $u : \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent \mathcal{O}_X -modules. Assume \mathcal{G} flat over S . Let $T \rightarrow S$ be a quasi-compact morphism of schemes such that the base change u_T is zero. Then exists a closed subscheme $Z \subset S$ such that (a) $T \rightarrow S$ factors through Z and (b) the base change u_Z is zero. If \mathcal{F} is a finite type \mathcal{O}_X -module and the scheme theoretic support of \mathcal{F} is quasi-compact, then we can take $Z \rightarrow S$ of finite presentation.*

Proof. Let $U \rightarrow X$ be a surjective étale morphism of algebraic spaces where $U = \coprod U_i$ is a disjoint union of affine schemes (see Properties of Spaces, Lemma 48.6.1). By Lemma 76.7.3 we see that we may replace X by U . In other words, we may assume that $X = \coprod X_i$ is a disjoint union of affine schemes X_i . Suppose that we can

prove the lemma for $u_i = u|_{X_i}$. Then we find a closed subscheme $Z_i \subset S$ such that $T \rightarrow S$ factors through Z_i and u_{i,Z_i} is zero. If $Z_i = \text{Spec}(R/I_i) \subset \text{Spec}(R) = S$, then taking $Z = \text{Spec}(R/\sum I_i)$ works. Thus we may assume that $X = \text{Spec}(A)$ is affine.

Choose a finite affine open covering $T = T_1 \cup \dots \cup T_m$. It is clear that we may replace T by $\coprod_{j=1, \dots, m} T_j$. Hence we may assume T is affine. Say $T = \text{Spec}(R')$. Let $u : M \rightarrow N$ be the homomorphisms of A -modules corresponding to $u : \mathcal{F} \rightarrow \mathcal{G}$. Then N is a flat R -module as \mathcal{G} is flat over S . The assumption of the lemma means that the composition

$$M \otimes_R R' \rightarrow N \otimes_R R'$$

is zero. Let $z \in M$. By Lazard's theorem (Algebra, Theorem 10.78.4) and the fact that \otimes commutes with colimits we can find free R -module F_z , an element $\tilde{z} \in F_z$, and a map $F_z \rightarrow N$ such that $u(z)$ is the image of \tilde{z} and \tilde{z} maps to zero in $F_z \otimes_R R'$. Choose a basis $\{e_{z,\alpha}\}$ of F_z and write $\tilde{z} = \sum f_{z,\alpha} e_{z,\alpha}$ with $f_{z,\alpha} \in R$. Let $I \subset R$ be the ideal generated by the elements $f_{z,\alpha}$ with z ranging over all elements of M . By construction I maps to zero in R' and the elements \tilde{z} map to zero in F_z/IF_z whence in N/IN . Thus $Z = \text{Spec}(R/I)$ is a solution to the problem in this case.

Assume \mathcal{F} is of finite type with quasi-compact scheme theoretic support. Write $Z = \text{Spec}(R/I)$. Write $I = \bigcup I_\lambda$ as a filtered union of finitely generated ideals. Set $Z_\lambda = \text{Spec}(R/I_\lambda)$, so $Z = \text{colim } Z_\lambda$. Since u_Z is zero, we see that u_{Z_λ} is zero for some λ by Lemma 76.7.4. This finishes the proof of the lemma. \square

Lemma 76.7.6. *Let A be a ring. Let $u : M \rightarrow N$ be a map of A -modules. If N is projective as an A -module, then there exists an ideal $I \subset A$ such that for any ring map $\varphi : A \rightarrow B$ the following are equivalent*

- (1) $u \otimes 1 : M \otimes_A B \rightarrow N \otimes_A B$ is zero, and
- (2) $\varphi(I) = 0$.

Proof. As M is projective we can find a projective A -module C such that $F = N \oplus C$ is a free R -module. By replacing u by $u \oplus 1 : F = M \oplus C \rightarrow N \oplus C$ we see that we may assume N is free. In this case let I be the ideal of A generated by coefficients of all the elements of $\text{Im}(u)$ with respect to some (fixed) basis of N . \square

It would be interesting to find a simple direct proof of the following lemma using the result of Lemma 76.7.5. A “classical” proof of this lemma when $f : X \rightarrow B$ is a projective morphism and B a Noetherian scheme would be: (a) choose a relatively ample invertible sheaf $\mathcal{O}_X(1)$, (b) set $u_n : f_*\mathcal{F}(n) \rightarrow f_*\mathcal{G}(n)$, (c) observe that $f_*\mathcal{G}(n)$ is a finite locally free sheaf for all $n \gg 0$, and (d) F_{zero} is represented by the vanishing locus of u_n for some $n \gg 0$.

Lemma 76.7.7. *In Situation 76.7.1. Assume*

- (1) f is locally of finite presentation,
- (2) \mathcal{G} is an \mathcal{O}_X -module of finite presentation flat over B ,
- (3) the scheme theoretic support of \mathcal{G} is proper over B .

Then the functor F_{zero} is an algebraic space and $F_{\text{zero}} \rightarrow B$ is a closed immersion. If \mathcal{F} is of finite type, then $F_{\text{zero}} \rightarrow B$ is of finite presentation.

Proof. In order to prove that F_{zero} is an algebraic space, it suffices to show that $F_{\text{zero}} \rightarrow B$ is representable, see Spaces, Lemma 47.11.1. Let $B' \rightarrow B$ be a morphism where B' is a scheme and let $u' : \mathcal{F}' \rightarrow \mathcal{G}'$ be the pullback of u to $X' = X_{B'}$. Then

the associated functor F'_{zero} equals $F_{zero} \times_B B'$. This reduces us to the case that B is a scheme.

Assume B is a scheme. We will show that F_{zero} is representable by a closed subscheme of B . By Lemma 76.7.2 and Descent, Lemmas 34.33.2 and 34.35.1 the question is local for the étale topology on B . Let $b \in B$. We first replace B by an affine neighbourhood of b . Denote $Z \subset X$ the scheme theoretic support of \mathcal{G} . Denote $Z_b \subset X_b$ the fibre of $Z \subset X \rightarrow B$ over b . The space $|Z_b|$ is quasi-compact by the last assumption of the lemma. Choose an affine scheme U and an étale morphism $\varphi : U \rightarrow X$ such that $|Z_b| \subset \text{Im}(|U| \rightarrow |X|)$. After replacing B by an affine elementary étale neighbourhood of b and replacing U by some affine U' étale over U with $U'_b \rightarrow U_b$ surjective, we may assume that $\Gamma(U, \varphi^* \mathcal{G})$ is a projective $\Gamma(B, \mathcal{O}_B)$ -module, see More on Flatness, Lemma 37.11.5. Since $Z \rightarrow B$ is proper the image of

$$|Z| \setminus \text{Im}(|U| \rightarrow |X|)$$

in $|B|$ is a closed subset not containing b . Hence, after replacing B by an affine open containing b , we may assume that $|Z| \subset \text{Im}(|U| \rightarrow |X|)$. (To be sure, after this replacement it is still true that $\Gamma(U, \varphi^* \mathcal{G})$ is a projective $\Gamma(B, \mathcal{O}_B)$ -module.) By Lemma 76.7.3 we see that F_{zero} is the same as the corresponding functor for the map $\varphi^* \mathcal{F} \rightarrow \varphi^* \mathcal{G}$. This case follows immediately from Lemma 76.7.6.

We still have to show that $F_{zero} \rightarrow B$ is of finite presentation if \mathcal{F} is of finite type. Let $\mathcal{F}' \subset \mathcal{G}$ be the image of u and denote F'_{zero} the functor corresponding to $\mathcal{F}' \rightarrow \mathcal{G}$. Then $F_{zero} = F'_{zero}$ and the scheme theoretic support of \mathcal{F}' is a closed subspace of the scheme theoretic support of \mathcal{G} , hence proper over B . Thus Lemma 76.7.4 implies that $F_{zero} = F'_{zero}$ is limit preserving over B . We conclude by Limits of Spaces, Proposition 52.3.9. \square

The following result is a variant of More on Flatness, Theorem 37.22.3.

Lemma 76.7.8. *In Situation 76.7.1. Assume*

- (1) f is locally of finite presentation,
- (2) \mathcal{F} is locally of finite presentation and flat over B ,
- (3) the scheme theoretic support of \mathcal{F} is proper over B , and
- (4) u is surjective.

Then the functor F_{iso} is an algebraic space and $F_{iso} \rightarrow B$ is a closed immersion. If \mathcal{G} is of finite presentation, then $F_{iso} \rightarrow B$ is of finite presentation.

Proof. Let $\mathcal{K} = \text{Ker}(u)$ and apply Lemma 76.7.7 to $\mathcal{K} \rightarrow \mathcal{F}$. Note that \mathcal{K} is of finite type if \mathcal{G} is of finite presentation, see Modules on Sites, Lemma 18.24.1. \square

We will use the following (easy) result when discussing the Quot functor.

Lemma 76.7.9. *In Situation 76.7.1. Assume*

- (1) f is locally of finite presentation,
- (2) \mathcal{G} is of finite type,
- (3) the scheme theoretic support of \mathcal{G} is proper over B .

Then F_{surj} is an algebraic space and $F_{surj} \rightarrow B$ is an open immersion.

Proof. Consider $\text{Coker}(u)$. Observe that $\text{Coker}(u_T) = \text{Coker}(u)_T$ for any T/B . Note that formation of the support of a finite type quasi-coherent module commutes

with pullback (Morphisms of Spaces, Lemma 49.15.1). Hence F_{surj} is representable by the open subspace of B corresponding to the open set

$$|B| \setminus |f|(\text{Supp}(\text{Coker}(u)))$$

see Properties of Spaces, Lemma 48.4.8. This is an open because $|f|$ is closed on $\text{Supp}(\mathcal{G})$ and $\text{Supp}(\text{Coker}(u))$ is a closed subset of $\text{Supp}(\mathcal{G})$. \square

76.8. The functor of quotients

In this section we discuss some generalities regarding the functor $Q_{\mathcal{F}/X/B}$ defined below. The notation $\text{Quot}_{\mathcal{F}/X/B}$ is reserved for a subfunctor of $Q_{\mathcal{F}/X/B}$. We urge the reader to skip this section on a first reading.

Situation 76.8.1. Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. For any scheme T over B we will denote X_T the base change of X to T and \mathcal{F}_T the pullback of \mathcal{F} via the projection morphism $X_T = X \times_S T \rightarrow X$. Given such a T we set

$$Q_{\mathcal{F}/X/B}(T) = \left\{ \begin{array}{l} \text{quotients } \mathcal{F}_T \rightarrow \mathcal{Q} \text{ where } \mathcal{Q} \text{ is a quasi-coherent} \\ \mathcal{O}_{X_T}\text{-module of finite presentation, flat over } T \end{array} \right\}$$

We identify quotients if they have the same kernel. Suppose that $T' \rightarrow T$ is a morphism of schemes over B and $\mathcal{F}_T \rightarrow \mathcal{Q}$ is an element of $Q_{\mathcal{F}/X/B}(T)$. Then the pullback $\mathcal{Q}' = (X_{T'} \rightarrow X_T)^* \mathcal{Q}$ is a quasi-coherent $\mathcal{O}_{X_{T'}}$ -module of finite presentation flat over T' (see Properties of Spaces, Section 48.28 and Morphisms of Spaces, Lemma 49.29.3). Thus we obtain a functor

$$(76.8.1.1) \quad Q_{\mathcal{F}/X/B} : (\text{Sch}/B)^{opp} \rightarrow \text{Sets}$$

This is the functor of quotients of $\mathcal{F}/X/B$.

In Situation 76.8.1 we sometimes think of $Q_{\mathcal{F}/X/B}$ as a functor $(\text{Sch}/S)^{opp} \rightarrow \text{Sets}$ endowed with a morphism $Q_{\mathcal{F}/X/B} \rightarrow B$. Namely, if T is a scheme over S , then we can think of an element of $Q_{\mathcal{F}/X/B}$ as a pair (h, \mathcal{Q}) where h a morphism $h : T \rightarrow B$, i.e., an element $h \in B(T)$, and \mathcal{Q} is a T -flat quotient $\mathcal{F}_T \rightarrow \mathcal{Q}$ of finite presentation on $X_T = X \times_{B,h} T$. In particular, when we say that $Q_{\mathcal{F}/X/S}$ is an algebraic space, we mean that the corresponding functor $(\text{Sch}/S)^{opp} \rightarrow \text{Sets}$ is an algebraic space.

Remark 76.8.2. In Situation 76.8.1 let $B' \rightarrow B$ be a morphism of algebraic spaces over S . Set $X' = X \times_B B'$ and denote \mathcal{F}' the pullback of \mathcal{F} to X' . Thus we have the functor $Q_{\mathcal{F}'/X'/B'}$ on the category of schemes over B' . For a scheme T over B' it is clear that we have

$$Q_{\mathcal{F}'/X'/B'}(T) = Q_{\mathcal{F}/X/B}(T)$$

where on the right hand side we think of T as a scheme over B via the composition $T \rightarrow B' \rightarrow B$. This trivial remark will occasionally be useful to change the base algebraic space.

Remark 76.8.3. Let S be a scheme, X an algebraic space over S , and \mathcal{F} a quasi-coherent \mathcal{O}_X -module. Suppose that $\{f_i : X_i \rightarrow X\}_{i \in I}$ is an fpqc covering and for each $i, j \in I$ we are given an fpqc covering $\{X_{ijk} \rightarrow X_i \times_X X_j\}$. In this situation we have a bijection

$$\left\{ \begin{array}{l} \text{quotients } \mathcal{F} \rightarrow \mathcal{Q} \text{ where} \\ \mathcal{Q} \text{ is a quasi-coherent} \end{array} \right\} \longrightarrow \left\{ \begin{array}{l} \text{families of quotients } f_i^* \mathcal{F} \rightarrow \mathcal{Q}_i \text{ where} \\ \mathcal{Q}_i \text{ is quasi-coherent and } \mathcal{Q}_i \text{ and } \mathcal{Q}_j \\ \text{restrict to the same quotient on } X_{ijk} \end{array} \right\}$$

Namely, let $(f_i^* \mathcal{F} \rightarrow \mathcal{Q}_i)_{i \in I}$ be an element of the right hand side. Then since $\{X_{ijk} \rightarrow X_i \times_X X_j\}$ is an fpqc covering we see that the pullbacks of \mathcal{Q}_i and \mathcal{Q}_j restrict to the same quotient of the pullback of \mathcal{F} to $X_i \times_X X_j$ (by fully faithfulness in Descent on Spaces, Proposition 56.4.1). Hence we obtain a descent datum for quasi-coherent modules with respect to $\{X_i \rightarrow X\}_{i \in I}$. By Descent on Spaces, Proposition 56.4.1 we find a map of quasi-coherent \mathcal{O}_X -modules $\mathcal{F} \rightarrow \mathcal{Q}$ whose restriction to X_i recovers the given maps $f_i^* \mathcal{F} \rightarrow \mathcal{Q}_i$. Since the family of morphisms $\{X_i \rightarrow X\}$ is jointly surjective and flat, for every point $x \in |X|$ there exists an i and a point $x_i \in |X_i|$ mapping to x . Note that the induced map on local rings $\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{X_i, \bar{x}_i}$ is faithfully flat, see Morphisms of Spaces, Section 49.28. Thus we see that $\mathcal{F} \rightarrow \mathcal{Q}$ is surjective.

Lemma 76.8.4. *In Situation 76.8.1. The functor $Q_{\mathcal{F}/X/B}$ satisfies the sheaf property for the fpqc topology.*

Proof. Let $\{T_i \rightarrow T\}_{i \in I}$ be an fpqc covering of schemes over S . Set $X_i = X_{T_i} = X \times_S T_i$ and $\mathcal{F}_i = \mathcal{F}_{T_i}$. Note that $\{X_i \rightarrow X_T\}_{i \in I}$ is an fpqc covering of X_T (Topologies on Spaces, Lemma 55.3.2) and that $X_{T_i \times_T T_{i'}} = X_i \times_{X_T} X_{i'}$. Suppose that $\mathcal{F}_i \rightarrow \mathcal{Q}_i$ is a collection of elements of $Q_{\mathcal{F}/X/B}(T_i)$ such that \mathcal{Q}_i and $\mathcal{Q}_{i'}$ restrict to the same element of $Q_{\mathcal{F}/X/B}(T_i \times_T T_{i'})$. By Remark 76.8.3 we obtain a surjective map of quasi-coherent \mathcal{O}_{X_T} -modules $\mathcal{F}_T \rightarrow \mathcal{Q}$ whose restriction to X_i recovers the given quotients. By Morphisms of Spaces, Lemma 49.29.5 we see that \mathcal{Q} is flat over T . Finally, Descent on Spaces, Lemma 56.5.2 guarantees that \mathcal{Q} is of finite presentation as an \mathcal{O}_{X_T} -module. \square

Lemma 76.8.5. *In Situation 76.8.1 let $\{X_i \rightarrow X\}_{i \in I}$ be an fppf covering and for each $i, j \in I$ let $\{X_{ijk} \rightarrow X_i \times_X X_j\}$ be an fppf covering. Denote \mathcal{F}_i , resp. \mathcal{F}_{ijk} the pullback of \mathcal{F} to X_i , resp. X_{ijk} . For every scheme T over B the diagram*

$$Q_{\mathcal{F}/X/B}(T) \longrightarrow \prod_i Q_{\mathcal{F}_i/X_i/B}(T) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{i,j,k} Q_{\mathcal{F}_{ijk}/X_{ijk}/B}(T)$$

presents the first arrow as the equalizer of the other two.

Proof. Let $\mathcal{F}_{i,T} \rightarrow \mathcal{Q}_i$ be an element in the equalizer of pr_0^* and pr_1^* . By Remark 76.8.3 we obtain a surjection $\mathcal{F}_T \rightarrow \mathcal{Q}$ of quasi-coherent \mathcal{O}_{X_T} -modules whose restriction to $X_{i,T}$ recovers $\mathcal{F}_i \rightarrow \mathcal{Q}_i$. By Morphisms of Spaces, Lemma 49.29.5 we see that \mathcal{Q} is flat over T as desired. \square

Lemma 76.8.6. *In Situation 76.8.1 assume also that (a) f is quasi-compact and quasi-separated and (b) \mathcal{F} is of finite presentation. Then the functor $Q_{\mathcal{F}/X/B}$ is limit preserving in the following sense: If $T = \lim T_i$ is a directed limit of affine schemes over B , then $Q_{\mathcal{F}/X/B}(T) = \text{colim } Q_{\mathcal{F}/X/B}(T_i)$.*

Proof. Let $T = \lim T_i$ be as in the statement of the lemma. Choose $i_0 \in I$ and replace I by $\{i \in I \mid i \geq i_0\}$. We may set $B = S = T_{i_0}$ and we may replace X by X_{T_0} and \mathcal{F} by the pullback to X_{T_0} . Then $X_T = \lim X_{T_i}$, see Limits of Spaces, Lemma 52.4.1. Let $\mathcal{F}_T \rightarrow \mathcal{Q}$ be an element of $Q_{\mathcal{F}/X/B}(T)$. By Limits of Spaces, Lemma 52.7.2 there exists an i and a map $\mathcal{F}_{T_i} \rightarrow \mathcal{Q}_i$ of $\mathcal{O}_{X_{T_i}}$ -modules of finite presentation whose pullback to X_T is the given quotient map.

We still have to check that, after possibly increasing i , the map $\mathcal{F}_{T_i} \rightarrow \mathcal{Q}_i$ is surjective and \mathcal{Q}_i is flat over T_i . To do this, choose an affine scheme U and a

surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 48.6.3). We may check surjectivity and flatness over T_i after pulling back to the étale cover $U_{T_i} \rightarrow X_{T_i}$ (by definition). This reduces us to the case where $X = \text{Spec}(B_0)$ is an affine scheme of finite presentation over $B = S = T_0 = \text{Spec}(A_0)$. Writing $T_i = \text{Spec}(A_i)$, then $T = \text{Spec}(A)$ with $A = \text{colim } A_i$ we have reached the following algebra problem. Let $M_i \rightarrow N_i$ be a map of finitely presented $B_0 \otimes_{A_0} A_i$ -modules such that $M_i \otimes_{A_i} A \rightarrow N_i \otimes_{A_i} A$ is surjective and $N_i \otimes_{A_i} A$ is flat over A . Show that for some $i' \geq i$ $M_i \otimes_{A_i} A_{i'} \rightarrow N_i \otimes_{A_i} A_{i'}$ is surjective and $N_i \otimes_{A_i} A_{i'}$ is flat over A . The first follows from Algebra, Lemma 10.123.3 and the second from Algebra, Lemma 10.156.1. \square

Lemma 76.8.7. *In Situation 76.8.1 assume $X \rightarrow B$ locally of finite presentation. Let*

$$\begin{array}{ccc} Z & \longrightarrow & Z' \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y' \end{array}$$

be a pushout in the category of schemes over B where $Z \rightarrow Z'$ is a thickening and $Z \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.1. Then the natural map

$$Q_{\mathcal{F}/X/B}(Y') \longrightarrow Q_{\mathcal{F}/X/B}(Y) \times_{Q_{\mathcal{F}/X/B}(Z)} Q_{\mathcal{F}/X/B}(Z')$$

is bijective.

Proof. We first argue that it suffices to prove this when all the schemes and algebraic spaces in sight are affine schemes. Let $Y' = \bigcup Y'_i$ be an affine open covering and let Y_i, Z'_i , and Z_i be the corresponding (affine) opens of Y, Z' , and Z . Since $Q_{\mathcal{F}/X/B}$ satisfies the sheaf property for the fpqc topology (Lemma 76.8.4), it suffices to prove the result of the lemma for the diagrams

$$\begin{array}{ccc} Z_i & \longrightarrow & Z'_i \\ \downarrow & & \downarrow \\ Y_i & \longrightarrow & Y'_i \end{array} \quad \text{and} \quad \begin{array}{ccc} Z_i \cap Z_j & \longrightarrow & Z'_i \cap Z'_j \\ \downarrow & & \downarrow \\ Y_i \cap Y_j & \longrightarrow & Y'_i \cap Y'_j \end{array}$$

This reduces us to the case where the schemes Y', Y, Z', Z are separated and a second application of this argument to the case where Y', Y, Z', Z are affine.

Assume Y' (and hence also Y, Z' , and Z) is affine. By Remark 76.8.2 we may replace B by Y' and X by $X \times_B Y'$, and \mathcal{F} by the pullback. Thus we may assume $B = Y'$.

Assume $B = Y'$ (and hence also Y, Z' , and Z) is affine. Choose an étale covering $\{X_i \rightarrow X\}_{i \in I}$ with each X_i affine and similarly choose étale coverings $\{X_{ijk} \rightarrow X_i \times_X X_j\}$ with each X_{ijk} affine (Properties of Spaces, Lemma 48.6.1). By Lemma 76.8.5 it suffices to prove the lemma for each of the functors associated to X_i and X_{ijk} . Hence we may assume X is affine as well. This reduces the lemma to More on Algebra, Remark 15.4.15. \square

76.9. The quot functor

In this section we prove the Quot functor is representable by an algebraic space.

Situation 76.9.1. Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. For any scheme T over B we will denote X_T the base change of X to T and \mathcal{F}_T the pullback of \mathcal{F} via the projection morphism $X_T = X \times_S T \rightarrow X$. Given such a T we set

$$\mathrm{Quot}_{\mathcal{F}/X/B}(T) = \left\{ \begin{array}{l} \text{quotients } \mathcal{F}_T \rightarrow \mathcal{Q} \text{ where } \mathcal{Q} \text{ is a quasi-coherent} \\ \mathcal{O}_{X_T}\text{-module of finite presentation, flat over } T \\ \text{with scheme theoretic support proper over } T \end{array} \right\}$$

This is a subfunctor of $Q_{\mathcal{F}/X/T}$ discussed in Section 76.8. Thus we obtain a functor

$$(76.9.1.1) \quad \mathrm{Quot}_{\mathcal{F}/X/B} : (\mathrm{Sch}/B)^{\mathrm{opp}} \longrightarrow \mathrm{Sets}$$

This is the *quot functor* associated to $\mathcal{F}/X/B$.

In Situation 76.9.1 we may think of $\mathrm{Quot}_{\mathcal{F}/X/B}$ as a functor $(\mathrm{Sch}/S)^{\mathrm{opp}} \rightarrow \mathrm{Sets}$ endowed with a morphism $\mathrm{Quot}_{\mathcal{F}/X/B} \rightarrow B$. Namely, if T is a scheme over S , then we can think of an element of $\mathrm{Quot}_{\mathcal{F}/X/B}$ as a pair (h, \mathcal{Q}) where h a morphism $h : T \rightarrow B$, i.e., an element $h \in B(T)$, and \mathcal{Q} is a finitely presented, T -flat quotient $\mathcal{F}_T \rightarrow \mathcal{Q}$ on $X_T = X \times_{B,h} T$ with support proper over T . In particular, when we say that $\mathrm{Quot}_{\mathcal{F}/X/S}$ is an algebraic space, we mean that the corresponding functor $(\mathrm{Sch}/S)^{\mathrm{opp}} \rightarrow \mathrm{Sets}$ is an algebraic space.

Lemma 76.9.2. *In Situation 76.9.1. The functor $\mathrm{Quot}_{\mathcal{F}/X/B}$ satisfies the sheaf property for the fppc topology.*

Proof. In Lemma 76.8.4 we have seen that the functor $Q_{\mathcal{F}/X/S}$ is a sheaf. Recall that for a scheme T over S the subset $\mathrm{Quot}_{\mathcal{F}/X/S}(T) \subset Q_{\mathcal{F}/X/S}(T)$ picks out those quotients whose support is proper over T . This defines a subsheaf by the result of Descent on Spaces, Lemma 56.10.17 (combined with Morphisms of Spaces, Lemma 49.28.10) which shows that taking scheme theoretic support commutes with flat base change). \square

Proposition 76.9.3. *Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X . If f is of finite presentation and separated, then $\mathrm{Quot}_{\mathcal{F}/X/B}$ is an algebraic space. If \mathcal{F} is of finite presentation, then $\mathrm{Quot}_{\mathcal{F}/X/B} \rightarrow B$ is locally of finite presentation.*

Proof. Note that $\mathrm{Quot}_{\mathcal{F}/X/B}$ is a sheaf in the fppf topology. Let $\mathrm{Quot}_{\mathcal{F}/X/B}$ be the stack in groupoids corresponding to $\mathrm{Quot}_{\mathcal{F}/X/S}$, see Algebraic Stacks, Section 71.7. By Algebraic Stacks, Proposition 71.13.3 it suffices to show that $\mathrm{Quot}_{\mathcal{F}/X/B}$ is an algebraic stack. Consider the 1-morphism of stacks in groupoids

$$\mathrm{Quot}_{\mathcal{F}/X/S} \longrightarrow \mathrm{Coh}_{X/B}$$

on $(\mathrm{Sch}/S)_{\mathrm{fppf}}$ which associates to the quotient $\mathcal{F}_T \rightarrow \mathcal{Q}$ the coherent sheaf \mathcal{Q} . By Theorem 76.6.5 we know that $\mathrm{Coh}_{X/B}$ is an algebraic stack. By Algebraic Stacks, Lemma 71.15.4 it suffices to show that this 1-morphism is representable by algebraic spaces.

Let T be a scheme over S and let the object (h, \mathcal{G}) of $\text{Coh}_{X/B}$ over T correspond to a 1-morphism $\xi : (\text{Sch}/T)_{\text{fpff}} \rightarrow \text{Coh}_{X/B}$. The 2-fibre product

$$\mathcal{Z} = (\text{Sch}/T)_{\text{fpff}} \times_{\xi, \text{Coh}_{X/B}} \text{Quot}_{\mathcal{F}/X/S}$$

is a stack in setoids, see Stacks, Lemma 8.6.7. The corresponding sheaf of sets (i.e., functor, see Stacks, Lemmas 8.6.7 and 8.6.2) assigns to a scheme T'/T the set of surjections $u : \mathcal{F}_{T'} \rightarrow \mathcal{G}_{T'}$ of quasi-coherent modules on $X_{T'}$. Thus we see that \mathcal{Z} is representable by an open subspace (by Lemma 76.7.9) of the algebraic space $\text{Hom}(\mathcal{F}_T, \mathcal{G})$ from Proposition 76.3.9. \square

Properties of Algebraic Stacks

77.1. Introduction

Please see Algebraic Stacks, Section 71.1 for a brief introduction to algebraic stacks, and please read some of that chapter for our foundations of algebraic stacks. The intent is that in that chapter we are careful to distinguish between schemes, algebraic spaces, algebraic stacks, and starting with this chapter we employ the customary abuse of language where all of these concepts are used interchangeably.

The goal of this chapter is to introduce some basic notions and properties of algebraic stacks. A fundamental reference for the case of quasi-separated algebraic stacks with representable diagonal is [LMB00].

77.2. Conventions and abuse of language

We choose a big fppf site Sch_{fppf} . All schemes are contained in Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

We also fix a base scheme S , by the conventions above an element of Sch_{fppf} . The reader who is only interested in the absolute case can take $S = \text{Spec}(\mathbf{Z})$.

Here are our conventions regarding algebraic stacks:

- (1) When we say *algebraic stack* we will mean an algebraic stacks over S , i.e., a category fibred in groupoids $p : \mathcal{X} \rightarrow (Sch/S)_{fppf}$ which satisfies the conditions of Algebraic Stacks, Definition 71.12.1.
- (2) We will say $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a *morphism of algebraic stacks* to indicate a 1-morphism of algebraic stacks over S , i.e., a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$, see Algebraic Stacks, Definition 71.12.3.
- (3) A *2-morphism* $\alpha : f \rightarrow g$ will indicate a 2-morphism in the 2-category of algebraic stacks over S , see Algebraic Stacks, Definition 71.12.3.
- (4) Given morphisms $\mathcal{X} \rightarrow \mathcal{Z}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ of algebraic stacks we abusively call the 2-fibre product $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y}$ the *fibre product*.
- (5) We will write $\mathcal{X} \times_S \mathcal{Y}$ for the product of the algebraic stacks \mathcal{X}, \mathcal{Y} .
- (6) We will often abuse notation and say two algebraic stacks \mathcal{X} and \mathcal{Y} are *isomorphic* if they are equivalent in this 2-category.

Here are our conventions regarding algebraic spaces.

- (1) If we say X is an *algebraic space* then we mean that X is an algebraic space over S , i.e., X is a presheaf on $(Sch/S)_{fppf}$ which satisfies the conditions of Spaces, Definition 47.6.1.
- (2) A *morphism of algebraic spaces* $f : X \rightarrow Y$ is a morphism of algebraic spaces over S as defined in Spaces, Definition 47.6.3.

- (3) We will **not** distinguish between an algebraic space X and the algebraic stack $\mathcal{S}_X \rightarrow (Sch/S)_{fppf}$ it gives rise to, see Algebraic Stacks, Lemma 71.13.1.
- (4) In particular, a *morphism* $f : X \rightarrow \mathcal{Y}$ from X to an algebraic stack \mathcal{Y} means a morphism $f : \mathcal{S}_X \rightarrow \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \rightarrow X$.
- (5) Moreover, given an algebraic stack \mathcal{X} we say \mathcal{X} is an *algebraic space* to indicate that \mathcal{X} is representable by an algebraic space, see Algebraic Stacks, Definition 71.8.1.
- (6) We will use the following notational convention: If we indicate an algebraic stack by a roman capital (such as X, Y, Z, A, B, \dots) then it will be the case that its inertia stack is trivial, and hence it is an algebraic space, see Algebraic Stacks, Proposition 71.13.3.

Here are our conventions regarding schemes.

- (1) If we say X is a *scheme* then we mean that X is a scheme over S , i.e., X is an object of $(Sch/S)_{fppf}$.
- (2) By a *morphism of schemes* we mean a morphism of schemes over S .
- (3) We will **not** distinguish between a scheme X and the algebraic stack $\mathcal{S}_X \rightarrow (Sch/S)_{fppf}$ it gives rise to, see Algebraic Stacks, Lemma 71.13.1.
- (4) In particular, a *morphism* $f : X \rightarrow \mathcal{Y}$ from a scheme X to an algebraic stack \mathcal{Y} means a morphism $f : \mathcal{S}_X \rightarrow \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \rightarrow X$.
- (5) Moreover, given an algebraic stack \mathcal{X} we say \mathcal{X} is a *scheme* to indicate that \mathcal{X} is representable, see Algebraic Stacks, Section 71.4.

Here are our conventions regarding morphism of algebraic stacks:

- (1) A morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is *representable*, or *representable by schemes* if for every scheme T and morphism $T \rightarrow \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is a scheme. See Algebraic Stacks, Section 71.6.
- (2) A morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is *representable by algebraic spaces* if for every scheme T and morphism $T \rightarrow \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space. See Algebraic Stacks, Definition 71.9.1. In this case $Z \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space whenever $Z \rightarrow \mathcal{Y}$ is a morphism whose source is an algebraic space, see Algebraic Stacks, Lemma 71.9.8.

Note that every morphism $X \rightarrow \mathcal{Y}$ from an algebraic space to an algebraic stack is representable by algebraic spaces, see Algebraic Stacks, Lemma 71.10.11. We will use this basic result without further mention.

77.3. Properties of morphisms representable by algebraic spaces

We will study properties of (arbitrary) morphisms of algebraic stacks in its own chapter. For morphisms representable by algebraic spaces we know what it means to be surjective, smooth, or étale, etc. This applies in particular to morphisms $X \rightarrow \mathcal{Y}$ from algebraic spaces to algebraic stacks. In this section, we recall how this works, we list the properties to which this applies, and we prove a few easy lemmas.

Our first lemma says a morphism is representable by algebraic spaces if it is so after a base change by a flat, locally finitely presented, surjective morphism.

Lemma 77.3.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let W be an algebraic space and let $W \rightarrow \mathcal{Y}$ be surjective, locally of finite presentation, and flat. The following are equivalent*

- (1) *f is representable by algebraic spaces, and*
- (2) *$W \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space.*

Proof. The implication (1) \Rightarrow (2) is Algebraic Stacks, Lemma 71.9.8. Conversely, let $W \rightarrow \mathcal{Y}$ be as in (2). To prove (1) it suffices to show that f is faithful on fibre categories, see Algebraic Stacks, Lemma 71.15.2. Assumption (2) implies in particular that $W \times_{\mathcal{Y}} \mathcal{X} \rightarrow W$ is faithful. Hence the faithfulness of f follows from Stacks, Lemma 8.6.9. \square

Let P be a property of morphisms of algebraic spaces which is fppf local on the target and preserved by arbitrary base change. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then we say f has property P if and only if for every scheme T and morphism $T \rightarrow \mathcal{Y}$ the morphism of algebraic spaces $T \times_{\mathcal{Y}} \mathcal{X} \rightarrow T$ has property P , see Algebraic Stacks, Definition 71.10.1.

It turns out that if $f : \mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces and has property P , then for any morphism of algebraic stacks $\mathcal{Y}' \rightarrow \mathcal{Y}$ the base change $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$ has property P , see Algebraic Stacks, Lemmas 71.9.7 and 71.10.6. If the property P is preserved under compositions, then this holds also in the setting of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemmas 71.9.9 and 71.10.5. Moreover, in this case products $\mathcal{X}_1 \times \mathcal{X}_2 \rightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$ of morphisms representable by algebraic spaces having property \mathcal{P} have property \mathcal{P} , see Algebraic Stacks, Lemma 71.10.8.

Finally, if we have two properties P, P' of morphisms of algebraic spaces which are fppf local on the target and preserved by arbitrary base change and if $P(f) \Rightarrow P'(f)$ for every morphism f , then the same implication holds for the corresponding property of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemma 71.10.9. We will use this *without further mention* in the following and in the following chapters.

The discussion above applies to each of the following properties of morphisms of algebraic spaces

- (1) quasi-compact, see Morphisms of Spaces, Lemma 49.8.3 and Descent on Spaces, Lemma 56.10.1,
- (2) quasi-separated, see Morphisms of Spaces, Lemma 49.4.4 and Descent on Spaces, Lemma 56.10.2,
- (3) universally closed, see Morphisms of Spaces, Lemma 49.9.3 and Descent on Spaces, Lemma 56.10.3,
- (4) universally open, see Morphisms of Spaces, Lemma 49.6.3 and Descent on Spaces, Lemma 56.10.4,
- (5) surjective, see Morphisms of Spaces, Lemma 49.5.5 and Descent on Spaces, Lemma 56.10.5,
- (6) universally injective, see Morphisms of Spaces, Lemma 49.19.5 and Descent on Spaces, Lemma 56.10.6,
- (7) locally of finite type, see Morphisms of Spaces, Lemma 49.23.3 and Descent on Spaces, Lemma 56.10.7,

- (8) locally of finite presentation, see Morphisms of Spaces, Lemma 49.27.3 and Descent on Spaces, Lemma 56.10.8,
- (9) finite type, see Morphisms of Spaces, Lemma 49.23.3 and Descent on Spaces, Lemma 56.10.9,
- (10) finite presentation, see Morphisms of Spaces, Lemma 49.27.3 and Descent on Spaces, Lemma 56.10.10,
- (11) flat, see Morphisms of Spaces, Lemma 49.28.4 and Descent on Spaces, Lemma 56.10.11,
- (12) open immersion, see Morphisms of Spaces, Section 49.12 and Descent on Spaces, Lemma 56.10.12,
- (13) isomorphism, see Descent on Spaces, Lemma 56.10.13,
- (14) affine, see Morphisms of Spaces, Lemma 49.20.5 and Descent on Spaces, Lemma 56.10.14,
- (15) closed immersion, see Morphisms of Spaces, Section 49.12 and Descent on Spaces, Lemma 56.10.15,
- (16) separated, see Morphisms of Spaces, Lemma 49.4.4 and Descent on Spaces, Lemma 56.10.16,
- (17) proper, see Morphisms of Spaces, Lemma 49.37.3 and Descent on Spaces, Lemma 56.10.17,
- (18) quasi-affine, see Morphisms of Spaces, Lemma 49.21.5 and Descent on Spaces, Lemma 56.10.18,
- (19) integral, see Morphisms of Spaces, Lemma 49.41.5 and Descent on Spaces, Lemma 56.10.20,
- (20) finite, see Morphisms of Spaces, Lemma 49.41.5 and Descent on Spaces, Lemma 56.10.21,
- (21) (locally) quasi-finite, see Morphisms of Spaces, Lemma 49.26.4 and Descent on Spaces, Lemma 56.10.22,
- (22) syntomic, see Morphisms of Spaces, Lemma 49.33.3 and Descent on Spaces, Lemma 56.10.23,
- (23) smooth, see Morphisms of Spaces, Lemma 49.34.3 and Descent on Spaces, Lemma 56.10.24,
- (24) unramified, see Morphisms of Spaces, Lemma 49.35.4 and Descent on Spaces, Lemma 56.10.25,
- (25) étale, see Morphisms of Spaces, Lemma 49.36.4 and Descent on Spaces, Lemma 56.10.26,
- (26) finite locally free, see Morphisms of Spaces, Lemma 49.42.5 and Descent on Spaces, Lemma 56.10.27,
- (27) monomorphism, see Morphisms of Spaces, Lemma 49.10.5 and Descent on Spaces, Lemma 56.10.28,
- (28) immersion, see Morphisms of Spaces, Section 49.12 and Descent on Spaces, Lemma 56.11.1,
- (29) locally separated, see Morphisms of Spaces, Lemma 49.4.4 and Descent on Spaces, Lemma 56.11.2,

Lemma 77.3.2. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. The following are equivalent:*

- (1) f has P ,

(2) for every algebraic space Z and morphism $Z \rightarrow \mathcal{Y}$ the morphism $Z \times_{\mathcal{Y}} \mathcal{X} \rightarrow Z$ has P .

Proof. The implication (2) \Rightarrow (1) is immediate. Assume (1). Let $Z \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme U and a surjective étale morphism $U \rightarrow Z$. By assumption the morphism $U \times_{\mathcal{Y}} \mathcal{X} \rightarrow U$ has P . But the diagram

$$\begin{array}{ccc} U \times_{\mathcal{Y}} \mathcal{X} & \longrightarrow & Z \times_{\mathcal{Y}} \mathcal{X} \\ \downarrow & & \downarrow \\ U & \longrightarrow & Z \end{array}$$

is cartesian, hence the right vertical arrow has P as $\{U \rightarrow Z\}$ is an fppf covering. \square

The following lemma tells us it suffices to check P after a base change by a surjective, flat, locally finitely presented morphism.

Lemma 77.3.3. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let W be an algebraic space and let $W \rightarrow \mathcal{Y}$ be surjective, locally of finite presentation, and flat. Set $V = W \times_{\mathcal{Y}} \mathcal{X}$. Then*

$$(f \text{ has } P) \Leftrightarrow (\text{the projection } V \rightarrow W \text{ has } P).$$

Proof. The implication from left to right follows from Lemma 77.3.2. Assume $V \rightarrow W$ has P . Let T be a scheme, and let $T \rightarrow \mathcal{Y}$ be a morphism. Consider the commutative diagram

$$\begin{array}{ccccc} T \times_{\mathcal{Y}} \mathcal{X} & \longleftarrow & T \times_{\mathcal{Y}} W & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ T & \longleftarrow & T \times_{\mathcal{Y}} V & \longrightarrow & V \end{array}$$

of algebraic spaces. The squares are cartesian. The bottom left morphism is a surjective, flat morphism which is locally of finite presentation, hence $\{T \times_{\mathcal{Y}} V \rightarrow T\}$ is an fppf covering. Hence the fact that the right vertical arrow has property P implies that the left vertical arrow has property P . \square

Lemma 77.3.4. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Set $\mathcal{W} = \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$. Then*

$$(f \text{ has } P) \Leftrightarrow (\text{the projection } \mathcal{W} \rightarrow \mathcal{Z} \text{ has } P).$$

Proof. Choose an algebraic space W and a morphism $W \rightarrow \mathcal{Z}$ which is surjective, flat, and locally of finite presentation. By the discussion above the composition $W \rightarrow \mathcal{Y}$ is also surjective, flat, and locally of finite presentation. Denote $V = W \times_{\mathcal{Z}} \mathcal{W} = V \times_{\mathcal{Y}} \mathcal{X}$. By Lemma 77.3.3 we see that f has P if and only if $V \rightarrow W$ does and that $\mathcal{W} \rightarrow \mathcal{Z}$ has P if and only if $V \rightarrow W$ does. The lemma follows. \square

Lemma 77.3.5. *Let P be a property of morphisms of algebraic spaces as above. Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks representable by algebraic spaces. Assume*

(1) $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation,

- (2) the composition has P , and
- (3) P is local on the source in the fppf topology.

Then $\mathcal{Y} \rightarrow \mathcal{Z}$ has property P .

Proof. Let Z be a scheme and let $Z \rightarrow \mathcal{Z}$ be a morphism. Set $X = \mathcal{X} \times_{\mathcal{Z}} Z$, $Y = \mathcal{Y} \times_{\mathcal{Z}} Z$. By (1) $\{X \rightarrow Y\}$ is an fppf covering of algebraic spaces and by (2) $X \rightarrow Z$ has property P . By (3) this implies that $Y \rightarrow Z$ has property P and we win. \square

Lemma 77.3.6. *Let $g : \mathcal{X}' \rightarrow \mathcal{X}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Let $[U/R] \rightarrow \mathcal{X}$ be a presentation. Set $U' = U \times_{\mathcal{X}} \mathcal{X}'$, and $R' = R \times_{\mathcal{X}} \mathcal{X}'$. Then there exists a groupoid in algebraic spaces of the form (U', R', s', t', c') , a presentation $[U'/R'] \rightarrow \mathcal{X}'$, and the diagram*

$$\begin{array}{ccc} [U'/R'] & \longrightarrow & \mathcal{X}' \\ [pr] \downarrow & & \downarrow g \\ [U/R] & \longrightarrow & \mathcal{X} \end{array}$$

is 2-commutative where the morphism $[pr]$ comes from a morphism of groupoids $pr : (U', R', s', t', c') \rightarrow (U, R, s, t, c)$.

Proof. Since $U \rightarrow \mathcal{Y}$ is surjective and smooth, see Algebraic Stacks, Lemma 71.17.2 the base change $U' \rightarrow \mathcal{X}'$ is also surjective and smooth. Hence, by Algebraic Stacks, Lemma 71.16.2 it suffices to show that $R' = U' \times_{\mathcal{X}'} U'$ in order to get a smooth groupoid (U', R', s', t', c') and a presentation $[U'/R'] \rightarrow \mathcal{X}'$. Using that $R = U \times_{\mathcal{Y}} V$ (see Groupoids in Spaces, Lemma 60.21.2) this follows from

$$R' = U \times_{\mathcal{X}} U \times_{\mathcal{X}} \mathcal{X}' = (U \times_{\mathcal{X}} \mathcal{X}') \times_{\mathcal{X}'} (U \times_{\mathcal{X}} \mathcal{X}')$$

see Categories, Lemmas 4.29.8 and 4.29.10. Clearly the projection morphisms $U' \rightarrow U$ and $R' \rightarrow R$ give the desired morphism of groupoids $pr : (U', R', s', t', c') \rightarrow (U, R, s, t, c)$. Hence the morphism $[pr]$ of quotient stacks by Groupoids in Spaces, Lemma 60.20.1.

We still have to show that the diagram 2-commutes. It is clear that the diagram

$$\begin{array}{ccc} U' & \longrightarrow & \mathcal{X}' \\ pr_U \downarrow & & \downarrow g \\ U & \longrightarrow & \mathcal{X} \end{array}$$

2-commutes where $pr_U : U' \rightarrow U$ is the projection. There is a canonical 2-arrow $\tau : f \circ t \rightarrow f \circ s$ in $\text{Mor}(R, \mathcal{X})$ coming from $R = U \times_{\mathcal{X}} U$, $t = pr_0$, and $s = pr_1$. Using the isomorphism $R' \rightarrow U' \times_{\mathcal{X}'} U'$ we get similarly an isomorphism $\tau' : f' \circ t' \rightarrow f' \circ s'$. Note that $g \circ f' \circ t' = f \circ t \circ pr_R$ and $g \circ f' \circ s' = f \circ s \circ pr_R$, where $pr_R : R' \rightarrow R$ is the projection. Thus it makes sense to ask if

$$(77.3.6.1) \quad \tau \star id_{pr_R} = id_g \star \tau'$$

Now we make two claims: (1) if Equation (77.3.6.1) holds, then the diagram 2-commutes, and (2) Equation (77.3.6.1) holds. We omit the proof of both claims. Hints: part (1) follows from the construction of $f = f_{can}$ and $f' = f'_{can}$ in Algebraic Stacks, Lemma 71.16.1. Part (2) follows by carefully working through the definitions. \square

Remark 77.3.7. Let \mathcal{Y} be an algebraic stack. Consider the following 2-category:

- (1) An object is a morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ which is representable by algebraic spaces,
- (2) a 1-morphism $(g, \beta) : (f_1 : \mathcal{X}_1 \rightarrow \mathcal{Y}) \rightarrow (f_2 : \mathcal{X}_2 \rightarrow \mathcal{Y})$ consists of a morphism $g : \mathcal{X}_1 \rightarrow \mathcal{X}_2$ and a 2-morphism $\beta : f_1 \rightarrow f_2 \circ g$, and
- (3) a 2-morphism between $(g, \beta), (g', \beta') : (f_1 : \mathcal{X}_1 \rightarrow \mathcal{Y}) \rightarrow (f_2 : \mathcal{X}_2 \rightarrow \mathcal{Y})$ is a 2-morphism $\alpha : g \rightarrow g'$ such that $(\text{id}_{f_2} \star \alpha) \circ \beta = \beta'$.

Let us denote this 2-category $\text{Spaces}/\mathcal{Y}$ by analogy with the notation of Topologies on Spaces, Section 55.2. Now we claim that in this 2-category the morphism categories

$$\text{Mor}_{\text{Spaces}/\mathcal{Y}}((f_1 : \mathcal{X}_1 \rightarrow \mathcal{Y}), (f_2 : \mathcal{X}_2 \rightarrow \mathcal{Y}))$$

are all setoids. Namely, a 2-morphism α is a rule which to each object x_1 of \mathcal{X}_1 assigns an isomorphism $\alpha_{x_1} : g(x_1) \rightarrow g'(x_1)$ in the relevant fibre category of \mathcal{X}_2 such that the diagram

$$\begin{array}{ccc} & f_2(x_1) & \\ \beta_{x_1} \swarrow & & \searrow \beta'_{x_1} \\ f_2(g(x_1)) & \xrightarrow{f_2(\alpha_{x_1})} & f_2(g'(x_1)) \end{array}$$

commutes. But since f_2 is faithful (see Algebraic Stacks, Lemma 71.15.2) this means that if α_{x_1} exists, then it is unique! In other words the 2-category $\text{Spaces}/\mathcal{Y}$ is very close to being a category. Namely, if we replace 1-morphisms by isomorphism classes of 1-morphisms we obtain a category. We will often perform this replacement without further mention.

77.4. Points of algebraic stacks

Let \mathcal{X} be an algebraic stack. Let K, L be two fields and let $p : \text{Spec}(K) \rightarrow \mathcal{X}$ and $q : \text{Spec}(L) \rightarrow \mathcal{X}$ be morphisms. We say that p and q are *equivalent* if there exists a field Ω and a 2-commutative diagram

$$\begin{array}{ccc} \text{Spec}(\Omega) & \longrightarrow & \text{Spec}(L) \\ \downarrow & & \downarrow q \\ \text{Spec}(K) & \xrightarrow{p} & \mathcal{X} \end{array}$$

Lemma 77.4.1. *The notion above does indeed define an equivalence relation on morphisms from spectra of fields into the algebraic stack \mathcal{X} .*

Proof. It is clear that the relation is reflexive and symmetric. Hence we have to prove that it is transitive. This comes down to the following: Given a diagram

$$\begin{array}{ccccc} \text{Spec}(\Omega) & \xrightarrow{b} & \text{Spec}(L) & \xleftarrow{b'} & \text{Spec}(\Omega') \\ a \downarrow & & \downarrow q & & \downarrow a' \\ \text{Spec}(K) & \xrightarrow{p} & \mathcal{X} & \xleftarrow{p'} & \text{Spec}(K') \end{array}$$

with both squares 2-commutative we have to show that p is equivalent to p' . By the 2-Yoneda lemma (see Algebraic Stacks, Section 71.5) the morphisms p, p' , and q are given by objects x, x' , and y in the fibre categories of \mathcal{X} over $\text{Spec}(K)$,

$\text{Spec}(K')$, and $\text{Spec}(L)$. The 2-commutativity of the squares means that there are isomorphisms $\alpha : a^*x \rightarrow b^*y$ and $\alpha' : (a')^*x' \rightarrow (b')^*y$ in the fibre categories of \mathcal{X} over $\text{Spec}(\Omega)$ and $\text{Spec}(\Omega')$. Choose any field Ω'' and embeddings $\Omega \rightarrow \Omega''$ and $\Omega' \rightarrow \Omega''$ agreeing on L . Then we can extend the diagram above to

$$\begin{array}{ccccc}
 & & \text{Spec}(\Omega'') & & \\
 & \swarrow c & \downarrow q' & \searrow c' & \\
 \text{Spec}(\Omega) & \xrightarrow{b} & \text{Spec}(L) & \xleftarrow{b'} & \text{Spec}(\Omega') \\
 \downarrow a & & \downarrow q & & \downarrow a' \\
 \text{Spec}(K) & \xrightarrow{p} & \mathcal{X} & \xleftarrow{p'} & \text{Spec}(K')
 \end{array}$$

with commutative triangles and

$$(q')^*(\alpha')^{-1} \circ (q')^*\alpha : (a \circ c)^*x \longrightarrow (a' \circ c')^*x'$$

is an isomorphism in the fibre category over $\text{Spec}(\Omega'')$. Hence p is equivalent to p' as desired. \square

Definition 77.4.2. Let \mathcal{X} be an algebraic stack. A *point* of \mathcal{X} is an equivalence class of morphisms from spectra of fields into \mathcal{X} . The set of points of \mathcal{X} is denoted $|\mathcal{X}|$.

This agrees with our definition of points of algebraic spaces, see Properties of Spaces, Definition 48.4.1. Moreover, for a scheme we recover the usual notion of points, see Properties of Spaces, Lemma 48.4.2. If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks then there is an induced map $|f| : |\mathcal{X}| \rightarrow |\mathcal{Y}|$ which maps a representative $x : \text{Spec}(K) \rightarrow \mathcal{X}$ to the representative $f \circ x : \text{Spec}(K) \rightarrow \mathcal{Y}$. This is well defined: namely 2-isomorphic 1-morphisms remain 2-isomorphic after pre- or post-composing by a 1-morphism because you can horizontally pre- or post-compose by the identity of the given 1-morphism. This holds in any (strict) $(2, 1)$ -category. If

$$\begin{array}{ccc}
 \mathcal{X} & \longrightarrow & \mathcal{Y} \\
 \downarrow & & \downarrow \\
 \mathcal{W} & \longrightarrow & \mathcal{Z}
 \end{array}$$

is a 2-commutative diagram of algebraic stacks, then the diagram of sets

$$\begin{array}{ccc}
 |\mathcal{X}| & \longrightarrow & |\mathcal{Y}| \\
 \downarrow & & \downarrow \\
 |\mathcal{W}| & \longrightarrow & |\mathcal{Z}|
 \end{array}$$

is commutative. In particular, if $\mathcal{X} \rightarrow \mathcal{Y}$ is an equivalence then $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is a bijection.

Lemma 77.4.3. *Let*

$$\begin{array}{ccc}
 \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} & \longrightarrow & \mathcal{X} \\
 \downarrow & & \downarrow \\
 \mathcal{Z} & \longrightarrow & \mathcal{Y}
 \end{array}$$

be a fibre product of algebraic stacks. Then the map of sets of points

$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |\mathcal{Z}| \times_{|\mathcal{Y}|} |\mathcal{X}|$$

is surjective.

Proof. Namely, suppose given fields K, L and morphisms $\text{Spec}(K) \rightarrow \mathcal{X}, \text{Spec}(L) \rightarrow \mathcal{Z}$, then the assumption that they agree as elements of $|\mathcal{Y}|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $\text{Spec}(M) \rightarrow \text{Spec}(K) \rightarrow \mathcal{X} \rightarrow \mathcal{Y}$ and $\text{Spec}(M) \rightarrow \text{Spec}(L) \rightarrow \mathcal{Z} \rightarrow \mathcal{Y}$ are 2-isomorphic. And this is exactly the condition which says you get a morphism $\text{Spec}(M) \rightarrow \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$. \square

Lemma 77.4.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:*

- (1) $|f| : |\mathcal{X}| \rightarrow |\mathcal{Y}|$ is surjective, and
- (2) f is surjective.

Proof. Assume (1). Let $T \rightarrow \mathcal{Y}$ be a morphism whose source is a scheme. To prove (2) we have to show that the morphism of algebraic spaces $T \times_{\mathcal{Y}} \mathcal{X} \rightarrow T$ is surjective. By Morphisms of Spaces, Definition 49.5.2 this means we have to show that $|T \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |T|$ is surjective. Applying Lemma 77.4.3 we see that this follows from (1).

Conversely, assume (2). Let $y : \text{Spec}(K) \rightarrow \mathcal{Y}$ be a morphism from the spectrum of a field into \mathcal{Y} . By assumption the morphism $\text{Spec}(K) \times_{y, \mathcal{Y}} \mathcal{X} \rightarrow \text{Spec}(K)$ of algebraic spaces is surjective. By Morphisms of Spaces, Definition 49.5.2 this means there exists a field extension $K \subset K'$ and a morphism $\text{Spec}(K') \rightarrow \text{Spec}(K) \times_{y, \mathcal{Y}} \mathcal{X}$ such that the left square of the diagram

$$\begin{array}{ccccc} \text{Spec}(K') & \longrightarrow & \text{Spec}(K) \times_{y, \mathcal{Y}} \mathcal{X} & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow & & \downarrow \\ \text{Spec}(K) & \xlongequal{\quad} & \text{Spec}(K) & \xrightarrow{y} & \mathcal{Y} \end{array}$$

is commutative. This shows that $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is surjective. \square

Here is a lemma explaining how to compute the set of points in terms of a presentation.

Lemma 77.4.5. *Let \mathcal{X} be an algebraic stack. Let $\mathcal{X} = [U/R]$ be a presentation of \mathcal{X} , see Algebraic Stacks, Definition 71.16.5. Then the image of $|R| \rightarrow |U| \times |U|$ is an equivalence relation and $|\mathcal{X}|$ is the quotient of $|U|$ by this equivalence relation.*

Proof. The assumption means that we have a smooth groupoid (U, R, s, t, c) in algebraic spaces, and an equivalence $f : [U/R] \rightarrow \mathcal{X}$. We may assume $\mathcal{X} = [U/R]$. The induced morphism $p : U \rightarrow \mathcal{X}$ is smooth and surjective, see Algebraic Stacks, Lemma 71.17.2. Hence $|U| \rightarrow |\mathcal{X}|$ is surjective by Lemma 77.4.4. Note that $R = U \times_{\mathcal{X}} U$, see Groupoids in Spaces, Lemma 60.21.2. Hence Lemma 77.4.3 implies the map

$$|R| \longrightarrow |U| \times_{|\mathcal{X}|} |U|$$

is surjective. Hence the image of $|R| \rightarrow |U| \times |U|$ is exactly the set of pairs $(u_1, u_2) \in |U| \times |U|$ such that u_1 and u_2 have the same image in $|\mathcal{X}|$. Combining these two statements we get the result of the lemma. \square

Remark 77.4.6. The result of Lemma 77.4.5 can be generalized as follows. Let \mathcal{X} be an algebraic stack. Let U be an algebraic space and let $f : U \rightarrow \mathcal{X}$ be a surjective morphism (which makes sense by Section 77.3). Let $R = U \times_{\mathcal{X}} U$, let (U, R, s, t, c) be the groupoid in algebraic spaces, and let $f_{can} : [U/R] \rightarrow \mathcal{X}$ be the canonical morphism as constructed in Algebraic Stacks, Lemma 71.16.1. Then the image of $|R| \rightarrow |U| \times |U|$ is an equivalence relation and $|\mathcal{X}| = |U|/|R|$. The proof of Lemma 77.4.5 works without change. (Of course in general $[U/R]$ is not an algebraic stack, and in general f_{can} is not an isomorphism.)

Lemma 77.4.7. *There exists a unique topology on the sets of points of algebraic stacks with the following properties:*

- (1) *for every morphism of algebraic stacks $\mathcal{X} \rightarrow \mathcal{Y}$ the map $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is continuous, and*
- (2) *for every morphism $U \rightarrow \mathcal{X}$ which is flat and locally of finite presentation with U an algebraic space the map of topological spaces $|U| \rightarrow |\mathcal{X}|$ is continuous and open.*

Proof. Choose a morphism $p : U \rightarrow \mathcal{X}$ which is surjective, flat, and locally of finite presentation with U an algebraic space. Such exist by the definition of an algebraic stack, as a smooth morphism is flat and locally of finite presentation (see Morphisms of Spaces, Lemmas 49.34.5 and 49.34.7). We define a topology on $|\mathcal{X}|$ by the rule: $W \subset |\mathcal{X}|$ is open if and only if $|p|^{-1}(W)$ is open in $|U|$. To show that this is independent of the choice of p , let $p' : U' \rightarrow \mathcal{X}$ be another morphism which is surjective, flat, locally of finite presentation from an algebraic space to \mathcal{X} . Set $U'' = U \times_{\mathcal{X}} U'$ so that we have a 2-commutative diagram

$$\begin{array}{ccc} U'' & \longrightarrow & U' \\ \downarrow & & \downarrow \\ U & \longrightarrow & \mathcal{X} \end{array}$$

As $U \rightarrow \mathcal{X}$ and $U' \rightarrow \mathcal{X}$ are surjective, flat, locally of finite presentation we see that $U'' \rightarrow U'$ and $U'' \rightarrow U$ are surjective, flat and locally of finite presentation, see Lemma 77.3.2. Hence the maps $|U''| \rightarrow |U'|$ and $|U''| \rightarrow |U|$ are continuous, open and surjective, see Morphisms of Spaces, Definition 49.5.2 and Lemma 49.28.6. This clearly implies that our definition is independent of the choice of $p : U \rightarrow \mathcal{X}$.

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. By Algebraic Stacks, Lemma 71.15.1 we can find a 2-commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{a} & V \\ x \downarrow & & \downarrow y \\ \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \end{array}$$

with surjective smooth vertical arrows. Consider the associated commutative diagram

$$\begin{array}{ccc} |U| & \xrightarrow{|a|} & |V| \\ |x| \downarrow & & \downarrow |y| \\ |\mathcal{X}| & \xrightarrow{|f|} & |\mathcal{Y}| \end{array}$$

of sets. If $W \subset |\mathcal{Y}|$ is open, then by the definition above this means exactly that $|y|^{-1}(W)$ is open in $|V|$. Since $|a|$ is continuous we conclude that $|a|^{-1}|y|^{-1}(W) = |x|^{-1}|f|^{-1}(W)$ is open in $|U|$ which means by definition that $|f|^{-1}(W)$ is open in $|\mathcal{X}|$. Thus $|f|$ is continuous.

Finally, we have to show that if U is an algebraic space, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation, then $|U| \rightarrow |\mathcal{X}|$ is open. Let $V \rightarrow \mathcal{X}$ be surjective, flat, and locally of finite presentation with V an algebraic space. Consider the commutative diagram

$$\begin{array}{ccccc}
 |U \times_{\mathcal{X}} V| & \xrightarrow{e} & |U| \times_{|\mathcal{X}|} |V| & \xrightarrow{d} & |V| \\
 & \searrow f & \downarrow c & & \downarrow b \\
 & & |U| & \xrightarrow{a} & |\mathcal{X}|
 \end{array}$$

Now the morphism $U \times_{\mathcal{X}} V \rightarrow U$ is surjective, i.e., $f : |U \times_{\mathcal{X}} V| \rightarrow |U|$ is surjective. The left top horizontal arrow is surjective, see Lemma 77.4.3. The morphism $U \times_{\mathcal{X}} V \rightarrow V$ is flat and locally of finite presentation, hence $d \circ e : |U \times_{\mathcal{X}} V| \rightarrow |V|$ is open, see Morphisms of Spaces, Lemma 49.28.6. Pick $W \subset |U|$ open. The properties above imply that $b^{-1}(a(W)) = (d \circ e)(f^{-1}(W))$ is open, which by construction means that $a(W)$ is open as desired. \square

Definition 77.4.8. Let \mathcal{X} be an algebraic stack. The underlying *topological space* of \mathcal{X} is the set of points $|\mathcal{X}|$ endowed with the topology constructed in Lemma 77.4.7.

This definition does not conflict with the already existing topology on $|\mathcal{X}|$ if \mathcal{X} is an algebraic space.

Lemma 77.4.9. *Let \mathcal{X} be an algebraic stack. Every point of $|\mathcal{X}|$ has a fundamental system of quasi-compact open neighbourhoods. In particular $|\mathcal{X}|$ is locally quasi-compact in the sense of Topology, Definition 5.12.1.*

Proof. This follows formally from the fact that there exists a scheme U and a surjective, open, continuous map $U \rightarrow |\mathcal{X}|$ of topological spaces. Namely, if $U \rightarrow \mathcal{X}$ is surjective and smooth, then Lemma 77.4.7 guarantees that $|U| \rightarrow |\mathcal{X}|$ is continuous, surjective, and open. \square

77.5. Surjective morphisms

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Section 77.3 we have already defined what it means for f to be surjective. In Lemma 77.4.4 we have seen that this is equivalent to requiring $|f| : |\mathcal{X}| \rightarrow |\mathcal{Y}|$ to be surjective. This clears the way for the following definition.

Definition 77.5.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *surjective* if the map $|f| : |\mathcal{X}| \rightarrow |\mathcal{Y}|$ of associated topological spaces is surjective.

Here are some lemmas.

Lemma 77.5.2. *The composition of surjective morphisms is surjective.*

Proof. Omitted. \square

Lemma 77.5.3. *The base change of a surjective morphism is surjective.*

Proof. Omitted. Hint: Use Lemma 77.4.3. □

Lemma 77.5.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Y}' \rightarrow \mathcal{Y}$ be a surjective morphism of algebraic stacks. If the base change $f' : \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$ of f is surjective, then f is surjective.*

Proof. Immediate from Lemma 77.4.3. □

Lemma 77.5.5. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is surjective so is $\mathcal{Y} \rightarrow \mathcal{Z}$.*

Proof. Immediate. □

77.6. Quasi-compact algebraic stacks

The following definition is equivalent with the definition for algebraic spaces by Properties of Spaces, Lemma 48.5.2.

Definition 77.6.1. Let \mathcal{X} be an algebraic stack. We say \mathcal{X} is *quasi-compact* if and only if $|\mathcal{X}|$ is quasi-compact.

Lemma 77.6.2. *Let \mathcal{X} be an algebraic stack. The following are equivalent:*

- (1) \mathcal{X} is quasi-compact,
- (2) there exists a surjective smooth morphism $U \rightarrow \mathcal{X}$ with U a quasi-compact scheme,
- (3) there exists a surjective smooth morphism $U \rightarrow \mathcal{X}$ with U a quasi-compact algebraic space, and
- (4) there exists a surjective morphism $\mathcal{U} \rightarrow \mathcal{X}$ of algebraic stacks such that \mathcal{U} is quasi-compact.

Proof. We will use Lemma 77.4.4. Suppose \mathcal{U} and $\mathcal{U} \rightarrow \mathcal{X}$ are as in (4). Then since $|\mathcal{U}| \rightarrow |\mathcal{X}|$ is surjective and continuous we conclude that $|\mathcal{X}|$ is quasi-compact. Thus (4) implies (1). The implications (2) \Rightarrow (3) \Rightarrow (4) are immediate. Assume (1), i.e., \mathcal{X} is quasi-compact, i.e., that $|\mathcal{X}|$ is quasi-compact. Choose a scheme U and a surjective smooth morphism $U \rightarrow \mathcal{X}$. Then since $|U| \rightarrow |\mathcal{X}|$ is open we see that there exists a quasi-compact open $U' \subset U$ such that $|U'| \rightarrow |\mathcal{X}|$ is surjective (and still smooth). Hence (2) holds. □

Lemma 77.6.3. *A finite disjoint union of quasi-compact algebraic stacks is a quasi-compact algebraic stack.*

Proof. This is clear from the corresponding topological fact. □

77.7. Properties of algebraic stacks defined by properties of schemes

Any smooth local property of schemes gives rise to a corresponding property of algebraic stacks via the following lemma. Note that a property of schemes which is smooth local is also étale local as any étale covering is also a smooth covering. Hence for a smooth local property P of schemes we know what it means to say that an algebraic space has P , see Properties of Spaces, Section 77.7.

Lemma 77.7.1. *Let \mathcal{P} be a property of schemes which is local in the smooth topology, see Descent, Definition 34.11.1. Let \mathcal{X} be an algebraic stack. The following are equivalent*

- (1) for some scheme U and some surjective smooth morphism $U \rightarrow \mathcal{X}$ the scheme U has property \mathcal{P} ,
- (2) for every scheme U and every smooth morphism $U \rightarrow \mathcal{X}$ the scheme U has property \mathcal{P} ,
- (3) for some algebraic space U and some surjective smooth morphism $U \rightarrow \mathcal{X}$ the algebraic space U has property \mathcal{P} , and
- (4) for every algebraic space U and every smooth morphism $U \rightarrow \mathcal{X}$ the algebraic space U has property \mathcal{P} .

If \mathcal{X} is a scheme this is equivalent to $\mathcal{P}(U)$. If \mathcal{X} is an algebraic space this is equivalent to X having property \mathcal{P} .

Proof. Let $U \rightarrow \mathcal{X}$ surjective and smooth with U an algebraic space. Let $V \rightarrow \mathcal{X}$ be a smooth morphism with V an algebraic space. Choose schemes U' and V' and surjective étale morphisms $U' \rightarrow U$ and $V' \rightarrow V$. Finally, choose a scheme W and a surjective étale morphism $W \rightarrow V' \times_{\mathcal{X}} U'$. Then $W \rightarrow V'$ and $W \rightarrow U'$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 49.36.6 and 49.34.2. Moreover, $W \rightarrow V'$ is surjective as $U' \rightarrow \mathcal{X}$ is surjective. Hence, we have

$$\mathcal{P}(U) \Leftrightarrow \mathcal{P}(U') \Rightarrow \mathcal{P}(W) \Rightarrow \mathcal{P}(V') \Leftrightarrow \mathcal{P}(V)$$

where the equivalences are by definition of property \mathcal{P} for algebraic spaces, and the two implications come from Descent, Definition 34.11.1. This proves (3) \Rightarrow (4).

The implications (2) \Rightarrow (1), (1) \Rightarrow (3), and (4) \Rightarrow (2) are immediate. \square

Definition 77.7.2. Let \mathcal{X} be an algebraic stack. Let \mathcal{P} be a property of schemes which is local in the smooth topology. We say \mathcal{X} has property \mathcal{P} if any of the equivalent conditions of Lemma 77.7.1 hold.

Remark 77.7.3. Here is a list of properties which are local for the smooth topology (keep in mind that the fpqc, fppf, and syntomic topologies are stronger than the smooth topology):

- (1) locally Noetherian, see Descent, Lemma 34.12.1,
- (2) Jacobson, see Descent, Lemma 34.12.2,
- (3) locally Noetherian and (S_k) , see Descent, Lemma 34.13.1,
- (4) Cohen-Macaulay, see Descent, Lemma 34.13.2,
- (5) reduced, see Descent, Lemma 34.14.1,
- (6) normal, see Descent, Lemma 34.14.2,
- (7) locally Noetherian and (R_k) , see Descent, Lemma 34.14.3,
- (8) regular, see Descent, Lemma 34.14.4,
- (9) Nagata, see Descent, Lemma 34.14.5.

Any smooth local property of germs of schemes gives rise to a corresponding property of algebraic stacks. Note that a property of germs which is smooth local is also étale local. Hence for a smooth local property of germs of schemes P we know what it means to say that an algebraic space X has property P at $x \in |X|$, see Properties of Spaces, Section 77.7.

Lemma 77.7.4. Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$ be a point of \mathcal{X} . Let \mathcal{P} be a property of germs of schemes which is smooth local, see Descent, Definition 34.17.1. The following are equivalent

- (1) for any smooth morphism $U \rightarrow \mathcal{X}$ with U a scheme and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$,
- (2) for some smooth morphism $U \rightarrow \mathcal{X}$ with U a scheme and some $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$,
- (3) for any smooth morphism $U \rightarrow \mathcal{X}$ with U an algebraic space and $u \in |U|$ with $a(u) = x$ the algebraic space U has property \mathcal{P} at u , and
- (4) for some smooth morphism $U \rightarrow \mathcal{X}$ with U an algebraic space and some $u \in |U|$ with $a(u) = x$ the algebraic space U has property \mathcal{P} at u .

If \mathcal{X} is representable, then this is equivalent to $\mathcal{P}(\mathcal{X}, x)$. If \mathcal{X} is an algebraic space then this is equivalent to \mathcal{X} having property \mathcal{P} at x .

Proof. Let $a : U \rightarrow \mathcal{X}$ and $u \in |U|$ as in (3). Let $b : V \rightarrow \mathcal{X}$ be another smooth morphism with V an algebraic space and $v \in |V|$ with $b(v) = x$ also. Choose a scheme U' , an étale morphism $U' \rightarrow U$ and $u' \in U'$ mapping to u . Choose a scheme V' , an étale morphism $V' \rightarrow V$ and $v' \in V'$ mapping to v . By Lemma 77.4.3 there exists a point $\bar{w} \in |V' \times_{\mathcal{X}} U'|$ mapping to u' and v' . Choose a scheme W and a surjective étale morphism $W \rightarrow V' \times_{\mathcal{X}} U'$. We may choose a $w \in |W|$ mapping to \bar{w} (see Properties of Spaces, Lemma 48.4.4). Then $W \rightarrow V'$ and $W \rightarrow U'$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 49.36.6 and 49.34.2. Hence

$$\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}(U', u') \Leftrightarrow \mathcal{P}(W, w) \Leftrightarrow \mathcal{P}(V', v') \Leftrightarrow \mathcal{P}(V, v)$$

The outer two equivalences by Properties of Spaces, Definition 48.7.5 and the other two by what it means to be a smooth local property of germs of schemes. This proves (4) \Rightarrow (3).

The implications (1) \Rightarrow (2), (2) \Rightarrow (4), and (3) \Rightarrow (1) are immediate. \square

Definition 77.7.5. Let \mathcal{P} be a property of germs of schemes which is smooth local. Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. We say \mathcal{X} has property \mathcal{P} at x if any of the equivalent conditions of Lemma 77.7.4 holds.

77.8. Monomorphisms of algebraic stacks

We define a monomorphism of algebraic stacks in the following way. We will see in Lemma 77.8.4 that this is compatible with the corresponding 2-category theoretic notion.

Definition 77.8.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is a *monomorphism* if it is representable by algebraic spaces and a monomorphism in the sense of Section 77.3.

First some basic lemmas.

Lemma 77.8.2. Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a monomorphism. Then $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X}$ is a monomorphism.

Proof. This follows from the general discussion in Section 77.3. \square

Lemma 77.8.3. Compositions of monomorphisms of algebraic stacks are monomorphisms.

Proof. This follows from the general discussion in Section 77.3 and Morphisms of Spaces, Lemma 49.10.4. \square

Lemma 77.8.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent:*

- (1) f is a monomorphism,
- (2) f is fully faithful,
- (3) the diagonal $\Delta_f : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ is an equivalence, and
- (4) there exists an algebraic space W and a surjective, flat morphism $W \rightarrow \mathcal{Y}$ which is locally of finite presentation such that $V = \mathcal{X} \times_{\mathcal{Y}} W$ is an algebraic space, and the morphism $V \rightarrow W$ is a monomorphism of algebraic spaces.

Proof. The equivalence of (1) and (4) follows from the general discussion in Section 77.3 and in particular Lemmas 77.3.1 and 77.3.3.

The equivalence of (2) and (3) is Categories, Lemma 4.33.9.

Assume the equivalent conditions (2) and (3). Then f is representable by algebraic spaces according to Algebraic Stacks, Lemma 71.15.2. Moreover, the 2-Yoneda lemma combined with the fully faithfulness implies that for every scheme T the functor

$$\mathrm{Mor}(T, \mathcal{X}) \longrightarrow \mathrm{Mor}(T, \mathcal{Y})$$

is fully faithful. Hence given a morphism $y : T \rightarrow \mathcal{Y}$ there exists up to unique 2-isomorphism at most one morphism $x : T \rightarrow \mathcal{X}$ such that $y \cong f \circ x$. In particular, given a morphism of schemes $h : T' \rightarrow T$ there exists at most one lift $\tilde{h} : T' \rightarrow T \times_{\mathcal{Y}} \mathcal{X}$ of h . Thus $T \times_{\mathcal{Y}} \mathcal{X} \rightarrow T$ is a monomorphism of algebraic spaces, which proves that (1) holds.

Finally, assume that (1) holds. Then for any scheme T and morphism $y : T \rightarrow \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and $T \times_{\mathcal{Y}} \mathcal{X} \rightarrow T$ is a monomorphism. Hence there exists up to unique isomorphism exactly one pair (x, α) where $x : T \rightarrow \mathcal{X}$ is a morphism and $\alpha : f \circ x \rightarrow y$ is a 2-morphism. Applying the 2-Yoneda lemma this says exactly that f is fully faithful, i.e., that (2) holds. \square

Lemma 77.8.5. *A monomorphism of algebraic stacks induces an injective map of sets of points.*

Proof. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a monomorphism of algebraic stacks. Suppose that $x_i : \mathrm{Spec}(K_i) \rightarrow \mathcal{X}$ be morphisms such that $f \circ x_1$ and $f \circ x_2$ define the same element of $|\mathcal{Y}|$. Applying the definition we find a common extension Ω with corresponding morphisms $c_i : \mathrm{Spec}(\Omega) \rightarrow \mathrm{Spec}(K_i)$ and a 2-isomorphism $\beta : f \circ x_1 \circ c_1 \rightarrow f \circ x_1 \circ c_2$. As f is fully faithful, see Lemma 77.8.4, we can lift β to an isomorphism $\alpha : f \circ x_1 \circ c_1 \rightarrow f \circ x_1 \circ c_2$. Hence x_1 and x_2 define the same point of $|\mathcal{X}|$ as desired. \square

77.9. Immersions of algebraic stacks

Immersion of algebraic stacks are defined as follows.

Definition 77.9.1. Immersions.

- (1) A morphism of algebraic stacks is called an *open immersion* if it is representable, and an open immersion in the sense of Section 77.3.
- (2) A morphism of algebraic stacks is called a *closed immersion* if it is representable, and a closed immersion in the sense of Section 77.3.
- (3) A morphism of algebraic stacks is called an *immersion* if it is representable, and an immersion in the sense of Section 77.3.

This is not the most convenient way to think about immersions for us. For us it is a little bit more convenient to think of an immersion as a morphism of algebraic stacks which is representable by algebraic spaces and is an immersion in the sense of Section 77.3. Similarly for closed and open immersions. Since this is clearly equivalent to the notion just defined we shall use this characterization without further mention. We prove a few simple lemmas about this notion.

Lemma 77.9.2. *Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a (closed, resp. open) immersion. Then $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X}$ is a (closed, resp. open) immersion.*

Proof. This follows from the general discussion in Section 77.3. \square

Lemma 77.9.3. *Compositions of immersions of algebraic stacks are immersions. Similarly for closed immersions and open immersions.*

Proof. This follows from the general discussion in Section 77.3 and Spaces, Lemma 47.12.2. \square

Lemma 77.9.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let W be an algebraic space and let $W \rightarrow \mathcal{Y}$ be a surjective, flat morphism which is locally of finite presentation. The following are equivalent:*

- (1) *f is an (open, resp. closed) immersion, and*
- (2) *$V = W \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and $V \rightarrow W$ is an (open, resp. closed) immersion.*

Proof. This follows from the general discussion in Section 77.3 and in particular Lemmas 77.3.1 and 77.3.3. \square

Lemma 77.9.5. *An immersion is a monomorphism.*

Proof. See Morphisms of Spaces, Lemma 49.10.7. \square

The following two lemmas explain how to think about immersions in terms of presentations.

Lemma 77.9.6. *Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces. Let $i : \mathcal{Z} \rightarrow [U/R]$ be an immersion. Then there exists an R -invariant locally closed subspace $Z \subset U$ and a presentation $[Z/R_Z] \rightarrow \mathcal{Z}$ where R_Z is the restriction of R to Z such that*

$$\begin{array}{ccc} [Z/R_Z] & \xrightarrow{\quad} & \mathcal{Z} \\ & \searrow & \swarrow i \\ & [U/R] & \end{array}$$

is 2-commutative. If i is a closed (resp. open) immersion then Z is a closed (resp. open) subspace of U .

Proof. By Lemma 77.3.6 we get a commutative diagram

$$\begin{array}{ccc} [U'/R'] & \xrightarrow{\quad} & \mathcal{Z} \\ & \searrow & \swarrow \\ & [U/R] & \end{array}$$

where $U' = \mathcal{Z} \times_{[U/R]} U$ and $R' = \mathcal{Z} \times_{[U/R]} R$. Since $\mathcal{Z} \rightarrow [U/R]$ is an immersion we see that $U' \rightarrow U$ is an immersion of algebraic spaces. Let $Z \subset U$ be the locally closed subspace such that $U' \rightarrow U$ factors through Z and induces an isomorphism $U' \rightarrow Z$. It is clear from the construction of R' that $R' = U' \times_{U,t} R = R \times_{s,U} U'$. This implies that $Z \cong U'$ is R -invariant and that the image of $R' \rightarrow R$ identifies R' with the restriction $R_Z = s^{-1}(Z) = t^{-1}(Z)$ of R to Z . Hence the lemma holds. \square

Lemma 77.9.7. *Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces. Let $\mathcal{X} = [U/R]$ be the associated algebraic stack, see Algebraic Stacks, Theorem 71.17.3. Let $Z \subset U$ be an R -invariant locally closed subspace. Then*

$$[Z/R_Z] \longrightarrow [U/R]$$

is an immersion of algebraic stacks, where R_Z is the restriction of R to Z . If $Z \subset U$ is open (resp. closed) then the morphism is an open (resp. closed) immersion of algebraic stacks.

Proof. Recall that by Groupoids in Spaces, Definition 60.17.1 (see also discussion following the definition) we have $R_Z = s^{-1}(Z) = t^{-1}(Z)$ as locally closed subspaces of R . Hence the two morphisms $R_Z \rightarrow Z$ are smooth as base changes of s and t . Hence $(Z, R_Z, s|_{R_Z}, t|_{R_Z}, c|_{R_Z \times_{s,z,t} R_Z})$ is a smooth groupoid in algebraic spaces, and we see that $[Z/R_Z]$ is an algebraic stack, see Algebraic Stacks, Theorem 71.17.3. The assumptions of Groupoids in Spaces, Lemma 60.24.3 are all satisfied and it follows that we have a 2-fibre square

$$\begin{array}{ccc} Z & \longrightarrow & [Z/R_Z] \\ \downarrow & & \downarrow \\ U & \longrightarrow & [U/R] \end{array}$$

It follows from this and Lemma 77.3.1 that $[Z/R_Z] \rightarrow [U/R]$ is representable by algebraic spaces, whereupon it follows from Lemma 77.3.3 that the right vertical arrow is an immersion (resp. closed immersion, resp. open immersion) if and only if the left vertical arrow is. \square

We can define open, closed, and locally closed substacks as follows.

Definition 77.9.8. Let \mathcal{X} be an algebraic stack.

- (1) An *open substack* of \mathcal{X} is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that \mathcal{X}' is an algebraic stack and $\mathcal{X}' \rightarrow \mathcal{X}$ is an open immersion.
- (2) A *closed substack* of \mathcal{X} is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that \mathcal{X}' is an algebraic stack and $\mathcal{X}' \rightarrow \mathcal{X}$ is a closed immersion.
- (3) A *locally closed substack* of \mathcal{X} is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that \mathcal{X}' is an algebraic stack and $\mathcal{X}' \rightarrow \mathcal{X}$ is an immersion.

This definition should be used with caution. Namely, if $f : \mathcal{X} \rightarrow \mathcal{Y}$ is an equivalence of algebraic stacks and $\mathcal{X}' \subset \mathcal{X}$ is an open substack, then it is not necessarily the case that the subcategory $f(\mathcal{X}')$ is an open substack of \mathcal{Y} . The problem is that it may not be a *strictly* full subcategory; but this is also the only problem. Here is a formal statement.

Lemma 77.9.9. *For any immersion $i : \mathcal{Z} \rightarrow \mathcal{X}$ there exists a unique locally closed substack $\mathcal{X}' \subset \mathcal{X}$ such that i factors as the composition of an equivalence $i' : \mathcal{Z} \rightarrow \mathcal{X}'$*

followed by the inclusion morphism $\mathcal{X}' \rightarrow \mathcal{X}$. If i is a closed (resp. open) immersion, then \mathcal{X}' is a closed (resp. open) substack of \mathcal{X} .

Proof. Omitted. □

Lemma 77.9.10. *Let $[U/R] \rightarrow \mathcal{X}$ be a presentation of an algebraic stack. There is a canonical bijection*

$$R\text{-invariant locally closed subspaces } Z \text{ of } U \leftrightarrow \text{locally closed substacks } \mathcal{Z} \text{ of } \mathcal{X}$$

where if Z corresponds to \mathcal{Z} , then $[Z/R_Z] \rightarrow \mathcal{Z}$ is a presentation fitting into a 2-commutative diagram with the given presentation of \mathcal{X} . Similarly for closed substacks and open substacks.

Proof. Omitted. Hints: Use Lemma 77.9.6 to go from right to left and Lemma 77.9.7 from left to right. □

Lemma 77.9.11. *Let \mathcal{X} be an algebraic stack. The rule $\mathcal{U} \mapsto |\mathcal{U}|$ defines an inclusion preserving bijection between open substacks of \mathcal{X} and open subsets of $|\mathcal{X}|$.*

Proof. Choose a presentation $[U/R] \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemma 71.16.2. By Lemma 77.9.10 we see that open substacks correspond to R -invariant open subschemes of U . On the other hand Lemmas 77.4.5 and 77.4.7 guarantee these correspond bijectively to open subsets of $|\mathcal{X}|$. □

Lemma 77.9.12. *Let \mathcal{X} be an algebraic stack. Let U be an algebraic space and $U \rightarrow \mathcal{X}$ a surjective smooth morphism. For an open immersion $V \hookrightarrow U$, there exists an algebraic stack \mathcal{Y} , an open immersion $\mathcal{Y} \rightarrow \mathcal{X}$, and a surjective smooth morphism $V \rightarrow \mathcal{Y}$.*

Proof. We define a category fibred in groupoids \mathcal{Y} by letting the fiber category \mathcal{Y}_T over an object T of $(Sch/S)_{fppf}$ be the full subcategory of \mathcal{X}_T consisting of all $y \in \text{Ob}(\mathcal{X}_T)$ such that the projection morphism $V \times_{\mathcal{X},y} T \rightarrow T$ is surjective. Now for any morphism $x : T \rightarrow \mathcal{X}$, the 2-fibred product $T \times_{x,\mathcal{X}} \mathcal{Y}$ has fiber category over T' consisting of triples $(f : T' \rightarrow T, y \in \mathcal{X}_{T'}, f^*x \simeq y)$ such that $V \times_{\mathcal{X},y} T' \rightarrow T'$ is surjective. Note that $T \times_{x,\mathcal{X}} \mathcal{Y}$ is fibered in sets since $\mathcal{Y} \rightarrow \mathcal{X}$ is faithful (see Stacks, Lemma 8.6.7). Now the isomorphism $f^*x \simeq y$ gives the diagram

$$\begin{array}{ccccc} V \times_{\mathcal{X},y} T' & \longrightarrow & V \times_{\mathcal{X},x} T & \longrightarrow & V \\ \downarrow & & \downarrow & & \downarrow \\ T' & \xrightarrow{f} & T & \xrightarrow{x} & \mathcal{X} \end{array}$$

where both squares are cartesian. The morphism $V \times_{\mathcal{X},x} T \rightarrow T$ is smooth by base change, and hence open. Let $T_0 \subset T$ be its image. From the cartesian squares we deduce that $V \times_{\mathcal{X},y} T' \rightarrow T'$ is surjective if and only if f lands in T_0 . Therefore $T \times_{x,\mathcal{X}} \mathcal{Y}$ is representable by T_0 , so the inclusion $\mathcal{Y} \rightarrow \mathcal{X}$ is an open immersion. By Algebraic Stacks, Lemma 71.15.5 we conclude that \mathcal{Y} is an algebraic stack. Lastly if we denote the morphism $V \rightarrow \mathcal{X}$ by g , we have $V \times_{\mathcal{X}} V \rightarrow V$ is surjective (the diagonal gives a section). Hence g is in the image of $\mathcal{Y}_V \rightarrow \mathcal{X}_V$, i.e., we obtain a

morphism $g' : V \rightarrow \mathcal{Y}$ fitting into the commutative diagram

$$\begin{array}{ccc} V & \longrightarrow & U \\ \downarrow g' & & \downarrow \\ \mathcal{Y} & \longrightarrow & \mathcal{X} \end{array}$$

Since $V \times_{g, \mathcal{X}} \mathcal{Y} \rightarrow V$ is a monomorphism, it is in fact an isomorphism since $(1, g')$ defines a section. Therefore $g' : V \rightarrow \mathcal{Y}$ is a smooth morphism, as it is the base change of the smooth morphism $g : V \rightarrow \mathcal{X}$. It is surjective by our construction of \mathcal{Y} which finishes the proof of the lemma. \square

Lemma 77.9.13. *Let \mathcal{X} be an algebraic stack and $\mathcal{X}_i \subset \mathcal{X}$ a collection of open substacks indexed by $i \in I$. Then there exists an open substack, which we denote $\bigcup_{i \in I} \mathcal{X}_i \subset \mathcal{X}$, such that the \mathcal{X}_i are open substacks covering it.*

Proof. We define a fibred subcategory $\mathcal{X}' = \bigcup_{i \in I} \mathcal{X}_i$ by letting the fiber category over an object T of $(Sch/S)_{fppf}$ be the full subcategory of \mathcal{X}_T consisting of all $x \in \text{Ob}(\mathcal{X}_T)$ such that the morphism $\prod_{i \in I} (\mathcal{X}_i \times_{\mathcal{X}} T) \rightarrow T$ is surjective. Let $x_i \in \text{Ob}((\mathcal{X}_i)_T)$. Then $(x_i, 1)$ gives a section of $\mathcal{X}_i \times_{\mathcal{X}} T \rightarrow T$, so we have an isomorphism. Thus $\mathcal{X}_i \subset \mathcal{X}'$ is a full subcategory. Now let $x \in \text{Ob}(\mathcal{X}_T)$. Then $\mathcal{X}_i \times_{\mathcal{X}} T$ is representable by an open subscheme $T_i \subset T$. The 2-fibred product $\mathcal{X}' \times_{\mathcal{X}} T$ has fiber over T' consisting of $(y \in \mathcal{X}_{T'}, f : T' \rightarrow T, f^*x \simeq y)$ such that $\prod (\mathcal{X}_i \times_{\mathcal{X}, y} T') \rightarrow T'$ is surjective. The isomorphism $f^*x \simeq y$ induces an isomorphism $\mathcal{X}_i \times_{\mathcal{X}, y} T' \simeq T_i \times_T T'$. Then the $T_i \times_T T'$ cover T' if and only if f lands in $\bigcup T_i$. Therefore we have a diagram

$$\begin{array}{ccccc} T_i & \longrightarrow & \bigcup T_i & \longrightarrow & T \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{X}_i & \longrightarrow & \mathcal{X}' & \longrightarrow & \mathcal{X} \end{array}$$

with both squares cartesian. By Algebraic Stacks, Lemma 71.15.5 we conclude that $\mathcal{X}' \subset \mathcal{X}$ is algebraic and an open substack. It is also clear from the cartesian squares above that the morphism $\prod_{i \in I} \mathcal{X}_i \rightarrow \mathcal{X}'$ which finishes the proof of the lemma. \square

Lemma 77.9.14. *Let \mathcal{X} be an algebraic stack and $\mathcal{X}' \subset \mathcal{X}$ a quasi-compact open substack. Suppose that we have a collection of open substacks $\mathcal{X}_i \subset \mathcal{X}$ indexed by $i \in I$ such that $\mathcal{X}' \subset \bigcup_{i \in I} \mathcal{X}_i$, where we define the union as in Lemma 77.9.13. Then there exists a finite subset $I' \subset I$ such that $\mathcal{X}' \subset \bigcup_{i \in I'} \mathcal{X}_i$.*

Proof. Since \mathcal{X} is algebraic, there exists a scheme U with a surjective smooth morphism $U \rightarrow \mathcal{X}$. Let $U_i \subset U$ be the open subscheme representing $\mathcal{X}_i \times_{\mathcal{X}} U$ and $U' \subset U$ the open subscheme representing $\mathcal{X}' \times_{\mathcal{X}} U$. By hypothesis, $U' \subset \bigcup_{i \in I} U_i$. From the proof of Lemma 77.6.2, there is a quasi-compact open $V \subset U'$ such that $V \rightarrow \mathcal{X}'$ is a surjective smooth morphism. Therefore there exists a finite subset $I' \subset I$ such that $V \subset \bigcup_{i \in I'} U_i$. We claim that $\mathcal{X}' \subset \bigcup_{i \in I'} \mathcal{X}_i$. Take $x \in \text{Ob}(\mathcal{X}'_T)$ for $T \in \text{Ob}((Sch/S)_{fppf})$. Since $\mathcal{X}' \rightarrow \mathcal{X}$ is a monomorphism, we have cartesian

squares

$$\begin{array}{ccccc} V \times_{\mathcal{X}} T & \longrightarrow & T & \xlongequal{\quad} & T \\ \downarrow & & \downarrow x & & \downarrow x \\ V & \longrightarrow & \mathcal{X}' & \longrightarrow & \mathcal{X} \end{array}$$

By base change, $V \times_{\mathcal{X}} T \rightarrow T$ is surjective. Therefore $\bigcup_{i \in I'} U_i \times_{\mathcal{X}} T \rightarrow T$ is also surjective. Let $T_i \subset T$ be the open subscheme representing $\mathcal{X}_i \times_{\mathcal{X}} T$. By a formal argument, we have a Cartesian square

$$\begin{array}{ccc} U_i \times_{\mathcal{X}_i} T_i & \longrightarrow & U \times_{\mathcal{X}} T \\ \downarrow & & \downarrow \\ T_i & \longrightarrow & T \end{array}$$

where the vertical arrows are surjective by base change. Since $U_i \times_{\mathcal{X}_i} T_i \simeq U_i \times_{\mathcal{X}} T$, we find that $\bigcup_{i \in I'} T_i = T$. Hence x is an object of $(\bigcup_{i \in I'} \mathcal{X}_i)_T$ by definition of the union. Observe that the inclusion $\mathcal{X}' \subset \bigcup_{i \in I'} \mathcal{X}_i$ is automatically an open substack. \square

Lemma 77.9.15. *Let \mathcal{X} be an algebraic stack. Let \mathcal{X}_i , $i \in I$ be a set of open substacks of \mathcal{X} . Assume*

- (1) $\mathcal{X} = \bigcup_{i \in I} \mathcal{X}_i$, and
- (2) each \mathcal{X}_i is an algebraic space.

Then \mathcal{X} is an algebraic space.

Proof. Apply Stacks, Lemma 8.6.10 to the morphism $\coprod_{i \in I} \mathcal{X}_i \rightarrow \mathcal{X}$ and the morphism $\text{id} : \mathcal{X} \rightarrow \mathcal{X}$ to see that \mathcal{X} is a stack in setoids. Hence \mathcal{X} is an algebraic space, see Algebraic Stacks, Proposition 71.13.3. \square

Lemma 77.9.16. *Let \mathcal{X} be an algebraic stack. Let \mathcal{X}_i , $i \in I$ be a set of open substacks of \mathcal{X} . Assume*

- (1) $\mathcal{X} = \bigcup_{i \in I} \mathcal{X}_i$, and
- (2) each \mathcal{X}_i is a scheme

Then \mathcal{X} is a scheme.

Proof. By Lemma 77.9.15 we see that \mathcal{X} is an algebraic space. Since any algebraic space has a largest open subspace which is a scheme, see Properties of Spaces, Lemma 48.10.1 we see that \mathcal{X} is a scheme. \square

The following lemma is the analogue of More on Groupoids, Lemma 39.5.1.

Lemma 77.9.17. *Let $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ be properties of morphisms of algebraic spaces. Assume*

- (1) $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ are fppf local on the target and stable under arbitrary base change,
- (2) $\text{smooth} \Rightarrow \mathcal{R}$,
- (3) for any morphism $f : X \rightarrow Y$ which has \mathcal{Q} there exists a largest open subspace $W(\mathcal{P}, f) \subset X$ such that $f|_{W(\mathcal{P}, f)}$ has \mathcal{P} , and
- (4) for any morphism $f : X \rightarrow Y$ which has \mathcal{Q} , and any morphism $Y' \rightarrow Y$ which has \mathcal{R} we have $Y' \times_Y W(\mathcal{P}, f) = W(\mathcal{P}, f')$, where $f' : X_{Y'} \rightarrow Y'$ is the base change of f .

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Assume f has \mathcal{Q} . Then

- (A) there exists a largest open substack $\mathcal{X}' \subset \mathcal{X}$ such that $f|_{\mathcal{X}'}$ has \mathcal{P} , and
- (B) if $\mathcal{Z} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has \mathcal{R} then $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}'$ is the largest open substack of $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ over which the base change $\text{id}_{\mathcal{Z}} \times f$ has property \mathcal{P} .

Proof. Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U = V \times_{\mathcal{Y}} \mathcal{X}$ and let $f' : U \rightarrow V$ be the base change of f . The morphism of algebraic spaces $f' : U \rightarrow V$ has property \mathcal{Q} . Thus we obtain the open $W(\mathcal{P}, f') \subset U$ by assumption (3). Note that $U \times_{\mathcal{X}} U = (V \times_{\mathcal{Y}} V) \times_{\mathcal{Y}} \mathcal{X}$ hence the morphism $f'' : U \times_{\mathcal{X}} U \rightarrow V \times_{\mathcal{Y}} V$ is the base change of f via either projection $V \times_{\mathcal{Y}} V \rightarrow V$. By our choice of V these projections are smooth, hence have property \mathcal{R} by (2). Thus by (4) we see that the inverse images of $W(\mathcal{P}, f')$ under the two projections $\text{pr}_i : U \times_{\mathcal{X}} U \rightarrow U$ agree. In other words, $W(\mathcal{P}, f')$ is an R -invariant subspace of U (where $R = U \times_{\mathcal{X}} U$). Let \mathcal{X}' be the open substack of \mathcal{X} corresponding to $W(\mathcal{P}, f')$ via Lemma 77.9.6. By construction $W(\mathcal{P}, f') = \mathcal{X}' \times_{\mathcal{Y}} V$ hence $f|_{\mathcal{X}'}$ has property \mathcal{P} by Lemma 77.3.3. Also, \mathcal{X}' is the largest open substack such that $f|_{\mathcal{X}'}$ has \mathcal{P} as the same maximality holds for $W(\mathcal{P}, f)$. This proves (A).

Finally, if $\mathcal{Z} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has \mathcal{R} then we set $T = V \times_{\mathcal{Y}} \mathcal{Z}$ and we see that $T \rightarrow V$ is a morphism of algebraic spaces having property \mathcal{R} . Set $f'_T : T \times_V U \rightarrow T$ the base change of f' . By (4) again we see that $W(\mathcal{P}, f'_T)$ is the inverse image of $W(\mathcal{P}, f)$ in $T \times_V U$. This implies (B); some details omitted. \square

Remark 77.9.18. Warning: Lemma 77.9.17 should be used with care. For example, it applies to \mathcal{P} = “flat”, \mathcal{Q} = “empty”, and \mathcal{R} = “flat and locally of finite presentation”. But given a morphism of algebraic spaces $f : X \rightarrow Y$ the largest open subspace $W \subset X$ such that $f|_W$ is flat is *not* the set of points where f is flat!

Remark 77.9.19. Notwithstanding the warning in Remark 77.9.18 there are some cases where Lemma 77.9.17 can be used without causing ambiguity. We give a list. In each case we omit the verification of assumptions (1) and (2) and we give references which imply (3) and (4). Here is the list:

- (1) \mathcal{Q} = “locally of finite type”, $\mathcal{R} = \emptyset$, and \mathcal{P} = “relative dimension $\leq d$ ”. See Morphisms of Spaces, Definition 49.31.2 and Morphisms of Spaces, Lemmas 49.32.4 and 49.32.3.
- (2) \mathcal{Q} = “locally of finite type”, $\mathcal{R} = \emptyset$, and \mathcal{P} = “locally quasi-finite”. This is the case $d = 0$ of the previous item, see Morphisms of Spaces, Lemma 49.32.6. On the other hand, properties (3) and (4) are spelled out in Morphisms of Spaces, Lemma 49.32.7.
- (3) \mathcal{Q} = “locally of finite type”, $\mathcal{R} = \emptyset$, and \mathcal{P} = “unramified”. This is Morphisms of Spaces, Lemma 49.35.10.
- (4) \mathcal{Q} = “locally of finite presentation”, \mathcal{R} = “flat and locally of finite presentation”, and \mathcal{P} = “flat”. See More on Morphisms of Spaces, Theorem 58.18.1 and Lemma 58.18.2. Note that here $W(\mathcal{P}, f)$ is always exactly the set of points where the morphism f is flat because we only consider this open when f has \mathcal{Q} (see loc.cit.).

- (5) \mathcal{Q} = “locally of finite presentation”, \mathcal{R} = “flat and locally of finite presentation”, and \mathcal{P} = “étale”. This follows on combining (3) and (4) because an unramified morphism which is flat and locally of finite presentation is étale, see Morphisms of Spaces, Lemma 49.36.12.
- (6) Add more here as needed (compare with the longer list at More on Groupoids, Remark 39.5.3).

77.10. Reduced algebraic stacks

We have already defined reduced algebraic stacks in Section 77.7.

Lemma 77.10.1. *Let \mathcal{X} be an algebraic stack. Let $T \subset |\mathcal{X}|$ be a closed subset. There exists a unique closed substack $\mathcal{Z} \subset \mathcal{X}$ with the following properties: (a) we have $|\mathcal{Z}| = T$, and (b) \mathcal{Z} is reduced.*

Proof. Let $U \rightarrow \mathcal{X}$ be a surjective smooth morphism, where U is an algebraic space. Set $R = U \times_{\mathcal{X}} U$, so that there is a presentation $[U/R] \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemma 71.16.2. As usual we denote $s, t : R \rightarrow U$ the two smooth projection morphisms. By Lemma 77.4.5 we see that T corresponds to a closed subset $T' \subset |U|$ such that $|s|^{-1}(T') = |t|^{-1}(T')$. Let $Z \subset U$ be the reduced induced algebraic space structure on T' , see Properties of Spaces, Definition 48.9.5. The fibre products $Z \times_{U,t} R$ and $R \times_{s,U} Z$ are closed subspaces of R (Spaces, Lemma 47.12.3). The projections $Z \times_{U,t} R \rightarrow Z$ and $R \times_{s,U} Z \rightarrow Z$ are smooth by Morphisms of Spaces, Lemma 49.34.3. Thus as Z is reduced, it follows that $Z \times_{U,t} R$ and $R \times_{s,U} Z$ are reduced, see Remark 77.7.3. Since

$$|Z \times_{U,t} R| = |t|^{-1}(T') = |s|^{-1}(T') = |R \times_{s,U} Z|$$

we conclude from the uniqueness in Properties of Spaces, Lemma 48.9.3 that $Z \times_{U,t} R = R \times_{s,U} Z$. Hence Z is an R -invariant closed subspace of U . By the correspondence of Lemma 77.9.10 (and its proof) we obtain a closed substack $\mathcal{Z} \subset \mathcal{X}$ with a presentation $[Z/R_Z] \rightarrow \mathcal{Z}$. Then $|\mathcal{Z}| = |Z|/|R_Z| = |T'|/\sim$ is the given closed subset T . We omit the proof of unicity. \square

Lemma 77.10.2. *Let \mathcal{X} be an algebraic stack. If $\mathcal{X}' \subset \mathcal{X}$ is a closed substack, \mathcal{X}' is reduced and $|\mathcal{X}'| = |\mathcal{X}|$, then $\mathcal{X}' = \mathcal{X}$.*

Proof. Choose a presentation $[U/R] \rightarrow \mathcal{X}$ with U a scheme. As \mathcal{X} is reduced, we see that U is reduced (by definition of reduced algebraic stacks). By Lemma 77.9.10 \mathcal{X}' corresponds to an R -invariant closed subscheme $Z \subset U$. But now $|Z| \subset |U|$ is the inverse image of $|\mathcal{X}'|$, and hence $|Z| = |U|$. Hence Z is a closed subscheme of U whose underlying sets of points agree. By Schemes, Lemma 25.12.6 the map $\text{id}_U : U \rightarrow U$ factors through $Z \rightarrow U$, and hence $Z = U$, i.e., $\mathcal{X}' = \mathcal{X}$. \square

Lemma 77.10.3. *Let \mathcal{X}, \mathcal{Y} be algebraic stacks. Let $\mathcal{Z} \subset \mathcal{X}$ be a closed substack. Assume \mathcal{Y} is reduced. A morphism $f : \mathcal{Y} \rightarrow \mathcal{X}$ factors through \mathcal{Z} if and only if $f(|\mathcal{Y}|) \subset |\mathcal{Z}|$.*

Proof. Assume $f(|\mathcal{Y}|) \subset |\mathcal{Z}|$. Consider $\mathcal{Y} \times_{\mathcal{X}} \mathcal{Z} \rightarrow \mathcal{Y}$. There is an equivalence $\mathcal{Y} \times_{\mathcal{X}} \mathcal{Z} \rightarrow \mathcal{Y}'$ where \mathcal{Y}' is a closed substack of \mathcal{Y} , see Lemmas 77.9.2 and 77.9.9. Using Lemmas 77.4.3, 77.8.5, and 77.9.5 we see that $|\mathcal{Y}'| = |\mathcal{Y}|$. Hence we have reduced the lemma to Lemma 77.10.2. \square

Definition 77.10.4. Let \mathcal{X} be an algebraic stack. Let $Z \subset |\mathcal{X}|$ be a closed subset. An *algebraic stack structure on Z* is given by a closed substack \mathcal{Z} of \mathcal{X} with $|\mathcal{Z}|$ equal to Z . The *reduced induced algebraic stack structure on Z* is the one constructed in Lemma 77.10.1. The *reduction \mathcal{X}_{red} of \mathcal{X}* is the reduced induced algebraic stack structure on $|\mathcal{X}|$.

In fact we can use this to define the reduced induced algebraic stack structure on a locally closed subset.

Remark 77.10.5. Let X be an algebraic stack. Let $T \subset |\mathcal{X}|$ be a locally closed subset. Let ∂T be the boundary of T in the topological space $|\mathcal{X}|$. In a formula

$$\partial T = \overline{T} \setminus T.$$

Let $\mathcal{U} \subset \mathcal{X}$ be the open substack of X with $|\mathcal{U}| = |\mathcal{X}| \setminus \partial T$, see Lemma 77.9.11. Let \mathcal{Z} be the reduced closed substack of \mathcal{U} with $|\mathcal{Z}| = T$ obtained by taking the reduced induced closed subspace structure, see Definition 77.10.4. By construction $\mathcal{Z} \rightarrow \mathcal{U}$ is a closed immersion of algebraic stacks and $\mathcal{U} \rightarrow \mathcal{X}$ is an open immersion, hence $\mathcal{Z} \rightarrow \mathcal{X}$ is an immersion of algebraic stacks by Lemma 77.9.3. Note that \mathcal{Z} is a reduced algebraic stack and that $|\mathcal{Z}| = T$ as subsets of $|\mathcal{X}|$. We sometimes say \mathcal{Z} is the *reduced induced substack structure on T* .

77.11. Residual gerbes

In the stacks project we would like to define the *residual gerbe* of an algebraic stack \mathcal{X} at a point $x \in |\mathcal{X}|$ to be a monomorphism of algebraic stacks $m_x : \mathcal{Z}_x \rightarrow \mathcal{X}$ where \mathcal{Z}_x is a reduced algebraic stack having a unique point which is mapped by m_x to x . It turns out that there are many issues with this notion; existence is not clear in general and neither is uniqueness. We resolve the uniqueness issue by imposing a slightly stronger condition on the algebraic stacks \mathcal{Z}_x . We discuss this in more detail by working through a few simple lemmas regarding reduced algebraic stacks having a unique point.

Lemma 77.11.1. *Let \mathcal{Z} be an algebraic stack. Let k be a field and let $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ be surjective and flat. Then any morphism $\mathrm{Spec}(k') \rightarrow \mathcal{Z}$ where k' is a field is surjective and flat.*

Proof. Consider the fibre square

$$\begin{array}{ccc} T & \longrightarrow & \mathrm{Spec}(k) \\ \downarrow & & \downarrow \\ \mathrm{Spec}(k') & \longrightarrow & \mathcal{Z} \end{array}$$

Note that $T \rightarrow \mathrm{Spec}(k')$ is flat and surjective hence T is not empty. On the other hand $T \rightarrow \mathrm{Spec}(k)$ is flat as k is a field. Hence $T \rightarrow \mathcal{Z}$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 49.29.5 (via the discussion in Section 77.3) that $\mathrm{Spec}(k') \rightarrow \mathcal{Z}$ is flat. It is clear that it is surjective as by assumption $|\mathcal{Z}|$ is a singleton. \square

Lemma 77.11.2. *Let \mathcal{Z} be an algebraic stack. The following are equivalent*

- (1) \mathcal{Z} is reduced and $|\mathcal{Z}|$ is a singleton,
- (2) there exists a surjective flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ where k is a field, and

- (3) *there exists a locally of finite type, surjective, flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ where k is a field.*

Proof. Assume (1). Let W be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Then W is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of W . Since W is reduced we have $\mathcal{O}_{W,\eta} = \kappa(\eta)$. It follows that the canonical morphism $\eta = \mathrm{Spec}(\kappa(\eta)) \rightarrow W$ is flat. We see that the composition $\eta \rightarrow \mathcal{Z}$ is flat (see Morphisms of Spaces, Lemma 49.28.3). It is also surjective as $|\mathcal{Z}|$ is a singleton. In other words (2) holds.

Assume (2). Let W be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Choose a field k and a surjective flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$. Then $W \times_{\mathcal{Z}} \mathrm{Spec}(k)$ is an algebraic space smooth over k , hence regular (see Spaces over Fields, Lemma 54.9.1) and in particular reduced. Since $W \times_{\mathcal{Z}} \mathrm{Spec}(k) \rightarrow W$ is surjective and flat we conclude that W is reduced (Descent on Spaces, Lemma 56.8.2). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme W and a smooth morphism $W \rightarrow \mathcal{Z}$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. The composition

$$\mathrm{Spec}(k) \xrightarrow{w} W \longrightarrow \mathcal{Z}$$

is locally of finite type by Morphisms of Spaces, Lemmas 49.23.2 and 49.34.6. It is also flat and surjective by Lemma 77.11.1. Hence (3) holds. \square

The following lemma singles out a slightly better class of singleton algebraic stacks than the preceding lemma.

Lemma 77.11.3. *Let \mathcal{Z} be an algebraic stack. The following are equivalent*

- (1) *\mathcal{Z} is reduced, locally Noetherian, and $|\mathcal{Z}|$ is a singleton, and*
- (2) *there exists a locally finitely presented, surjective, flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ where k is a field.*

Proof. Assume (2) holds. By Lemma 77.11.2 we see that \mathcal{Z} is reduced and $|\mathcal{Z}|$ is a singleton. Let W be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Choose a field k and a locally finitely presented, surjective, flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$. Then $W \times_{\mathcal{Z}} \mathrm{Spec}(k)$ is an algebraic space smooth over k , hence locally Noetherian (see Morphisms of Spaces, Lemma 49.23.5). Since $W \times_{\mathcal{Z}} \mathrm{Spec}(k) \rightarrow W$ is flat, surjective, and locally of finite presentation, we see that $\{W \times_{\mathcal{Z}} \mathrm{Spec}(k) \rightarrow W\}$ is an fppf covering and we conclude that W is locally Noetherian (Descent on Spaces, Lemma 56.8.3). In other words (1) holds.

Assume (1). Pick a nonempty affine scheme W and a smooth morphism $W \rightarrow \mathcal{Z}$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. Because W is locally Noetherian the morphism $w : \mathrm{Spec}(k) \rightarrow W$ is of finite presentation, see Morphisms, Lemma 28.22.7. Hence the composition

$$\mathrm{Spec}(k) \xrightarrow{w} W \longrightarrow \mathcal{Z}$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 49.27.2 and 49.34.5. It is also flat and surjective by Lemma 77.11.1. Hence (2) holds. \square

Lemma 77.11.4. *Let $\mathcal{Z}' \rightarrow \mathcal{Z}$ be a monomorphism of algebraic stacks. Assume there exists a field k and a locally finitely presented, surjective, flat morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$. Then either \mathcal{Z}' is empty or $\mathcal{Z}' \rightarrow \mathcal{Z}$ is an equivalence.*

Proof. We may assume that \mathcal{Z}' is nonempty. In this case the fibre product $T = \mathcal{Z}' \times_{\mathcal{Z}} \text{Spec}(k)$ is nonempty, see Lemma 77.4.3. Now T is an algebraic space and the projection $T \rightarrow \text{Spec}(k)$ is a monomorphism. Hence $T = \text{Spec}(k)$, see Morphisms of Spaces, Lemma 49.10.8. We conclude that $\text{Spec}(k) \rightarrow \mathcal{Z}$ factors through \mathcal{Z}' . Suppose the morphism $z : \text{Spec}(k) \rightarrow \mathcal{Z}$ is given by the object ξ over $\text{Spec}(k)$. We have just seen that ξ is isomorphic to an object ξ' of \mathcal{Z}' over $\text{Spec}(k)$. Since z is surjective, flat, and locally of finite presentation we see that every object of \mathcal{Z} over any scheme is fppf locally isomorphic to a pullback of ξ , hence also to a pullback of ξ' . By descent of objects for stacks in groupoids this implies that $\mathcal{Z}' \rightarrow \mathcal{Z}$ is essentially surjective (as well as fully faithful, see Lemma 77.8.4). Hence we win. \square

Lemma 77.11.5. *Let \mathcal{Z} be an algebraic stack. Assume \mathcal{Z} satisfies the equivalent conditions of Lemma 77.11.2. Then there exists a unique strictly full subcategory $\mathcal{Z}' \subset \mathcal{Z}$ such that \mathcal{Z}' is an algebraic stack which satisfies the equivalent conditions of Lemma 77.11.3. The inclusion morphism $\mathcal{Z}' \rightarrow \mathcal{Z}$ is a monomorphism of algebraic stacks.*

Proof. The last part is immediate from the first part and Lemma 77.8.4. Pick a field k and a morphism $\text{Spec}(k) \rightarrow \mathcal{Z}$ which is surjective, flat, and locally of finite type. Set $U = \text{Spec}(k)$ and $R = U \times_{\mathcal{Z}} U$. The projections $s, t : R \rightarrow U$ are locally of finite type. Since U is the spectrum of a field, it follows that s, t are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 49.27.7). We see that $\mathcal{Z}' = [U/R]$ is an algebraic stack by Criteria for Representability, Theorem 74.17.2. By Algebraic Stacks, Lemma 71.16.1 we obtain a canonical morphism

$$f : \mathcal{Z}' \longrightarrow \mathcal{Z}$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 71.15.2 and a monomorphism, see Lemma 77.8.4. By Criteria for Representability, Lemma 74.17.1 the morphism $U \rightarrow \mathcal{Z}'$ is surjective, flat, and locally of finite presentation. Hence \mathcal{Z}' is an algebraic stack which satisfies the equivalent conditions of Lemma 77.11.3. By Algebraic Stacks, Lemma 71.12.4 we may replace \mathcal{Z}' by its essential image in \mathcal{Z} . Hence we have proved all the assertions of the lemma except for the uniqueness of $\mathcal{Z}' \subset \mathcal{Z}$. Suppose that $\mathcal{Z}'' \subset \mathcal{Z}$ is a second such algebraic stack. Then the projections

$$\mathcal{Z}' \longleftarrow \mathcal{Z}' \times_{\mathcal{Z}} \mathcal{Z}'' \longrightarrow \mathcal{Z}''$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 77.4.3. Hence the two projections are isomorphisms by Lemma 77.11.4 and we win. \square

Example 77.11.6. Here is an example where the morphism constructed in Lemma 77.11.5 isn't an isomorphism. This example shows that imposing that residual gerbes are locally Noetherian is necessary in Definition 77.11.8. In fact, the example is even an algebraic space! Let $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ be the absolute Galois group of \mathbf{Q} with the pro-finite topology. Let

$$U = \text{Spec}(\overline{\mathbf{Q}}) \times_{\text{Spec}(\mathbf{Q})} \text{Spec}(\overline{\mathbf{Q}}) = \text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q}) \times \text{Spec}(\overline{\mathbf{Q}})$$

(we omit a precise explanation of the meaning of the last equal sign). Let G denote the absolute Galois group $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ with the discrete topology viewed as a constant group scheme over $\text{Spec}(\mathbf{Q})$, see Groupoids, Example 38.5.6. Then G acts

freely and transitively on U . Let $X = U/G$, see Spaces, Definition 47.14.4. Then X is a non-noetherian reduced algebraic space with exactly one point. Furthermore, X has a (locally) finite type point:

$$x : \mathrm{Spec}(\overline{\mathbf{Q}}) \longrightarrow U \longrightarrow X$$

Indeed, every point of U is actually closed! As X is an algebraic space over $\overline{\mathbf{Q}}$ it follows that x is a monomorphism. So x is the morphism constructed in Lemma 77.11.5 but x is not an isomorphism. In fact $\mathrm{Spec}(\overline{\mathbf{Q}}) \rightarrow X$ is the residual gerbe of X at x .

It will turn out later that under mild assumptions on the algebraic stack \mathcal{X} the equivalent conditions of the following lemma are satisfied for every point $x \in |\mathcal{X}|$ (insert future reference here).

Lemma 77.11.7. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$ be a point. The following are equivalent*

- (1) *there exists an algebraic stack \mathcal{Z} and a monomorphism $\mathcal{Z} \rightarrow \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is x ,*
- (2) *there exists a reduced algebraic stack \mathcal{Z} and a monomorphism $\mathcal{Z} \rightarrow \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is x ,*
- (3) *there exists an algebraic stack \mathcal{Z} , a monomorphism $f : \mathcal{Z} \rightarrow \mathcal{X}$, and a surjective flat morphism $z : \mathrm{Spec}(k) \rightarrow \mathcal{Z}$ where k is a field such that $x = f(z)$.*

Moreover, if these conditions hold, then there exists a unique strictly full subcategory $\mathcal{Z}_x \subset \mathcal{X}$ such that \mathcal{Z}_x is a reduced, locally Noetherian algebraic stack and $|\mathcal{Z}_x|$ is a singleton which maps to x via the map $|\mathcal{Z}_x| \rightarrow |\mathcal{X}|$.

Proof. If $\mathcal{Z} \rightarrow \mathcal{X}$ is as in (1), then $\mathcal{Z}_{red} \rightarrow \mathcal{X}$ is as in (2). (See Section 77.10 for the notion of the reduction of an algebraic stack.) Hence (1) implies (2). It is immediate that (2) implies (1). The equivalence of (2) and (3) is immediate from Lemma 77.11.2.

At this point we've seen the equivalence of (1) – (3). Pick a monomorphism $f : \mathcal{Z} \rightarrow \mathcal{X}$ as in (2). Note that this implies that f is fully faithful, see Lemma 77.8.4. Denote $\mathcal{Z}' \subset \mathcal{X}$ the essential image of the functor f . Then $f : \mathcal{Z} \rightarrow \mathcal{Z}'$ is an equivalence and hence \mathcal{Z}' is an algebraic stack, see Algebraic Stacks, Lemma 71.12.4. Apply Lemma 77.11.5 to get a strictly full subcategory $\mathcal{Z}_x \subset \mathcal{Z}'$ as in the statement of the lemma. This proves all the statements of the lemma except for uniqueness.

In order to prove the uniqueness suppose that $\mathcal{Z}_x \subset \mathcal{X}$ and $\mathcal{Z}'_x \subset \mathcal{X}$ are two strictly full subcategories as in the statement of the lemma. Then the projections

$$\mathcal{Z}'_x \longleftarrow \mathcal{Z}'_x \times_{\mathcal{X}} \mathcal{Z}_x \longrightarrow \mathcal{Z}_x$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 77.4.3. Hence the two projections are isomorphisms by Lemma 77.11.4 and we win. \square

Having explained the above we can now make the following definition.

Definition 77.11.8. Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$.

- (1) We say the *residual gerbe of \mathcal{X} at x exists* if the equivalent conditions (1), (2), and (3) of Lemma 77.11.7 hold.

- (2) If the residual gerbe of \mathcal{X} at x exists, then the *residual gerbe of \mathcal{X} at x* ¹ is the strictly full subcategory $\mathcal{Z}_x \subset \mathcal{X}$ constructed in Lemma 77.11.7.

In particular we know that \mathcal{Z}_x (if it exists) is a locally Noetherian, reduced algebraic stack and that there exists a field and a surjective, flat, locally finitely presented morphism

$$\mathrm{Spec}(k) \longrightarrow \mathcal{Z}_x.$$

We will see in Morphisms of Stacks, Lemma 78.19.10 that \mathcal{Z}_x is a gerbe. It turns out that \mathcal{Z}_x is a regular algebraic stack as follows from the following lemma.

Lemma 77.11.9. *A reduced, locally Noetherian algebraic stack \mathcal{Z} such that $|\mathcal{Z}|$ is a singleton is regular.*

Proof. Let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism where W is a scheme. Let k be a field and let $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ be surjective, flat, and locally of finite presentation (see Lemma 77.11.3). The algebraic space $T = W \times_{\mathcal{Z}} \mathrm{Spec}(k)$ is smooth over k in particular regular, see Spaces over Fields, Lemma 54.9.1. Since $T \rightarrow W$ is locally of finite presentation, flat, and surjective it follows that W is regular, see Descent on Spaces, Lemma 56.8.4. By definition this means that \mathcal{Z} is regular. \square

Lemma 77.11.10. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. Assume that the residual gerbe \mathcal{Z}_x of \mathcal{X} exists. Let $f : \mathrm{Spec}(K) \rightarrow \mathcal{X}$ be a morphism where K is a field in the equivalence class of x . Then f factors through the inclusion morphism $\mathcal{Z}_x \rightarrow \mathcal{X}$.*

Proof. Choose a field k and a surjective flat locally finite presentation morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}_x$. Set $T = \mathrm{Spec}(K) \times_{\mathcal{X}} \mathcal{Z}_x$. By Lemma 77.4.3 we see that T is nonempty. As $\mathcal{Z}_x \rightarrow \mathcal{X}$ is a monomorphism we see that $T \rightarrow \mathrm{Spec}(K)$ is a monomorphism. Hence by Morphisms of Spaces, Lemma 49.10.8 we see that $T = \mathrm{Spec}(K)$ which proves the lemma. \square

Lemma 77.11.11. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. Let \mathcal{Z} be an algebraic stack satisfying the equivalent conditions of Lemma 77.11.3 and let $\mathcal{Z} \rightarrow \mathcal{X}$ be a monomorphism such that the image of $|\mathcal{Z}| \rightarrow |\mathcal{X}|$ is x . Then the residual gerbe \mathcal{Z}_x of \mathcal{X} at x exists and $\mathcal{Z} \rightarrow \mathcal{X}$ factors as $\mathcal{Z} \rightarrow \mathcal{Z}_x \rightarrow \mathcal{X}$ where the first arrow is an equivalence.*

Proof. Let $\mathcal{Z}_x \subset \mathcal{X}$ be the full subcategory corresponding to the essential image of the functor $\mathcal{Z} \rightarrow \mathcal{X}$. Then $\mathcal{Z} \rightarrow \mathcal{Z}_x$ is an equivalence, hence \mathcal{Z}_x is an algebraic stack, see Algebraic Stacks, Lemma 71.12.4. Since \mathcal{Z}_x inherits all the properties of \mathcal{Z} from this equivalence it is clear from the uniqueness in Lemma 77.11.7 that \mathcal{Z}_x is the residual gerbe of \mathcal{X} at x . \square

¹This clashes with [LMB00] in spirit, but not in fact. Namely, in Chapter 11 they associate to any point on any quasi-separated algebraic stack a gerbe (not necessarily algebraic) which they call the residual gerbe. We will see in Morphisms of Stacks, Lemma 78.21.1 that on a quasi-separated algebraic stack every point has a residual gerbe in our sense which is then equivalent to theirs. For more information on this topic see [Ryd10, Appendix B].

77.12. Dimension of a stack

We can define the dimension of an algebraic stack \mathcal{X} at a point x , using the notion of dimension of an algebraic space at a point (Properties of Spaces, Definition 48.8.1). In the following lemma the output may be ∞ either because \mathcal{X} is not quasi-compact or because we run into the phenomenon described in Examples, Section 82.14.

Lemma 77.12.1. *Let \mathcal{X} be a locally Noetherian algebraic stack over a scheme S . Let $x \in |\mathcal{X}|$ be a point of \mathcal{X} . Let $[U/R] \rightarrow \mathcal{X}$ be a presentation (Algebraic Stacks, Definition 71.16.5) where U is a scheme. Let $u \in U$ be a point that maps to x . Let $e : U \rightarrow R$ be the “identity” map and let $s : R \rightarrow U$ be the “source” map, which is a smooth morphism of algebraic spaces. Let R_u be the fiber of $s : R \rightarrow U$ over u . The element*

$$\dim_x(\mathcal{X}) = \dim_u(U) - \dim_{e(u)}(R_u) \in \mathbf{Z} \cup \infty$$

is independent of the choice of presentation and the point u over x .

Proof. Since $R \rightarrow U$ is smooth, the scheme R_u is smooth over $\kappa(u)$ and hence has finite dimension. On the other hand, the scheme U is locally Noetherian, but this does not guarantee that $\dim_u(U)$ is finite. Thus the difference is an element of $\mathbf{Z} \cup \{\infty\}$.

Let $[U'/R'] \rightarrow \mathcal{X}$ and $u' \in U'$ be a second presentation where U' is a scheme and u' maps to x . Consider the algebraic space $P = U \times_{\mathcal{X}} U'$. By Lemma 77.4.3 there exists a $p \in |P|$ mapping to u and u' . Since $P \rightarrow U$ and $P' \rightarrow U'$ are smooth we see that $\dim_p(P) = \dim_u(U) + \dim_p(P_u)$ and $\dim_p(P) = \dim_{u'}(U') + \dim_p(P_{u'})$, see Morphisms of Spaces, Lemma 49.34.9. Note that

$$R'_{u'} = \mathrm{Spec}(\kappa(u')) \times_{\mathcal{X}} U' \quad \text{and} \quad P_u = \mathrm{Spec}(\kappa(u)) \times_{\mathcal{X}} U'$$

Let us represent $p \in |P|$ by a morphism $\mathrm{Spec}(\Omega) \rightarrow P$. Since p maps to both u and u' it induces a 2-morphism between the compositions $\mathrm{Spec}(\Omega) \rightarrow \mathrm{Spec}(\kappa(u')) \rightarrow \mathcal{X}$ and $\mathrm{Spec}(\Omega) \rightarrow \mathrm{Spec}(\kappa(u)) \rightarrow \mathcal{X}$ which in turn defines an isomorphism

$$\mathrm{Spec}(\Omega) \times_{\mathrm{Spec}(\kappa(u'))} R'_{u'} \cong \mathrm{Spec}(\Omega) \times_{\mathrm{Spec}(\kappa(u))} P_u$$

as algebraic spaces over $\mathrm{Spec}(\Omega)$ mapping the Ω -rational point $(1, e'(u'))$ to $(1, p)$ (some details omitted). We conclude that

$$\dim_{e'(u')}(R'_{u'}) = \dim_p(P_u)$$

by Morphisms of Spaces, Lemma 49.32.3. By symmetry we have $\dim_{e(u)}(R_u) = \dim_p(P_{u'})$. Putting everything together we obtain the independence of choices. \square

We can use the lemma above to make the following definition.

Definition 77.12.2. Let \mathcal{X} be a locally Noetherian algebraic stack over a scheme S . Let $x \in |\mathcal{X}|$ be a point of \mathcal{X} . Let $[U/R] \rightarrow \mathcal{X}$ be a presentation (Algebraic Stacks, Definition 71.16.5) where U is a scheme and let $u \in U$ be a point that maps to x . We define the *dimension of \mathcal{X} at x* to be the element $\dim_x(\mathcal{X}) \in \mathbf{Z} \cup \infty$ such that

$$\dim_x(\mathcal{X}) = \dim_u(U) - \dim_{e(u)}(R_u).$$

with notation as in Lemma 77.12.1.

The dimension of a stack at a point agrees with the usual notion when \mathcal{X} is a scheme (Topology, Definition 5.9.1), or more generally when \mathcal{X} is a locally Noetherian algebraic space (Properties of Spaces, Definition 48.8.1).

Definition 77.12.3. Let S be a scheme. Let \mathcal{X} be a locally Noetherian algebraic stack over S . The *dimension* $\dim(\mathcal{X})$ of \mathcal{X} is defined to be

$$\dim(\mathcal{X}) = \sup_{x \in |\mathcal{X}|} \dim_x(\mathcal{X})$$

This definition of dimension agrees with the usual notion if \mathcal{X} is a scheme (Properties, Lemma 27.10.2) or an algebraic space (Properties of Spaces, Definition 48.8.2).

Remark 77.12.4. If \mathcal{X} is a nonempty stack of finite type over a field, then $\dim(\mathcal{X})$ is an integer. For an arbitrary locally Noetherian algebraic stack \mathcal{X} , $\dim(\mathcal{X})$ is in $\mathbb{Z} \cup \{\pm\infty\}$, and $\dim(\mathcal{X}) = -\infty$ if and only if \mathcal{X} is empty.

Example 77.12.5. Let X be a scheme of finite type over a field k , and let G be a group scheme of finite type over k which acts on X . Then the dimension of the quotient stack $[X/G]$ is equal to $\dim(X) - \dim(G)$. In particular, the dimension of the classifying stack $BG = [\mathrm{Spec}(k)/G]$ is $-\dim(G)$. Thus the dimension of an algebraic stack can be a negative integer, in contrast to what happens for schemes or algebraic spaces.

Morphisms of Algebraic Stacks

78.1. Introduction

In this chapter we introduce some types of morphisms of algebraic stacks. A reference in the case of quasi-separated algebraic stacks with representable diagonal is [LMB00].

The goal is to extend the definition of each of the types of morphisms of algebraic spaces to morphisms of algebraic stacks. Each case is slightly different and it seems best to treat them all separately.

For morphisms of algebraic stacks which are representable by algebraic spaces we have already defined a large number of types of morphisms, see Properties of Stacks, Section 77.3. For each corresponding case in this chapter we have to make sure the definition in the general case is compatible with the definition given there.

78.2. Conventions and abuse of language

We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 77.2.

78.3. Properties of diagonals

The diagonal of an algebraic stack is closely related to the *Isom*-sheaves, see Algebraic Stacks, Lemma 71.10.11. By the second defining property of an algebraic stack these *Isom*-sheaves are always algebraic spaces.

Lemma 78.3.1. *Let \mathcal{X} be an algebraic stack. Let T be a scheme and let x, y be objects of the fibre category of \mathcal{X} over T . Then the morphism $Isom_{\mathcal{X}}(x, y) \rightarrow T$ is locally of finite type.*

Proof. By Algebraic Stacks, Lemma 71.16.2 we may assume that $\mathcal{X} = [U/R]$ for some smooth groupoid in algebraic spaces. By Descent on Spaces, Lemma 56.10.7 it suffices to check the property fppf locally on T . Thus we may assume that x, y come from morphisms $x', y' : T \rightarrow U$. By Groupoids in Spaces, Lemma 60.21.1 we see that in this case $Isom_{\mathcal{X}}(x, y) = T \times_{(y', x'), U \times_S U} R$. Hence it suffices to prove that $R \rightarrow U \times_S U$ is locally of finite type. This follows from the fact that the composition $s : R \rightarrow U \times_S U \rightarrow U$ is smooth (hence locally of finite type, see Morphisms of Spaces, Lemmas 49.34.5 and 49.27.5) and Morphisms of Spaces, Lemma 49.23.6. \square

Lemma 78.3.2. *Let \mathcal{X} be an algebraic stack. Let T be a scheme and let x, y be objects of the fibre category of \mathcal{X} over T . Then*

- (1) *$Isom_{\mathcal{X}}(y, y)$ is a group algebraic space over T , and*
- (2) *$Isom_{\mathcal{X}}(x, y)$ is a pseudo torsor for $Isom_{\mathcal{X}}(y, y)$ over T .*

Proof. See Groupoids in Spaces, Definitions 60.5.1 and 60.9.1. The lemma follows immediately from the fact that \mathcal{X} is a stack in groupoids. \square

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The *diagonal of f* is the morphism

$$\Delta_f : \mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$$

Here are two properties that every diagonal morphism has.

Lemma 78.3.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then*

- (1) Δ_f is representable by algebraic spaces, and
- (2) Δ_f is locally of finite type.

Proof. Let T be a scheme and let $a : T \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ be a morphism. By definition of the fibre product and the 2-Yoneda lemma the morphism a is given by a triple $a = (x, x', \alpha)$ where x, x' are objects of \mathcal{X} over T , and $\alpha : f(x) \rightarrow f(x')$ is a morphism in the fibre category of \mathcal{Y} over T . By definition of an algebraic stack the sheaves $Isom_{\mathcal{X}}(x, x')$ and $Isom_{\mathcal{Y}}(f(x), f(x'))$ are algebraic spaces over T . In this language α defines a section of the morphism $Isom_{\mathcal{Y}}(f(x), f(x')) \rightarrow T$. A T' -valued point of $\mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T$ for $T' \rightarrow T$ a scheme over T is the same thing as an isomorphism $x|_{T'} \rightarrow x'|_{T'}$ whose image under f is $\alpha|_{T'}$. Thus we see that

$$(78.3.3.1) \quad \begin{array}{ccc} \mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T & \longrightarrow & Isom_{\mathcal{X}}(x, x') \\ \downarrow & & \downarrow \\ T & \xrightarrow{\alpha} & Isom_{\mathcal{Y}}(f(x), f(x')) \end{array}$$

is a fibre square of sheaves over T . In particular we see that $\mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T$ is an algebraic space which proves part (1) of the lemma.

To prove the second statement we have to show that the left vertical arrow of Diagram (78.3.3.1) is locally of finite type. By Lemma 78.3.1 the algebraic space $Isom_{\mathcal{X}}(x, x')$ and is locally of finite type over T . Hence the right vertical arrow of Diagram (78.3.3.1) is locally of finite type, see Morphisms of Spaces, Lemma 49.23.6. We conclude by Morphisms of Spaces, Lemma 49.23.3. \square

Lemma 78.3.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Then*

- (1) Δ_f is representable (by schemes),
- (2) Δ_f is locally of finite type,
- (3) Δ_f is a monomorphism,
- (4) Δ_f is separated, and
- (5) Δ_f is locally quasi-finite.

Proof. We have already seen in Lemma 78.3.3 that Δ_f is representable by algebraic spaces. Hence the statements (2) – (5) make sense, see Properties of Stacks, Section 77.3. Also Lemma 78.3.3 guarantees (2) holds. Let $T \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ be a morphism and contemplate Diagram (78.3.3.1). By Algebraic Stacks, Lemma 71.9.2 the right vertical arrow is injective as a map of sheaves, i.e., a monomorphism of algebraic spaces. Hence also the morphism $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \rightarrow T$ is a monomorphism. Thus (3) holds. We already know that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \rightarrow T$ is locally of finite type. Thus Morphisms of Spaces, Lemma 49.26.10 allows us to conclude that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \rightarrow T$ is locally quasi-finite and separated. This proves (4) and (5). Finally, Morphisms

of Spaces, Proposition 49.44.2 implies that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X}$ is a scheme which proves (1). \square

Lemma 78.3.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

- (1) f is separated,
- (2) Δ_f is a closed immersion,
- (3) Δ_f is proper, or
- (4) Δ_f is universally closed.

Proof. The statements “ f is separated”, “ Δ_f is a closed immersion”, “ Δ_f is universally closed”, and “ Δ_f is proper” refer to the notions defined in Properties of Stacks, Section 77.3. Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U = \mathcal{X} \times_{\mathcal{Y}} V$ which is an algebraic space by assumption, and the morphism $U \rightarrow \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.29.14 and Properties of Stacks, Lemma 77.3.3 we see that for any property P (as in that lemma) we have: Δ_f has P if and only if $\Delta_{U/V} : U \rightarrow U \times_V U$ has P . Hence the equivalence of (2), (3) and (4) follows from Morphisms of Spaces, Lemma 49.37.9 applied to $U \rightarrow V$. Moreover, if (1) holds, then $U \rightarrow V$ is separated and we see that $\Delta_{U/V}$ is a closed immersion, i.e., (2) holds. Finally, assume (2) holds. Let T be a scheme, and $a : T \rightarrow \mathcal{Y}$ a morphism. Set $T' = \mathcal{X} \times_{\mathcal{Y}} T$. To prove (1) we have to show that the morphism of algebraic spaces $T' \rightarrow T$ is separated. Using Categories, Lemma 4.29.14 once more we see that $\Delta_{T'/T}$ is the base change of Δ_f . Hence our assumption (2) implies that $\Delta_{T'/T}$ is a closed immersion, hence $T' \rightarrow T$ is separated as desired. \square

Lemma 78.3.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

- (1) f is quasi-separated,
- (2) Δ_f is quasi-compact, or
- (3) Δ_f is finite type.

Proof. The statements “ f is quasi-separated”, “ Δ_f is quasi-compact”, and “ Δ_f is finite type” refer to the notions defined in Properties of Stacks, Section 77.3. Note that (2) and (3) are equivalent in view of the fact that Δ_f is locally of finite type by Lemma 78.3.4 (and Algebraic Stacks, Lemma 71.10.9). Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U = \mathcal{X} \times_{\mathcal{Y}} V$ which is an algebraic space by assumption, and the morphism $U \rightarrow \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.29.14 and Properties of Stacks, Lemma 77.3.3 we see that we have: Δ_f is quasi-compact if and only if $\Delta_{U/V} : U \rightarrow U \times_V U$ is quasi-compact. If (1) holds, then $U \rightarrow V$ is quasi-separated and we see that $\Delta_{U/V}$ is quasi-compact, i.e., (2) holds. Assume (2) holds. Let T be a scheme, and $a : T \rightarrow \mathcal{Y}$ a morphism. Set $T' = \mathcal{X} \times_{\mathcal{Y}} T$. To prove (1) we have to show that the morphism of algebraic spaces $T' \rightarrow T$ is quasi-separated. Using Categories, Lemma 4.29.14 once more we see that $\Delta_{T'/T}$ is the base change of Δ_f . Hence our assumption (2) implies that $\Delta_{T'/T}$ is quasi-compact, hence $T' \rightarrow T$ is quasi-separated as desired. \square

Lemma 78.3.7. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

- (1) f is locally separated, and

(2) Δ_f is an immersion.

Proof. The statements “ f is locally separated”, and “ Δ_f is an immersion” refer to the notions defined in Properties of Stacks, Section 77.3. Proof omitted. Hint: Argue as in the proofs of Lemmas 78.3.5 and 78.3.6. \square

78.4. Separation axioms

Let $\mathcal{X} = [U/R]$ be a presentation of an algebraic stack. Then the properties of the diagonal of \mathcal{X} over S , are the properties of the morphism $j : R \rightarrow U \times_S U$. For example, if $\mathcal{X} = [S/G]$ for some smooth group G in algebraic spaces over S then j is the structure morphism $G \rightarrow U$. Hence the diagonal is not automatically separated itself (contrary to what happens in the case of schemes and algebraic spaces). To say that $[S/G]$ is quasi-separated over S should certainly imply that $G \rightarrow S$ is quasi-compact, but we hesitate to say that $[S/G]$ is quasi-separated over S without also requiring the morphism $G \rightarrow S$ to be quasi-separated. In other words, requiring the diagonal morphism to be quasi-compact does not really agree with our intuition for a “quasi-separated algebraic stack”, and we should also require the diagonal itself to be quasi-separated.

What about “separated algebraic stacks”? We have seen in Morphisms of Spaces, Lemma 49.37.9 that an algebraic space is separated if and only if the diagonal is proper. This is the condition that is usually used to define separated algebraic stacks too. In the example $[S/G] \rightarrow S$ above this means that $G \rightarrow S$ is a proper group scheme. This means algebraic stacks of the form $[\mathrm{Spec}(k)/E]$ are proper over k where E is an elliptic curve over k (insert future reference here). In certain situations it may be more natural to assume the diagonal is finite.

Definition 78.4.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f is *DM* if Δ_f is unramified¹.
- (2) We say f is *quasi-DM* if Δ_f is locally quasi-finite².
- (3) We say f is *separated* if Δ_f is proper.
- (4) We say f is *quasi-separated* if Δ_f is quasi-compact and quasi-separated.

In this definition we are using that Δ_f is representable by algebraic spaces and we are using Properties of Stacks, Section 77.3 to make sense out of imposing conditions on Δ_f . We note that these definitions do not conflict with the already existing notions if f is representable by algebraic spaces, see Lemmas 78.3.6 and 78.3.5. There is an interesting way to characterize these conditions by looking at higher diagonals, see Lemma 78.6.4.

Definition 78.4.2. Let \mathcal{X} be an algebraic stack over the base scheme S . Denote $p : \mathcal{X} \rightarrow S$ the structure morphism.

¹The letters DM stand for Deligne-Mumford. If f is DM then given any scheme T and any morphism $T \rightarrow \mathcal{Y}$ the fibre product $\mathcal{X}_T = \mathcal{X} \times_{\mathcal{Y}} T$ is an algebraic stack over T whose diagonal is unramified, i.e., \mathcal{X}_T is DM. This implies \mathcal{X}_T is a Deligne-Mumford stack, see Theorem 78.15.6. In other words a DM morphism is one whose “fibres” are Deligne-Mumford stacks. This hopefully at least motivates the terminology.

²If f is quasi-DM, then the “fibres” \mathcal{X}_T of $\mathcal{X} \rightarrow \mathcal{Y}$ are quasi-DM. An algebraic stack \mathcal{X} is quasi-DM exactly if there exists a scheme U and a surjective flat morphism $U \rightarrow \mathcal{X}$ of finite presentation which is locally quasi-finite, see Theorem 78.15.3. Note the similarity to being Deligne-Mumford, which is defined in terms of having an étale covering by a scheme.

- (1) We say \mathcal{X} is *DM over S* if $p : \mathcal{X} \rightarrow S$ is DM.
- (2) We say \mathcal{X} is *quasi-DM over S* if $p : \mathcal{X} \rightarrow S$ is quasi-DM.
- (3) We say \mathcal{X} is *separated over S* if $p : \mathcal{X} \rightarrow S$ is separated.
- (4) We say \mathcal{X} is *quasi-separated over S* if $p : \mathcal{X} \rightarrow S$ is quasi-separated.
- (5) We say \mathcal{X} is *DM* if \mathcal{X} is DM³ over $\mathrm{Spec}(\mathbf{Z})$.
- (6) We say \mathcal{X} is *quasi-DM* if \mathcal{X} is quasi-DM over $\mathrm{Spec}(\mathbf{Z})$.
- (7) We say \mathcal{X} is *separated* if \mathcal{X} is separated over $\mathrm{Spec}(\mathbf{Z})$.
- (8) We say \mathcal{X} is *quasi-separated* if \mathcal{X} is quasi-separated over $\mathrm{Spec}(\mathbf{Z})$.

In the last 4 definitions we view \mathcal{X} as an algebraic stack over $\mathrm{Spec}(\mathbf{Z})$ via Algebraic Stacks, Definition 71.19.2.

Thus in each case we have an absolute notion and a notion relative to our given base scheme (mention of which is usually suppressed by our abuse of notation introduced in Properties of Stacks, Section 77.2). We will see that (1) \Leftrightarrow (5) and (2) \Leftrightarrow (6) in Lemma 78.4.13. We spend some time proving some standard results on these notions.

Lemma 78.4.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.*

- (1) *If f is separated, then f is quasi-separated.*
- (2) *If f is DM, then f is quasi-DM.*
- (3) *If f is representable by algebraic spaces, then f is DM.*

Proof. To see (1) note that a proper morphism of algebraic spaces is quasi-compact and quasi-separated, see Morphisms of Spaces, Definition 49.37.1. To see (2) note that an unramified morphism of algebraic spaces is locally quasi-finite, see Morphisms of Spaces, Lemma 49.35.7. Finally (3) follows from Lemma 78.3.4. \square

Lemma 78.4.4. *All of the separation axioms listed in Definition 78.4.1 are stable under base change.*

Proof. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y}' \rightarrow \mathcal{Y}$ be morphisms of algebraic stacks. Let $f' : \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$ be the base change of f by $\mathcal{Y}' \rightarrow \mathcal{Y}$. Then $\Delta_{f'}$ is the base change of Δ_f by the morphism $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{X}' \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$, see Categories, Lemma 4.29.14. By the results of Properties of Stacks, Section 77.3 each of the properties of the diagonal used in Definition 78.4.1 is stable under base change. Hence the lemma is true. \square

Lemma 78.4.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \rightarrow \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where W is an algebraic space. If the base change $W \times_{\mathcal{Y}} \mathcal{X} \rightarrow W$ has one of the separation properties of Definition 78.4.1 then so does f .*

Proof. Denote $g : W \times_{\mathcal{Y}} \mathcal{X} \rightarrow W$ the base change. Then Δ_g is the base change of Δ_f by the morphism $q : W \times_{\mathcal{Y}} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$. Since q is the base change of $W \rightarrow \mathcal{Y}$ we see that q is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Hence the result follows from Properties of Stacks, Lemma 77.3.4. \square

Lemma 78.4.6. *Let S be a scheme. The property of being quasi-DM over S , quasi-separated over S , or separated over S (see Definition 78.4.2) is stable under change of base scheme, see Algebraic Stacks, Definition 71.19.3.*

³Theorem 78.15.6 shows that this is equivalent to \mathcal{X} being a Deligne-Mumford stack.

Proof. Follows immediately from Lemma 78.4.4. \square

Lemma 78.4.7. *Let $f : \mathcal{X} \rightarrow \mathcal{Z}$, $g : \mathcal{Y} \rightarrow \mathcal{Z}$ and $\mathcal{Z} \rightarrow \mathcal{T}$ be morphisms of algebraic stacks. Consider the induced morphism $i : \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$. Then*

- (1) *i is representable by algebraic spaces and locally of finite type,*
- (2) *if $\Delta_{\mathcal{Z}/\mathcal{T}}$ is quasi-separated, then i is quasi-separated,*
- (3) *if $\Delta_{\mathcal{Z}/\mathcal{T}}$ is separated, then i is separated,*
- (4) *if $\mathcal{Z} \rightarrow \mathcal{T}$ is DM, then i is unramified,*
- (5) *if $\mathcal{Z} \rightarrow \mathcal{T}$ is quasi-DM, then i is locally quasi-finite,*
- (6) *if $\mathcal{Z} \rightarrow \mathcal{T}$ is separated, then i is proper, and*
- (7) *if $\mathcal{Z} \rightarrow \mathcal{T}$ is quasi-separated, then i is quasi-compact and quasi-separated.*

Proof. The following diagram

$$\begin{array}{ccc} \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} & \xrightarrow{i} & \mathcal{X} \times_{\mathcal{T}} \mathcal{Y} \\ \downarrow & & \downarrow \\ \mathcal{Z} & \xrightarrow{\Delta_{\mathcal{Z}/\mathcal{T}}} & \mathcal{Z} \times_{\mathcal{T}} \mathcal{Z} \end{array}$$

is a 2-fibre product diagram, see Categories, Lemma 4.29.13. Hence i is the base change of the diagonal morphism $\Delta_{\mathcal{Z}/\mathcal{T}}$. Thus the lemma follows from Lemma 78.3.3, and the material in Properties of Stacks, Section 77.3. \square

Lemma 78.4.8. *Let \mathcal{T} be an algebraic stack. Let $g : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over \mathcal{T} . Consider the graph $i : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$ of g . Then*

- (1) *i is representable by algebraic spaces and locally of finite type,*
- (2) *if $\mathcal{Y} \rightarrow \mathcal{T}$ is DM, then i is unramified,*
- (3) *if $\mathcal{Y} \rightarrow \mathcal{T}$ is quasi-DM, then i is locally quasi-finite,*
- (4) *if $\mathcal{Y} \rightarrow \mathcal{T}$ is separated, then i is proper, and*
- (5) *if $\mathcal{Y} \rightarrow \mathcal{T}$ is quasi-separated, then i is quasi-compact and quasi-separated.*

Proof. This is a special case of Lemma 78.4.7 applied to the morphism $\mathcal{X} = \mathcal{X} \times_{\mathcal{Y}} \mathcal{Y} \rightarrow \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$. \square

Lemma 78.4.9. *Let $f : \mathcal{X} \rightarrow \mathcal{T}$ be a morphism of algebraic stacks. Let $s : \mathcal{T} \rightarrow \mathcal{X}$ be a morphism such that $f \circ s$ is 2-isomorphic to $\text{id}_{\mathcal{T}}$. Then*

- (1) *s is representable by algebraic spaces and locally of finite type,*
- (2) *if f is DM, then s is unramified,*
- (3) *if f is quasi-DM, then s is locally quasi-finite,*
- (4) *if f is separated, then s is proper, and*
- (5) *if f is quasi-separated, then s is quasi-compact and quasi-separated.*

Proof. This is a special case of Lemma 78.4.8 applied to $g = s$ and $\mathcal{Y} = \mathcal{T}$ in which case $i : \mathcal{T} \rightarrow \mathcal{T} \times_{\mathcal{T}} \mathcal{X}$ is 2-isomorphic to s . \square

Lemma 78.4.10. *All of the separation axioms listed in Definition 78.4.1 are stable under composition of morphisms.*

Proof. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks to which the axiom in question applies. The diagonal $\Delta_{\mathcal{X}/\mathcal{Z}}$ is the composition

$$\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}.$$

Our separation axiom is defined by requiring the diagonal to have some property \mathcal{P} . By Lemma 78.4.7 above we see that the second arrow also has this property. Hence the lemma follows since the composition of morphisms which are representable by algebraic spaces with property \mathcal{P} also is a morphism with property \mathcal{P} , see our general discussion in Properties of Stacks, Section 77.3 and Morphisms of Spaces, Lemmas 49.35.3, 49.26.3, 49.37.4, 49.8.4, and 49.4.8. \square

Lemma 78.4.11. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme S .*

- (1) *If \mathcal{Y} is DM over S and f is DM, then \mathcal{X} is DM over S .*
- (2) *If \mathcal{Y} is quasi-DM over S and f is quasi-DM, then \mathcal{X} is quasi-DM over S .*
- (3) *If \mathcal{Y} is separated over S and f is separated, then \mathcal{X} is separated over S .*
- (4) *If \mathcal{Y} is quasi-separated over S and f is quasi-separated, then \mathcal{X} is quasi-separated over S .*
- (5) *If \mathcal{Y} is DM and f is DM, then \mathcal{X} is DM.*
- (6) *If \mathcal{Y} is quasi-DM and f is quasi-DM, then \mathcal{X} is quasi-DM.*
- (7) *If \mathcal{Y} is separated and f is separated, then \mathcal{X} is separated.*
- (8) *If \mathcal{Y} is quasi-separated and f is quasi-separated, then \mathcal{X} is quasi-separated.*

Proof. Parts (1), (2), (3), and (4) follow immediately from Lemma 78.4.10 and Definition 78.4.2. For (5), (6), (7), and (8) think of \mathcal{X} and \mathcal{Y} as algebraic stacks over $\text{Spec}(\mathbf{Z})$ and apply Lemma 78.4.10. Details omitted. \square

The following lemma is a bit different to the analogue for algebraic spaces. To compare take a look at Morphisms of Spaces, Lemma 49.4.10.

Lemma 78.4.12. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks.*

- (1) *If $g \circ f$ is DM then so is f .*
- (2) *If $g \circ f$ is quasi-DM then so is f .*
- (3) *If $g \circ f$ is separated and Δ_g is separated, then f is separated.*
- (4) *If $g \circ f$ is quasi-separated and Δ_g is quasi-separated, then f is quasi-separated.*

Proof. Consider the factorization

$$\mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces, see Lemmas 78.3.3 and 78.4.7. Hence for any scheme T and morphism $T \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T.$$

If $g \circ f$ is DM (resp. quasi-DM), then the composition $A \rightarrow T$ is unramified (resp. locally quasi-finite). Hence (1) (resp. (2)) follows on applying Morphisms of Spaces, Lemma 49.35.11 (resp. Morphisms of Spaces, Lemma 49.26.8). This proves (1) and (2).

Proof of (4). Assume $g \circ f$ is quasi-separated and Δ_g is quasi-separated. Consider the factorization

$$\mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is quasi-separated, see Lemmas 78.3.3 and 78.4.7. Hence for any scheme T and morphism $T \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T$$

such that $B \rightarrow T$ is quasi-separated. The composition $A \rightarrow T$ is quasi-compact and quasi-separated as we have assumed that $g \circ f$ is quasi-separated. Hence $A \rightarrow B$ is quasi-separated by Morphisms of Spaces, Lemma 49.4.10. And $A \rightarrow B$ is quasi-compact by Morphisms of Spaces, Lemma 49.8.8. Thus f is quasi-separated.

Proof of (3). Assume $g \circ f$ is separated and Δ_g is separated. Consider the factorization

$$\mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is separated, see Lemmas 78.3.3 and 78.4.7. Hence for any scheme T and morphism $T \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T$$

such that $B \rightarrow T$ is separated. The composition $A \rightarrow T$ is proper as we have assumed that $g \circ f$ is quasi-separated. Hence $A \rightarrow B$ is proper by Morphisms of Spaces, Lemma 49.37.6 which means that f is separated. \square

Lemma 78.4.13. *Let \mathcal{X} be an algebraic stack over the base scheme S .*

- (1) \mathcal{X} is DM $\Leftrightarrow \mathcal{X}$ is DM over S .
- (2) \mathcal{X} is quasi-DM $\Leftrightarrow \mathcal{X}$ is quasi-DM over S .
- (3) If \mathcal{X} is separated, then \mathcal{X} is separated over S .
- (4) If \mathcal{X} is quasi-separated, then \mathcal{X} is quasi-separated over S .

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme S .

- (5) If \mathcal{X} is DM over S , then f is DM.
- (6) If \mathcal{X} is quasi-DM over S , then f is quasi-DM.
- (7) If \mathcal{X} is separated over S and $\Delta_{\mathcal{Y}/S}$ is separated, then f is separated.
- (8) If \mathcal{X} is quasi-separated over S and $\Delta_{\mathcal{Y}/S}$ is quasi-separated, then f is quasi-separated.

Proof. Parts (5), (6), (7), and (8) follow immediately from Lemma 78.4.12 and Spaces, Definition 47.13.2. To prove (3) and (4) think of X and Y as algebraic stacks over $\text{Spec}(\mathbf{Z})$ and apply Lemma 78.4.12. Similarly, to prove (1) and (2), think of \mathcal{X} as an algebraic stack over $\text{Spec}(\mathbf{Z})$ consider the morphisms

$$\mathcal{X} \longrightarrow \mathcal{X} \times_S \mathcal{X} \longrightarrow \mathcal{X} \times_{\text{Spec}(\mathbf{Z})} \mathcal{X}$$

Both arrows are representable by algebraic spaces. The second arrow is unramified and locally quasi-finite as the base change of the immersion $\Delta_{S/\mathbf{Z}}$. Hence the composition is unramified (resp. locally quasi-finite) if and only if the first arrow is unramified (resp. locally quasi-finite), see Morphisms of Spaces, Lemmas 49.35.3 and 49.35.11 (resp. Morphisms of Spaces, Lemmas 49.26.3 and 49.26.8). \square

Lemma 78.4.14. *Let \mathcal{X} be an algebraic stack. Let W be an algebraic space, and let $f : W \rightarrow \mathcal{X}$ be a surjective, flat, locally finitely presented morphism.*

- (1) If f is unramified (i.e., étale, i.e., \mathcal{X} is Deligne-Mumford), then \mathcal{X} is DM.
- (2) If f is locally quasi-finite, then \mathcal{X} is quasi-DM.

Proof. Note that if f is unramified, then it is étale by Morphisms of Spaces, Lemma 49.36.12. This explains the parenthetical remark in (1). Assume f is unramified (resp. locally quasi-finite). We have to show that $\Delta_{\mathcal{X}} : \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is unramified (resp. locally quasi-finite). Note that $W \times W \rightarrow \mathcal{X} \times \mathcal{X}$ is also surjective, flat, and locally of finite presentation. Hence it suffices to show that

$$W \times_{\mathcal{X} \times \mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X} = W \times_{\mathcal{X}} W \longrightarrow W \times W$$

is unramified (resp. locally quasi-finite), see Properties of Stacks, Lemma 77.3.3. By assumption the morphism $\text{pr}_i : W \times_{\mathcal{X}} W \rightarrow W$ is unramified (resp. locally quasi-finite). Hence the displayed arrow is unramified (resp. locally quasi-finite) by Morphisms of Spaces, Lemma 49.35.11 (resp. Morphisms of Spaces, Lemma 49.26.8). \square

Lemma 78.4.15. *A monomorphism of algebraic stacks is separated and DM. The same is true for immersions of algebraic stacks.*

Proof. If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a monomorphism of algebraic stacks, then Δ_f is an isomorphism, see Properties of Stacks, Lemma 77.8.4. Since an isomorphism of algebraic spaces is proper and unramified we see that f is separated and DM. The second assertion follows from the first as an immersion is a monomorphism, see Properties of Stacks, Lemma 77.9.5. \square

Lemma 78.4.16. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. Assume the residual gerbe \mathcal{Z}_x of \mathcal{X} at x exists. If \mathcal{X} is DM, resp. quasi-DM, resp. separated, resp. quasi-separated, then so is \mathcal{Z}_x .*

Proof. This is true because $\mathcal{Z}_x \rightarrow \mathcal{X}$ is a monomorphism hence DM and separated by Lemma 78.4.15. Apply Lemma 78.4.11 to conclude. \square

78.5. Inertia stacks

The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 8.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.32.

Lemma 78.5.1. *Let \mathcal{X} be an algebraic stack. Then the inertia stack $\mathcal{I}_{\mathcal{X}}$ is an algebraic stack as well. The morphism*

$$\mathcal{I}_{\mathcal{X}} \longrightarrow \mathcal{X}$$

is representable by algebraic spaces and locally of finite type. More generally, let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then the morphism

$$\mathcal{I}_{\mathcal{X}/\mathcal{Y}} \longrightarrow \mathcal{X}$$

is representable by algebraic spaces and locally of finite type.

Proof. By Categories, Lemma 4.32.1 there are equivalences

$$\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X} \times_{\Delta, \mathcal{X} \times_S \mathcal{X}, \Delta} \mathcal{X} \quad \text{and} \quad \mathcal{I}_{\mathcal{X}/\mathcal{Y}} \rightarrow \mathcal{X} \times_{\Delta, \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, \Delta} \mathcal{X}$$

which shows that the inertia stacks are algebraic stacks. Let $T \rightarrow \mathcal{X}$ be a morphism given by the object x of the fibre category of \mathcal{X} over T . Then we get a 2-fibre product

square

$$\begin{array}{ccc} \text{Isom}_{\mathcal{X}}(x, x) & \longrightarrow & \mathcal{I}_{\mathcal{X}} \\ \downarrow & & \downarrow \\ T & \xrightarrow{x} & \mathcal{X} \end{array}$$

This follows immediately from the definition of $\mathcal{I}_{\mathcal{X}}$. Since $\text{Isom}_{\mathcal{X}}(x, x)$ is always an algebraic space locally of finite type over T (see Lemma 78.3.1) we conclude that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is representable by algebraic spaces and locally of finite type. Finally, for the relative inertia we get

$$\begin{array}{ccccc} \text{Isom}_{\mathcal{X}}(x, x) & \longleftarrow & K & \longrightarrow & \mathcal{I}_{\mathcal{X}/Y} \\ \downarrow & & \downarrow & & \downarrow \\ \text{Isom}_Y(f(x), f(x)) & \xleftarrow{e} & T & \xrightarrow{x} & \mathcal{X} \end{array}$$

with both squares 2-fibre products. This follows from Categories, Lemma 4.32.3. The left vertical arrow is a morphism of algebraic spaces locally of finite type over T , and hence is locally of finite type, see Morphisms of Spaces, Lemma 49.23.6. Thus K is an algebraic space and $K \rightarrow T$ is locally of finite type. This proves the assertion on the relative inertia. \square

Remark 78.5.2. Let \mathcal{X} be an algebraic stack. In Properties of Stacks, Remark 77.3.7 we have seen that the 2-category of morphisms $\mathcal{X}' \rightarrow \mathcal{X}$ representable by algebraic spaces with target \mathcal{X} forms a category. In this category the inertia stack of \mathcal{X} is a *group object*. Recall that an object of $\mathcal{I}_{\mathcal{X}}$ is just a pair (x, α) where x is an object of \mathcal{X} and α is an automorphism of x in the fibre category of \mathcal{X} that x lives in. The composition

$$c : \mathcal{I}_{\mathcal{X}} \times_{\mathcal{X}} \mathcal{I}_{\mathcal{X}} \longrightarrow \mathcal{I}_{\mathcal{X}}$$

is given by the rule on objects

$$((x, \alpha), (x', \alpha'), \beta) \mapsto (x, \alpha \circ \beta^{-1} \circ \alpha' \circ \beta)$$

which makes sense as $\beta : x \rightarrow x'$ is an isomorphism in the fibre category by our definition of fibre products. The neutral element $e : \mathcal{X} \rightarrow \mathcal{I}_{\mathcal{X}}$ is given by the functor $x \mapsto (x, \text{id}_x)$. We omit the proof that the axioms of a group object hold. There is a variant of this remark for relative inertia stacks.

Let \mathcal{X} be an algebraic stack and let $\mathcal{I}_{\mathcal{X}}$ be its inertia stack. We have seen in the proof of Lemma 78.5.1 that for any scheme T and object x of \mathcal{X} over T there is a canonical cartesian square

$$\begin{array}{ccc} \text{Isom}_{\mathcal{X}}(x, x) & \longrightarrow & \mathcal{I}_{\mathcal{X}} \\ \downarrow & & \downarrow \\ T & \xrightarrow{x} & \mathcal{X} \end{array}$$

The group structure on $\mathcal{I}_{\mathcal{X}}$ discussed in Remark 78.5.2 induces the group structure on $\text{Isom}_{\mathcal{X}}(x, x)$ of Lemma 78.3.2. This allows us to define the sheaf $\text{Isom}_{\mathcal{X}}$ also for morphisms from algebraic spaces to \mathcal{X} . We formalize this in the following definition.

Definition 78.5.3. Let \mathcal{X} be an algebraic stack and let X be an algebraic space. Let $x : X \rightarrow \mathcal{X}$ be a morphism. We set

$$\text{Isom}_{\mathcal{X}}(x, x) = X \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}}$$

We endow it with the structure of a group algebraic space over X by pulling back the composition law discussed in Remark 78.5.2. We will sometimes refer to $\text{Isom}_{\mathcal{X}}(x, x)$ as the *sheaf of automorphisms of x* .

As a variant we may occasionally use the notation $\text{Isom}_{\mathcal{X}}(x, y)$ when given two morphisms $x, y : X \rightarrow \mathcal{X}$. This will mean simply the algebraic space

$$(X \times_{x, \mathcal{X}, y} X) \times_{X \times X, \Delta_X} X.$$

Then it is true, as in Lemma 78.3.2, that $\text{Isom}_{\mathcal{X}}(x, y)$ is a pseudo torsor for $\text{Isom}_{\mathcal{X}}(x, x)$ over X . We omit the verification.

Lemma 78.5.4. Let $\pi : \mathcal{X}' \rightarrow X$ be a morphism from an algebraic stack to an algebraic space. Let $f : X' \rightarrow X$ be a morphism of algebraic spaces. Set $\mathcal{X}' = X' \times_X \mathcal{X}$. Then both squares in the diagram

$$\begin{array}{ccccc} \mathcal{I}_{\mathcal{X}'} & \longrightarrow & \mathcal{X}' & \longrightarrow & X' \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{I}_{\mathcal{X}} & \longrightarrow & \mathcal{X} & \longrightarrow & X \end{array}$$

Categories, Equation (4.32.2.1)

are fibre product squares.

Proof. The inertia stack $\mathcal{I}_{\mathcal{X}'}$ is defined as the category of pairs (x', α') where x' is an object of \mathcal{X}' and α' is an automorphism of x' in its fibre category over $(\text{Sch}/S)_{\text{fppf}}$, see Categories, Section 4.32. Suppose that x' lies over the scheme U and maps to the object x of \mathcal{X} . By the construction of the 2-fibre product in Categories, Lemma 4.30.3 we see that $x' = (U, a', x, 1)$ where $a' : U \rightarrow X'$ is a morphism and 1 indicates that $f \circ a' = \pi \circ x$ as morphisms $U \rightarrow X$. Moreover we have $\text{Isom}_{\mathcal{X}'}(x', x') = \text{Isom}_{\mathcal{X}}(x, x)$ as sheaves on U (by the very construction of the 2-fibre product). This implies that the left square is a fibre product square (details omitted). \square

Lemma 78.5.5. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a monomorphism of algebraic stacks. Then the diagram

$$\begin{array}{ccc} \mathcal{I}_{\mathcal{X}} & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow \\ \mathcal{I}_{\mathcal{Y}} & \longrightarrow & \mathcal{Y} \end{array}$$

is a fibre product square.

Proof. This follows immediately from the fact that f is fully faithful (see Properties of Stacks, Lemma 77.8.4) and the definition of the inertia in Categories, Section 4.32. Namely, an object of $\mathcal{I}_{\mathcal{X}}$ over a scheme T is the same thing as a pair (x, α) consisting of an object x of \mathcal{X} over T and a morphism $\alpha : x \rightarrow x$ in the fibre category of \mathcal{X} over T . As f is fully faithful we see that α is the same thing as a morphism $\beta : f(x) \rightarrow f(x)$ in the fibre category of \mathcal{Y} over T . Hence we can think of objects of $\mathcal{I}_{\mathcal{X}}$ over T as triples $((y, \beta), x, \gamma)$ where y is an object of \mathcal{Y} over T ,

$\beta : y \rightarrow y$ in \mathcal{Y}_T and $\gamma : y \rightarrow f(x)$ is an isomorphism over T , i.e., an object of $\mathcal{I}_{\mathcal{Y}} \times_{\mathcal{Y}} \mathcal{X}$ over T . \square

Lemma 78.5.6. *Let \mathcal{X} be an algebraic stack. Let $[U/R] \rightarrow \mathcal{X}$ be a presentation. Let G/U be the stabilizer group algebraic space associated to the groupoid (U, R, s, t, c) . Then*

$$\begin{array}{ccc} G & \longrightarrow & U \\ \downarrow & & \downarrow \\ \mathcal{I}_{\mathcal{X}} & \longrightarrow & \mathcal{X} \end{array}$$

is a fibre product diagram.

Proof. Immediate from Groupoids in Spaces, Lemma 60.25.2. \square

78.6. Higher diagonals

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. In this situation it makes sense to consider not only the diagonal

$$\Delta_f : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$$

but also the diagonal of the diagonal, i.e., the morphism

$$\Delta_{\Delta_f} : \mathcal{X} \rightarrow \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} \mathcal{X}$$

Because of this we sometimes use the following terminology. We denote $\Delta_{f,0} = f$ the *zeroth diagonal*, we denote $\Delta_{f,1} = \Delta_f$ the *first diagonal*, and we denote $\Delta_{f,2} = \Delta_{\Delta_f}$ the *second diagonal*. Note that $\Delta_{f,1}$ is representable by algebraic spaces and locally of finite type, see Lemma 78.3.3. Hence $\Delta_{f,2}$ is representable, a monomorphism, locally of finite type, separated, and locally quasi-finite, see Lemma 78.3.4.

We can describe the second diagonal using the relative inertia stack. Namely, the fibre product $\mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} \mathcal{X}$ is equivalent to the relative inertia stack $\mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ by Categories, Lemma 4.32.1. Moreover, via this identification the second diagonal becomes the *neutral section*

$$e : \mathcal{X} \rightarrow \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$$

of the relative inertia stack. Moreover, recall from the proof of Lemma 78.5.1 that given a morphism $x : T \rightarrow \mathcal{X}$ the fibre product $T \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ is given as the *kernel* K of the homomorphism of group algebraic spaces

$$\text{Isom}_{\mathcal{X}}(x, x) \longrightarrow \text{Isom}_{\mathcal{Y}}(f(x), f(x))$$

over T . The morphism e corresponds to the neutral section $e : T \rightarrow K$ in this situation.

Lemma 78.6.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then f is representable by algebraic spaces if and only if the second diagonal is an isomorphism.*

Proof. Namely, f is representable by algebraic spaces if and only if f is faithful, see Algebraic Stacks, Lemma 71.15.2. On the other hand, f is faithful if and only if for every object x of \mathcal{X} over a scheme T the functor f induces an injection $\text{Isom}_{\mathcal{X}}(x, x) \rightarrow \text{Isom}_{\mathcal{Y}}(f(x), f(x))$, which happens if and only if the kernel K is trivial, which happens if and only if $e : T \rightarrow K$ is an isomorphism for every $x : T \rightarrow \mathcal{X}$. Since $K = T \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ as discussed above, this proves the lemma. \square

This lemma leads to the following hierarchy for morphisms of algebraic stacks.

Lemma 78.6.2. *A morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is*

- (1) *a monomorphism if and only if $\Delta_{f,1}$ is an isomorphism,*
- (2) *representable by algebraic spaces if and only if $\Delta_{f,1}$ is a monomorphism,*
- (3) *the second diagonal $\Delta_{f,2}$ is always a monomorphism.*

Proof. Recall from Properties of Stacks, Lemma 77.8.4 that a morphism of algebraic stacks is a monomorphism if and only if its diagonal is an isomorphism of stacks. Thus Lemma 78.6.1 can be rephrased as saying that a morphism is representable by algebraic spaces if the diagonal is a monomorphism. In particular, it shows that condition (3) of Lemma 78.3.4 is actually an if and only if, i.e., a morphism of algebraic stacks is representable by algebraic spaces if and only if its diagonal is a monomorphism. \square

Lemma 78.6.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then*

- (1) *$\Delta_{f,1}$ separated $\Leftrightarrow \Delta_{f,2}$ closed immersion $\Leftrightarrow \Delta_{f,2}$ proper $\Leftrightarrow \Delta_{f,2}$ universally closed,*
- (2) *$\Delta_{f,1}$ quasi-separated $\Leftrightarrow \Delta_{f,2}$ finite type $\Leftrightarrow \Delta_{f,2}$ quasi-compact, and*
- (3) *$\Delta_{f,1}$ locally separated $\Leftrightarrow \Delta_{f,2}$ immersion.*

Proof. Follows from Lemmas 78.3.5, 78.3.6, and 78.3.7 applied to $\Delta_{f,1}$. \square

The following lemma is kind of cute and it may suggest a generalization of these conditions to higher algebraic stacks.

Lemma 78.6.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then*

- (1) *f is separated if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are universally closed, and*
- (2) *f is quasi-separated if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are quasi-compact.*
- (3) *f is quasi-DM if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are locally quasi-finite.*
- (4) *f is DM if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are unramified.*

Proof. Proof of (1). Assume that $\Delta_{f,2}$ and $\Delta_{f,1}$ are universally closed. Then $\Delta_{f,1}$ is separated and universally closed by Lemma 78.6.3. By Morphisms of Spaces, Lemma 49.9.7 and Algebraic Stacks, Lemma 71.10.9 we see that $\Delta_{f,1}$ is quasi-compact. Hence it is quasi-compact, separated, universally closed and locally of finite type (by Lemma 78.3.3) so proper. This proves “ \Leftarrow ” of (1). The proof of the implication in the other direction is omitted.

Proof of (2). This follows immediately from Lemma 78.6.3.

Proof of (3). This follows from the fact that $\Delta_{f,2}$ is always locally quasi-finite by Lemma 78.3.4 applied to $\Delta_f = \Delta_{f,1}$.

Proof of (4). This follows from the fact that $\Delta_{f,2}$ is always unramified as Lemma 78.3.4 applied to $\Delta_f = \Delta_{f,1}$ shows that $\Delta_{f,2}$ is locally of finite type and a monomorphism. See More on Morphisms of Spaces, Lemma 58.11.8. \square

78.7. Quasi-compact morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 77.3 we have defined what it means for f to be quasi-compact. Here is another characterization.

Lemma 78.7.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:*

- (1) *f is quasi-compact, and*
- (2) *for every quasi-compact algebraic stack \mathcal{Z} and any morphism $\mathcal{Z} \rightarrow \mathcal{Y}$ the algebraic stack $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact.*

Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks with \mathcal{Z} quasi-compact. By Properties of Stacks, Lemma 77.6.2 there exists a quasi-compact scheme U and a surjective smooth morphism $U \rightarrow \mathcal{Z}$. Since f is representable by algebraic spaces and quasi-compact we see by definition that $U \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and that $U \times_{\mathcal{Y}} \mathcal{X} \rightarrow U$ is quasi-compact. Hence $U \times_{\mathcal{Y}} \mathcal{X}$ is a quasi-compact algebraic space. The morphism $U \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is smooth and surjective (as the base change of the smooth and surjective morphism $U \rightarrow \mathcal{Z}$). Hence $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact by another application of Properties of Stacks, Lemma 77.6.2

Assume (2). Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a morphism, where \mathcal{Z} is a scheme. We have to show that the morphism of algebraic spaces $p : \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ is quasi-compact. Let $U \subset \mathcal{Z}$ be affine open. Then $p^{-1}(U) = U \times_{\mathcal{Y}} \mathcal{X}$ and the algebraic space $U \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact by assumption (2). Hence p is quasi-compact, see Morphisms of Spaces, Lemma 49.8.7. \square

This motivates the following definition.

Definition 78.7.2. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *quasi-compact* if for every quasi-compact algebraic stack \mathcal{Z} and morphism $\mathcal{Z} \rightarrow \mathcal{Y}$ the fibre product $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact.

By Lemma 78.7.1 above this agrees with the already existing notion for morphisms of algebraic stacks representable by algebraic spaces. In particular this notion agrees with the notions already defined for morphisms between algebraic stacks and schemes.

Lemma 78.7.3. *The base change of a quasi-compact morphism of algebraic stacks by any morphism of algebraic stacks is quasi-compact.*

Proof. Omitted. \square

Lemma 78.7.4. *The composition of a pair of quasi-compact morphisms of algebraic stacks is quasi-compact.*

Proof. Omitted. \square

Lemma 78.7.5. *Let*

$$\begin{array}{ccc} \mathcal{X} & \xrightarrow{\quad f \quad} & \mathcal{Y} \\ & \searrow p & \swarrow q \\ & \mathcal{Z} & \end{array}$$

be a 2-commutative diagram of morphisms of algebraic stacks. If f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Let \mathcal{T} be a quasi-compact algebraic stack, and let $\mathcal{T} \rightarrow \mathcal{Z}$ be a morphism. By Properties of Stacks, Lemma 77.5.3 the morphism $\mathcal{T} \times_{\mathcal{Z}} \mathcal{X} \rightarrow \mathcal{T} \times_{\mathcal{Z}} \mathcal{Y}$ is surjective and by assumption $\mathcal{T} \times_{\mathcal{Z}} \mathcal{X}$ is quasi-compact. Hence $\mathcal{T} \times_{\mathcal{Z}} \mathcal{Y}$ is quasi-compact by Properties of Stacks, Lemma 77.6.2. \square

Lemma 78.7.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f$ is quasi-compact and g is quasi-separated then f is quasi-compact.*

Proof. This is true because f equals the composition $(1, f) : \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{Y}$. The first map is quasi-compact by Lemma 78.4.9 because it is a section of the quasi-separated morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{X}$ (a base change of g , see Lemma 78.4.4). The second map is quasi-compact as it is the base change of f , see Lemma 78.7.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 78.7.4. \square

Lemma 78.7.7. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.*

- (1) *If \mathcal{X} is quasi-compact and \mathcal{Y} is quasi-separated, then f is quasi-compact.*
- (2) *If \mathcal{X} is quasi-compact and quasi-separated and \mathcal{Y} is quasi-separated, then f is quasi-compact and quasi-separated.*
- (3) *A fibre product of quasi-compact and quasi-separated algebraic stacks is quasi-compact and quasi-separated.*

Proof. Part (1) follows from Lemma 78.7.6. Part (2) follows from (1) and Lemma 78.4.12. For (3) let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ be morphisms of quasi-compact and quasi-separated algebraic stacks. Then $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$ is quasi-compact and quasi-separated as a base change of $\mathcal{X} \rightarrow \mathcal{Y}$ using (2) and Lemmas 78.7.3 and 78.4.4. Hence $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ is quasi-compact and quasi-separated as an algebraic stack quasi-compact and quasi-separated over \mathcal{Z} , see Lemmas 78.4.11 and 78.7.4. \square

78.8. Noetherian algebraic stacks

We have already defined locally Noetherian algebraic stacks in Properties of Stacks, Section 77.7.

Definition 78.8.1. Let \mathcal{X} be an algebraic stack. We say \mathcal{X} is *Noetherian* if \mathcal{X} is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic stack \mathcal{X} is not just quasi-compact and locally Noetherian, but also quasi-separated. In the language of Section 78.6 if we denote $p : \mathcal{X} \rightarrow \text{Spec}(\mathbf{Z})$ the “absolute” structure morphism (i.e., the structure morphism of \mathcal{X} viewed as an algebraic stack over \mathbf{Z}), then

$$\mathcal{X} \text{ Noetherian} \Leftrightarrow \mathcal{X} \text{ locally Noetherian and } \Delta_{p,0}, \Delta_{p,1}, \Delta_{p,2} \text{ quasi-compact.}$$

This will later mean that an algebraic stack of finite type over a Noetherian algebraic stack is not automatically Noetherian.

78.9. Open morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 77.3 we have defined what it means for f to be universally open. Here is another characterization.

Lemma 78.9.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent*

- (1) *f is universally open, and*
- (2) *for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |\mathcal{Z}|$ is open.*

Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Z}$. By assumption the morphism $V \times_{\mathcal{Y}} \mathcal{X} \rightarrow V$ of algebraic spaces is universally open, in particular the map $|V \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |V|$ is open. By Properties of Stacks, Section 77.4 in the commutative diagram

$$\begin{array}{ccc} |V \times_{\mathcal{Y}} \mathcal{X}| & \longrightarrow & |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \\ \downarrow & & \downarrow \\ |V| & \longrightarrow & |\mathcal{Z}| \end{array}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |V| \times_{|\mathcal{Z}|} |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}|$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication (2) \Rightarrow (1) follows from the definitions. \square

Thus we may use the following natural definition.

Definition 78.9.2. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f is *open* if the map of topological spaces $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is open.
- (2) We say f is *universally open* if for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces

$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |\mathcal{Z}|$$

is open, i.e., the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ is open.

Lemma 78.9.3. *The base change of a universally open morphism of algebraic stacks by any morphism of algebraic stacks is universally open.*

Proof. This is immediate from the definition. \square

Lemma 78.9.4. *The composition of a pair of (universally) open morphisms of algebraic stacks is (universally) open.*

Proof. Omitted. \square

78.10. Submersive morphisms

Definition 78.10.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f is *submersive*⁴ if the continuous map $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is submersive, see Topology, Definition 5.5.3.
- (2) We say f is *universally submersive* if for every morphism of algebraic stacks $\mathcal{Y}' \rightarrow \mathcal{Y}$ the base change $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$ is submersive.

We note that a submersive morphism is in particular surjective.

⁴This is very different from the notion of a submersion of differential manifolds.

78.11. Universally closed morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 77.3 we have defined what it means for f to be universally closed. Here is another characterization.

Lemma 78.11.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent*

- (1) f is universally closed, and
- (2) for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |\mathcal{Z}|$ is closed.

Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Z}$. By assumption the morphism $V \times_{\mathcal{Y}} \mathcal{X} \rightarrow V$ of algebraic spaces is universally closed, in particular the map $|V \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |V|$ is closed. By Properties of Stacks, Section 77.4 in the commutative diagram

$$\begin{array}{ccc} |V \times_{\mathcal{Y}} \mathcal{X}| & \longrightarrow & |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \\ \downarrow & & \downarrow \\ |V| & \longrightarrow & |\mathcal{Z}| \end{array}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |V| \times_{|\mathcal{Z}|} |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}|$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication (2) \Rightarrow (1) follows from the definitions. \square

Thus we may use the following natural definition.

Definition 78.11.2. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f is *closed* if the map of topological spaces $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is closed.
- (2) We say f is *universally closed* if for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces

$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \rightarrow |\mathcal{Z}|$$

is closed, i.e., the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ is closed.

Lemma 78.11.3. *The base change of a universally closed morphism of algebraic stacks by any morphism of algebraic stacks is universally closed.*

Proof. This is immediate from the definition. \square

Lemma 78.11.4. *The composition of a pair of (universally) closed morphisms of algebraic stacks is (universally) closed.*

Proof. Omitted. \square

78.12. Types of morphisms smooth local on source-and-target

Given a property of morphisms of algebraic spaces which is *smooth local on the source-and-target*, see Descent on Spaces, Definition 56.18.1 we may use it to define a corresponding property of morphisms of algebraic stacks, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 78.12.1. *Let \mathcal{P} be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Consider commutative diagrams*

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \end{array}$$

where U and V are algebraic spaces and the vertical arrows are smooth. The following are equivalent

- (1) for any diagram as above such that in addition $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ is smooth the morphism h has property \mathcal{P} , and
- (2) for some diagram as above with $a : U \rightarrow \mathcal{X}$ surjective the morphism h has property \mathcal{P} .

If \mathcal{X} and \mathcal{Y} are representable by algebraic spaces, then this is also equivalent to f (as a morphism of algebraic spaces) having property \mathcal{P} . If \mathcal{P} is also preserved under any base change, and fppf local on the base, then for morphisms f which are representable by algebraic spaces this is also equivalent to f having property \mathcal{P} in the sense of Properties of Stacks, Section 77.3.

Proof. Let us prove the implication (1) \Rightarrow (2). Pick an algebraic space V and a surjective and smooth morphism $V \rightarrow \mathcal{Y}$. Pick an algebraic space U and a surjective and smooth morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. Note that $U \rightarrow \mathcal{X}$ is surjective and smooth as well, as a composition of the base change $\mathcal{X} \times_{\mathcal{Y}} V \rightarrow \mathcal{X}$ and the chosen map $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. Hence we obtain a diagram as in (1). Thus if (1) holds, then $h : U \rightarrow V$ has property \mathcal{P} , which means that (2) holds as $U \rightarrow \mathcal{X}$ is surjective.

Conversely, assume (2) holds and let U, V, a, b, h be as in (2). Next, let U', V', a', b', h' be any diagram as in (1). Picture

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ \downarrow & & \downarrow \\ \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \end{array} \quad \begin{array}{ccc} U' & \xrightarrow{h'} & V' \\ \downarrow & & \downarrow \\ \mathcal{X} & \xrightarrow{f} & \mathcal{Y} \end{array}$$

To show that (2) implies (1) we have to prove that h' has \mathcal{P} . To do this consider the commutative diagram

$$\begin{array}{ccccc}
 U & \longleftarrow & U \times_{\mathcal{X}} U' & \longrightarrow & U' \\
 \downarrow h & \swarrow & \downarrow & \searrow & \downarrow h' \\
 & & U \times_{\mathcal{Y}} V' & & \\
 & & \downarrow & \swarrow & \\
 V & \longleftarrow & V \times_{\mathcal{Y}} V' & \longrightarrow & V'
 \end{array}$$

of algebraic spaces. Note that the horizontal arrows are smooth as base changes of the smooth morphisms $V \rightarrow \mathcal{Y}$, $V' \rightarrow \mathcal{Y}$, $U \rightarrow \mathcal{X}$, and $U' \rightarrow \mathcal{X}$. Note that

$$\begin{array}{ccc}
 U \times_{\mathcal{X}} U' & \longrightarrow & U' \\
 \downarrow & & \downarrow \\
 U \times_{\mathcal{Y}} V' & \longrightarrow & \mathcal{X} \times_{\mathcal{Y}} V'
 \end{array}$$

is cartesian, hence the left vertical arrow is smooth as U', V', a', b', h' is as in (1). Since \mathcal{P} is local on the target we see that the base change $U \times_{\mathcal{Y}} V' \rightarrow V \times_{\mathcal{Y}} V'$ has \mathcal{P} and hence after precomposing by the smooth morphism $U \times_{\mathcal{X}} U' \rightarrow U \times_{\mathcal{Y}} V'$ the morphism we conclude (h, h') has \mathcal{P} . Finally, since $U \times_{\mathcal{X}} U' \rightarrow U'$ is surjective this implies that h' has \mathcal{P} as \mathcal{P} is local on the source-and-target. This finishes the proof of the equivalence of (1) and (2).

If \mathcal{X} and \mathcal{Y} are representable, then Descent on Spaces, Lemma 56.18.3 applies which shows that (1) and (2) are equivalent to f having \mathcal{P} .

Finally, suppose f is representable, and U, V, a, b, h are as in part (2) of the lemma, and that \mathcal{P} is preserved under arbitrary base change. We have to show that for any scheme Z and morphism $Z \rightarrow \mathcal{X}$ the base change $Z \times_{\mathcal{Y}} \mathcal{X} \rightarrow Z$ has property \mathcal{P} . Consider the diagram

$$\begin{array}{ccc}
 Z \times_{\mathcal{Y}} U & \longrightarrow & Z \times_{\mathcal{Y}} V \\
 \downarrow & & \downarrow \\
 Z \times_{\mathcal{Y}} \mathcal{X} & \longrightarrow & Z
 \end{array}$$

Note that the top horizontal arrow is a base change of h and hence has property \mathcal{P} . The left vertical arrow is smooth and surjective and the right vertical arrow is smooth. Thus Descent on Spaces, Lemma 56.18.3 kicks in and shows that $Z \times_{\mathcal{Y}} \mathcal{X} \rightarrow Z$ has property \mathcal{P} . \square

Definition 78.12.2. Let \mathcal{P} be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. We say a morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks has property \mathcal{P} if the equivalent conditions of Lemma 78.12.1 hold.

Remark 78.12.3. Let \mathcal{P} be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under composition. Then the property of morphisms of algebraic stacks defined in Definition 78.12.2 is stable under composition. Namely, let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks having property \mathcal{P} . Choose an algebraic space W and a surjective

smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$. Finally, choose an algebraic space U and a surjective and smooth morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. Then the morphisms $V \rightarrow W$ and $U \rightarrow V$ have property \mathcal{P} by definition. Whence $U \rightarrow W$ has property \mathcal{P} as we assumed that \mathcal{P} is stable under composition. Thus, by definition again, we see that $g \circ f : \mathcal{X} \rightarrow \mathcal{Z}$ has property \mathcal{P} .

Remark 78.12.4. Let \mathcal{P} be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under base change. Then the property of morphisms of algebraic stacks defined in Definition 78.12.2 is stable under base change. Namely, let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y}' \rightarrow \mathcal{Y}$ be morphisms of algebraic stacks and assume f has property \mathcal{P} . Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. Finally, choose an algebraic space V' and a surjective and smooth morphism $V' \rightarrow \mathcal{Y}' \times_{\mathcal{Y}} V$. Then the morphism $U \rightarrow V$ has property \mathcal{P} by definition. Whence $V' \times_V U \rightarrow V'$ has property \mathcal{P} as we assumed that \mathcal{P} is stable under base change. Considering the diagram

$$\begin{array}{ccccc} V' \times_V U & \longrightarrow & \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow & & \downarrow \\ V' & \longrightarrow & \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

we see that the left top horizontal arrow is smooth and surjective, whence by definition we see that the projection $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$ has property \mathcal{P} .

Remark 78.12.5. Let $\mathcal{P}, \mathcal{P}'$ be properties of morphisms of algebraic spaces which are smooth local on the source-and-target and stable under base change. Suppose that we have $\mathcal{P} \Rightarrow \mathcal{P}'$ for morphisms of algebraic spaces. Then we also have $\mathcal{P} \Rightarrow \mathcal{P}'$ for the properties of morphisms of algebraic stacks defined in Definition 78.12.2 using \mathcal{P} and \mathcal{P}' . This is clear from the definition.

78.13. Morphisms of finite type

The property “locally of finite type” of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 56.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 49.23.3 and Descent on Spaces, Lemma 56.10.7. Hence, by Lemma 78.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 77.3 when the morphism is representable by algebraic spaces.

Definition 78.13.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f *locally of finite type* if the equivalent conditions of Lemma 78.12.1 hold with $\mathcal{P} =$ locally of finite type.
- (2) We say f is *of finite type* if it is locally of finite type and quasi-compact.

Lemma 78.13.2. *The composition of finite type morphisms is of finite type. The same holds for locally of finite type.*

Proof. Combine Remark 78.12.3 with Morphisms of Spaces, Lemma 49.23.2. \square

Lemma 78.13.3. *A base change of a finite type morphism is finite type. The same holds for locally of finite type.*

Proof. Combine Remark 78.12.4 with Morphisms of Spaces, Lemma 49.23.3. \square

Lemma 78.13.4. *An immersion is locally of finite type.*

Proof. Follows from Morphisms of Spaces, Lemma 49.23.7. \square

Lemma 78.13.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type and \mathcal{Y} is locally Noetherian, then \mathcal{X} is locally Noetherian.*

Proof. Let

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} \end{array}$$

be a commutative diagram where U, V are schemes, $V \rightarrow \mathcal{Y}$ is surjective and smooth, and $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$ is surjective and smooth. Then $U \rightarrow V$ is locally of finite type. If \mathcal{Y} is locally Noetherian, then V is locally Noetherian. By Morphisms, Lemma 28.16.6 we see that U is locally Noetherian, which means that \mathcal{X} is locally Noetherian. \square

The following two lemmas will be improved on later (after we have discussed morphisms of algebraic stacks which are locally of finite presentation).

Lemma 78.13.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \rightarrow \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where W is an algebraic space. If the base change $W \times_{\mathcal{Y}} \mathcal{X} \rightarrow W$ is locally of finite type, then f is locally of finite type.*

Proof. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \rightarrow V$ is locally of finite presentation. Now we base change everything by $W \rightarrow \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$, $\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \rightarrow V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of locally finite type morphisms of algebraic stacks and the assumption that $\mathcal{X}' \rightarrow \mathcal{Y}'$ is locally of finite type, we see that $U' \rightarrow V'$ is locally of finite type. Then, since $V' \rightarrow V$ is surjective, flat, and locally of finite presentation as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is locally of finite type by Descent on Spaces, Lemma 56.10.7 and we win. \square

Lemma 78.13.7. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. Assume $\mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite type and that $\mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then $\mathcal{Y} \rightarrow \mathcal{Z}$ is locally of finite type.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow W \times_{\mathcal{Z}} \mathcal{Y}$. Set $U = V \times_{\mathcal{Y}} \mathcal{X}$ which is an algebraic space. We know that $U \rightarrow V$ is surjective, flat, and locally of finite presentation and that $U \rightarrow W$ is locally of finite type. Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 56.14.2. \square

Lemma 78.13.8. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$, $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f : \mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite type, then $f : \mathcal{X} \rightarrow \mathcal{Y}$ is locally of finite type.*

Proof. We can find a diagram

$$\begin{array}{ccccc} U & \longrightarrow & V & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} & \longrightarrow & \mathcal{Z} \end{array}$$

where U, V, W are schemes, the vertical arrow $W \rightarrow \mathcal{Z}$ is surjective and smooth, the arrow $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$ is surjective and smooth, and the arrow $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ is surjective and smooth. Then also $U \rightarrow \mathcal{X} \times_{\mathcal{Z}} W$ is surjective and smooth (as a composition of a surjective and smooth morphism with a base change of such). By definition we see that $U \rightarrow W$ is locally of finite type. Hence $U \rightarrow V$ is locally of finite type by Morphisms, Lemma 28.16.8 which in turn means (by definition) that $\mathcal{X} \rightarrow \mathcal{Y}$ is locally of finite type. \square

78.14. Points of finite type

Let \mathcal{X} be an algebraic stack. A finite type point $x \in |\mathcal{X}|$ is a point which can be represented by a morphism $\mathrm{Spec}(k) \rightarrow \mathcal{X}$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always “enough of them” for example.

Lemma 78.14.1. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. The following are equivalent:*

- (1) *There exists a morphism $\mathrm{Spec}(k) \rightarrow \mathcal{X}$ which is locally of finite type and represents x .*
- (2) *There exists a scheme U , a closed point $u \in U$, and a smooth morphism $\varphi : U \rightarrow \mathcal{X}$ such that $\varphi(u) = x$.*

Proof. Let $u \in U$ and $U \rightarrow \mathcal{X}$ be as in (2). Then $\mathrm{Spec}(\kappa(u)) \rightarrow U$ is of finite type, and $U \rightarrow \mathcal{X}$ is representable and locally of finite type (by Morphisms of Spaces, Lemmas 49.36.8 and 49.27.5). Hence we see (1) holds by Lemma 78.13.2.

Conversely, assume $\mathrm{Spec}(k) \rightarrow \mathcal{X}$ is locally of finite type and represents x . Let $U \rightarrow \mathcal{X}$ be a surjective smooth morphism where U is a scheme. By assumption $U \times_{\mathcal{X}} \mathrm{Spec}(k) \rightarrow U$ is a morphism of algebraic spaces which is locally of finite type. Pick a finite type point v of $U \times_{\mathcal{X}} \mathrm{Spec}(k)$ (there exists at least one, see Morphisms of Spaces, Lemma 49.25.3). By Morphisms of Spaces, Lemma 49.25.4 the image $u \in U$ of v is a finite type point of U . Hence by Morphisms, Lemma 28.17.4 after shrinking U we may assume that u is a closed point of U , i.e., (2) holds. \square

Definition 78.14.2. Let \mathcal{X} be an algebraic stack. We say a point $x \in |\mathcal{X}|$ is a *finite type point*⁵ if the equivalent conditions of Lemma 78.14.1 are satisfied. We denote $\mathcal{X}_{\mathrm{ft-pts}}$ the set of finite type points of \mathcal{X} .

We can describe the set of finite type points as follows.

⁵This is a slight abuse of language as it would perhaps be more correct to say “locally finite type point”.

Lemma 78.14.3. *Let \mathcal{X} be an algebraic stack. We have*

$$\mathcal{X}_{ft\text{-pts}} = \bigcup_{\varphi: U \rightarrow \mathcal{X} \text{ smooth}} |\varphi|(U_0)$$

where U_0 is the set of closed points of U . Here we may let U range over all schemes smooth over \mathcal{X} or over all affine schemes smooth over \mathcal{X} .

Proof. Immediate from Lemma 78.14.1. \square

Lemma 78.14.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type, then $f(\mathcal{X}_{ft\text{-pts}}) \subset \mathcal{Y}_{ft\text{-pts}}$.*

Proof. Take $x \in \mathcal{X}_{ft\text{-pts}}$. Represent x by a locally finite type morphism $x : \text{Spec}(k) \rightarrow \mathcal{X}$. Then $f \circ x$ is locally of finite type by Lemma 78.13.2. Hence $f(x) \in \mathcal{Y}_{ft\text{-pts}}$. \square

Lemma 78.14.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type and surjective, then $f(\mathcal{X}_{ft\text{-pts}}) = \mathcal{Y}_{ft\text{-pts}}$.*

Proof. We have $f(\mathcal{X}_{ft\text{-pts}}) \subset \mathcal{Y}_{ft\text{-pts}}$ by Lemma 78.14.4. Let $y \in |\mathcal{Y}|$ be a finite type point. Represent y by a morphism $\text{Spec}(k) \rightarrow \mathcal{Y}$ which is locally of finite type. As f is surjective the algebraic stack $\mathcal{X}_k = \text{Spec}(k) \times_{\mathcal{Y}} \mathcal{X}$ is nonempty, therefore has a finite type point $x \in |\mathcal{X}_k|$ by Lemma 78.14.3. Now $\mathcal{X}_k \rightarrow \mathcal{X}$ is a morphism which is locally of finite type as a base change of $\text{Spec}(k) \rightarrow \mathcal{Y}$ (Lemma 78.13.3). Hence the image of x in \mathcal{X} is a finite type point by Lemma 78.14.4 which maps to y by construction. \square

Lemma 78.14.6. *Let \mathcal{X} be an algebraic stack. For any locally closed subset $T \subset |\mathcal{X}|$ we have*

$$T \neq \emptyset \Rightarrow T \cap \mathcal{X}_{ft\text{-pts}} \neq \emptyset.$$

In particular, for any closed subset $T \subset |\mathcal{X}|$ we see that $T \cap \mathcal{X}_{ft\text{-pts}}$ is dense in T .

Proof. Let $i : \mathcal{Z} \rightarrow \mathcal{X}$ be the reduced induced substack structure on T , see Properties of Stacks, Remark 77.10.5. An immersion is locally of finite type, see Lemma 78.13.4. Hence by Lemma 78.14.4 we see $\mathcal{Z}_{ft\text{-pts}} \subset \mathcal{X}_{ft\text{-pts}} \cap T$. Finally, any nonempty affine scheme U with a smooth morphism towards \mathcal{Z} has at least one closed point, hence \mathcal{Z} has at least one finite type point by Lemma 78.14.3. The lemma follows. \square

Here is another, more technical, characterization of a finite type point on an algebraic stack. It tells us in particular that the residual gerbe of \mathcal{X} at x exists whenever x is a finite type point!

Lemma 78.14.7. *Let \mathcal{X} be an algebraic stack. Let $x \in |\mathcal{X}|$. The following are equivalent:*

- (1) x is a finite type point,
- (2) there exists an algebraic stack \mathcal{Z} whose underlying topological space $|\mathcal{Z}|$ is a singleton, and a morphism $f : \mathcal{Z} \rightarrow \mathcal{X}$ which is locally of finite type such that $\{x\} = |f|(|\mathcal{Z}|)$, and
- (3) the residual gerbe \mathcal{Z}_x of \mathcal{X} at x exists and the inclusion morphism $\mathcal{Z}_x \rightarrow \mathcal{X}$ is locally of finite type.

Proof. (All of the morphisms occurring in this paragraph are representable by algebraic spaces, hence the conventions and results of Properties of Stacks, Section 77.3 are applicable.) Assume x is a finite type point. Choose an affine scheme U , a closed point $u \in U$, and a smooth morphism $\varphi : U \rightarrow \mathcal{X}$ with $\varphi(u) = x$, see Lemma 78.14.3. Set $u = \text{Spec}(\kappa(u))$ as usual. Set $R = u \times_{\mathcal{X}} u$ so that we obtain a groupoid in algebraic spaces (u, R, s, t, c) , see Algebraic Stacks, Lemma 71.16.1. The projection morphisms $R \rightarrow u$ are the compositions

$$R = u \times_{\mathcal{X}} u \rightarrow u \times_{\mathcal{X}} U \rightarrow u \times_{\mathcal{X}} \mathcal{X} = u$$

where the first arrow is of finite type (a base change of the closed immersion of schemes $u \rightarrow U$) and the second arrow is smooth (a base change of the smooth morphism $U \rightarrow \mathcal{X}$). Hence $s, t : R \rightarrow u$ are locally of finite type (as compositions, see Morphisms of Spaces, Lemma 49.23.2). Since u is the spectrum of a field, it follows that s, t are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 49.27.7). We see that $\mathcal{Z} = [u/R]$ is an algebraic stack by Criteria for Representability, Theorem 74.17.2. By Algebraic Stacks, Lemma 71.16.1 we obtain a canonical morphism

$$f : \mathcal{Z} \rightarrow \mathcal{X}$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 71.15.2 and a monomorphism, see Properties of Stacks, Lemma 77.8.4. It follows that the residual gerbe $\mathcal{Z}_x \subset \mathcal{Z}$ of \mathcal{Z} at x exists and that f factors through an equivalence $\mathcal{Z} \rightarrow \mathcal{Z}_x$, see Properties of Stacks, Lemma 77.11.11. By construction the diagram

$$\begin{array}{ccc} u & \longrightarrow & U \\ \downarrow & & \downarrow \\ \mathcal{Z} & \xrightarrow{f} & \mathcal{X} \end{array}$$

is commutative. By Criteria for Representability, Lemma 74.17.1 the left vertical arrow is surjective, flat, and locally of finite presentation. Consider

$$\begin{array}{ccccc} u \times_{\mathcal{X}} U & \longrightarrow & \mathcal{Z} \times_{\mathcal{X}} U & \longrightarrow & U \\ \downarrow & & \downarrow & & \downarrow \\ u & \longrightarrow & \mathcal{Z} & \xrightarrow{f} & \mathcal{X} \end{array}$$

As $u \rightarrow \mathcal{X}$ is locally of finite type, we see that the base change $u \times_{\mathcal{X}} U \rightarrow U$ is locally of finite type. Moreover, $u \times_{\mathcal{X}} U \rightarrow \mathcal{Z} \times_{\mathcal{X}} U$ is surjective, flat, and locally of finite presentation as a base change of $u \rightarrow \mathcal{Z}$. Thus $\{u \times_{\mathcal{X}} U \rightarrow \mathcal{Z} \times_{\mathcal{X}} U\}$ is an fppf covering of algebraic spaces, and we conclude that $\mathcal{Z} \times_{\mathcal{X}} U \rightarrow U$ is locally of finite type by Descent on Spaces, Lemma 56.14.1. By definition this means that f is locally of finite type (because the vertical arrow $\mathcal{Z} \times_{\mathcal{X}} U \rightarrow \mathcal{Z}$ is smooth as a base change of $U \rightarrow \mathcal{X}$ and surjective as \mathcal{Z} has only one point). Since $\mathcal{Z} = \mathcal{Z}_x$ we see that (3) holds.

It is clear that (3) implies (2). If (2) holds then x is a finite type point of \mathcal{X} by Lemma 78.14.4 and Lemma 78.14.6 to see that $\mathcal{Z}_{\text{ft-pts}}$ is nonempty, i.e., the unique point of \mathcal{Z} is a finite type point of \mathcal{Z} . \square

78.15. Special presentations of algebraic stacks

The following lemma gives a criterion for when a “slice” of a presentation is still flat over the algebraic stack.

Lemma 78.15.1. *Let \mathcal{X} be an algebraic stack. Consider a cartesian diagram*

$$\begin{array}{ccc} U & \xleftarrow{p} & F \\ \downarrow & & \downarrow \\ \mathcal{X} & \xleftarrow{\quad} & \mathrm{Spec}(k) \end{array}$$

where U is an algebraic space, k is a field, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Let $f_1, \dots, f_r \in \Gamma(U, \mathcal{O}_U)$ and $z \in |F|$ such that f_1, \dots, f_r map to a regular sequence in the local ring $\mathcal{O}_{F, \bar{z}}$. Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$V(f_1, \dots, f_r) \rightarrow \mathcal{X}$$

is flat and locally of finite presentation.

Proof. Choose a scheme W and a surjective smooth morphism $W \rightarrow \mathcal{X}$. Choose an extension of fields $k \subset k'$ and a morphism $w : \mathrm{Spec}(k') \rightarrow W$ such that $\mathrm{Spec}(k') \rightarrow W \rightarrow \mathcal{X}$ is 2-isomorphic to $\mathrm{Spec}(k') \rightarrow \mathrm{Spec}(k) \rightarrow \mathcal{X}$. This is possible as $W \rightarrow \mathcal{X}$ is surjective. Consider the commutative diagram

$$\begin{array}{ccccc} U & \xleftarrow{\mathrm{pr}_0} & U \times_{\mathcal{X}} W & \xleftarrow{p'} & F' \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{X} & \xleftarrow{\quad} & W & \xleftarrow{\quad} & \mathrm{Spec}(k') \end{array}$$

both of whose squares are cartesian. By our choice of w we see that $F' = F \times_{\mathrm{Spec}(k)} \mathrm{Spec}(k')$. Thus $F' \rightarrow F$ is surjective and we can choose a point $z' \in |F'|$ mapping to z . Since $F' \rightarrow F$ is flat we see that $\mathcal{O}_{F, \bar{z}} \rightarrow \mathcal{O}_{F', \bar{z}'}$ is flat, see Morphisms of Spaces, Lemma 49.28.8. Hence f_1, \dots, f_r map to a regular sequence in $\mathcal{O}_{F', \bar{z}'}$, see Algebra, Lemma 10.67.7. Note that $U \times_{\mathcal{X}} W \rightarrow W$ is a morphism of algebraic spaces which is flat and locally of finite presentation. Hence by More on Morphisms of Spaces, Lemma 58.22.1 we see that there exists an open subspace U' of $U \times_{\mathcal{X}} W$ containing $p(z')$ such that the intersection $U' \cap (V(f_1, \dots, f_r) \times_{\mathcal{X}} W)$ is flat and locally of finite presentation over W . Note that $\mathrm{pr}_0(U')$ is an open subspace of U containing $p(z)$ as pr_0 is smooth hence open. Now we see that $U' \cap (V(f_1, \dots, f_r) \times_{\mathcal{X}} W) \rightarrow \mathcal{X}$ is flat and locally of finite presentation as the composition

$$U' \cap (V(f_1, \dots, f_r) \times_{\mathcal{X}} W) \rightarrow W \rightarrow \mathcal{X}.$$

Hence Properties of Stacks, Lemma 77.3.5 implies $\mathrm{pr}_0(U') \cap V(f_1, \dots, f_r) \rightarrow \mathcal{X}$ is flat and locally of finite presentation as desired. \square

Lemma 78.15.2. *Let \mathcal{X} be an algebraic stack. Consider a cartesian diagram*

$$\begin{array}{ccc} U & \xleftarrow{p} & F \\ \downarrow & & \downarrow \\ \mathcal{X} & \xleftarrow{\quad} & \mathrm{Spec}(k) \end{array}$$

where U is an algebraic space, k is a field, and $U \rightarrow \mathcal{X}$ is locally of finite type. Let $z \in |F|$ be such that $\dim_z(F) = 0$. Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$U \longrightarrow \mathcal{X}$$

is locally quasi-finite.

Proof. Since $f : U \rightarrow \mathcal{X}$ is locally of finite type there exists a maximal open $W(f) \subset U$ such that the restriction $f|_{W(f)} : W(f) \rightarrow \mathcal{X}$ is locally quasi-finite, see Properties of Stacks, Remark 77.9.19 (2). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \rightarrow \text{Spec}(k)$ is locally quasi-finite at z . This follows immediately from Morphisms of Spaces, Lemma 49.32.6. \square

A quasi-DM stack has a locally quasi-finite “covering” by a scheme.

Theorem 78.15.3. *Let \mathcal{X} be an algebraic stack. The following are equivalent*

- (1) \mathcal{X} is quasi-DM, and
- (2) there exists a scheme W and a surjective, flat, locally finitely presented, locally quasi-finite morphism $W \rightarrow \mathcal{X}$.

Proof. The implication (2) \Rightarrow (1) is Lemma 78.4.14. Assume (1). Let $x \in |\mathcal{X}|$ be a finite type point. We will produce a scheme over \mathcal{X} which “works” in a neighbourhood of x . At the end of the proof we will take the disjoint union of all of these to conclude.

Let U be an affine scheme, $U \rightarrow \mathcal{X}$ a smooth morphism, and $u \in U$ a closed point which maps to x , see Lemma 78.14.1. Denote $u = \text{Spec}(\kappa(u))$ as usual. Consider the following commutative diagram

$$\begin{array}{ccc} u & \longleftarrow & R \\ \downarrow & & \downarrow \\ U & \xleftarrow{p} & F \\ \downarrow & & \downarrow \\ \mathcal{X} & \longleftarrow & u \end{array}$$

with both squares fibre product squares, in particular $R = u \times_{\mathcal{X}} u$. In the proof of Lemma 78.14.7 we have seen that (u, R, s, t, c) is a groupoid in algebraic spaces with s, t locally of finite type. Let $G \rightarrow u$ be the stabilizer group algebraic space (see Groupoids in Spaces, Definition 60.15.2). Note that

$$G = R \times_{(u \times u)} u = (u \times_{\mathcal{X}} u) \times_{(u \times u)} u = \mathcal{X} \times_{\mathcal{X} \times \mathcal{X}} u.$$

As \mathcal{X} is quasi-DM we see that G is locally quasi-finite over u . By More on Groupoids in Spaces, Lemma 61.7.11 we have $\dim(G) = 0$.

Let $e : u \rightarrow R$ be the identity of the groupoid. Thus both compositions $u \rightarrow R \rightarrow u$ are equal to the identity morphism of u . Note that $R \subset F$ is a closed subspace as $u \subset U$ is a closed subscheme. Hence we can also think of e as a point of F . Consider the maps of étale local rings

$$\mathcal{O}_{U,u} \xrightarrow{p^\#} \mathcal{O}_{F,\bar{e}} \longrightarrow \mathcal{O}_{R,\bar{e}}$$

Note that $\mathcal{O}_{R,\bar{e}}$ has dimension 0 by the result of the first paragraph. On the other hand, the kernel of the second arrow is $p^\sharp(\mathfrak{m}_u)\mathcal{O}_{F,\bar{e}}$ as R is cut out in F by \mathfrak{m}_u . Thus we see that

$$\mathfrak{m}_{\bar{z}} = \sqrt{p^\sharp(\mathfrak{m}_u)\mathcal{O}_{F,\bar{e}}}$$

On the other hand, as the morphism $U \rightarrow \mathcal{X}$ is smooth we see that $F \rightarrow u$ is a smooth morphism of algebraic spaces. This means that F is a regular algebraic space (Spaces over Fields, Lemma 54.9.1). Hence $\mathcal{O}_{F,\bar{e}}$ is a regular local ring (Properties of Spaces, Lemma 48.23.1). Note that a regular local ring is Cohen-Macaulay (Algebra, Lemma 10.102.3). Let $d = \dim(\mathcal{O}_{F,\bar{e}})$. By Algebra, Lemma 10.100.10 we can find $f_1, \dots, f_d \in \mathcal{O}_{U,u}$ whose images $\varphi(f_1), \dots, \varphi(f_d)$ form a regular sequence in $\mathcal{O}_{F,\bar{z}}$. By Lemma 78.15.1 after shrinking U we may assume that $Z = V(f_1, \dots, f_d) \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Note that by construction $F_Z = Z \times_{\mathcal{X}} u$ is a closed subspace of $F = U \times_{\mathcal{X}} u$, that e is a point of this closed subspace, and that

$$\dim(\mathcal{O}_{F_Z,\bar{e}}) = 0.$$

By Morphisms of Spaces, Lemma 49.32.1 it follows that $\dim_e(F_Z) = 0$ because the transcendence degree of e relative to u is zero. Hence it follows from Lemma 78.15.2 that after possibly shrinking U the morphism $Z \rightarrow \mathcal{X}$ is locally quasi-finite.

We conclude that for every finite type point x of \mathcal{X} there exists a locally quasi-finite, flat, locally finitely presented morphism $f_x : Z_x \rightarrow \mathcal{X}$ with x in the image of $|f_x|$. Set $W = \coprod_x Z_x$ and $f = \coprod f_x$. Then f is flat, locally of finite presentation, and locally quasi-finite. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 77.4.7. By construction the image contains all finite type points of \mathcal{X} , hence f is surjective by Lemma 78.14.6 (and Properties of Stacks, Lemma 77.4.4). \square

Lemma 78.15.4. *Let \mathcal{Z} be a DM, locally Noetherian, reduced algebraic stack with $|\mathcal{Z}|$ a singleton. Then there exists a field k and a surjective étale morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$.*

Proof. By Properties of Stacks, Lemma 77.11.3 there exists a field k and a surjective, flat, locally finitely presented morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$. Set $U = \mathrm{Spec}(k)$ and $R = U \times_{\mathcal{Z}} U$ so we obtain a groupoid in algebraic spaces (U, R, s, t, c) , see Algebraic Stacks, Lemma 71.9.2. Note that by Algebraic Stacks, Remark 71.16.3 we have an equivalence

$$f_{\mathrm{can}} : [U/R] \longrightarrow \mathcal{Z}$$

The projections $s, t : R \rightarrow U$ are locally of finite presentation. As \mathcal{Z} is DM we see that the stabilizer group algebraic space

$$G = U \times_{U \times U} R = U \times_{U \times U} (U \times_{\mathcal{Z}} U) = U \times_{\mathcal{X} \times_{\mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X}} \mathcal{X}$$

is unramified over U . In particular $\dim(G) = 0$ and by More on Groupoids in Spaces, Lemma 61.7.11 we have $\dim(R) = 0$. This implies that R is a scheme, see Spaces over Fields, Lemma 54.7.1. By Varieties, Lemma 32.13.2 we see that R (and also G) is the disjoint union of spectra of Artinian local rings finite over k via either s or t . Let $P = \mathrm{Spec}(A) \subset R$ be the open and closed subscheme whose underlying point is the identity e of the groupoid scheme (U, R, s, t, c) . As $s \circ e = t \circ e = \mathrm{id}_{\mathrm{Spec}(k)}$ we see that A is an Artinian local ring whose residue field is identified with k via

either $s^\sharp : k \rightarrow A$ or $t^\sharp : k \rightarrow A$. Note that $s, t : \text{Spec}(A) \rightarrow \text{Spec}(k)$ are finite (by the lemma referenced above). Since $G \rightarrow \text{Spec}(k)$ is unramified we see that

$$G \cap P = P \times_{U \times U} U = \text{Spec}(A \otimes_{k \otimes k} k)$$

is unramified over k . On the other hand $A \otimes_{k \otimes k} k$ is local as a quotient of A and surjects onto k . We conclude that $A \otimes_{k \otimes k} k = k$. It follows that $P \rightarrow U \times U$ is universally injective (as P has only one point with residue field k , unramified (by the computation of the fibre over the unique image point above), and of finite type (because s, t are) hence a monomorphism (see Étale Morphisms, Lemma 40.7.1). Thus $s|_P, t|_P : P \rightarrow U$ define a finite flat equivalence relation. Thus we may apply Groupoids, Proposition 38.21.8 to conclude that U/P exists and is a scheme \bar{U} . Moreover, $U \rightarrow \bar{U}$ is finite locally free and $P = U \times_{\bar{U}} U$. In fact $\bar{U} = \text{Spec}(k_0)$ where $k_0 \subset k$ is the ring of R -invariant functions. As k is a field it follows from the definition Groupoids, Equation (38.21.0.1) that k_0 is a field.

We claim that

$$(78.15.4.1) \quad \text{Spec}(k_0) = \bar{U} = U/P \rightarrow [U/R] = \mathcal{Z}$$

is the desired surjective étale morphism. It follows from Properties of Stacks, Lemma 77.11.1 that this morphism is surjective. Thus it suffices to show that (78.15.4.1) is étale⁶. Instead of proving the étaleness directly we first apply Bootstrap, Lemma 62.9.1 to see that there exists a groupoid scheme $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ such that (U, R, s, t, c) is the restriction of $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ via the quotient morphism $U \rightarrow \bar{U}$. (We verified all the hypothesis of the lemma above except for the assertion that $j : R \rightarrow U \times U$ is separated and locally quasi-finite which follows from the fact that R is a separated scheme locally quasi-finite over k .) Since $U \rightarrow \bar{U}$ is finite locally free we see that $[U/R] \rightarrow [\bar{U}/\bar{R}]$ is an equivalence, see Groupoids in Spaces, Lemma 60.24.2.

Note that s, t are the base changes of the morphisms \bar{s}, \bar{t} by $U \rightarrow \bar{U}$. As $\{U \rightarrow \bar{U}\}$ is an fppf covering we conclude \bar{s}, \bar{t} are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 34.19.13, 34.19.9, and 34.19.22. Consider the commutative diagram

$$\begin{array}{ccccc} U \times_{\bar{U}} U & \xlongequal{\quad} & P & \longrightarrow & R \\ & \searrow & \downarrow & & \downarrow \\ & & \bar{U} & \xrightarrow{\bar{c}} & \bar{R} \end{array}$$

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since P is open in R we conclude that \bar{c} is an open immersion by Descent, Lemma 34.19.14.

But of course, if \bar{c} is an open immersion and \bar{s}, \bar{t} are flat and locally of finite presentation then the morphisms \bar{t}, \bar{s} are étale. For example you can see this by applying More on Groupoids, Lemma 39.4.1 which shows that $\Omega_{\bar{R}/\bar{U}} = 0$ implies that $\bar{s}, \bar{t} : \bar{R} \rightarrow \bar{U}$ is unramified (see Morphisms, Lemma 28.36.2), which in turn implies that \bar{s}, \bar{t} are étale (see Morphisms, Lemma 28.37.16). Hence $\mathcal{Z} = [\bar{U}/\bar{R}]$ is

⁶We urge the reader to find his/her own proof of this fact. In fact the argument has a lot in common with the final argument of the proof of Bootstrap, Theorem 62.10.1 hence probably should be isolated into its own lemma somewhere.

an étale presentation of the algebraic stack \mathcal{Z} and we conclude that $\overline{U} \rightarrow \mathcal{Z}$ is étale by Properties of Stacks, Lemma 77.3.3. \square

Lemma 78.15.5. *Let \mathcal{X} be an algebraic stack. Consider a cartesian diagram*

$$\begin{array}{ccc} U & \xleftarrow{p} & F \\ \downarrow & & \downarrow \\ \mathcal{X} & \xleftarrow{\quad} & \mathrm{Spec}(k) \end{array}$$

where U is an algebraic space, k is a field, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Let $z \in |F|$ be such that $F \rightarrow \mathrm{Spec}(k)$ is unramified at z . Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$U \rightarrow \mathcal{X}$$

is étale.

Proof. Since $f : U \rightarrow \mathcal{X}$ is flat and locally of finite presentation there exists a maximal open $W(f) \subset U$ such that the restriction $f|_{W(f)} : W(f) \rightarrow \mathcal{X}$ is étale, see Properties of Stacks, Remark 77.9.19 (5). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \rightarrow \mathrm{Spec}(k)$ is étale at z . Since it is flat and locally of finite presentation as a base change of $U \rightarrow \mathcal{X}$ and since $F \rightarrow \mathrm{Spec}(k)$ is unramified at z by assumption, this follows from Morphisms of Spaces, Lemma 49.36.12. \square

A DM stack is a Deligne-Mumford stack.

Theorem 78.15.6. *Let \mathcal{X} be an algebraic stack. The following are equivalent*

- (1) \mathcal{X} is DM,
- (2) \mathcal{X} is Deligne-Mumford, and
- (3) there exists a scheme W and a surjective étale morphism $W \rightarrow \mathcal{X}$.

Proof. Recall that (3) is the definition of (2), see Algebraic Stacks, Definition 71.12.2. The implication (3) \Rightarrow (1) is Lemma 78.4.14. Assume (1). Let $x \in |\mathcal{X}|$ be a finite type point. We will produce a scheme over \mathcal{X} which “works” in a neighbourhood of x . At the end of the proof we will take the disjoint union of all of these to conclude.

By Lemma 78.14.7 the residual gerbe \mathcal{Z}_x of \mathcal{X} at x exists and $\mathcal{Z}_x \rightarrow \mathcal{X}$ is locally of finite type. By Lemma 78.4.16 the algebraic stack \mathcal{Z}_x is DM. By Lemma 78.15.4 there exists a field k and a surjective étale morphism $z : \mathrm{Spec}(k) \rightarrow \mathcal{Z}_x$. In particular the composition $x : \mathrm{Spec}(k) \rightarrow \mathcal{X}$ is locally of finite type (by Morphisms of Spaces, Lemmas 49.23.2 and 49.36.9).

Pick a scheme U and a smooth morphism $U \rightarrow \mathcal{X}$ such that x is in the image of $|U| \rightarrow |\mathcal{X}|$. Consider the following fibre square

$$\begin{array}{ccc} U & \xleftarrow{\quad} & F \\ \downarrow & & \downarrow \\ \mathcal{X} & \xleftarrow{x} & \mathrm{Spec}(k) \end{array}$$

in other words $F = U \times_{\mathcal{X}, x} \text{Spec}(k)$. By Properties of Stacks, Lemma 77.4.3 we see that F is nonempty. As $\mathcal{Z}_x \rightarrow \mathcal{X}$ is a monomorphism we have

$$\text{Spec}(k) \times_{z, \mathcal{Z}_x, z} \text{Spec}(k) = \text{Spec}(k) \times_{x, \mathcal{X}, x} \text{Spec}(k)$$

with étale projection maps to $\text{Spec}(k)$ by construction of z . Since

$$F \times_U F = (\text{Spec}(k) \times_{\mathcal{X}} \text{Spec}(k)) \times_{\text{Spec}(k)} F$$

we see that the projections maps $F \times_U F \rightarrow F$ are étale as well. It follows that $\Delta_{F/U} : F \rightarrow F \times_U F$ is étale (see Morphisms of Spaces, Lemma 49.36.11). By Morphisms of Spaces, Lemma 49.45.2 this implies that $\Delta_{F/U}$ is an open immersion, which finally implies by Morphisms of Spaces, Lemma 49.35.9 that $F \rightarrow U$ is unramified.

Pick a nonempty affine scheme V and an étale morphism $V \rightarrow F$. (This could be avoided by working directly with F , but it seems easier to explain what's going on by doing so.) Picture

$$\begin{array}{ccccc} U & \longleftarrow & F & \longleftarrow & V \\ \downarrow & & \downarrow & \swarrow & \\ \mathcal{X} & \xleftarrow{x} & \text{Spec}(k) & & \end{array}$$

Then $V \rightarrow \text{Spec}(k)$ is a smooth morphism of schemes and $V \rightarrow U$ is an unramified morphism of schemes (see Morphisms of Spaces, Lemmas 49.34.2 and 49.35.3). Pick a closed point $v \in V$ with $k \subset \kappa(v)$ finite separable, see Varieties, Lemma 32.15.6. Let $u \in U$ be the image point. The local ring $\mathcal{O}_{V,v}$ is regular (see Varieties, Lemma 32.15.3) and the local ring homomorphism

$$\varphi : \mathcal{O}_{U,u} \longrightarrow \mathcal{O}_{V,v}$$

coming from the morphism $V \rightarrow U$ is such that $\varphi(\mathfrak{m}_u)\mathcal{O}_{V,v} = \mathfrak{m}_v$, see Morphisms, Lemma 28.36.14. Hence we can find $f_1, \dots, f_d \in \mathcal{O}_{U,u}$ such that the images $\varphi(f_1), \dots, \varphi(f_d) \in \mathcal{O}_{V,v}$ form a basis for $\mathfrak{m}_v/\mathfrak{m}_v^2$ over $\kappa(v)$. Since $\mathcal{O}_{V,v}$ is a regular local ring this implies that $\varphi(f_1), \dots, \varphi(f_d)$ form a regular sequence in $\mathcal{O}_{V,v}$ (see Algebra, Lemma 10.102.3). After replacing U by an open neighbourhood of u we may assume $f_1, \dots, f_d \in \Gamma(U, \mathcal{O}_U)$. After replacing U by a possibly even smaller open neighbourhood of u we may assume that $V(f_1, \dots, f_d) \rightarrow \mathcal{X}$ is flat and locally of finite presentation, see Lemma 78.15.1. By construction

$$V(f_1, \dots, f_d) \times_{\mathcal{X}} \text{Spec}(k) \longleftarrow V(f_1, \dots, f_d) \times_{\mathcal{X}} V$$

is étale and $V(f_1, \dots, f_d) \times_{\mathcal{X}} V$ is the closed subscheme $T \subset V$ cut out by $f_1|_V, \dots, f_d|_V$. Hence by construction $v \in T$ and

$$\mathcal{O}_{T,v} = \mathcal{O}_{V,v}/(\varphi(f_1), \dots, \varphi(f_d)) = \kappa(v)$$

a finite separable extension of k . It follows that $T \rightarrow \text{Spec}(k)$ is unramified at v , see Morphisms, Lemma 28.36.14. By definition of an unramified morphism of algebraic spaces this means that $V(f_1, \dots, f_d) \times_{\mathcal{X}} \text{Spec}(k) \rightarrow \text{Spec}(k)$ is unramified at the image of v in $V(f_1, \dots, f_d) \times_{\mathcal{X}} \text{Spec}(k)$. Applying Lemma 78.15.5 we see that on shrinking U to yet another open neighbourhood of u the morphism $V(f_1, \dots, f_d) \rightarrow \mathcal{X}$ is étale.

We conclude that for every finite type point x of \mathcal{X} there exists an étale morphism $f_x : W_x \rightarrow \mathcal{X}$ with x in the image of $|f_x|$. Set $W = \coprod_x W_x$ and $f = \coprod f_x$. Then

f is étale. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 77.4.7. By construction the image contains all finite type points of \mathcal{X} , hence f is surjective by Lemma 78.14.6 (and Properties of Stacks, Lemma 77.4.4). \square

78.16. Quasi-finite morphisms

The property “locally quasi-finite” of morphisms of algebraic spaces is not smooth local on the source-and-target so we cannot use the material in Section 78.12 to define locally quasi-finite morphisms of algebraic stacks. We do already know what it means for a morphism of algebraic stacks representable by algebraic spaces to be locally quasi-finite, see Properties of Stacks, Section 77.3. To find a condition suitable for general morphisms we make the following observation.

Lemma 78.16.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Assume f is representable by algebraic spaces. The following are equivalent*

- (1) *f is locally quasi-finite, and*
- (2) *f is locally of finite type and for every morphism $\text{Spec}(k) \rightarrow \mathcal{Y}$ where k is a field the space $|\text{Spec}(k) \times_{\mathcal{Y}} \mathcal{X}|$ is discrete.*

Proof. Assume (1). In this case the morphism of algebraic spaces $\mathcal{X}_k \rightarrow \text{Spec}(k)$ is locally quasi-finite as a base change of f . Hence $|\mathcal{X}_k|$ is discrete by Morphisms of Spaces, Lemma 49.26.5. Conversely, assume (2). Pick a surjective smooth morphism $V \rightarrow \mathcal{Y}$ where V is a scheme. It suffices to show that the morphism of algebraic spaces $V \times_{\mathcal{Y}} \mathcal{X} \rightarrow V$ is locally quasi-finite, see Properties of Stacks, Lemma 77.3.3. The morphism $V \times_{\mathcal{Y}} \mathcal{X} \rightarrow V$ is locally of finite type by assumption. For any morphism $\text{Spec}(k) \rightarrow V$ where k is a field

$$\text{Spec}(k) \times_V (V \times_{\mathcal{Y}} \mathcal{X}) = \text{Spec}(k) \times_{\mathcal{Y}} \mathcal{X}$$

has a discrete space of points by assumption. Hence we conclude that $V \times_{\mathcal{Y}} \mathcal{X} \rightarrow V$ is locally quasi-finite by Morphisms of Spaces, Lemma 49.26.5. \square

A morphism of algebraic stacks which is representable by algebraic spaces is quasi-DM, see Lemma 78.4.3. Combined with the lemma above we see that the following definition does not conflict with all of the already existing notion in the case of morphisms representable by algebraic spaces.

Definition 78.16.2. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *locally quasi-finite* if f is quasi-DM, locally of finite type, and for every morphism $\text{Spec}(k) \rightarrow \mathcal{Y}$ where k is a field the space $|\mathcal{X}_k|$ is discrete.

The condition that f be quasi-DM is natural. For example, let k be a field and consider the morphism $\pi : [\text{Spec}(k)/\mathbf{G}_m] \rightarrow \text{Spec}(k)$ which has singleton fibres and is locally of finite type. As we will see later this morphism is smooth of relative dimension -1 , and we’d like our locally quasi-finite morphisms to have relative dimension 0. Also, note that the section $\text{Spec}(k) \rightarrow [\text{Spec}(k)/\mathbf{G}_m]$ does not have discrete fibres, hence is not locally quasi-finite, and we’d like to have the following permanence property for locally quasi-finite morphisms: If $f : \mathcal{X} \rightarrow \mathcal{X}'$ is a morphism of algebraic stacks locally quasi-finite over the algebraic stack \mathcal{Y} , then f is locally quasi-finite (in fact something a bit stronger holds, see Lemma 78.16.8).

Another justification for the definition above is Lemma 78.16.7 below which characterizes being locally quasi-finite in terms of the existence of suitable “presentations” or “coverings” of \mathcal{X} and \mathcal{Y} .

Lemma 78.16.3. *A base change of a locally quasi-finite morphism is locally quasi-finite.*

Proof. We have seen this for quasi-DM morphisms in Lemma 78.4.4 and for locally finite type morphisms in Lemma 78.13.3. It is immediate that the condition on fibres is inherited by a base change. \square

Lemma 78.16.4. *Let $\mathcal{X} \rightarrow \mathrm{Spec}(k)$ be a locally quasi-finite morphism where \mathcal{X} is an algebraic stack and k is a field. Let $f : V \rightarrow \mathcal{X}$ be a locally quasi-finite morphism where V is a scheme. Then $V \rightarrow \mathrm{Spec}(k)$ is locally quasi-finite.*

Proof. By Lemma 78.13.2 we see that $V \rightarrow \mathrm{Spec}(k)$ is locally of finite type. Assume, to get a contradiction, that $V \rightarrow \mathrm{Spec}(k)$ is not locally quasi-finite. Then there exists a nontrivial specialization $v \rightsquigarrow v'$ of points of V , see Morphisms, Lemma 28.21.6. In particular $\mathrm{trdeg}_k(\kappa(v)) > \mathrm{trdeg}_k(\kappa(v'))$, see Morphisms, Lemma 28.29.6. Because $|\mathcal{X}|$ is discrete we see that $|f|(v) = |f|(v')$. Consider $R = V \times_{\mathcal{X}} V$. Then R is an algebraic space and the projections $s, t : R \rightarrow V$ are locally quasi-finite as base changes of $V \rightarrow \mathcal{X}$ (which is representable by algebraic spaces so this follows from the discussion in Properties of Stacks, Section 77.3). By Properties of Stacks, Lemma 77.4.3 we see that there exists an $r \in |R|$ such that $s(r) = v$ and $t(r) = v'$. By Morphisms of Spaces, Lemma 49.31.3 we see that the transcendence degree of v/k is equal to the transcendence degree of r/k is equal to the transcendence degree of v'/k . This contradiction proves the lemma. \square

Lemma 78.16.5. *A composition of a locally quasi-finite morphisms is locally quasi-finite.*

Proof. We have seen this for quasi-DM morphisms in Lemma 78.4.10 and for locally finite type morphisms in Lemma 78.13.2. Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be locally quasi-finite. Let k be a field and let $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ be a morphism. It suffices to show that $|\mathcal{X}_k|$ is discrete. By Lemma 78.16.3 the morphisms $\mathcal{X}_k \rightarrow \mathcal{Y}_k$ and $\mathcal{Y}_k \rightarrow \mathrm{Spec}(k)$ are locally quasi-finite. In particular we see that \mathcal{Y}_k is a quasi-DM algebraic stack, see Lemma 78.4.13. By Theorem 78.15.3 we can find a scheme V and a surjective, flat, locally finitely presented, locally quasi-finite morphism $V \rightarrow \mathcal{Y}_k$. By Lemma 78.16.4 we see that V is locally quasi-finite over k , in particular $|V|$ is discrete. The morphism $V \times_{\mathcal{Y}_k} \mathcal{X}_k \rightarrow \mathcal{X}_k$ is surjective, flat, and locally of finite presentation hence $|V \times_{\mathcal{Y}_k} \mathcal{X}_k| \rightarrow |\mathcal{X}_k|$ is surjective and open. Thus it suffices to show that $|V \times_{\mathcal{Y}_k} \mathcal{X}_k|$ is discrete. Note that V is a disjoint union of spectra of Artinian local k -algebras A_i with residue fields k_i , see Varieties, Lemma 32.13.2. Thus it suffices to show that each

$$|\mathrm{Spec}(A_i) \times_{\mathcal{Y}_k} \mathcal{X}_k| = |\mathrm{Spec}(k_i) \times_{\mathcal{Y}_k} \mathcal{X}_k| = |\mathrm{Spec}(k_i) \times_{\mathcal{Y}} \mathcal{X}|$$

is discrete, which follows from the assumption that $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite. \square

Before we characterize locally quasi-finite morphisms in terms of coverings we do it for quasi-DM morphisms.

Lemma 78.16.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

- (1) *f is quasi-DM,*
- (2) *for any morphism $V \rightarrow \mathcal{Y}$ with V an algebraic space there exists a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space, and*

- (3) *there exist algebraic spaces U, V and a morphism $V \rightarrow \mathcal{Y}$ which is surjective, flat, and locally of finite presentation, and a morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ which is surjective, flat, locally of finite presentation, and locally quasi-finite.*

Proof. The implication (2) \Rightarrow (3) is immediate.

Assume (1) and let $V \rightarrow \mathcal{Y}$ be as in (2). Then $\mathcal{X} \times_{\mathcal{Y}} V \rightarrow V$ is quasi-DM, see Lemma 78.4.4. By Lemma 78.4.3 the algebraic space V is DM, hence quasi-DM. Thus $\mathcal{X} \times_{\mathcal{Y}} V$ is quasi-DM by Lemma 78.4.11. Hence we may apply Theorem 78.15.3 to get the morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ as in (2).

Assume (3). Let $V \rightarrow \mathcal{Y}$ and $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ be as in (3). To prove that f is quasi-DM it suffices to show that $\mathcal{X} \times_{\mathcal{Y}} V \rightarrow V$ is quasi-DM, see Lemma 78.4.5. By Lemma 78.4.14 we see that $\mathcal{X} \times_{\mathcal{Y}} V$ is quasi-DM. Hence $\mathcal{X} \times_{\mathcal{Y}} V \rightarrow V$ is quasi-DM by Lemma 78.4.13 and (1) holds. This finishes the proof of the lemma. \square

Lemma 78.16.7. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

- (1) *f is locally quasi-finite,*
- (2) *f is quasi-DM and for any morphism $V \rightarrow \mathcal{Y}$ with V an algebraic space and any locally quasi-finite morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space the morphism $U \rightarrow V$ is locally quasi-finite,*
- (3) *for any morphism $V \rightarrow \mathcal{Y}$ from an algebraic space V there exists a surjective, flat, locally finitely presented, and locally quasi-finite morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space such that $U \rightarrow V$ is locally quasi-finite,*
- (4) *there exists algebraic spaces U, V , a surjective, flat, and locally of finite presentation morphism $V \rightarrow \mathcal{Y}$, and a morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ which is surjective, flat, locally of finite presentation, and locally quasi-finite such that $U \rightarrow V$ is locally quasi-finite.*

Proof. Assume (1). Then f is quasi-DM by assumption. Let $V \rightarrow \mathcal{Y}$ and $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ be as in (2). By Lemma 78.16.5 the composition $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V \rightarrow V$ is locally quasi-finite. Thus (1) implies (2).

Assume (2). Let $V \rightarrow \mathcal{Y}$ be as in (3). By Lemma 78.16.6 we can find an algebraic space U and a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. By (2) the composition $U \rightarrow V$ is locally quasi-finite. Thus (2) implies (3).

It is immediate that (3) implies (4).

Assume (4). We will prove (1) holds, which finishes the proof. By Lemma 78.16.6 we see that f is quasi-DM. To prove that f is locally of finite type it suffices to prove that $g : \mathcal{X} \times_{\mathcal{Y}} V \rightarrow V$ is locally of finite type, see Lemma 78.13.6. Then it suffices to check that g precomposed with $h : U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$ is locally of finite type, see Lemma 78.13.7. Since $g \circ h : U \rightarrow V$ was assumed to be locally quasi-finite this holds, hence f is locally of finite type. Finally, let k be a field and let $\text{Spec}(k) \rightarrow \mathcal{Y}$ be a morphism. Then $V \times_{\mathcal{Y}} \text{Spec}(k)$ is a nonempty algebraic space which is locally of finite presentation over k . Hence we can find a finite extension $k \subset k'$ and a

morphism $\mathrm{Spec}(k') \rightarrow V$ such that

$$\begin{array}{ccc} \mathrm{Spec}(k') & \longrightarrow & V \\ \downarrow & & \downarrow \\ \mathrm{Spec}(k) & \longrightarrow & \mathcal{Y} \end{array}$$

commutes (details omitted). Then $\mathcal{X}_{k'} \rightarrow \mathcal{X}_k$ is representable (by schemes), surjective, and finite locally free. In particular $|\mathcal{X}_{k'}| \rightarrow |\mathcal{X}_k|$ is surjective and open. Thus it suffices to prove that $|\mathcal{X}_{k'}|$ is discrete. Since

$$U \times_V \mathrm{Spec}(k') = U \times_{\mathcal{X} \times_{\mathcal{Y}} V} \mathcal{X}_{k'}$$

we see that $U \times_V \mathrm{Spec}(k') \rightarrow \mathcal{X}_{k'}$ is surjective, flat, and locally of finite presentation (as a base change of $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$). Hence $|U \times_V \mathrm{Spec}(k')| \rightarrow |\mathcal{X}_{k'}|$ is surjective and open. Thus it suffices to show that $|U \times_V \mathrm{Spec}(k')|$ is discrete. This follows from the fact that $U \rightarrow V$ is locally quasi-finite (either by our definition above or from the original definition for morphisms of algebraic spaces, via Morphisms of Spaces, Lemma 49.26.5). \square

Lemma 78.16.8. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. Assume that $\mathcal{X} \rightarrow \mathcal{Z}$ is locally quasi-finite and $\mathcal{Y} \rightarrow \mathcal{Z}$ is quasi-DM. Then $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite.*

Proof. Write $\mathcal{X} \rightarrow \mathcal{Y}$ as the composition

$$\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{Y}$$

The second arrow is locally quasi-finite as a base change of $\mathcal{X} \rightarrow \mathcal{Z}$, see Lemma 78.16.3. The first arrow is locally quasi-finite by Lemma 78.4.8 as $\mathcal{Y} \rightarrow \mathcal{Z}$ is quasi-DM. Hence $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite by Lemma 78.16.5. \square

78.17. Flat morphisms

The property “being flat” of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 56.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 49.28.4 and Descent on Spaces, Lemma 56.10.11. Hence, by Lemma 78.12.1 above, we may define what it means for a morphism of algebraic spaces to be flat as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 77.3 when the morphism is representable by algebraic spaces.

Definition 78.17.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *flat* if the equivalent conditions of Lemma 78.12.1 hold with $\mathcal{P} = \text{flat}$.

Lemma 78.17.2. *The composition of flat morphisms is flat.*

Proof. Combine Remark 78.12.3 with Morphisms of Spaces, Lemma 49.28.3. \square

Lemma 78.17.3. *A base change of a flat morphism is flat.*

Proof. Combine Remark 78.12.4 with Morphisms of Spaces, Lemma 49.28.4. \square

Lemma 78.17.4. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a surjective flat morphism of algebraic stacks. If the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ is flat, then f is flat.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Then $W \rightarrow \mathcal{Z}$ is surjective and flat (Morphisms of Spaces, Lemma 49.34.7) hence $W \rightarrow \mathcal{Y}$ is surjective and flat (by Properties of Stacks, Lemma 77.5.2 and Lemma 78.17.2). Since the base change of $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ by $W \rightarrow \mathcal{Z}$ is a flat morphism (Lemma 78.17.3) we may replace \mathcal{Z} by W .

Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \rightarrow V$ is flat. Now we base change everything by $W \rightarrow \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$, $\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \rightarrow V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of flat morphisms of algebraic stacks and the assumption that $\mathcal{X}' \rightarrow \mathcal{Y}'$ is flat, we see that $U' \rightarrow V'$ is flat. Then, since $V' \rightarrow V$ is surjective as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is flat by Morphisms of Spaces, Lemma 49.29.3 (2) and we win. \square

Lemma 78.17.5. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is flat and $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective and flat, then $\mathcal{Y} \rightarrow \mathcal{Z}$ is flat.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow W \times_{\mathcal{Z}} \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. We know that $U \rightarrow V$ is flat and that $U \rightarrow W$ is flat. Also, as $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective we see that $U \rightarrow V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Morphisms of Spaces, Lemma 49.29.5. \square

78.18. Morphisms of finite presentation

The property “locally of finite presentation” of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 56.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 49.27.3 and Descent on Spaces, Lemma 56.10.8. Hence, by Lemma 78.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 77.3 when the morphism is representable by algebraic spaces.

Definition 78.18.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.

- (1) We say f *locally of finite presentation* if the equivalent conditions of Lemma 78.12.1 hold with $\mathcal{P} =$ locally of finite presentation.
- (2) We say f is *of finite presentation* if it is locally of finite presentation, quasi-compact, and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation.

Lemma 78.18.2. *The composition of finitely presented morphisms is of finite presentation. The same holds for morphisms which are locally of finite presentation.*

Proof. Combine Remark 78.12.3 with Morphisms of Spaces, Lemma 49.27.2. \square

Lemma 78.18.3. *A base change of a finitely presented morphism is of finite presentation. The same holds for morphisms which are locally of finite presentation.*

Proof. Combine Remark 78.12.4 with Morphisms of Spaces, Lemma 49.27.3. \square

Lemma 78.18.4. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Combine Remark 78.12.5 with Morphisms of Spaces, Lemma 49.27.5. \square

Lemma 78.18.5. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f$ is locally of finite presentation and g is locally of finite type, then f is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow \mathcal{X} \times_{\mathcal{Y}} V$. The lemma follows upon applying Morphisms of Spaces, Lemma 49.27.9 to the morphisms $U \rightarrow V \rightarrow W$. \square

Lemma 78.18.6. *An open immersion is locally of finite presentation.*

Proof. Follows from Morphisms of Spaces, Lemma 49.27.11. \square

Lemma 78.18.7. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a surjective, flat, locally finitely presented morphism of algebraic stacks. If the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite presentation, then f is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Then $W \rightarrow \mathcal{Z}$ is surjective, flat, and locally of finite presentation (Morphisms of Spaces, Lemmas 49.34.7 and 49.34.5) hence $W \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation (by Properties of Stacks, Lemma 77.5.2 and Lemmas 78.17.2 and 78.18.2). Since the base change of $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Z}$ by $W \rightarrow \mathcal{Z}$ is locally of finite presentation (Lemma 78.17.3) we may replace \mathcal{Z} by W .

Choose an algebraic space V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \rightarrow V$ is locally of finite presentation. Now we base change everything by $W \rightarrow \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$, $\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \rightarrow V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of locally finitely presented morphisms of algebraic stacks and the assumption that $\mathcal{X}' \rightarrow \mathcal{Y}'$ is locally of finite presentation, we see that $U' \rightarrow V'$ is locally of finite presentation. Then, since $V' \rightarrow V$ is surjective, flat, and locally of finite presentation as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is locally of finite presentation by Descent on Spaces, Lemma 56.10.8 and we win. \square

Lemma 78.18.8. *Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite presentation and $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation, then $\mathcal{Y} \rightarrow \mathcal{Z}$ is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \rightarrow W \times_{\mathcal{Z}} \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. We know that $U \rightarrow V$ is flat and locally of finite presentation and that $U \rightarrow W$ is locally of finite presentation. Also, as $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective we see that $U \rightarrow V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces

to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 56.14.1. \square

Lemma 78.18.9. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is surjective, flat, and locally of finite presentation. Then for every scheme U and object y of \mathcal{Y} over U there exists an fppf covering $\{U_i \rightarrow U\}$ and objects x_i of \mathcal{X} over U_i such that $f(x_i) \cong y|_{U_i}$ in \mathcal{Y}_{U_i} .*

Proof. We may think of y as a morphism $U \rightarrow \mathcal{Y}$. By Properties of Stacks, Lemma 77.5.3 and Lemmas 78.18.3 and 78.17.3 we see that $\mathcal{X} \times_{\mathcal{Y}} U \rightarrow U$ is surjective, flat, and locally of finite presentation. Let V be a scheme and let $V \rightarrow \mathcal{X} \times_{\mathcal{Y}} U$ smooth and surjective. Then $V \rightarrow \mathcal{X} \times_{\mathcal{Y}} U$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 49.34.7 and 49.34.5). Hence also $V \rightarrow U$ is surjective, flat, and locally of finite presentation, see Properties of Stacks, Lemma 77.5.2 and Lemmas 78.18.2, and 78.17.2. Hence $\{V \rightarrow U\}$ is the desired fppf covering and $x : V \rightarrow \mathcal{X}$ is the desired object. \square

Lemma 78.18.10. *Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$, $j \in J$ be a family of morphisms of algebraic stacks which are each flat and locally of finite presentation and which are jointly surjective, i.e., $|\mathcal{X}| = \bigcup |\mathcal{X}_j|$. Then for every scheme U and object x of \mathcal{X} over U there exists an fppf covering $\{U_i \rightarrow U\}_{i \in I}$, a map $a : I \rightarrow J$, and objects x_i of $\mathcal{X}_{a(i)}$ over U_i such that $f_{a(i)}(x_i) \cong x|_{U_i}$ in \mathcal{X}_{U_i} .*

Proof. Apply Lemma 78.18.9 to the morphism $\coprod_{j \in J} \mathcal{X}_j \rightarrow \mathcal{X}$. (There is a slight set theoretic issue here – due to our setup of things – which we ignore.) To finish, note that a morphism $x_i : U_i \rightarrow \coprod_{j \in J} \mathcal{X}_j$ is given by a disjoint union decomposition $U_i = \coprod U_{i,j}$ and morphisms $U_{i,j} \rightarrow \mathcal{X}_j$. Then the fppf covering $\{U_{i,j} \rightarrow U\}$ and the morphisms $U_{i,j} \rightarrow \mathcal{X}_j$ do the job. \square

Lemma 78.18.11. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be flat and locally of finite presentation. Then $|f| : |\mathcal{X}| \rightarrow |\mathcal{Y}|$ is open.*

Proof. Choose a scheme V and a smooth surjective morphism $V \rightarrow \mathcal{Y}$. Choose a scheme U and a smooth surjective morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. By assumption the morphism of schemes $U \rightarrow V$ is flat and locally of finite presentation. Hence $U \rightarrow V$ is open by Morphisms, Lemma 28.26.9. By construction of the topology on $|\mathcal{Y}|$ the map $|V| \rightarrow |\mathcal{Y}|$ is open. The map $|U| \rightarrow |\mathcal{X}|$ is surjective. The result follows from these facts by elementary topology. \square

78.19. Gerbes

An important type of algebraic stack are the stacks of the form $[B/G]$ where B is an algebraic space and G is a flat and locally finitely presented group algebraic space over B (acting trivially on B), see Criteria for Representability, Lemma 74.18.3. It turns out that an algebraic stack is a gerbe when it locally in the fppf topology is of this form, see Lemma 78.19.8. In this section we briefly discuss this notion and the corresponding relative notion.

Definition 78.19.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say \mathcal{X} is a *gerbe over \mathcal{Y}* if \mathcal{X} is a gerbe over \mathcal{Y} as stacks in groupoids over $(Sch/S)_{fppf}$, see Stacks, Definition 8.11.4. We say an algebraic stack \mathcal{X} is a *gerbe* if there exists a morphism $\mathcal{X} \rightarrow X$ where X is an algebraic space which turns \mathcal{X} into a gerbe over X .

The condition that \mathcal{X} be a gerbe over \mathcal{Y} is defined purely in terms of the topology and category theory underlying the given algebraic stacks; but as we will see later this condition has geometric consequences. For example it implies that $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation, see Lemma 78.19.7. The absolute notion is trickier to parse, because it may not be at first clear that X is well determined. Actually, it is.

Lemma 78.19.2. *Let \mathcal{X} be an algebraic stack. If \mathcal{X} is a gerbe, then the sheafification of the presheaf*

$$(Sch/S)_{fppf}^{opp} \rightarrow Sets, \quad U \mapsto \text{Ob}(\mathcal{X}_U)/\cong$$

is an algebraic space and \mathcal{X} is a gerbe over it.

Proof. (In this proof the abuse of language introduced in Section 78.2 really pays off.) Choose a morphism $\pi : \mathcal{X} \rightarrow X$ where X is an algebraic space which turns \mathcal{X} into a gerbe over X . It suffices to prove that X is the sheafification of the presheaf \mathcal{F} displayed in the lemma. It is clear that there is a map $c : \mathcal{F} \rightarrow X$. We will use Stacks, Lemma 8.11.3 properties (2)(a) and (2)(b) to see that the map $c^\# : \mathcal{F}^\# \rightarrow X$ is surjective and injective, hence an isomorphism, see Sites, Lemma 7.12.2. Surjective: Let T be a scheme and let $f : T \rightarrow X$. By property (2)(a) there exists an fppf covering $\{h_i : T_i \rightarrow T\}$ and morphisms $x_i : T_i \rightarrow \mathcal{X}$ such that $f \circ h_i$ corresponds to $\pi \circ x_i$. Hence we see that $f|_{T_i}$ is in the image of c . Injective: Let T be a scheme and let $x, y : T \rightarrow \mathcal{X}$ be morphisms such that $c \circ x = c \circ y$. By (2)(b) we can find a covering $\{T_i \rightarrow T\}$ and morphisms $x|_{T_i} \rightarrow y|_{T_i}$ in the fibre category \mathcal{X}_{T_i} . Hence the restrictions $x|_{T_i}, y|_{T_i}$ are equal in $\mathcal{F}(T_i)$. This proves that x, y give the same section of $\mathcal{F}^\#$ over T as desired. \square

Lemma 78.19.3. *Let*

$$\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

be a fibre product of algebraic stacks. If \mathcal{X} is a gerbe over \mathcal{Y} , then \mathcal{X}' is a gerbe over \mathcal{Y}' .

Proof. Immediate from the definitions and Stacks, Lemma 8.11.5. \square

Lemma 78.19.4. *Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If \mathcal{X} is a gerbe over \mathcal{Y} and \mathcal{Y} is a gerbe over \mathcal{Z} , then \mathcal{X} is a gerbe over \mathcal{Z} .*

Proof. Immediate from Stacks, Lemma 8.11.6. \square

Lemma 78.19.5. *Let*

$$\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow \\ \mathcal{Y}' & \longrightarrow & \mathcal{Y} \end{array}$$

be a fibre product of algebraic stacks. If $\mathcal{Y}' \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation and \mathcal{X}' is a gerbe over \mathcal{Y}' , then \mathcal{X} is a gerbe over \mathcal{Y} .

Proof. Follows immediately from Lemma 78.18.9 and Stacks, Lemma 8.11.7. \square

Lemma 78.19.6. *Let $\pi : \mathcal{X} \rightarrow U$ be a morphism from an algebraic stack to an algebraic space and let $x : U \rightarrow \mathcal{X}$ be a section of π . Set $G = \text{Isom}_{\mathcal{X}}(x, x)$, see Definition 78.5.3. If \mathcal{X} is a gerbe over U , then*

- (1) *there is a canonical equivalence of stacks in groupoids*

$$x_{\text{can}} : [U/G] \longrightarrow \mathcal{X}.$$

where $[U/G]$ is the quotient stack for the trivial action of G on U ,

- (2) *$G \rightarrow U$ is flat and locally of finite presentation, and*
 (3) *$U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation.*

Proof. Set $R = U \times_{x, \mathcal{X}, x} U$. The morphism $R \rightarrow U \times U$ factors through the diagonal $\Delta_U : U \rightarrow U \times U$ as it factors through $U \times_U U = U$. Hence $R = G$ because

$$\begin{aligned} G &= \text{Isom}_{\mathcal{X}}(x, x) \\ &= U \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}} \\ &= U \times_{x, \mathcal{X}} (\mathcal{X} \times_{\Delta, \mathcal{X} \times_S \mathcal{X}, \Delta} \mathcal{X}) \\ &= (U \times_{x, \mathcal{X}, x} U) \times_{U \times_U, \Delta_U} U \\ &= R \times_{U \times_U, \Delta_U} U \\ &= R \end{aligned}$$

for the fourth equality use Categories, Lemma 4.29.12. Let $t, s : R \rightarrow U$ be the projections. The composition law $c : R \times_{s, U, t} R \rightarrow R$ constructed on R in Algebraic Stacks, Lemma 71.16.1 agrees with the group law on G (proof omitted). Thus Algebraic Stacks, Lemma 71.16.1 shows we obtain a canonical fully faithful 1-morphism

$$x_{\text{can}} : [U/G] \longrightarrow \mathcal{X}$$

of stacks in groupoids over $(\text{Sch}/S)_{\text{fppf}}$. To see that it is an equivalence it suffices to show that it is essentially surjective. To do this it suffices to show that any object of \mathcal{X} over a scheme T comes fppf locally from x via a morphism $T \rightarrow U$, see Stacks, Lemma 8.4.8. However, this follows the condition that π turns \mathcal{X} into a gerbe over X , see property (2)(a) of Stacks, Lemma 8.11.3.

By Criteria for Representability, Lemma 74.18.3 we conclude that $G \rightarrow U$ is flat and locally of finite presentation. Finally, $U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation by Criteria for Representability, Lemma 74.17.1. \square

Lemma 78.19.7. *Let $\pi : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

- (1) *\mathcal{X} is a gerbe over \mathcal{Y} , and*
 (2) *there exists an algebraic space U , a group algebraic space G flat and locally of finite presentation over U , and a surjective, flat, and locally finitely presented morphism $U \rightarrow \mathcal{Y}$ such that $\mathcal{X} \times_{\mathcal{Y}} U \cong [U/G]$ over U .*

Proof. Assume (2). By Lemma 78.19.5 to prove (1) it suffices to show that $[U/G]$ is a gerbe over U . This is immediate from Groupoids in Spaces, Lemma 60.26.2.

Assume (1). Any base change of π is a gerbe, see Lemma 78.19.3. As a first step we choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Thus we may assume that $\pi : \mathcal{X} \rightarrow V$ is a gerbe over a scheme. This means that there exists an fppf covering $\{V_i \rightarrow V\}$ such that the fibre category \mathcal{X}_{V_i} is nonempty, see Stacks,

Lemma 8.11.3 (2)(a). Note that $U = \coprod V_i \rightarrow U$ is surjective, flat, and locally of finite presentation. Hence we may replace V by U and assume that $\pi : \mathcal{X} \rightarrow U$ is a gerbe over a scheme U and that there exists an object x of \mathcal{X} over U . By Lemma 78.19.6 we see that $\mathcal{X} = [U/G]$ over U for some flat and locally finitely presented group algebraic space G over U . \square

Lemma 78.19.8. *Let $\pi : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If \mathcal{X} is a gerbe over \mathcal{Y} , then π is surjective, flat, and locally of finite presentation.*

Proof. By Properties of Stacks, Lemma 77.5.4 and Lemmas 78.17.4 and 78.18.7 it suffices to prove to the lemma after replacing π by a base change with a surjective, flat, locally finitely presented morphism $\mathcal{Y}' \rightarrow \mathcal{Y}$. By Lemma 78.19.7 we may assume $\mathcal{Y} = U$ is an algebraic space and $\mathcal{X} = [U/G]$ over U . Then $U \rightarrow [U/G]$ is surjective, flat, and locally of finite presentation, see Lemma 78.19.6. This implies that π is surjective, flat, and locally of finite presentation by Properties of Stacks, Lemma 77.5.5 and Lemmas 78.17.5 and 78.18.8. \square

Proposition 78.19.9. *Let \mathcal{X} be an algebraic stack. The following are equivalent*

- (1) \mathcal{X} is a gerbe, and
- (2) $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is flat and locally of finite presentation.

Proof. Assume (1). Choose a morphism $\mathcal{X} \rightarrow X$ into an algebraic space X which turns \mathcal{X} into a gerbe over X . Let $X' \rightarrow X$ is a surjective, flat, locally finitely presented morphism and set $\mathcal{X}' = X' \times_X \mathcal{X}$. Note that \mathcal{X}' is a gerbe over X' by Lemma 78.19.3. Then both squares in

$$\begin{array}{ccccc} \mathcal{I}_{\mathcal{X}'} & \longrightarrow & \mathcal{X}' & \longrightarrow & X' \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{I}_{\mathcal{X}} & \longrightarrow & \mathcal{X} & \longrightarrow & X \end{array}$$

are fibre product squares, see Lemma 78.5.4. Hence to prove $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is flat and locally of finite presentation it suffices to do so after such a base change by Lemmas 78.17.4 and 78.18.7. Thus we can apply Lemma 78.19.7 to assume that $\mathcal{X} = [U/G]$. By Lemma 78.19.6 we see G is flat and locally of finite presentation over U and that $x : U \rightarrow [U/G]$ is surjective, flat, and locally of finite presentation. Moreover, the pullback of $\mathcal{I}_{\mathcal{X}}$ by x is G and we conclude that (2) holds by descent again, i.e., by Lemmas 78.17.4 and 78.18.7.

Conversely, assume (2). Choose a smooth presentation $\mathcal{X} = [U/R]$, see Algebraic Stacks, Section 71.16. Denote $G \rightarrow U$ the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i) , see Groupoids in Spaces, Definition 60.15.2. By Lemma 78.5.6 we see that $G \rightarrow U$ is flat and locally of finite presentation as a base change of $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$, see Lemmas 78.17.3 and 78.18.3. Consider the following action

$$a : G \times_{U,t} R \rightarrow R, \quad (g, r) \mapsto c(g, r)$$

of G on R . This action is free on T -valued points for any scheme T as R is a groupoid. Hence $R' = R/G$ is an algebraic space and the quotient morphism $\pi : R \rightarrow R'$ is surjective, flat, and locally of finite presentation by Bootstrap, Lemma 62.11.7. The projections $s, t : R \rightarrow U$ are G -invariant, hence we obtain morphisms $s', t' : R' \rightarrow U$ such that $s = s' \circ \pi$ and $t = t' \circ \pi$. Since $s, t : R \rightarrow U$ are flat and locally of finite presentation we conclude that s', t' are flat and locally

of finite presentation, see Morphisms of Spaces, Lemmas 49.29.5 and Descent on Spaces, Lemma 56.14.1. Consider the morphism

$$j' = (t', s') : R' \longrightarrow U \times U.$$

We claim this is a monomorphism. Namely, suppose that T is a scheme and that $a, b : T \rightarrow R'$ are morphisms which have the same image in $U \times U$. By definition of the quotient $R' = R/G$ there exists an fppf covering $\{h_j : T_j \rightarrow T\}$ such that $a \circ h_j = \pi \circ a_j$ and $b \circ h_j = \pi \circ b_j$ for some morphisms $a_j, b_j : T_j \rightarrow R$. Since a_j, b_j have the same image in $U \times U$ we see that $g_j = c(a_j, i(b_j))$ is a T_j -valued point of G such that $c(g_j, b_j) = a_j$. In other words, a_j and b_j have the same image in R' and the claim is proved. Since $j : R \rightarrow U \times U$ is a pre-equivalence relation (see Groupoids in Spaces, Lemma 60.11.2) and $R \rightarrow R'$ is surjective (as a map of sheaves) we see that $j' : R' \rightarrow U \times U$ is an equivalence relation. Hence Bootstrap, Theorem 62.10.1 shows that $X = U/R'$ is an algebraic space. Finally, we claim that the morphism

$$\mathcal{X} = [U/R] \longrightarrow X = U/R'$$

turns \mathcal{X} into a gerbe over X . This follows from Groupoids in Spaces, Lemma 60.26.1 as $R \rightarrow R'$ is surjective, flat, and locally of finite presentation (if needed use Bootstrap, Lemma 62.4.6 to see this implies the required hypothesis). \square

At this point we have developed enough machinery to prove that residual gerbes (when they exist) are gerbes.

Lemma 78.19.10. *Let \mathcal{Z} be a reduced, locally Noetherian algebraic stack such that $|\mathcal{Z}|$ is a singleton. Then \mathcal{Z} is a gerbe over a reduced, locally Noetherian algebraic space Z with $|Z|$ a singleton.*

Proof. By Properties of Stacks, Lemma 77.11.3 there exists a surjective, flat, locally finitely presented morphism $\mathrm{Spec}(k) \rightarrow \mathcal{Z}$ where k is a field. Then $\mathcal{I}_{\mathcal{Z}} \times_{\mathcal{Z}} \mathrm{Spec}(k) \rightarrow \mathrm{Spec}(k)$ is representable by algebraic spaces and locally of finite type (as a base change of $\mathcal{I}_{\mathcal{Z}} \rightarrow \mathcal{Z}$, see Lemmas 78.5.1 and 78.13.3). Therefore it is locally of finite presentation, see Morphisms of Spaces, Lemma 49.27.7. Of course it is also flat as k is a field. Hence we may apply Lemmas 78.17.4 and 78.18.7 to see that $\mathcal{I}_{\mathcal{Z}} \rightarrow \mathcal{Z}$ is flat and locally of finite presentation. We conclude that \mathcal{Z} is a gerbe by Proposition 78.19.9. Let $\pi : \mathcal{Z} \rightarrow Z$ be a morphism to an algebraic space such that \mathcal{Z} is a gerbe over Z . Then π is surjective, flat, and locally of finite presentation by Lemma 78.19.8. Hence $\mathrm{Spec}(k) \rightarrow Z$ is surjective, flat, and locally of finite presentation as a composition, see Properties of Stacks, Lemma 77.5.2 and Lemmas 78.17.2 and 78.18.2. Hence by Properties of Stacks, Lemma 77.11.3 we see that $|Z|$ is a singleton and that Z is locally Noetherian and reduced. \square

Lemma 78.19.11. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If \mathcal{X} is a gerbe over \mathcal{Y} then the map $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is a homeomorphism of topological spaces.*

Proof. Let k be a field and let y be an object of \mathcal{Y} over $\mathrm{Spec}(k)$. By Stacks, Lemma 8.11.3 property (2)(a) there exists an fppf covering $\{T_i \rightarrow \mathrm{Spec}(k)\}$ and objects x_i of \mathcal{X} over T_i with $f(x_i) \cong y|_{T_i}$. Choose an i such that $T_i \neq \emptyset$. Choose a morphism $\mathrm{Spec}(K) \rightarrow T_i$ for some field K . Then $k \subset K$ and $x_i|_K$ is an object of \mathcal{X} lying over $y|_K$. Thus we see that $|\mathcal{Y}| \rightarrow |\mathcal{X}|$ is surjective. The map $|\mathcal{Y}| \rightarrow |\mathcal{X}|$ is also injective. Namely, if x, x' are objects of \mathcal{X} over $\mathrm{Spec}(k)$ whose images $f(x), f(x')$ become isomorphic (over an extension) in \mathcal{Y} , then Stacks, Lemma 8.11.3 property

(2)(b) guarantees the existence of an extension of k over which x and x' become isomorphic (details omitted). Hence $|\mathcal{X}| \rightarrow |\mathcal{Y}|$ is continuous and bijective and it suffices to show that it is also open. This follows from Lemmas 78.19.8 and 78.18.11. \square

The following lemma tells us that residual gerbes exist for all points on any algebraic stack which is a gerbe.

Lemma 78.19.12. *Let \mathcal{X} be an algebraic stack. If \mathcal{X} is a gerbe then for every $x \in |\mathcal{X}|$ the residual gerbe of \mathcal{X} at x exists.*

Proof. Let $\pi : \mathcal{X} \rightarrow X$ be a morphism from \mathcal{X} into an algebraic space X which turns \mathcal{X} into a gerbe over X . Let $Z_x \rightarrow X$ be the residual space of X at x , see Decent Spaces, Definition 50.11.6. Let $\mathcal{Z} = \mathcal{X} \times_X Z_x$. By Lemma 78.19.3 the algebraic stack \mathcal{Z} is a gerbe over Z_x . Hence $|\mathcal{Z}| = |Z_x|$ (Lemma 78.19.11) is a singleton. Since $\mathcal{Z} \rightarrow Z_x$ is locally of finite presentation as a base change of π (see Lemmas 78.19.8 and 78.18.3) we see that \mathcal{Z} is locally Noetherian, see Lemma 78.13.5. Thus the residual gerbe \mathcal{Z}_x of \mathcal{X} at x exists and is equal to $\mathcal{Z}_x = \mathcal{Z}_{red}$ the reduction of the algebraic stack \mathcal{Z} . Namely, we have seen above that $|\mathcal{Z}_{red}|$ is a singleton mapping to $x \in |\mathcal{X}|$, it is reduced by construction, and it is locally Noetherian (as the reduction of a locally Noetherian algebraic stack is locally Noetherian, details omitted). \square

78.20. Stratification by gerbes

The goal of this section is to show that many algebraic stacks \mathcal{X} have a “stratification” by locally closed substacks $\mathcal{X}_i \subset \mathcal{X}$ such that each \mathcal{X}_i is a gerbe. This shows that in some sense gerbes are the building blocks out of which any algebraic stack is constructed. Note that by stratification we only mean that

$$|\mathcal{X}| = \bigcup_i |\mathcal{X}_i|$$

is a stratification of the topological space associated to \mathcal{X} and nothing more (in this section). Hence it is harmless to replace \mathcal{X} by its reduction (see Properties of Stacks, Section 77.10) in order to study this stratification.

The following proposition tells us there is (almost always) a dense open substack of the reduction of \mathcal{X}

Proposition 78.20.1. *Let \mathcal{X} be a reduced algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then there exists a dense open substack $\mathcal{U} \subset \mathcal{X}$ which is a gerbe.*

Proof. According to Proposition 78.19.9 it is enough to find a dense open substack \mathcal{U} such that $\mathcal{I}_{\mathcal{U}} \rightarrow \mathcal{U}$ is flat and locally of finite presentation. Note that $\mathcal{I}_{\mathcal{U}} = \mathcal{I}_{\mathcal{X}} \times_{\mathcal{X}} \mathcal{U}$, see Lemma 78.5.4.

Choose a presentation $\mathcal{X} = [U/R]$. Let $G \rightarrow U$ be the stabilizer group algebraic space of the groupoid R . By Lemma 78.5.6 we see that $G \rightarrow U$ is the base change of $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ hence quasi-compact (by assumption) and locally of finite type (by Lemma 78.5.1). Let $W \subset U$ be the largest open (possibly empty) subscheme such that the restriction $G_W \rightarrow W$ is flat and locally of finite presentation (we omit the proof that W exists; hint: use that the properties are local). By Morphisms of Spaces, Proposition 49.30.1 we see that $W \subset U$ is dense. Note that $W \subset U$ is R -invariant by More on Groupoids in Spaces, Lemma 61.4.2. Hence W corresponds to an open

substack $\mathcal{U} \subset \mathcal{X}$ by Properties of Stacks, Lemma 77.9.10. Since $|U| \rightarrow |\mathcal{X}|$ is open and $|W| \subset |U|$ is dense we conclude that \mathcal{U} is dense in \mathcal{X} . Finally, the morphism $\mathcal{I}_{\mathcal{U}} \rightarrow \mathcal{U}$ is flat and locally of finite presentation because the base change by the surjective smooth morphism $W \rightarrow \mathcal{U}$ is the morphism $G_W \rightarrow W$ which is flat and locally of finite presentation by construction. See Lemmas 78.17.4 and 78.18.7. \square

The above proposition immediately implies that any point has a residual gerbe on an algebraic stack with quasi-compact inertia, as we will show in Lemma 78.21.1. It turns out that there doesn't always exist a finite stratification by gerbes. Here is an example.

Example 78.20.2. Let k be a field. Take $U = \text{Spec}(k[x_0, x_1, x_2, \dots])$ and let \mathbf{G}_m act by $t(x_0, x_1, x_2, \dots) = (tx_0, t^p x_1, t^{p^2} x_2, \dots)$ where p is a prime number. Let $\mathcal{X} = [U/\mathbf{G}_m]$. This is an algebraic stack. There is a stratification of \mathcal{X} by strata

- (1) \mathcal{X}_0 is where x_0 is not zero,
- (2) \mathcal{X}_1 is where x_0 is zero but x_1 is not zero,
- (3) \mathcal{X}_2 is where x_0, x_1 are zero, but x_2 is not zero,
- (4) and so on, and
- (5) \mathcal{X}_{∞} is where all the x_i are zero.

Each stratum is a gerbe over a scheme with group μ_{p^i} for \mathcal{X}_i and \mathbf{G}_m for \mathcal{X}_{∞} . The strata are reduced locally closed substacks. There is no coarser stratification with the same properties.

Nonetheless, using transfinite induction we can use Proposition 78.20.1 find possibly infinite stratifications by gerbes...!

Lemma 78.20.3. *Let \mathcal{X} be an algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then there exists a well-ordered index set I and for every $i \in I$ a reduced locally closed substack $\mathcal{U}_i \subset \mathcal{X}$ such that*

- (1) each \mathcal{U}_i is a gerbe,
- (2) we have $|\mathcal{X}| = \bigcup_{i \in I} |\mathcal{U}_i|$,
- (3) $T_i = |\mathcal{X}| \setminus \bigcup_{i' < i} |\mathcal{U}_{i'}|$ is closed in $|\mathcal{X}|$ for all $i \in I$, and
- (4) $|\mathcal{U}_i|$ is open in T_i .

We can moreover arrange it so that either (a) $|\mathcal{U}_i| \subset T_i$ is dense, or (b) \mathcal{U}_i is quasi-compact. In case (a), if we choose \mathcal{U}_i as large as possible (see proof for details), then the stratification is canonical.

Proof. Let $T \subset |\mathcal{X}|$ be a nonempty closed subset. We are going to find (resp. choose) for every such T a reduced locally closed substack $\mathcal{U}(T) \subset \mathcal{X}$ with $|\mathcal{U}(T)| \subset T$ open dense (resp. nonempty quasi-compact). Namely, by Properties of Stacks, Lemma 77.10.1 there exists a unique reduced closed substack $\mathcal{X}' \subset \mathcal{X}$ such that $T = |\mathcal{X}'|$. Note that $\mathcal{I}_{\mathcal{X}'} = \mathcal{I}_{\mathcal{X}} \times_{\mathcal{X}} \mathcal{X}'$ by Lemma 78.5.5. Hence $\mathcal{I}_{\mathcal{X}'} \rightarrow \mathcal{X}'$ is quasi-compact as a base change, see Lemma 78.7.3. Therefore Proposition 78.20.1 implies there exists a dense maximal (see proof proposition) open substack $\mathcal{U} \subset \mathcal{X}'$ which is a gerbe. In case (a) we set $\mathcal{U}(T) = \mathcal{U}$ (this is canonical) and in case (b) we simply choose a nonempty quasi-compact open $\mathcal{U}(T) \subset \mathcal{U}$, see Properties of Stacks, Lemma 77.4.9 (we can do this for all T simultaneously by the axiom of choice).

By transfinite induction we construct for every ordinal α a closed subset $T_{\alpha} \subset |\mathcal{X}|$. For $\alpha = 0$ we set $T_0 = |\mathcal{X}|$. Given T_{α} set

$$T_{\alpha+1} = T_{\alpha} \setminus |\mathcal{U}(T_{\alpha})|.$$

If β is a limit ordinal we set

$$T_\beta = \bigcap_{\alpha < \beta} T_\alpha.$$

We claim that $T_\alpha = \emptyset$ for all α large enough. Namely, assume that $T_\alpha \neq \emptyset$ for all α . Then we obtain an injective map from the class of ordinals into the set of subsets of $|\mathcal{X}|$ which is a contradiction.

The claim implies the lemma. Namely, let

$$I = \{\alpha \mid \mathcal{U}_\alpha \neq \emptyset\}.$$

This is a well-ordered set by the claim. For $i = \alpha \in I$ we set $\mathcal{U}_i = \mathcal{U}_\alpha$. So \mathcal{U}_i is a reduced locally closed substack and a gerbe, i.e., (1) holds. By construction $T_i = T_\alpha$ if $i = \alpha \in I$, hence (3) holds. Also, (4) and (a) or (b) hold by our choice of $\mathcal{U}(T)$ as well. Finally, to see (2) let $x \in |\mathcal{X}|$. There exists a smallest ordinal β with $x \notin T_\beta$ (because the ordinals are well-ordered). In this case β has to be a successor ordinal by the definition of T_β for limit ordinals. Hence $\beta = \alpha + 1$ and $x \in |\mathcal{U}(T_\alpha)|$ and we win. \square

Remark 78.20.4. We can wonder about the order type of the canonical stratifications which occur as output of the stratifications of type (a) constructed in Lemma 78.20.3. A natural guess is that the well-ordered set I has *cardinality* at most \aleph_0 . We have no idea if this is true or false. If you do please email stacks.project@gmail.com.

78.21. Existence of residual gerbes

In this section we prove that residual gerbes (as defined in Properties of Stacks, Definition 77.11.8) exist on many algebraic stacks. First, here is the promised application of Proposition 78.20.1.

Lemma 78.21.1. *Let \mathcal{X} be an algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then the residual gerbe of \mathcal{X} at x exists for every $x \in |\mathcal{X}|$.*

Proof. Let $T = \overline{\{x\}} \subset |\mathcal{X}|$ be the closure of x . By Properties of Stacks, Lemma 77.10.1 there exists a reduced closed substack $\mathcal{X}' \subset \mathcal{X}$ such that $T = |\mathcal{X}'|$. Note that $\mathcal{I}_{\mathcal{X}'} = \mathcal{I}_{\mathcal{X}} \times_{\mathcal{X}} \mathcal{X}'$ by Lemma 78.5.5. Hence $\mathcal{I}_{\mathcal{X}'} \rightarrow \mathcal{X}'$ is quasi-compact as a base change, see Lemma 78.7.3. Therefore Proposition 78.20.1 implies there exists a dense open substack $\mathcal{U} \subset \mathcal{X}'$ which is a gerbe. Note that $x \in |\mathcal{U}|$ because $\{x\} \subset T$ is a dense subset too. Hence a residual gerbe $\mathcal{Z}_x \subset \mathcal{U}$ of \mathcal{U} at x exists by Lemma 78.19.12. It is immediate from the definitions that $\mathcal{Z}_x \rightarrow \mathcal{X}$ is a residual gerbe of \mathcal{X} at x . \square

If the stack is quasi-DM then residual gerbes exist too. In particular, residual gerbes always exist for Deligne-Mumford stacks.

Lemma 78.21.2. *Let \mathcal{X} be a quasi-DM algebraic stack. Then the residual gerbe of \mathcal{X} at x exists for every $x \in |\mathcal{X}|$.*

Proof. Choose a scheme U and a surjective, flat, locally finite presented, and locally quasi-finite morphism $U \rightarrow \mathcal{X}$, see Theorem 78.15.3. Set $R = U \times_{\mathcal{X}} U$. The projections $s, t : R \rightarrow U$ are surjective, flat, locally of finite presentation, and locally quasi-finite as base changes of the morphism $U \rightarrow \mathcal{X}$. There is a canonical morphism $[U/R] \rightarrow \mathcal{X}$ (see Algebraic Stacks, Lemma 71.16.1) which is an equivalence because $U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Remark 71.16.3. Thus we may assume that $\mathcal{X} = [U/R]$ where (U, R, s, t, c) is a

groupoid in algebraic spaces such that $s, t : R \rightarrow U$ are surjective, flat, locally of finite presentation, and locally quasi-finite. Set

$$U' = \coprod_{u \in U \text{ lying over } x} \text{Spec}(\kappa(u)).$$

The canonical morphism $U' \rightarrow U$ is a monomorphism. Let

$$R' = U' \times_{\mathcal{X}} U' = R \times_{(U \times U)} (U' \times U')$$

Because $U' \rightarrow U$ is a monomorphism we see that both projections $s', t' : R' \rightarrow U'$ factor as a monomorphism followed by a locally quasi-finite morphism. Hence, as U' is a disjoint union of spectra of fields, using Spaces over Fields, Lemma 54.7.3 we conclude that the morphisms $s', t' : R' \rightarrow U'$ are locally quasi-finite. Again since U' is a disjoint union of spectra of fields, the morphisms s', t' are also flat. Finally, s', t' locally quasi-finite implies s', t' locally of finite type, hence s', t' locally of finite presentation (because U' is a disjoint union of spectra of fields in particular locally Noetherian, so that Morphisms of Spaces, Lemma 49.27.7 applies). Hence $\mathcal{Z} = [U'/R']$ is an algebraic stack by Criteria for Representability, Theorem 74.17.2. As R' is the restriction of R by $U' \rightarrow U$ we see $\mathcal{Z} \rightarrow \mathcal{X}$ is a monomorphism by Groupoids in Spaces, Lemma 60.24.1 and Properties of Stacks, Lemma 77.8.4. Since $\mathcal{Z} \rightarrow \mathcal{X}$ is a monomorphism we see that $|\mathcal{Z}| \rightarrow |\mathcal{X}|$ is injective, see Properties of Stacks, Lemma 77.8.5. By Properties of Stacks, Lemma 77.4.3 we see that

$$|U'| = |\mathcal{Z} \times_{\mathcal{X}} U'| \longrightarrow |\mathcal{Z}| \times_{|\mathcal{X}|} |U'|$$

is surjective which implies (by our choice of U') that $|\mathcal{Z}| \rightarrow |\mathcal{X}|$ has image $\{x\}$. We conclude that $|\mathcal{Z}|$ is a singleton. Finally, by construction U' is locally Noetherian and reduced, i.e., \mathcal{Z} is reduced and locally Noetherian. This means that the essential image of $\mathcal{Z} \rightarrow \mathcal{X}$ is the residual gerbe of \mathcal{X} at x , see Properties of Stacks, Lemma 77.11.11. \square

78.22. Smooth morphisms

The property “being smooth” of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 56.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 49.34.3 and Descent on Spaces, Lemma 56.10.24. Hence, by Lemma 78.12.1 above, we may define what it means for a morphism of algebraic spaces to be smooth as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 77.3 when the morphism is representable by algebraic spaces.

Definition 78.22.1. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *smooth* if the equivalent conditions of Lemma 78.12.1 hold with $\mathcal{P} = \text{smooth}$.

Lemma 78.22.2. *The composition of smooth morphisms is smooth.*

Proof. Combine Remark 78.12.3 with Morphisms of Spaces, Lemma 49.34.2. \square

Lemma 78.22.3. *A base change of a smooth morphism is smooth.*

Proof. Combine Remark 78.12.4 with Morphisms of Spaces, Lemma 49.34.3. \square

Cohomology of Algebraic Stacks

79.1. Introduction

In this chapter we write about cohomology of algebraic stacks. This mean in particular cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapters entitled “Cohomology of Schemes” and “Cohomology of Algebraic Spaces”. The results in this chapter are different from those in [LMB00] mainly because we consistently use the “big sites”. Before reading this chapter please take a quick look at the chapter “Sheaves on Algebraic Stacks” in order to become familiar with the terminology introduced there, see Sheaves on Stacks, Section 73.1.

79.2. Conventions and abuse of language

We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 77.2.

79.3. Notation

Different topologies. If we indicate an algebraic stack by a calligraphic letter, such as $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$, then the notation $\mathcal{X}_{Zar}, \mathcal{X}_{\acute{e}tale}, \mathcal{X}_{smooth}, \mathcal{X}_{syntomic}, \mathcal{X}_{fppf}$ indicates the site introduced in Sheaves on Stacks, Definition 73.4.1. (Think “big site”.) Correspondingly the structure sheaf of \mathcal{X} is a sheaf on \mathcal{X}_{fppf} . On the other hand, algebraic spaces and schemes are usually indicated by roman capitals, such as X, Y, Z , and in this case $X_{\acute{e}tale}$ indicates the small étale site of X (as defined in Topologies, Definition 33.4.8 or Properties of Spaces, Definition 48.15.1). It seems that the distinction should be clear enough.

The default topology is the fppf topology. Hence we will sometimes say “sheaf on \mathcal{X} ” or “sheaf of $\mathcal{O}_{\mathcal{X}}$ ” modules when we mean sheaf on \mathcal{X}_{fppf} or object of $Mod(\mathcal{X}_{fppf}, \mathcal{O}_{\mathcal{X}})$.

If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks, then the functors f_* and f^{-1} defined on presheaves preserves sheaves for any of the topologies mentioned above. In particular when we discuss the pushforward or pullback of a sheaf we don’t have to mention which topology we are working with. The same isn’t true when we compute cohomology groups and/or higher direct images. In this case we will always mention which topology we are working with.

Suppose that $f : X \rightarrow \mathcal{Y}$ is a morphism from an algebraic space X to an algebraic stack \mathcal{Y} . Let \mathcal{G} be a sheaf on \mathcal{Y}_{τ} for some topology τ . In this case $f^{-1}\mathcal{G}$ is a sheaf for the τ topology on \mathcal{S}_X (the algebraic stack associated to X) because (by our conventions) f really is a 1-morphism $f : \mathcal{S}_X \rightarrow \mathcal{Y}$. If $\tau = \acute{e}tale$ or stronger, then we write $f^{-1}\mathcal{G}|_{X_{\acute{e}tale}}$ to denote the restriction to the étale site of X , see Sheaves on

Stacks, Section 73.21. If \mathcal{G} is an $\mathcal{O}_{\mathcal{X}}$ -module we sometimes write $f^*\mathcal{G}$ and $f^*\mathcal{G}|_{\mathcal{X}_{\acute{e}t\acute{a}l\acute{e}}}$ instead.

79.4. Pullback of quasi-coherent modules

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. It is a very general fact that quasi-coherent modules on ringed topoi are compatible with pullbacks. In particular the pullback f^* preserves quasi-coherent modules and we obtain a functor

$$f^* : QCoh(\mathcal{O}_{\mathcal{Y}}) \longrightarrow QCoh(\mathcal{O}_{\mathcal{X}}),$$

see Sheaves on Stacks, Lemma 73.11.2. In general this functor isn't exact, but if f is flat then it is.

Lemma 79.4.1. *If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a flat morphism of algebraic stacks then $f^* : QCoh(\mathcal{O}_{\mathcal{Y}}) \rightarrow QCoh(\mathcal{O}_{\mathcal{X}})$ is an exact functor.*

Proof. Choose a scheme V and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose a scheme U and a surjective smooth morphism $U \rightarrow V \times_{\mathcal{Y}} \mathcal{X}$. Then $U \rightarrow \mathcal{X}$ is still smooth and surjective as a composition of two such morphisms. From the commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \searrow f' & \downarrow \\ \mathcal{X} & \xrightarrow{\quad f \quad} & \mathcal{Y} \end{array}$$

we obtain a commutative diagram

$$\begin{array}{ccc} QCoh(\mathcal{O}_U) & \longleftarrow & QCoh(\mathcal{O}_V) \\ \uparrow & & \uparrow \\ QCoh(\mathcal{O}_{\mathcal{X}}) & \longleftarrow & QCoh(\mathcal{O}_{\mathcal{Y}}) \end{array}$$

of abelian categories. Our proof that the bottom two categories in this diagram are abelian showed that the vertical functors are faithful exact functors (see proof of Sheaves on Stacks, Lemma 73.14.1). Since f' is a flat morphism of schemes (by our definition of flat morphisms of algebraic stacks) we see that $(f')^*$ is an exact functor on quasi-coherent sheaves on V . Thus we win. \square

79.5. The key lemma

The following lemma is the basis for our understanding of higher direct images of certain types of sheaves of modules. There are two versions: one for the étale topology and one for the fppf topology.

Lemma 79.5.1. *Let \mathcal{M} be a rule which associates to every algebraic stack \mathcal{X} a subcategory $\mathcal{M}_{\mathcal{X}}$ of $\text{Mod}(\mathcal{X}_{\acute{e}t\acute{a}l\acute{e}}, \mathcal{O}_{\mathcal{X}})$ such that*

- (1) $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\text{Mod}(\mathcal{X}_{\acute{e}t\acute{a}l\acute{e}}, \mathcal{O}_{\mathcal{X}})$ (see Homology, Definition 12.9.1) for all algebraic stacks \mathcal{X} ,
- (2) for a smooth morphism of algebraic stacks $f : \mathcal{Y} \rightarrow \mathcal{X}$ the functor f^* maps $\mathcal{M}_{\mathcal{X}}$ into $\mathcal{M}_{\mathcal{Y}}$,
- (3) if $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_i|(|\mathcal{X}_i|)$, then an object \mathcal{F} of $\text{Mod}(\mathcal{X}_{\acute{e}t\acute{a}l\acute{e}}, \mathcal{O}_{\mathcal{X}})$ is in $\mathcal{M}_{\mathcal{X}}$ if and only if $f_i^*\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$ for all i , and

- (4) if $f : \mathcal{Y} \rightarrow \mathcal{X}$ is a morphism of algebraic stacks such that \mathcal{X} and \mathcal{Y} are representable by affine schemes, then $R^i f_*$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$.

Then for any quasi-compact and quasi-separated morphism $f : \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks $R^i f_*$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$. (Higher direct images computed in étale topology.)

Proof. Let $f : \mathcal{Y} \rightarrow \mathcal{X}$ be a quasi-compact and quasi-separated morphism of algebraic stacks and let \mathcal{F} be an object of $\mathcal{M}_{\mathcal{Y}}$. Choose a surjective smooth morphism $\mathcal{U} \rightarrow \mathcal{X}$ where \mathcal{U} is representable by a scheme. By Sheaves on Stacks, Lemma 73.20.3 taking higher direct images commutes with base change. Assumption (2) shows that the pullback of \mathcal{F} to $\mathcal{U} \times_{\mathcal{X}} \mathcal{Y}$ is in $\mathcal{M}_{\mathcal{U} \times_{\mathcal{X}} \mathcal{Y}}$ because the projection $\mathcal{U} \times_{\mathcal{X}} \mathcal{Y} \rightarrow \mathcal{Y}$ is smooth as a base change of a smooth morphism. Hence (3) shows we may replace $\mathcal{Y} \rightarrow \mathcal{X}$ by the projection $\mathcal{U} \times_{\mathcal{X}} \mathcal{Y} \rightarrow \mathcal{U}$. In other words, we may assume that \mathcal{X} is representable by a scheme. Using (3) once more, we see that the question is Zariski local on \mathcal{X} , hence we may assume that \mathcal{X} is representable by an affine scheme. Since f is quasi-compact this implies that also \mathcal{Y} is quasi-compact. Thus we may choose a surjective smooth morphism $g : \mathcal{V} \rightarrow \mathcal{Y}$ where \mathcal{V} is representable by an affine scheme.

In this situation we have the spectral sequence

$$E_2^{p,q} = R^q(f \circ g_p)_* g_p^* \mathcal{F} \Rightarrow R^{p+q} f_* \mathcal{F}$$

of Sheaves on Stacks, Proposition 73.20.1. Recall that this is the spectral sequence associated to a double complex. By assumption (1) we may use Homology, Remark 12.22.8. Note that the morphisms

$$g_p : \mathcal{V}_p = \mathcal{V} \times_{\mathcal{Y}} \dots \times_{\mathcal{Y}} \mathcal{V} \longrightarrow \mathcal{Y}$$

are smooth as compositions of base changes of the smooth morphism g . Thus the sheaves $g_p^* \mathcal{F}$ are in $\mathcal{M}_{\mathcal{V}_p}$ by (2). Hence it suffices to prove that the higher direct images of objects of $\mathcal{M}_{\mathcal{V}_p}$ under the morphisms

$$\mathcal{V}_p = \mathcal{V} \times_{\mathcal{Y}} \dots \times_{\mathcal{Y}} \mathcal{V} \longrightarrow \mathcal{X}$$

are in $\mathcal{M}_{\mathcal{X}}$. The algebraic stacks \mathcal{V}_p are quasi-compact and quasi-separated by Morphisms of Stacks, Lemma 78.7.7. Of course each \mathcal{V}_p is representable by an algebraic space (the diagonal of the algebraic stack \mathcal{V} is representable by algebraic spaces). This reduces us to the case where \mathcal{Y} is representable by an algebraic space and \mathcal{X} is representable by an affine scheme.

In the situation where \mathcal{Y} is representable by an algebraic space and \mathcal{X} is representable by an affine scheme, we choose anew a surjective smooth morphism $\mathcal{V} \rightarrow \mathcal{Y}$ where \mathcal{V} is representable by an affine scheme. Going through the argument above once again we once again reduce to the morphisms $\mathcal{V}_p \rightarrow \mathcal{X}$. But in the current situation the algebraic stacks \mathcal{V}_p are representable by quasi-compact and quasi-separated schemes (because the diagonal of an algebraic space is representable by schemes).

Thus we may assume \mathcal{Y} is representable by a scheme and \mathcal{X} is representable by an affine scheme. Choose (again) a surjective smooth morphism $\mathcal{V} \rightarrow \mathcal{Y}$ where \mathcal{V} is representable by an affine scheme. In this case all the algebraic stacks \mathcal{V}_p are representable by separated schemes (because the diagonal of a scheme is separated).

Thus we may assume \mathcal{Y} is representable by a separated scheme and \mathcal{X} is representable by an affine scheme. Choose (yet again) a surjective smooth morphism

$\mathcal{V} \rightarrow \mathcal{Y}$ where \mathcal{V} is representable by an affine scheme. In this case all the algebraic stacks \mathcal{V}_p are representable by affine schemes (because the diagonal of a separated scheme is a closed immersion hence affine) and this case is handled by assumption (4). This finishes the proof. \square

Here is the version for the fppf topology.

Lemma 79.5.2. *Let \mathcal{M} be a rule which associates to every algebraic stack \mathcal{X} a subcategory $\mathcal{M}_{\mathcal{X}}$ of $\text{Mod}(\mathcal{O}_{\mathcal{X}})$ such that*

- (1) $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_{\mathcal{X}})$ for all algebraic stacks \mathcal{X} ,
- (2) for a smooth morphism of algebraic stacks $f : \mathcal{Y} \rightarrow \mathcal{X}$ the functor f^* maps $\mathcal{M}_{\mathcal{X}}$ into $\mathcal{M}_{\mathcal{Y}}$,
- (3) if $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_i|(|\mathcal{X}_i|)$, then an object \mathcal{F} of $\text{Mod}(\mathcal{O}_{\mathcal{X}})$ is in $\mathcal{M}_{\mathcal{X}}$ if and only if $f_i^* \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$ for all i , and
- (4) if $f : \mathcal{Y} \rightarrow \mathcal{X}$ is a morphism of algebraic stacks and \mathcal{X} and \mathcal{Y} are representable by affine schemes, then $R^i f_*$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$.

Then for any quasi-compact and quasi-separated morphism $f : \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks $R^i f_*$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$. (Higher direct images computed in fppf topology.)

Proof. Identical to the proof of Lemma 79.5.1. \square

79.6. Locally quasi-coherent modules

Let \mathcal{X} be an algebraic stack. Let \mathcal{F} be a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules. We can ask whether \mathcal{F} is *locally quasi-coherent*, see Sheaves on Stacks, Definition 73.11.4. Briefly, this means \mathcal{F} is an $\mathcal{O}_{\mathcal{X}}$ -module for the étale topology such that for any morphism $f : U \rightarrow \mathcal{X}$ the restriction $f^* \mathcal{F}|_{U_{\text{étale}}}$ is quasi-coherent on $U_{\text{étale}}$. (The actual definition is slightly different, but equivalent.) A useful fact is that

$$LQCoh(\mathcal{O}_{\mathcal{X}}) \subset \text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$$

is a weak Serre subcategory, see Sheaves on Stacks, Lemma 73.11.7.

Lemma 79.6.1. *Let \mathcal{X} be an algebraic stack. Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on $\mathcal{X}_{\text{étale}}$. If each $f_j^{-1} \mathcal{F}$ is locally quasi-coherent, then so is \mathcal{F} .*

Proof. We may replace each of the algebraic stacks \mathcal{X}_j by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 78.22.2). The pullback of \mathcal{F} to $(\text{Sch}/U_j)_{\text{étale}}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 73.11.6. Then $f = \coprod f_j : U = \coprod U_j \rightarrow \mathcal{X}$ is a surjective smooth morphism. Let x be an object of \mathcal{X} . By Sheaves on Stacks, Lemma 73.18.10 there exists an étale covering $\{x_i \rightarrow x\}_{i \in I}$ such that each x_i lifts to an object u_i of $(\text{Sch}/U)_{\text{étale}}$. This just means that x, x_i live over schemes V, V_i , that $\{V_i \rightarrow V\}$ is an étale covering, and that x_i comes from a morphism $u_i : V_i \rightarrow U$. The restriction $x_i^* \mathcal{F}|_{V_i, \text{étale}}$ is equal to the restriction of $f^* \mathcal{F}$ to $V_i, \text{étale}$, see Sheaves on Stacks, Lemma 73.9.3. Hence $x^* \mathcal{F}|_{V, \text{étale}}$ is a sheaf on the small étale site of V which is quasi-coherent when restricted to $V_i, \text{étale}$ for each i . This implies that it is quasi-coherent (as desired), for example by Properties of Spaces, Lemma 48.27.6. \square

Lemma 79.6.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let \mathcal{F} be a locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -module on $\mathcal{X}_{\acute{e}tale}$. Then $R^i f_* \mathcal{F}$ (computed in the étale topology) is a locally quasi-coherent on $\mathcal{Y}_{\acute{e}tale}$.*

Proof. We will use Lemma 79.5.1 to prove this. We will check its assumptions (1) – (4). Parts (1) and (2) follows from Sheaves on Stacks, Lemma 73.11.7. Part (3) follows from Lemma 79.6.1. Thus it suffices to show (4).

Suppose $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks such that \mathcal{X} and \mathcal{Y} are representable by affine schemes X and Y . Choose any object y of \mathcal{Y} lying over a scheme V . For clarity, denote $\mathcal{V} = (Sch/V)_{fppf}$ the algebraic stack corresponding to V . Consider the cartesian diagram

$$\begin{array}{ccc} \mathcal{Z} & \xrightarrow{g} & \mathcal{X} \\ f' \downarrow & & \downarrow f \\ \mathcal{V} & \xrightarrow{y} & \mathcal{Y} \end{array}$$

Thus \mathcal{Z} is representable by the scheme $Z = V \times_Y X$ and f' is quasi-compact and separated (even affine). By Sheaves on Stacks, Lemma 73.21.3 we have

$$R^i f_* \mathcal{F}|_{V_{\acute{e}tale}} = R^i f'_{small,*} (g^* \mathcal{F}|_{Z_{\acute{e}tale}})$$

The right hand side is a quasi-coherent sheaf on $V_{\acute{e}tale}$ by Cohomology of Spaces, Lemma 51.3.2. This implies the left hand side is quasi-coherent which is what we had to prove. \square

Lemma 79.6.3. *Let \mathcal{X} be an algebraic stack. Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on \mathcal{X}_{fppf} . If each $f_j^{-1} \mathcal{F}$ is locally quasi-coherent, then so is \mathcal{F} .*

Proof. First, suppose there is a morphism $a : \mathcal{U} \rightarrow \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^* \mathcal{F}$ is locally quasi-coherent. Then there is an exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow a_* a^* \mathcal{F} \rightarrow b_* b^* \mathcal{F}$$

where b is the morphism $b : \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$, see Sheaves on Stacks, Proposition 73.18.7 and Lemma 73.18.10. Moreover, the pullback $b^* \mathcal{F}$ is the pullback of $a^* \mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent (Sheaves on Stacks, Lemma 73.11.6). The modules $a_* a^* \mathcal{F}$ and $b_* b^* \mathcal{F}$ are locally quasi-coherent by Lemma 79.6.2. (Note that a_* and b_* don't care about which topology is used to calculate them.) We conclude that \mathcal{F} is locally quasi-coherent, see Sheaves on Stacks, Lemma 73.11.7.

We are going to reduce the proof of the general case the the situation in the first paragraph. Let x be an object of \mathcal{X} lying over the scheme U . We have to show that $\mathcal{F}|_{U_{\acute{e}tale}}$ is a quasi-coherent \mathcal{O}_U -module. It suffices to do this (Zariski) locally on U , hence we may assume that U is affine. By Morphisms of Stacks, Lemma 78.18.10 there exists an fppf covering $\{a_i : U_i \rightarrow U\}$ such that each $x \circ a_i$ factors through some f_j . Hence $a_i^* \mathcal{F}$ is locally quasi-coherent on $(Sch/U_i)_{fppf}$. After refining the covering we may assume $\{U_i \rightarrow U\}_{i=1, \dots, n}$ is a standard fppf covering. Then $x^* \mathcal{F}$ is an fppf module on $(Sch/U)_{fppf}$ whose pullback by the morphism $a : U_1 \amalg \dots \amalg U_n \rightarrow U$

is locally quasi-coherent. Hence by the first paragraph we see that $x^*\mathcal{F}$ is locally quasi-coherent, which certainly implies that $\mathcal{F}|_{U_{\acute{e}tale}}$ is quasi-coherent. \square

79.7. Flat comparison maps

Let \mathcal{X} be an algebraic stack and let \mathcal{F} be an object of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$. Given an object x of \mathcal{X} lying over the scheme U the restriction $\mathcal{F}|_{U_{\acute{e}tale}}$ is the restriction of $x^{-1}\mathcal{F}$ to the small étale site of U , see Sheaves on Stacks, Definition 73.9.2. Next, let $\varphi : x \rightarrow x'$ be a morphism of \mathcal{X} lying over a morphism of schemes $f : U \rightarrow U'$. Thus a 2-commutative diagram

Associated to φ we obtain a comparison map between restrictions

$$(79.7.0.1) \quad c_\varphi : f_{small}^*(\mathcal{F}|_{U'_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}}$$

see Sheaves on Stacks, Equation (73.9.4.1). In this situation we can consider the following property of \mathcal{F} .

Definition 79.7.1. Let \mathcal{X} be an algebraic stack and let \mathcal{F} in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$. We say \mathcal{F} has the *flat base change property*¹ if and only if c_φ is an isomorphism whenever f is flat.

Here is a lemma with some properties of this notion.

Lemma 79.7.2. *Let \mathcal{X} be an algebraic stack. Let \mathcal{F} be an $\mathcal{O}_{\mathcal{X}}$ -module on $\mathcal{X}_{\acute{e}tale}$.*

- (1) *If \mathcal{F} has the flat base change property then for any morphism $g : \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks, the pullback $g^*\mathcal{F}$ does too.*
- (2) *The full subcategory of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ consisting of modules with the flat base change property is a weak Serre subcategory.*
- (3) *Let $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^*\mathcal{F}$ has the flat base change property then so does \mathcal{F} .*
- (4) *The category of $\mathcal{O}_{\mathcal{X}}$ -modules on $\mathcal{X}_{\acute{e}tale}$ with the flat base change property has colimits and they agree with colimits in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$.*

Proof. Let $g : \mathcal{Y} \rightarrow \mathcal{X}$ be as in (1). Let y be an object of \mathcal{Y} lying over a scheme V . By Sheaves on Stacks, Lemma 73.9.3 we have $(g^*\mathcal{F})|_{V_{\acute{e}tale}} = \mathcal{F}|_{V_{\acute{e}tale}}$. Moreover a comparison mapping for the sheaf $g^*\mathcal{F}$ on \mathcal{Y} is a special case of a comparison map for the sheaf \mathcal{F} on \mathcal{X} , see Sheaves on Stacks, Lemma 73.9.3. In this way (1) is clear.

Proof of (2). We use the characterization of weak Serre subcategories of Homology, Lemma 12.9.3. Kernels and cokernels of maps between sheaves having the flat base change property also have the flat base change property. This is clear because f_{small}^* is exact for a flat morphism of schemes and since the restriction functors $(-)|_{U_{\acute{e}tale}}$ are exact (because we are working in the étale topology). Finally, if $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ is a short exact sequence of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ and the outer two sheaves have the flat base change property then the middle one does as

¹This may be nonstandard notation.

well, again because of the exactness of f_{small}^* and the restriction functors (and the 5 lemma).

Proof of (3). Let $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_i^* \mathcal{F}$ has the flat base change property. By part (1), the definition of an algebraic stack, and the fact that compositions of smooth morphisms are smooth (see Morphisms of Stacks, Lemma 78.22.2) we may assume that each \mathcal{X}_i is representable by a scheme. Let $\varphi : x \rightarrow x'$ be a morphism of \mathcal{X} lying over a flat morphism $a : U \rightarrow U'$ of schemes. By Sheaves on Stacks, Lemma 73.18.10 there exists a jointly surjective family of étale morphisms $U'_i \rightarrow U'$ such that $U' \rightarrow U' \rightarrow \mathcal{X}$ factors through \mathcal{X}_i . Thus we obtain commutative diagrams

$$\begin{array}{ccccc} U_i = U \times_{U'} U'_i & \xrightarrow{a_i} & U'_i & \xrightarrow{x'_i} & \mathcal{X}_i \\ \downarrow & & \downarrow & & \downarrow f_i \\ U & \xrightarrow{a} & U' & \xrightarrow{x'} & \mathcal{X} \end{array}$$

Note that each a_i is a flat morphism of schemes as a base change of a . Denote $\psi_i : x_i \rightarrow x'_i$ the morphism of \mathcal{X}_i lying over a_i with target x'_i . By assumption the comparison maps $c_{\psi_i} : (a_i)_{small}^*(f_i^* \mathcal{F}|_{(U'_i)_{\acute{e}tale}}) \rightarrow f_i^* \mathcal{F}|_{(U_i)_{\acute{e}tale}}$ is an isomorphism. Because the vertical arrows $U'_i \rightarrow U'$ and $U_i \rightarrow U$ are étale, the sheaves $f_i^* \mathcal{F}|_{(U'_i)_{\acute{e}tale}}$ and $f_i^* \mathcal{F}|_{(U_i)_{\acute{e}tale}}$ are the restrictions of $\mathcal{F}|_{U'_{\acute{e}tale}}$ and $\mathcal{F}|_{U_{\acute{e}tale}}$ and the map c_{ψ_i} is the restriction of c_φ to $(U_i)_{\acute{e}tale}$, see Sheaves on Stacks, Lemma 73.9.3. Since $\{U_i \rightarrow U\}$ is an étale covering, this implies that the comparison map c_φ is an isomorphism which is what we wanted to prove.

Proof of (4). Let $\mathcal{I} \rightarrow Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$, $i \mapsto \mathcal{F}_i$ be a diagram and assume each \mathcal{F}_i has the flat base change property. Recall that $\text{colim}_i \mathcal{F}_i$ is the sheafification of the presheaf colimit. As we are using the étale topology, it is clear that

$$(\text{colim}_i \mathcal{F}_i)|_{U_{\acute{e}tale}} = \text{colim}_i \mathcal{F}_i|_{U_{\acute{e}tale}}$$

As f_{small}^* commutes with colimits (as a left adjoint) we see that (4) holds. \square

Lemma 79.7.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let \mathcal{F} be an object of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ which is locally quasi-coherent and has the flat base change property. Then each $R^i g_* \mathcal{F}$ (computed in the étale topology) has the flat base change property.*

Proof. We will use Lemma 79.5.1 to prove this. For every algebraic stack \mathcal{X} let $\mathcal{M}_{\mathcal{X}}$ denote the full subcategory of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ consisting of locally quasi-coherent sheaves with the flat base change property. Once we verify conditions (1) – (4) of Lemma 79.5.1 the lemma will follow. Properties (1), (2), and (3) follow from Sheaves on Stacks, Lemmas 73.11.6 and 73.11.7 and Lemmas 79.6.1 and 79.7.2. Thus it suffices to show part (4).

Suppose $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks such that \mathcal{X} and \mathcal{Y} are representable by affine schemes X and Y . In this case, suppose that $\psi : y \rightarrow y'$ is a morphism of \mathcal{Y} lying over a flat morphism $b : V \rightarrow V'$ of schemes. For clarity denote $\mathcal{V} = (Sch/V)_{fppf}$ and $\mathcal{V}' = (Sch/V')_{fppf}$ the corresponding algebraic stacks.

Consider the diagram of algebraic stacks

$$\begin{array}{ccccc}
 \mathcal{Z} & \xrightarrow{a} & \mathcal{Z}' & \xrightarrow{x'} & \mathcal{X} \\
 \downarrow f'' & & \downarrow f' & & \downarrow f \\
 \mathcal{Y} & \xrightarrow{b} & \mathcal{Y}' & \xrightarrow{y'} & \mathcal{Y}
 \end{array}$$

with both squares cartesian. As f is representable by schemes (and quasi-compact and separated – even affine) we see that \mathcal{Z} and \mathcal{Z}' are representable by schemes Z and Z' and in fact $Z = V \times_{V'} Z'$. Since \mathcal{F} has the flat base change property we see that

$$a_{small}^*(\mathcal{F}|_{\mathcal{Z}'_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{\mathcal{Z}_{\acute{e}tale}}$$

is an isomorphism. Moreover,

$$R^i f_* \mathcal{F}|_{V'_{\acute{e}tale}} = R^i (f')_{small,*}(\mathcal{F}|_{Z'_{\acute{e}tale}})$$

and

$$R^i f_* \mathcal{F}|_{V_{\acute{e}tale}} = R^i (f'')_{small,*}(\mathcal{F}|_{Z_{\acute{e}tale}})$$

by Sheaves on Stacks, Lemma 73.21.3. Hence we see that the comparison map

$$c_\psi : b_{small}^*(R^i f_* \mathcal{F}|_{V'_{\acute{e}tale}}) \longrightarrow R^i f_* \mathcal{F}|_{V_{\acute{e}tale}}$$

is an isomorphism by Cohomology of Spaces, Lemma 51.10.1. Thus $R^i f_* \mathcal{F}$ has the flat base change property. Since $R^i f_* \mathcal{F}$ is locally quasi-coherent by Lemma 79.6.2 we win. \square

Proposition 79.7.4. *Summary of results on locally quasi-coherent modules having the flat base change property.*

- (1) *Let \mathcal{X} be an algebraic stack. If \mathcal{F} is an object of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ which is locally quasi-coherent and has the flat base change property, then \mathcal{F} is a sheaf for the fppf topology, i.e., it is an object of $Mod(\mathcal{O}_{\mathcal{X}})$.*
- (2) *The category of modules which are locally quasi-coherent and have the flat base change property is a weak Serre subcategory $\mathcal{M}_{\mathcal{X}}$ of both $Mod(\mathcal{O}_{\mathcal{X}})$ and $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$.*
- (3) *Pullback f^* along any morphism of algebraic stacks $f : \mathcal{X} \rightarrow \mathcal{Y}$ induces a functor $f^* : \mathcal{M}_{\mathcal{Y}} \rightarrow \mathcal{M}_{\mathcal{X}}$.*
- (4) *If $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a quasi-compact and quasi-separated morphism of algebraic stacks and \mathcal{F} is an object of $\mathcal{M}_{\mathcal{X}}$, then*
 - (a) *the derived direct image $Rf_* \mathcal{F}$ and the higher direct images $R^i f_* \mathcal{F}$ can be computed in either the étale or the fppf topology with the same result, and*
 - (b) *each $R^i f_* \mathcal{F}$ is an object of $\mathcal{M}_{\mathcal{Y}}$.*
- (5) *The category $\mathcal{M}_{\mathcal{X}}$ has colimits and they agree with colimits in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ as well as in $Mod(\mathcal{O}_{\mathcal{X}})$.*

Proof. Part (1) is Sheaves on Stacks, Lemma 73.22.1.

Part (2) for the embedding $\mathcal{M}_{\mathcal{X}} \subset Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ we have seen in the proof of Lemma 79.7.3. Let us prove (2) for the embedding $\mathcal{M}_{\mathcal{X}} \subset Mod(\mathcal{O}_{\mathcal{X}})$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism between objects of $\mathcal{M}_{\mathcal{X}}$. Since $\text{Ker}(\varphi)$ is the same whether computed in the étale or the fppf topology, we see that $\text{Ker}(\varphi)$ is in $\mathcal{M}_{\mathcal{X}}$ by the étale case. On the other hand, the cokernel computed in the fppf topology is the fppf sheafification of the cokernel computed in the étale topology. However,

this étale cokernel is in $\mathcal{M}_{\mathcal{X}}$ hence an fppf sheaf by (1) and we see that the cokernel is in $\mathcal{M}_{\mathcal{X}}$. Finally, suppose that

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

is an exact sequence in $\text{Mod}(\mathcal{O}_{\mathcal{X}})$ (i.e., using the fppf topology) with $\mathcal{F}_1, \mathcal{F}_2$ in $\mathcal{M}_{\mathcal{X}}$. In order to show that \mathcal{F}_3 is an object of $\mathcal{M}_{\mathcal{X}}$ it suffices to show that the sequence is also exact in the étale topology. To do this it suffices to show that any element of $H_{fppf}^1(x, \mathcal{F}_1)$ becomes zero on the members of an étale covering of x (for any object x of \mathcal{X}). This is true because $H_{fppf}^1(x, \mathcal{F}_1) = H_{\text{étale}}^1(x, \mathcal{F}_1)$ by Sheaves on Stacks, Lemma 73.22.2 and because of locality of cohomology, see Cohomology on Sites, Lemma 21.8.3. This proves (2).

Part (3) follows from Lemma 79.7.2 and Sheaves on Stacks, Lemma 73.11.6.

Part (4)(b) for $R^i f_* \mathcal{F}$ computed in the étale cohomology follows from Lemma 79.7.3. Whereupon part (4)(a) follows from Sheaves on Stacks, Lemma 73.22.2 combined with (1) above.

Part (5) for the étale topology follows from Sheaves on Stacks, Lemma 73.11.7 and Lemma 79.7.2. The fppf version then follows as the colimit in the étale topology is already an fppf sheaf by part (1). \square

Lemma 79.7.5. *Let \mathcal{X} be an algebraic stack. With $\mathcal{M}_{\mathcal{X}}$ the category of locally quasi-coherent modules with the flat base change property.*

- (1) *Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on $\mathcal{X}_{\text{étale}}$. If each $f_j^{-1} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_j}$, then \mathcal{F} is in $\mathcal{M}_{\mathcal{X}}$.*
- (2) *Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on \mathcal{X}_{fppf} . If each $f_j^{-1} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_j}$, then \mathcal{F} is in $\mathcal{M}_{\mathcal{X}}$.*

Proof. Part (1) follows from a combination of Lemmas 79.6.1 and 79.7.2. The proof of (2) is analogous to the proof of Lemma 79.6.3. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on \mathcal{X}_{fppf} .

First, suppose there is a morphism $a : \mathcal{U} \rightarrow \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^* \mathcal{F}$ is locally quasi-coherent and has the flat base change property. Then there is an exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow a_* a^* \mathcal{F} \rightarrow b_* b^* \mathcal{F}$$

where b is the morphism $b : \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$, see Sheaves on Stacks, Proposition 73.18.7 and Lemma 73.18.10. Moreover, the pullback $b^* \mathcal{F}$ is the pullback of $a^* \mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent and has the flat base change property, see Proposition 79.7.4. The modules $a_* a^* \mathcal{F}$ and $b_* b^* \mathcal{F}$ are locally quasi-coherent and have the flat base change property by Proposition 79.7.4. We conclude that \mathcal{F} is locally quasi-coherent and has the flat base change property by Proposition 79.7.4.

Choose a scheme U and a surjective smooth morphism $x : U \rightarrow \mathcal{X}$. By part (1) it suffices to show that $x^* \mathcal{F}$ is locally quasi-coherent and has the flat base change property. Again by part (1) it suffices to do this (Zariski) locally on U , hence we may assume that U is affine. By Morphisms of Stacks, Lemma 78.18.10 there exists

an fppf covering $\{a_i : U_i \rightarrow U\}$ such that each $x \circ a_i$ factors through some f_j . Hence the module $a_i^* \mathcal{F}$ on $(Sch/U_i)_{fppf}$ is locally quasi-coherent and has the flat base change property. After refining the covering we may assume $\{U_i \rightarrow U\}_{i=1, \dots, n}$ is a standard fppf covering. Then $x^* \mathcal{F}$ is an fppf module on $(Sch/U)_{fppf}$ whose pullback by the morphism $a : U_1 \amalg \dots \amalg U_n \rightarrow U$ is locally quasi-coherent and has the flat base change property. Hence by the previous paragraph we see that $x^* \mathcal{F}$ is locally quasi-coherent and has the flat base change property as desired. \square

79.8. Parasitic modules

The following definition is compatible with Descent, Definition 34.8.1.

Definition 79.8.1. Let \mathcal{X} be an algebraic stack. A presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules \mathcal{F} is *parasitic* if we have $\mathcal{F}(x) = 0$ for any object x of \mathcal{X} which lies over a scheme U such that the corresponding morphism $x : U \rightarrow \mathcal{X}$ is flat.

Here is a lemma with some properties of this notion.

Lemma 79.8.2. *Let \mathcal{X} be an algebraic stack. Let \mathcal{F} be a presheaf of $\mathcal{O}_{\mathcal{X}}$ -modules.*

- (1) *If \mathcal{F} is parasitic and $g : \mathcal{Y} \rightarrow \mathcal{X}$ is a flat morphism of algebraic stacks, then $g^* \mathcal{F}$ is parasitic.*
- (2) *For $\tau \in \{\text{Zariski, étale, smooth, syntomic, fppf}\}$ we have*
 - (a) *the τ sheafification of a parasitic presheaf of modules is parasitic, and*
 - (b) *the full subcategory of $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$ consisting of parasitic modules is a Serre subcategory.*
- (3) *Suppose \mathcal{F} is a sheaf for the étale topology. Let $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^* \mathcal{F}$ is parasitic then so is \mathcal{F} .*
- (4) *Suppose \mathcal{F} is a sheaf for the fppf topology. Let $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^* \mathcal{F}$ is parasitic then so is \mathcal{F} .*

Proof. To see part (1) let y be an object of \mathcal{Y} which lies over a scheme V such that the corresponding morphism $y : V \rightarrow \mathcal{Y}$ is flat. Then $g(y) : V \rightarrow \mathcal{Y} \rightarrow \mathcal{X}$ is flat as a composition of flat morphisms (see Morphisms of Stacks, Lemma 78.17.2) hence $\mathcal{F}(g(y))$ is zero by assumption. Since $g^* \mathcal{F} = g^{-1} \mathcal{F}(y) = \mathcal{F}(g(y))$ we conclude $g^* \mathcal{F}$ is parasitic.

To see part (2)(a) note that if $\{x_i \rightarrow x\}$ is a τ -covering of \mathcal{X} , then each of the morphisms $x_i \rightarrow x$ lies over a flat morphism of schemes. Hence if x lies over a scheme U such that $x : U \rightarrow \mathcal{X}$ is flat, so do all of the objects x_i . Hence the presheaf \mathcal{F}^+ (see Sites, Section 7.10) is parasitic if the presheaf \mathcal{F} is parasitic. This proves (2)(a) as the sheafification of \mathcal{F} is $(\mathcal{F}^+)^+$.

Let \mathcal{F} be a parasitic τ -module. It is immediate from the definitions that any submodule of \mathcal{F} is parasitic. On the other hand, if $\mathcal{F}' \subset \mathcal{F}$ is a submodule, then it is equally clear that the presheaf $x \mapsto \mathcal{F}(x)/\mathcal{F}'(x)$ is parasitic. Hence the quotient \mathcal{F}/\mathcal{F}' is a parasitic module by (2)(a). Finally, we have to show that given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ with \mathcal{F}_1 and \mathcal{F}_3 parasitic, then \mathcal{F}_2 is parasitic. This follows immediately on evaluating on x lying over a scheme flat over \mathcal{X} . This proves (2)(b), see Homology, Lemma 12.9.2.

Let $f_i : \mathcal{X}_i \rightarrow \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_i^* \mathcal{F}$ is parasitic. Let x be an object of \mathcal{X} which lies over a scheme U such that $x : U \rightarrow \mathcal{X}$ is flat. Consider a surjective smooth covering $W_i \rightarrow U \times_{x, \mathcal{X}} \mathcal{X}_i$. Denote $y_i : W_i \rightarrow \mathcal{X}_i$ the projection. It follows that $\{f_i(y_i) \rightarrow x\}$ is a covering for the smooth topology on \mathcal{X} . Since a composition of flat morphisms is flat we see that $f_i^* \mathcal{F}(y_i) = 0$. On the other hand, as we saw in the proof of (1), we have $f_i^* \mathcal{F}(y_i) = \mathcal{F}(f_i(y_i))$. Hence we see that for some smooth covering $\{x_i \rightarrow x\}_{i \in I}$ in \mathcal{X} we have $\mathcal{F}(x_i) = 0$. This implies $\mathcal{F}(x) = 0$ because the smooth topology is the same as as the étale topology, see More on Morphisms, Lemma 36.28.7. Namely, $\{x_i \rightarrow x\}_{i \in I}$ lies over a smooth covering $\{U_i \rightarrow U\}_{i \in I}$ of schemes. By the lemma just referenced there exists an étale covering $\{V_j \rightarrow U\}_{j \in J}$ which refines $\{U_i \rightarrow U\}_{i \in I}$. Denote $x'_j = x|_{V_j}$. Then $\{x'_j \rightarrow x\}$ is an étale covering in \mathcal{X} refining $\{x_i \rightarrow x\}_{i \in I}$. This means the map $\mathcal{F}(x) \rightarrow \prod_{j \in J} \mathcal{F}(x'_j)$, which is injective as \mathcal{F} is a sheaf in the étale topology, factors through $\mathcal{F}(x) \rightarrow \prod_{i \in I} \mathcal{F}(x_i)$ which is zero. Hence $\mathcal{F}(x) = 0$ as desired.

Proof of (4): omitted. Hint: similar, but simpler, than the proof of (3). \square

Parasitic modules are preserved under absolutely any pushforward.

Lemma 79.8.3. *Let $\tau \in \{\text{étale}, \text{fppf}\}$. Let \mathcal{X} be an algebraic stack. Let \mathcal{F} be a parasitic object of $\text{Mod}(\mathcal{X}_\tau, \mathcal{O}_{\mathcal{X}})$.*

- (1) $H_\tau^i(\mathcal{X}, \mathcal{F}) = 0$ for all i .
- (2) Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then $R^i f_* \mathcal{F}$ (computed in τ -topology) is a parasitic object of $\text{Mod}(\mathcal{Y}_\tau, \mathcal{O}_{\mathcal{Y}})$.

Proof. We first reduce (2) to (1). By Sheaves on Stacks, Lemma 73.20.2 we see that $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf

$$y \longmapsto H_\tau^i(V \times_{y, \mathcal{Y}} \mathcal{X}, \text{pr}^{-1} \mathcal{F})$$

Here y is a typical object of \mathcal{Y} lying over the scheme V . By Lemma 79.8.2 it suffices to show that these cohomology groups are zero when $y : V \rightarrow \mathcal{Y}$ is flat. Note that $\text{pr} : V \times_{y, \mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X}$ is flat as a base change of y . Hence by Lemma 79.8.2 we see that $\text{pr}^{-1} \mathcal{F}$ is parasitic. Thus it suffices to prove (1).

To see (1) we can use the spectral sequence of Sheaves on Stacks, Proposition 73.19.1 to reduce this to the case where \mathcal{X} is an algebraic stack representable by an algebraic space. Note that in the spectral sequence each $f_p^{-1} \mathcal{F} = f_p^* \mathcal{F}$ is a parasitic module by Lemma 79.8.2 because the morphisms $f_p : \mathcal{U}_p = \mathcal{U} \times_{\mathcal{X}} \dots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ are flat. Reusing this spectral sequence one more time (as in the proof of the key Lemma 79.5.1) we reduce to the case where the algebraic stack \mathcal{X} is representable by a scheme X . Then $H_\tau^i(\mathcal{X}, \mathcal{F}) = H^i((\text{Sch}/X)_\tau, \mathcal{F})$. In this case the vanishing follows easily from an argument with Čech coverings, see Descent, Lemma 34.8.2. \square

The following lemma is one of the major reasons we care about parasitic modules. To understand the statement, recall that the functors $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow \text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ and $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow \text{Mod}(\mathcal{O}_{\mathcal{X}})$ aren't exact in general.

Lemma 79.8.4. *Let \mathcal{X} be an algebraic stack. Let \mathcal{F}^\bullet be an exact complex in $QCoh(\mathcal{O}_{\mathcal{X}})$. Then the cohomology sheaves of \mathcal{F}^\bullet in either the étale or the fppf topology are parasitic $\mathcal{O}_{\mathcal{X}}$ -modules.*

Proof. Let $x : U \rightarrow \mathcal{X}$ be a flat morphism where U is a scheme. Then $x^*\mathcal{F}^\bullet$ is exact by Lemma 79.4.1. Hence the restriction $x^*\mathcal{F}^\bullet|_{U_{\acute{e}tale}}$ is exact which is what we had to prove. \square

79.9. Quasi-coherent modules, I

We have seen that the category of quasi-coherent modules on an algebraic stack is equivalent to the category of quasi-coherent modules on a presentation, see Sheaves on Stacks, Section 73.14. This fact is the basis for the following.

Lemma 79.9.1. *Let \mathcal{X} be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}}$ be the category of locally quasi-coherent modules with the flat base change property, see Proposition 79.7.4. The inclusion functor $i : QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow \mathcal{M}_{\mathcal{X}}$ has a right adjoint*

$$Q : \mathcal{M}_{\mathcal{X}} \rightarrow QCoh(\mathcal{O}_{\mathcal{X}})$$

such that $Q \circ i$ is the identity functor.

Proof. Choose a scheme U and a surjective smooth morphism $f : U \rightarrow \mathcal{X}$. Set $R = U \times_{\mathcal{X}} U$ so that we obtain a smooth groupoid (U, R, s, t, c) in algebraic spaces with the property that $\mathcal{X} = [U/R]$, see Algebraic Stacks, Lemma 71.16.2. We may and do replace \mathcal{X} by $[U/R]$. In the proof of Sheaves on Stacks, Proposition 73.13.1 we constructed a functor

$$q_1 : QCoh(U, R, s, t, c) \rightarrow QCoh(\mathcal{O}_{\mathcal{X}}).$$

The construction of the inverse functor in the proof of Sheaves on Stacks, Proposition 73.13.1 works for objects of $\mathcal{M}_{\mathcal{X}}$ and induces a functor

$$q_2 : \mathcal{M}_{\mathcal{X}} \rightarrow QCoh(U, R, s, t, c).$$

Namely, if \mathcal{F} is an object of $\mathcal{M}_{\mathcal{X}}$ then we set

$$q_2(\mathcal{F}) = (f^*\mathcal{F}|_{U_{\acute{e}tale}}, \alpha)$$

where α is the isomorphism

$$t_{small}^*(f^*\mathcal{F}|_{U_{\acute{e}tale}}) \rightarrow t^*f^*\mathcal{F}|_{R_{\acute{e}tale}} \rightarrow s^*f^*\mathcal{F}|_{R_{\acute{e}tale}} \rightarrow s_{small}^*(f^*\mathcal{F}|_{U_{\acute{e}tale}})$$

where the outer two morphisms are the comparison maps. Note that $q_2(\mathcal{F})$ is quasi-coherent precisely because \mathcal{F} is locally quasi-coherent (and we used the flat base change property in the construction of the descent datum α). We omit the verification that the cocycle condition (see Groupoids in Spaces, Definition 60.12.1) holds. We define $Q = q_1 \circ q_2$. Let \mathcal{F} be an object of $\mathcal{M}_{\mathcal{X}}$ and let \mathcal{G} be an object of $QCoh(\mathcal{O}_{\mathcal{X}})$. We have

$$\begin{aligned} \text{Mor}_{\mathcal{M}_{\mathcal{X}}}(i(\mathcal{G}), \mathcal{F}) &= \text{Mor}_{QCoh(U, R, s, t, c)}(q_2(\mathcal{G}), q_2(\mathcal{F})) \\ &= \text{Mor}_{QCoh(\mathcal{O}_{\mathcal{X}})}(\mathcal{G}, Q(\mathcal{F})) \end{aligned}$$

where the first equality is Sheaves on Stacks, Lemma 73.13.2 and the second equality holds because q_1 and q_2 are inverse equivalences of categories. The assertion $Q \circ i \cong \text{id}$ is a formal consequence of the fact that i is fully faithful. \square

Lemma 79.9.2. *Let \mathcal{X} be an algebraic stack. Let $Q : \mathcal{M}_{\mathcal{X}} \rightarrow QCoh(\mathcal{O}_{\mathcal{X}})$ be the functor constructed in Lemma 79.9.1.*

- (1) *The kernel of Q is exactly the collection of parasitic objects of $\mathcal{M}_{\mathcal{X}}$.*
- (2) *For any object \mathcal{F} of $\mathcal{M}_{\mathcal{X}}$ both the kernel and the cokernel of the adjunction map $Q(\mathcal{F}) \rightarrow \mathcal{F}$ are parasitic.*

(3) *The functor Q is exact.*

Proof. Write $\mathcal{X} = [U/R]$ as in the proof of Lemma 79.9.1. Let \mathcal{F} be an object of $\mathcal{M}_{\mathcal{X}}$. It is clear from the proof of Lemma 79.9.1 that \mathcal{F} is in the kernel of Q if and only if $\mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}} = 0$. In particular, if \mathcal{F} is parasitic then \mathcal{F} is in the kernel. Next, let $x : V \rightarrow \mathcal{X}$ be a flat morphism, where V is a scheme. Set $W = V \times_{\mathcal{X}} U$ and consider the diagram

$$\begin{array}{ccc} W & \xrightarrow{\quad q \quad} & V \\ p \downarrow & & \downarrow \\ U & \longrightarrow & \mathcal{X} \end{array}$$

Note that the projection $p : W \rightarrow U$ is flat and the projection $q : W \rightarrow V$ is smooth and surjective. This implies that q_{small}^* is a faithful functor on quasi-coherent modules. By assumption \mathcal{F} has the flat base change property so that we obtain $p_{small}^* \mathcal{F}|_{U_{\acute{e}t\acute{a}l\acute{e}}} \cong q_{small}^* \mathcal{F}|_{V_{\acute{e}t\acute{a}l\acute{e}}}$. Thus if \mathcal{F} is in the kernel of Q , then $\mathcal{F}|_{V_{\acute{e}t\acute{a}l\acute{e}}} = 0$ which completes the proof of (1).

Part (2) follows from the discussion above and the fact that the map $Q(\mathcal{F}) \rightarrow \mathcal{F}$ becomes an isomorphism after restricting to $U_{\acute{e}t\acute{a}l\acute{e}}$.

To see part (3) note that Q is left exact as a right adjoint. Suppose that $0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$ is a short exact sequence in $\mathcal{M}_{\mathcal{X}}$. Let $\mathcal{E} = \text{Coker}(Q(\mathcal{G}) \rightarrow Q(\mathcal{H}))$ in $QCoh(\mathcal{O}_{\mathcal{X}})$. Since $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow \mathcal{M}_{\mathcal{X}}$ is a left adjoint it is right exact. Hence we see that $Q(\mathcal{G}) \rightarrow Q(\mathcal{H}) \rightarrow \mathcal{E} \rightarrow 0$ is exact in $\mathcal{M}_{\mathcal{X}}$. Using Lemma 79.8.4 we find that the top row of the following commutative diagram has parasitic cohomology sheaves at $Q(\mathcal{F})$ and $Q(\mathcal{G})$:

$$\begin{array}{ccccccccc} 0 & \longrightarrow & Q(\mathcal{F}) & \longrightarrow & Q(\mathcal{G}) & \longrightarrow & Q(\mathcal{H}) & \longrightarrow & \mathcal{E} & \longrightarrow & 0 \\ & & a \downarrow & & b \downarrow & & c \downarrow & & \downarrow & & \\ 0 & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{G} & \longrightarrow & \mathcal{H} & \longrightarrow & 0 & & \end{array}$$

The bottom row is exact and the vertical arrows a, b, c have parasitic kernel and cokernels by part (2). It follows that \mathcal{E} is parasitic: in the quotient category of $Mod(\mathcal{O}_{\mathcal{X}})/\text{Parasitic}$ (see Homology, Lemma 12.9.6 and Lemma 79.8.2) we see that a, b, c are isomorphisms and that the top row becomes exact. As it is also quasi-coherent, we conclude that \mathcal{E} is zero because $\mathcal{E} = Q(\mathcal{E}) = 0$ by part (1). \square

79.10. Pushforward of quasi-coherent modules

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Consider the pushforward

$$f_* : Mod(\mathcal{O}_{\mathcal{X}}) \longrightarrow Mod(\mathcal{O}_{\mathcal{Y}})$$

It turns out that this functor almost never preserves the subcategories of quasi-coherent sheaves. For example, consider the morphism of schemes

$$j : X = \mathbf{A}_k^2 \setminus \{0\} \longrightarrow \mathbf{A}_k^2 = Y.$$

Associated to this we have the corresponding morphism of algebraic stacks

$$f = j_{big} : \mathcal{X} = (Sch/X)_{fppf} \rightarrow (Sch/Y)_{fppf} = \mathcal{Y}$$

The pushforward $f_* \mathcal{O}_{\mathcal{X}}$ of the structure sheaf has global sections $k[x, y]$. Hence if $f_* \mathcal{O}_{\mathcal{X}}$ is quasi-coherent on \mathcal{Y} then we would have $f_* \mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{Y}}$. However, consider $T = \text{Spec}(k) \rightarrow \mathbf{A}_k^2 = Y$ mapping to 0. Then $\Gamma(T, f_* \mathcal{O}_{\mathcal{X}}) = 0$ because $X \times_Y T =$

\emptyset whereas $\Gamma(T, \mathcal{O}_Y) = k$. On the positive side, we know from Cohomology of Schemes, Lemma 29.5.2 that for any flat morphism $T \rightarrow Y$ we have the equality $\Gamma(T, f_*\mathcal{O}_X) = \Gamma(T, \mathcal{O}_Y)$ (this uses that j is quasi-compact and quasi-separated).

Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. We work around the problem mentioned above using the following three observations:

- (1) f_* does preserve locally quasi-coherent modules (Lemma 79.6.2),
- (2) f_* transforms a quasi-coherent sheaf into a locally quasi-coherent sheaf whose flat comparison maps are isomorphisms (Lemma 79.7.3), and
- (3) locally quasi-coherent \mathcal{O}_Y -modules with the flat base change property give rise to quasi-coherent modules on a presentation of \mathcal{Y} and hence quasi-coherent modules on \mathcal{Y} , see Sheaves on Stacks, Section 73.14.

Thus we obtain a functor

$$f_{QCoh,*} : QCoh(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_Y)$$

which is a right adjoint to $f^* : QCoh(\mathcal{O}_Y) \rightarrow QCoh(\mathcal{O}_X)$ such that moreover

$$\Gamma(y, f_*\mathcal{F}) = \Gamma(y, f_{QCoh,*}\mathcal{F})$$

for any $y \in \text{Ob}(\mathcal{Y})$ such that the associated 1-morphism $y : V \rightarrow \mathcal{Y}$ is flat, see (insert future reference here). Moreover, a similar construction will produce functors $R^i f_{QCoh,*}$. However, these results will not be sufficient to produce a total direct image functor (of complexes with quasi-coherent cohomology sheaves).

Proposition 79.10.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor $f^* : QCoh(\mathcal{O}_Y) \rightarrow QCoh(\mathcal{O}_X)$ has a right adjoint*

$$f_{QCoh,*} : QCoh(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_Y)$$

which can be defined as the composition

$$QCoh(\mathcal{O}_X) \rightarrow \mathcal{M}_X \xrightarrow{f_*} \mathcal{M}_Y \xrightarrow{Q} QCoh(\mathcal{O}_Y)$$

where the functors f_* and Q are as in Proposition 79.7.4 and Lemma 79.9.1. Moreover, if we define $R^i f_{QCoh,*}$ as the composition

$$QCoh(\mathcal{O}_X) \rightarrow \mathcal{M}_X \xrightarrow{R^i f_*} \mathcal{M}_Y \xrightarrow{Q} QCoh(\mathcal{O}_Y)$$

then the sequence of functors $\{R^i f_{QCoh,*}\}_{i \geq 0}$ forms a cohomological δ -functor.

Proof. This is a combination of the results mentioned in the statement. The adjointness can be shown as follows: Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module and let \mathcal{G} be a quasi-coherent \mathcal{O}_Y -module. Then we have

$$\begin{aligned} \text{Mor}_{QCoh(\mathcal{O}_X)}(f^*\mathcal{G}, \mathcal{F}) &= \text{Mor}_{\mathcal{M}_Y}(\mathcal{G}, f_*\mathcal{F}) \\ &= \text{Mor}_{QCoh(\mathcal{O}_Y)}(\mathcal{G}, Q(f_*\mathcal{F})) \\ &= \text{Mor}_{QCoh(\mathcal{O}_Y)}(\mathcal{G}, f_{QCoh,*}\mathcal{F}) \end{aligned}$$

the first equality by adjointness of f_* and f^* (for arbitrary sheaves of modules). By Proposition 79.7.4 we see that $f_*\mathcal{F}$ is an object of \mathcal{M}_Y (and can be computed in either the fppf or étale topology) and we obtain the second equality by Lemma 79.9.1. The third equality is the definition of $f_{QCoh,*}$.

To see that $\{R^i f_{QCoh,*}\}_{i \geq 0}$ is a cohomological δ -functor as defined in Homology, Definition 12.11.1 let

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

be a short exact sequence of $QCoh(\mathcal{O}_{\mathcal{X}})$. This sequence may not be an exact sequence in $Mod(\mathcal{O}_{\mathcal{X}})$ but we know that it is up to parasitic modules, see Lemma 79.8.4. Thus we may break up the sequence into short exact sequences

$$\begin{aligned} 0 &\rightarrow \mathcal{P}_1 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{I}_2 \rightarrow 0 \\ 0 &\rightarrow \mathcal{I}_2 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{Q}_2 \rightarrow 0 \\ 0 &\rightarrow \mathcal{P}_2 \rightarrow \mathcal{Q}_2 \rightarrow \mathcal{I}_3 \rightarrow 0 \\ 0 &\rightarrow \mathcal{I}_3 \rightarrow \mathcal{F}_3 \rightarrow \mathcal{P}_3 \rightarrow 0 \end{aligned}$$

of $Mod(\mathcal{O}_{\mathcal{X}})$ with \mathcal{P}_i parasitic. Note that each of the sheaves $\mathcal{P}_j, \mathcal{I}_j, \mathcal{Q}_j$ is an object of $\mathcal{M}_{\mathcal{X}}$, see Proposition 79.7.4. Applying $R^i f_*$ we obtain long exact sequences

$$\begin{aligned} 0 &\rightarrow f_* \mathcal{P}_1 \rightarrow f_* \mathcal{F}_1 \rightarrow f_* \mathcal{I}_2 \rightarrow R^1 f_* \mathcal{P}_1 \rightarrow \dots \\ 0 &\rightarrow f_* \mathcal{I}_2 \rightarrow f_* \mathcal{F}_2 \rightarrow f_* \mathcal{Q}_2 \rightarrow R^1 f_* \mathcal{I}_2 \rightarrow \dots \\ 0 &\rightarrow f_* \mathcal{P}_2 \rightarrow f_* \mathcal{Q}_2 \rightarrow f_* \mathcal{I}_3 \rightarrow R^1 f_* \mathcal{P}_2 \rightarrow \dots \\ 0 &\rightarrow f_* \mathcal{I}_3 \rightarrow f_* \mathcal{F}_3 \rightarrow f_* \mathcal{P}_3 \rightarrow R^1 f_* \mathcal{I}_3 \rightarrow \dots \end{aligned}$$

where the terms are objects of $\mathcal{M}_{\mathcal{Y}}$ by Proposition 79.7.4. By Lemma 79.8.3 the sheaves $R^i f_* \mathcal{P}_j$ are parasitic, hence vanish on applying the functor Q , see Lemma 79.9.2. Since Q is exact the maps

$$Q(R^i f_* \mathcal{F}_3) \cong Q(R^i f_* \mathcal{I}_3) \cong Q(R^i f_* \mathcal{Q}_2) \rightarrow Q(R^{i+1} f_* \mathcal{I}_2) \cong Q(R^{i+1} f_* \mathcal{F}_1)$$

can serve as the connecting map which turns the family of functors $\{R^i f_{QCoh,*}\}_{i \geq 0}$ into a cohomological δ -functor. \square

Lemma 79.10.2. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let \mathcal{F} be a quasi-coherent sheaf on \mathcal{X} . Then there exists a spectral sequence with E_2 -page*

$$E_2^{p,q} = H^p(\mathcal{Y}, R^q f_{QCoh,*} \mathcal{F})$$

converging to $H^{p+q}(\mathcal{X}, \mathcal{F})$.

Proof. By Cohomology on Sites, Lemma 21.14.5 the Leray spectral sequence with

$$E_2^{p,q} = H^p(\mathcal{Y}, R^q f_* \mathcal{F})$$

converges to $H^{p+q}(\mathcal{X}, \mathcal{F})$. The kernel and cokernel of the adjunction map

$$R^q f_{QCoh,*} \mathcal{F} \rightarrow R^q f_* \mathcal{F}$$

are parasitic modules on \mathcal{Y} (Lemma 79.9.2) hence have vanishing cohomology (Lemma 79.8.3). It follows formally that $H^p(\mathcal{Y}, R^q f_{QCoh,*} \mathcal{F}) = H^p(\mathcal{Y}, R^q f_* \mathcal{F})$ and we win. \square

Lemma 79.10.3. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be quasi-compact and quasi-separated morphisms of algebraic stacks. Let \mathcal{F} be a quasi-coherent sheaf on \mathcal{X} . Then there exists a spectral sequence with E_2 -page*

$$E_2^{p,q} = R^p g_{QCoh,*} (R^q f_{QCoh,*} \mathcal{F})$$

converging to $R^{p+q}(g \circ f)_{QCoh,*} \mathcal{F}$.

Proof. By Cohomology on Sites, Lemma 21.14.7 the Leray spectral sequence with

$$E_2^{p,q} = R^p g_* (R^q f_* \mathcal{F})$$

converges to $R^{p+q}(g \circ f)_* \mathcal{F}$. By the results of Proposition 79.7.4 all the terms of this spectral sequence are objects of $\mathcal{M}_{\mathcal{Z}}$. Applying the exact functor $Q_{\mathcal{Z}} : \mathcal{M}_{\mathcal{Z}} \rightarrow QCoh(\mathcal{O}_{\mathcal{Z}})$ we obtain a spectral sequence in $QCoh(\mathcal{O}_{\mathcal{Z}})$ covering to $R^{p+q}(g \circ f)_{QCoh,*} \mathcal{F}$. Hence the result follows if we can show that

$$Q_{\mathcal{Z}}(R^p g_* (R^q f_* \mathcal{F})) = Q_{\mathcal{Z}}(R^p g_* (Q_{\mathcal{X}}(R^q f_* \mathcal{F})))$$

This follows from the fact that the kernel and cokernel of the map

$$Q_{\mathcal{X}}(R^q f_* \mathcal{F}) \longrightarrow R^q f_* \mathcal{F}$$

are parasitic (Lemma 79.9.2) and that $R^p g_*$ transforms parasitic modules into parasitic modules (Lemma 79.8.3). \square

To end this section we make explicit the spectral sequences associated to a smooth covering by a scheme. Please compare with Sheaves on Stacks, Sections 73.19 and 73.20.

Proposition 79.10.4. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ be a morphism of algebraic stacks. Assume f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Let \mathcal{F} be a quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -module. Then there is a spectral sequence*

$$E_2^{p,q} = H^q(\mathcal{U}_p, f_p^* \mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}, \mathcal{F})$$

where f_p is the morphism $\mathcal{U} \times_{\mathcal{X}} \dots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ ($p + 1$ factors).

Proof. This is a special case of Sheaves on Stacks, Proposition 73.19.1. \square

Proposition 79.10.5. *Let $f : \mathcal{U} \rightarrow \mathcal{X}$ and $g : \mathcal{X} \rightarrow \mathcal{Y}$ be composable morphisms of algebraic stacks. Assume that*

- (1) *f is representable by algebraic spaces, surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated, and*
- (2) *g is quasi-compact and quasi-separated.*

If \mathcal{F} is in $QCoh(\mathcal{O}_{\mathcal{X}})$ then there is a spectral sequence

$$E_2^{p,q} = R^q(g \circ f_p)_{QCoh,*} f_p^* \mathcal{F} \Rightarrow R^{p+q} g_{QCoh,*} \mathcal{F}$$

in $QCoh(\mathcal{O}_{\mathcal{Y}})$.

Proof. Note that each of the morphisms $f_p : \mathcal{U} \times_{\mathcal{X}} \dots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ is quasi-compact and quasi-separated, hence $g \circ f_p$ is quasi-compact and quasi-separated, hence the assertion makes sense (i.e., the functors $R^q(g \circ f_p)_{QCoh,*}$ are defined). There is a spectral sequence

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1} \mathcal{F} \Rightarrow R^{p+q} g_* \mathcal{F}$$

by Sheaves on Stacks, Proposition 73.20.1. Applying the exact functor $Q_{\mathcal{Y}} : \mathcal{M}_{\mathcal{Y}} \rightarrow QCoh(\mathcal{O}_{\mathcal{Y}})$ gives the desired spectral sequence in $QCoh(\mathcal{O}_{\mathcal{Y}})$. \square

79.11. The lisse-étale and the flat-fppf sites

In the book [LMB00] many of the results above are proved using the lisse-étale site of an algebraic stack. We define this site here. In Examples, Section 82.50 we show that the lisse-étale site isn't functorial. We also define its analogue, the flat-fppf site, which is better suited to the development of algebraic stacks as given in the stacks project (because we use the fppf topology as our base topology). Of course the flat-fppf site isn't functorial either.

Definition 79.11.1. Let \mathcal{X} be an algebraic stack.

- (1) The *lisse-étale site* of \mathcal{X} is the full subcategory $\mathcal{X}_{\text{lisse},\text{étale}}^2$ of \mathcal{X} whose objects are those $x \in \text{Ob}(\mathcal{X})$ lying over a scheme U such that $x : U \rightarrow \mathcal{X}$ is smooth. A covering of $\mathcal{X}_{\text{lisse},\text{étale}}$ is a family of morphisms $\{x_i \rightarrow x\}_{i \in I}$ of $\mathcal{X}_{\text{lisse},\text{étale}}$ which forms a covering of $\mathcal{X}_{\text{étale}}$.
- (2) The *flat-fppf site* of \mathcal{X} is the full subcategory $\mathcal{X}_{\text{flat},\text{fppf}}$ of \mathcal{X} whose objects are those $x \in \text{Ob}(\mathcal{X})$ lying over a scheme U such that $x : U \rightarrow \mathcal{X}$ is flat. A covering of $\mathcal{X}_{\text{flat},\text{fppf}}$ is a family of morphisms $\{x_i \rightarrow x\}_{i \in I}$ of $\mathcal{X}_{\text{flat},\text{fppf}}$ which forms a covering of $\mathcal{X}_{\text{fppf}}$.

We denote $\mathcal{O}_{\mathcal{X}_{\text{lisse},\text{étale}}}$ the restriction of $\mathcal{O}_{\mathcal{X}}$ to the lisse-étale site and similarly for $\mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}$. The relationship between the lisse-étale site and the étale site is as follows (we mainly stick to “topological” properties in this lemma).

Lemma 79.11.2. *Let \mathcal{X} be an algebraic stack.*

- (1) *The inclusion functor $\mathcal{X}_{\text{lisse},\text{étale}} \rightarrow \mathcal{X}_{\text{étale}}$ is fully faithful, continuous and cocontinuous. It follows that*
 - (a) *there is a morphism of topoi*

$$g : \text{Sh}(\mathcal{X}_{\text{lisse},\text{étale}}) \longrightarrow \text{Sh}(\mathcal{X}_{\text{étale}})$$

with g^{-1} given by restriction,

- (b) *the functor g^{-1} has a left adjoint $g_!^{\text{Sh}}$ on sheaves of sets,*
 - (c) *the adjunction maps $g^{-1}g_* \rightarrow \text{id}$ and $\text{id} \rightarrow g^{-1}g_!^{\text{Sh}}$ are isomorphisms,*
 - (d) *the functor g^{-1} has a left adjoint $g_!$ on abelian sheaves,*
 - (e) *the adjunction map $\text{id} \rightarrow g^{-1}g_!$ is an isomorphism, and*
 - (f) *we have $g^{-1}\mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{X}_{\text{lisse},\text{étale}}}$ hence g induces a flat morphism of ringed topoi such that $g^{-1} = g^*$.*
- (2) *The inclusion functor $\mathcal{X}_{\text{flat},\text{fppf}} \rightarrow \mathcal{X}_{\text{fppf}}$ is fully faithful, continuous and cocontinuous. It follows that*
 - (a) *there is a morphism of topoi*

$$g : \text{Sh}(\mathcal{X}_{\text{flat},\text{fppf}}) \longrightarrow \text{Sh}(\mathcal{X}_{\text{fppf}})$$

with g^{-1} given by restriction,

- (b) *the functor g^{-1} has a left adjoint $g_!^{\text{Sh}}$ on sheaves of sets,*
- (c) *the adjunction maps $g^{-1}g_* \rightarrow \text{id}$ and $\text{id} \rightarrow g^{-1}g_!^{\text{Sh}}$ are isomorphisms,*
- (d) *the functor g^{-1} has a left adjoint $g_!$ on abelian sheaves,*
- (e) *the adjunction map $\text{id} \rightarrow g^{-1}g_!$ is an isomorphism, and*
- (f) *we have $g^{-1}\mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}$ hence g induces a flat morphism of ringed topoi such that $g^{-1} = g^*$.*

²In the literature the site is denoted $\text{Lis-ét}(\mathcal{X})$ or $\text{Lis-Et}(\mathcal{X})$ and the associated topos is denoted $\mathcal{X}_{\text{lisse-ét}}$ or $\mathcal{X}_{\text{lisse-et}}$. In the stacks project our convention is to name the site and denote the corresponding topos by $\text{Sh}(\mathcal{C})$.

Proof. In both cases it is immediate that the functor is fully faithful, continuous, and cocontinuous (see Sites, Definitions 7.14.1 and 7.19.1). Hence properties (a), (b), (c) follow from Sites, Lemmas 7.20.5 and 7.20.7. Parts (d), (e) follow from Modules on Sites, Lemmas 18.16.2 and 18.16.4. Part (f) is immediate. \square

Lemma 79.11.3. *Let \mathcal{X} be an algebraic stack. Notation as in Lemma 79.11.2.*

(1) *There exists a functor*

$$g_! : \text{Mod}(\mathcal{X}_{\text{lisse}, \text{étale}}, \mathcal{O}_{\mathcal{X}_{\text{lisse}, \text{étale}}}) \longrightarrow \text{Mod}(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^ . Moreover it agrees with the functor $g_!$ on abelian sheaves and $g^*g_! = \text{id}$.*

(2) *There exists a functor*

$$g_! : \text{Mod}(\mathcal{X}_{\text{flat}, \text{fppf}}, \mathcal{O}_{\mathcal{X}_{\text{flat}, \text{fppf}}}) \longrightarrow \text{Mod}(\mathcal{X}_{\text{fppf}}, \mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^ . Moreover it agrees with the functor $g_!$ on abelian sheaves and $g^*g_! = \text{id}$.*

Proof. In both cases, the existence of the functor $g_!$ follows from Modules on Sites, Lemma 18.40.1. To see that $g_!$ agrees with the functor on abelian sheaves we will show the maps Modules on Sites, Equation (18.40.2.1) are isomorphisms.

Lisse-étale case. Let $x \in \text{Ob}(\mathcal{X}_{\text{lisse}, \text{étale}})$ lying over a scheme U with $x : U \rightarrow \mathcal{X}$ smooth. Consider the induced fully faithful functor

$$g' : \mathcal{X}_{\text{lisse}, \text{étale}}/x \longrightarrow \mathcal{X}_{\text{étale}}/x$$

The right hand side is identified with $(\text{Sch}/U)_{\text{étale}}$ and the left hand side with the full subcategory of schemes U'/U such that the composition $U' \rightarrow U \rightarrow \mathcal{X}$ is smooth. Thus Étale Cohomology, Lemma 44.50.2 applies.

Flat-fppf case. Let $x \in \text{Ob}(\mathcal{X}_{\text{flat}, \text{fppf}})$ lying over a scheme U with $x : U \rightarrow \mathcal{X}$ flat. Consider the induced fully faithful functor

$$g' : \mathcal{X}_{\text{flat}, \text{fppf}}/x \longrightarrow \mathcal{X}_{\text{fppf}}/x$$

The right hand side is identified with $(\text{Sch}/U)_{\text{fppf}}$ and the left hand side with the full subcategory of schemes U'/U such that the composition $U' \rightarrow U \rightarrow \mathcal{X}$ is flat. Thus Étale Cohomology, Lemma 44.50.2 applies.

In both cases the equality $g^*g_! = \text{id}$ follows from $g^* = g^{-1}$ and the equality for abelian sheaves in Lemma 79.11.2. \square

Lemma 79.11.4. *Let \mathcal{X} be an algebraic stack. Notation as in Lemmas 79.11.2 and 79.11.3.*

(1) *We have $g_!\mathcal{O}_{\mathcal{X}_{\text{lisse}, \text{étale}}} = \mathcal{O}_{\mathcal{X}}$.*

(2) *We have $g_!\mathcal{O}_{\mathcal{X}_{\text{flat}, \text{fppf}}} = \mathcal{O}_{\mathcal{X}}$.*

Proof. In this proof we write $\mathcal{C} = \mathcal{X}_{\text{étale}}$ (resp. $\mathcal{C} = \mathcal{X}_{\text{fppf}}$) and we denote $\mathcal{C}' = \mathcal{X}_{\text{lisse}, \text{étale}}$ (resp. $\mathcal{C}' = \mathcal{X}_{\text{flat}, \text{fppf}}$). Then \mathcal{C}' is a full subcategory of \mathcal{C} . In this proof we will think of objects V of \mathcal{C} as schemes over \mathcal{X} and objects U of \mathcal{C}' as schemes smooth (resp. flat) over \mathcal{X} . Finally, we write $\mathcal{O} = \mathcal{O}_{\mathcal{X}}$ and $\mathcal{O}' = \mathcal{O}_{\mathcal{X}_{\text{lisse}, \text{étale}}}$ (resp. $\mathcal{O}' = \mathcal{O}_{\mathcal{X}_{\text{flat}, \text{fppf}}}$). In the notation above we have $\mathcal{O}(V) = \Gamma(V, \mathcal{O}_V)$ and $\mathcal{O}'(U) = \Gamma(U, \mathcal{O}_U)$. Consider the \mathcal{O} -module homomorphism $g_!\mathcal{O}' \rightarrow \mathcal{O}$ adjoint to the identification $\mathcal{O}' = g^{-1}\mathcal{O}$.

Recall that $g_!\mathcal{O}'$ is the sheaf associated to the presheaf $g_{p!}\mathcal{O}'$ given by the rule

$$V \longmapsto \operatorname{colim}_{V \rightarrow U} \mathcal{O}'(U)$$

where the colimit is taken in the category of abelian groups (Modules on Sites, Definition 18.16.1). Below we will use frequently that if

$$V \rightarrow U \rightarrow U'$$

are morphisms and if $f' \in \mathcal{O}'(U')$ restricts to $f \in \mathcal{O}'(U)$, then $(V \rightarrow U, f)$ and $(V \rightarrow U', f')$ define the same element of the colimit. Also, $g_!\mathcal{O}' \rightarrow \mathcal{O}$ maps the element $(V \rightarrow U, f)$ simply to the pullback of f to V .

To see that $g_!\mathcal{O}' \rightarrow \mathcal{O}$ is surjective it suffices to show that $1 \in \Gamma(\mathcal{C}, \mathcal{O})$ is locally in the image. Choose an object U of \mathcal{C}' corresponding to a surjective smooth morphism $U \rightarrow \mathcal{X}$. Then viewing U both as an object of \mathcal{C}' and \mathcal{C} we see that $(U \rightarrow U, 1)$ is an element of the colimit above which maps to $1 \in \mathcal{O}(U)$. Since U surjects onto the final object of $Sh(\mathcal{C})$ we conclude $g_!\mathcal{O}' \rightarrow \mathcal{O}$ is surjective.

Suppose that $s \in g_!\mathcal{O}'(V)$ is a section mapping to zero in $\mathcal{O}(V)$. To finish the proof we have to show that s is zero. After replacing V by the members of a covering we may assume s is an element of the colimit

$$\operatorname{colim}_{V \rightarrow U} \mathcal{O}'(U)$$

Say $s = \sum(\varphi_i, s_i)$ is a finite sum with $\varphi_i : V \rightarrow U_i$, U_i smooth (resp. flat) over \mathcal{X} , and $s_i \in \Gamma(U_i, \mathcal{O}_{U_i})$. Choose a scheme W surjective étale over the algebraic space $U = U_1 \times_{\mathcal{X}} \dots \times_{\mathcal{X}} U_n$. Note that W is still smooth (resp. flat) over \mathcal{X} , i.e., defines an object of \mathcal{C}' . The fibre product

$$V' = V \times_{(\varphi_1, \dots, \varphi_n), U} W$$

is surjective étale over V , hence it suffices to show that s maps to zero in $g_!\mathcal{O}'(V')$. Note that the restriction $\sum(\varphi_i, s_i)|_{V'}$ corresponds to the sum of the pullbacks of the functions s_i to W . In other words, we have reduced to the case of (φ, s) where $\varphi : V \rightarrow U$ is a morphism with U in \mathcal{C}' and $s \in \mathcal{O}'(U)$ restricts to zero in $\mathcal{O}(V)$. By the commutative diagram

$$\begin{array}{ccc} V & \xrightarrow{\quad} & U \times \mathbf{A}^1 \\ & \searrow_{(\varphi, 0)} & \uparrow_{(\operatorname{id}, 0)} \\ & \searrow_{\varphi} & U \end{array}$$

we see that $((\varphi, 0) : V \rightarrow U \times \mathbf{A}^1, \operatorname{pr}_2^*x)$ represents zero in the colimit above. Hence we may replace U by $U \times \mathbf{A}^1$, φ by $(\varphi, 0)$ and s by $\operatorname{pr}_1^*s + \operatorname{pr}_2^*x$. Thus we may assume that the vanishing locus $Z : s = 0$ in U of s is smooth (resp. flat) over \mathcal{X} . Then we see that $(V \rightarrow Z, 0)$ and (φ, s) have the same value in the colimit, i.e., we see that the element s is zero as desired. \square

The lisse-étale and the flat-fppf sites can be used to characterize parasitic modules as follows.

Lemma 79.11.5. *Let \mathcal{X} be an algebraic stack.*

- (1) *Let \mathcal{F} be an $\mathcal{O}_{\mathcal{X}}$ -module with the flat base change property on $\mathcal{X}_{\text{étale}}$. The following are equivalent*
 - (a) *\mathcal{F} is parasitic, and*

- (b) $g^*\mathcal{F} = 0$ where $g : Sh(\mathcal{X}_{\text{lis\`e},\acute{e}t\`a}le) \rightarrow Sh(\mathcal{X}_{\acute{e}t\`a}le)$ is as in Lemma 79.11.2.
- (2) Let \mathcal{F} be an $\mathcal{O}_{\mathcal{X}}$ -module on $\mathcal{X}_{\text{fppf}}$. The following are equivalent
 - (a) \mathcal{F} is parasitic, and
 - (b) $g^*\mathcal{F} = 0$ where $g : Sh(\mathcal{X}_{\text{flat},\text{fppf}}) \rightarrow Sh(\mathcal{X}_{\text{fppf}})$ is as in Lemma 79.11.2.

Proof. Part (2) is immediate from the definitions (this is one of the advantages of the flat-fppf site over the lisse-étale site). The implication (1)(a) \Rightarrow (1)(b) is immediate as well. To see (1)(b) \Rightarrow (1)(a) let U be a scheme and let $x : U \rightarrow \mathcal{X}$ be a surjective smooth morphism. Then x is an object of the lisse-étale site of \mathcal{X} . Hence we see that (1)(b) implies that $\mathcal{F}|_{U_{\acute{e}t\`a}le} = 0$. Let $V \rightarrow \mathcal{X}$ be an flat morphism where V is a scheme. Set $W = U \times_{\mathcal{X}} V$ and consider the diagram

$$\begin{array}{ccc} W & \xrightarrow{q} & V \\ p \downarrow & & \downarrow \\ U & \longrightarrow & \mathcal{X} \end{array}$$

Note that the projection $p : W \rightarrow U$ is flat and the projection $q : W \rightarrow V$ is smooth and surjective. This implies that q_{small}^* is a faithful functor on quasi-coherent modules. By assumption \mathcal{F} has the flat base change property so that we obtain $p_{\text{small}}^*\mathcal{F}|_{U_{\acute{e}t\`a}le} \cong q_{\text{small}}^*\mathcal{F}|_{V_{\acute{e}t\`a}le}$. Thus if \mathcal{F} is in the kernel of g^* , then $\mathcal{F}|_{V_{\acute{e}t\`a}le} = 0$ as desired. \square

The lisse-étale site is functorial for smooth morphisms of algebraic stacks and the flat-fppf site is functorial for flat morphisms of algebraic stacks.

Lemma 79.11.6. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.*

- (1) *If f is smooth, then f restricts to a continuous and cocontinuous functor $\mathcal{X}_{\text{lis\`e},\acute{e}t\`a}le \rightarrow \mathcal{Y}_{\text{lis\`e},\acute{e}t\`a}le$ which gives a morphism of ringed topoi fitting into the following commutative diagram*

$$\begin{array}{ccc} Sh(\mathcal{X}_{\text{lis\`e},\acute{e}t\`a}le) & \xrightarrow{g'} & Sh(\mathcal{X}_{\acute{e}t\`a}le) \\ f' \downarrow & & \downarrow f \\ Sh(\mathcal{Y}_{\text{lis\`e},\acute{e}t\`a}le) & \xrightarrow{g} & Sh(\mathcal{Y}_{\acute{e}t\`a}le) \end{array}$$

We have $f'_(g')^{-1} = g^{-1}f_*$ and $g'_!(f')^{-1} = f^{-1}g_!$.*

- (2) *If f is flat, then f restricts to a continuous and cocontinuous functor $\mathcal{X}_{\text{flat},\text{fppf}} \rightarrow \mathcal{Y}_{\text{flat},\text{fppf}}$ which gives a morphism of ringed topoi fitting into the following commutative diagram*

$$\begin{array}{ccc} Sh(\mathcal{X}_{\text{flat},\text{fppf}}) & \xrightarrow{g'} & Sh(\mathcal{X}_{\text{fppf}}) \\ f' \downarrow & & \downarrow f \\ Sh(\mathcal{Y}_{\text{flat},\text{fppf}}) & \xrightarrow{g} & Sh(\mathcal{Y}_{\text{fppf}}) \end{array}$$

We have $f'_(g')^{-1} = g^{-1}f_*$ and $g'_!(f')^{-1} = f^{-1}g_!$.*

Proof. The initial statement comes from the fact that if $x \in \text{Ob}(\mathcal{X})$ lies over a scheme U such that $x : U \rightarrow \mathcal{X}$ is smooth (resp. flat) and if f is smooth (resp. flat) then $f(x) : U \rightarrow \mathcal{Y}$ is smooth (resp. flat), see Morphisms of Stacks, Lemmas 78.22.2

and 78.17.2. The induced functor $\mathcal{X}_{\text{lisse},\text{étale}} \rightarrow \mathcal{Y}_{\text{lisse},\text{étale}}$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}} \rightarrow \mathcal{Y}_{\text{flat},\text{fppf}}$) is continuous and cocontinuous by our definition of coverings in these categories. Finally, the commutativity of the diagram is a consequence of the fact that the horizontal morphisms are given by the inclusion functors (see Lemma 79.11.2) and Sites, Lemma 7.20.2.

To show that $f'_*(g')^{-1} = g^{-1}f_*$ let \mathcal{F} be a sheaf on $\mathcal{X}_{\text{étale}}$ (resp. $\mathcal{X}_{\text{fppf}}$). There is a canonical pullback map

$$g^{-1}f_*\mathcal{F} \longrightarrow f'_*(g')^{-1}\mathcal{F}$$

see Sites, Section 7.44. We claim this map is an isomorphism. To prove this pick an object y of $\mathcal{Y}_{\text{lisse},\text{étale}}$ (resp. $\mathcal{Y}_{\text{flat},\text{fppf}}$). Say y lies over the scheme V such that $y : V \rightarrow \mathcal{Y}$ is smooth (resp. flat). Since g^{-1} is the restriction we find that

$$(g^{-1}f_*\mathcal{F})(y) = \Gamma(V \times_{y,\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{F})$$

by Sheaves on Stacks, Equation (73.5.0.1). Let $(V \times_{y,\mathcal{Y}} \mathcal{X})' \subset V \times_{y,\mathcal{Y}} \mathcal{X}$ be the full subcategory consisting of objects $z : W \rightarrow V \times_{y,\mathcal{Y}} \mathcal{X}$ such that the induced morphism $W \rightarrow \mathcal{X}$ is smooth (resp. flat). Denote

$$\text{pr}' : (V \times_{y,\mathcal{Y}} \mathcal{X})' \longrightarrow \mathcal{X}_{\text{lisse},\text{étale}} \text{ (resp. } \mathcal{X}_{\text{flat},\text{fppf}})$$

the restriction of the functor pr used in the formula above. Exactly the same argument that proves Sheaves on Stacks, Equation (73.5.0.1) shows that for any sheaf \mathcal{H} on $\mathcal{X}_{\text{lisse},\text{étale}}$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}}$) we have

$$(79.11.6.1) \quad f'_*\mathcal{H}(y) = \Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', (\text{pr}')^{-1}\mathcal{H})$$

Since $(g')^{-1}$ is restriction we see that

$$(f'_*(g')^{-1}\mathcal{F})(y) = \Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', \text{pr}^{-1}\mathcal{F}|_{(V \times_{y,\mathcal{Y}} \mathcal{X})'})$$

By Sheaves on Stacks, Lemma 73.22.3 we see that

$$\Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', \text{pr}^{-1}\mathcal{F}|_{(V \times_{y,\mathcal{Y}} \mathcal{X})'}) = \Gamma(V \times_{y,\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{F})$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \rightarrow \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.

Finally, the equality $g'_!(f')^{-1} = f^{-1}g_!$ follows formally from the equality $f'_*(g')^{-1} = g^{-1}f_*$ by the adjointness of f^{-1} and f_* , the adjointness of $g_!$ and g^{-1} , and their “primed” versions. \square

79.12. Quasi-coherent modules, II

In this section we explain how to think of quasi-coherent modules on an algebraic stack in terms of its lisse-étale or flat-fppf site.

Lemma 79.12.1. *Let \mathcal{X} be an algebraic stack.*

- (1) *Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on $\mathcal{X}_{\text{étale}}$. If each $f_j^{-1}\mathcal{F}$ is quasi-coherent, then so is \mathcal{F} .*
- (2) *Let $f_j : \mathcal{X}_j \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules on $\mathcal{X}_{\text{fppf}}$. If each $f_j^{-1}\mathcal{F}$ is quasi-coherent, then so is \mathcal{F} .*

Proof. Proof of (1). We may replace each of the algebraic stacks \mathcal{X}_j by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 78.22.2). The pullback of \mathcal{F} to $(Sch/U_j)_{\acute{e}tale}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 73.11.2. Then $f = \coprod f_j : U = \coprod U_j \rightarrow \mathcal{X}$ is a smooth surjective morphism. Let $x : V \rightarrow \mathcal{X}$ be an object of \mathcal{X} . By Sheaves on Stacks, Lemma 73.18.10 there exists an étale covering $\{x_i \rightarrow x\}_{i \in I}$ such that each x_i lifts to an object u_i of $(Sch/U)_{\acute{e}tale}$. This just means that x_i lives over a scheme V_i , that $\{V_i \rightarrow V\}$ is an étale covering, and that x_i comes from a morphism $u_i : V_i \rightarrow U$. Then $x_i^* \mathcal{F} = u_i^* f^* \mathcal{F}$ is quasi-coherent. This implies that $x^* \mathcal{F}$ on $(Sch/V)_{\acute{e}tale}$ is quasi-coherent, for example by Modules on Sites, Lemma 18.23.3. By Sheaves on Stacks, Lemma 73.11.3 we see that \mathcal{F} is quasi-coherent.

Proof of (2). This is proved using exactly the same argument, which we fully write out here. We may replace each of the algebraic stacks \mathcal{X}_j by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that flat and locally finite presented morphisms are preserved by composition, see Morphisms of Stacks, Lemmas 78.17.2 and 78.18.2). The pullback of \mathcal{F} to $(Sch/U_j)_{\acute{e}tale}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 73.11.2. Then $f = \coprod f_j : U = \coprod U_j \rightarrow \mathcal{X}$ is a surjective, flat, and locally finitely presented morphism. Let $x : V \rightarrow \mathcal{X}$ be an object of \mathcal{X} . By Sheaves on Stacks, Lemma 73.18.10 there exists an fppf covering $\{x_i \rightarrow x\}_{i \in I}$ such that each x_i lifts to an object u_i of $(Sch/U)_{\acute{e}tale}$. This just means that x_i lives over a scheme V_i , that $\{V_i \rightarrow V\}$ is an fppf covering, and that x_i comes from a morphism $u_i : V_i \rightarrow U$. Then $x_i^* \mathcal{F} = u_i^* f^* \mathcal{F}$ is quasi-coherent. This implies that $x^* \mathcal{F}$ on $(Sch/V)_{\acute{e}tale}$ is quasi-coherent, for example by Modules on Sites, Lemma 18.23.3. By Sheaves on Stacks, Lemma 73.11.3 we see that \mathcal{F} is quasi-coherent. \square

We recall that we have defined the notion of a quasi-coherent module on any ringed topos in Modules on Sites, Section 18.23.

Lemma 79.12.2. *Let \mathcal{X} be an algebraic stack. Notation as in Lemma 79.11.2.*

- (1) *Let \mathcal{H} be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}}$ -module on the lisse-étale site of \mathcal{X} . Then $g_! \mathcal{H}$ is a quasi-coherent module on \mathcal{X} .*
- (2) *Let \mathcal{H} be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{flat, fppf}}$ -module on the flat-fppf site of \mathcal{X} . Then $g_! \mathcal{H}$ is a quasi-coherent module on \mathcal{X} .*

Proof. Pick a scheme U and a surjective smooth morphism $x : U \rightarrow \mathcal{X}$. By Modules on Sites, Definition 18.23.1 there exists an étale (resp. fppf) covering $\{U_i \rightarrow U\}_{i \in I}$ such that each pullback $f_i^{-1} \mathcal{H}$ has a global presentation (see Modules on Sites, Definition 18.17.1). Here $f_i : U_i \rightarrow \mathcal{X}$ is the composition $U_i \rightarrow U \rightarrow \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback “is” the restriction to \mathcal{X}/f_i , see Sheaves on Stacks, Definition 73.9.2 and the discussion following.) Since each f_i is smooth (resp. flat) by Lemma 79.11.6 we see that $f_i^{-1} g_! \mathcal{H} = g_{i,!} (f'_i)^{-1} \mathcal{H}$. Using Lemma 79.12.1 we reduce the statement of the lemma to the case where \mathcal{H} has a global presentation. Say we have

$$\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{H} \longrightarrow 0$$

of \mathcal{O} -modules where $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}}$ (resp. $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{flat, fppf}}$). Since $g_!$ commutes with arbitrary colimits (as a left adjoint functor, see Lemma 79.11.3 and Categories,

Lemma 4.24.4) we conclude that there exists an exact sequence

$$\bigoplus_{j \in J} g_! \mathcal{O} \longrightarrow \bigoplus_{i \in I} g_! \mathcal{O} \longrightarrow g_! \mathcal{H} \longrightarrow 0$$

Finally, Lemma 79.11.4 shows that $g_! \mathcal{O} = \mathcal{O}_{\mathcal{X}}$ and we win. \square

Lemma 79.12.3. *Let \mathcal{X} be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}}$ be the category of locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -modules with the flat base change property.*

- (1) *With g as in Lemma 79.11.2 for the lisse-étale site we have*
 (a) *the functors g^{-1} and $g_!$ define mutually inverse functors*

$$QCoh(\mathcal{O}_{\mathcal{X}}) \begin{array}{c} \xrightarrow{g^{-1}} \\ \xleftarrow{g_!} \end{array} QCoh(\mathcal{X}_{\text{lisse}, \text{étale}}, \mathcal{O}_{\mathcal{X}_{\text{lisse}, \text{étale}}})$$

- (b) *if \mathcal{F} is in $\mathcal{M}_{\mathcal{X}}$ then $g^{-1}\mathcal{F}$ is in $QCoh(\mathcal{X}_{\text{lisse}, \text{étale}}, \mathcal{O}_{\mathcal{X}_{\text{lisse}, \text{étale}}})$ and*
 (c) *$Q(\mathcal{F}) = g_! g^{-1}\mathcal{F}$ where Q is as in Lemma 79.9.1.*

- (2) *With g as in Lemma 79.11.2 for the flat-fppf site we have*
 (a) *the functors g^{-1} and $g_!$ define mutually inverse functors*

$$QCoh(\mathcal{O}_{\mathcal{X}}) \begin{array}{c} \xrightarrow{g^{-1}} \\ \xleftarrow{g_!} \end{array} QCoh(\mathcal{X}_{\text{flat}, \text{fppf}}, \mathcal{O}_{\mathcal{X}_{\text{flat}, \text{fppf}}})$$

- (b) *if \mathcal{F} is in $\mathcal{M}_{\mathcal{X}}$ then $g^{-1}\mathcal{F}$ is in $QCoh(\mathcal{X}_{\text{flat}, \text{fppf}}, \mathcal{O}_{\mathcal{X}_{\text{flat}, \text{fppf}}})$ and*
 (c) *$Q(\mathcal{F}) = g_! g^{-1}\mathcal{F}$ where Q is as in Lemma 79.9.1.*

Proof. Pullback by any morphism of ringed topoi preserves categories of quasi-coherent modules, see Modules on Sites, Lemma 18.23.4. Hence g^{-1} preserves the categories of quasi-coherent modules. The same is true for $g_!$ by Lemma 79.12.2. We know that $\mathcal{H} \rightarrow g^{-1}g_!\mathcal{H}$ is an isomorphism by Lemma 79.11.2. Conversely, if \mathcal{F} is in $QCoh(\mathcal{O}_{\mathcal{X}})$ then the map $g_! g^{-1}\mathcal{F} \rightarrow \mathcal{F}$ is a map of quasi-coherent modules on \mathcal{X} whose restriction to any scheme smooth over \mathcal{X} is an isomorphism. Then the discussion in Sheaves on Stacks, Sections 73.13 and 73.14 (comparing with quasi-coherent modules on presentations) shows it is an isomorphism. This proves (1)(a) and (2)(a).

Let \mathcal{F} be an object of $\mathcal{M}_{\mathcal{X}}$. By Lemma 79.9.2 the kernel and cokernel of the map $Q(\mathcal{F}) \rightarrow \mathcal{F}$ are parasitic. Hence by Lemma 79.11.5 and since $g^* = g^{-1}$ is exact, we conclude $g^*Q(\mathcal{F}) \rightarrow g^*\mathcal{F}$ is an isomorphism. Thus $g^*\mathcal{F}$ is quasi-coherent. This proves (1)(b) and (2)(b). Finally, (1)(c) and (2)(c) follow because $g_! g^*Q(\mathcal{F}) \rightarrow Q(\mathcal{F})$ is an isomorphism by our arguments above. \square

Remark 79.12.4. Let \mathcal{X} be an algebraic stack. The results of Lemmas 79.9.1 and 79.9.2 imply that

$$QCoh(\mathcal{O}_{\mathcal{X}}) = \mathcal{M}_{\mathcal{X}}/\text{Parasitic} \cap \mathcal{M}_{\mathcal{X}}$$

in words: the category of quasi-coherent modules is the category of locally quasi-coherent modules with the flat base change property divided out by the Serre subcategory consisting of parasitic objects. See Homology, Lemma 12.9.6. The existence of the inclusion functor $i : QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow \mathcal{M}_{\mathcal{X}}$ which is left adjoint to the quotient functor means that $\mathcal{M}_{\mathcal{X}} \rightarrow QCoh(\mathcal{O}_{\mathcal{X}})$ is a *Bousfield colocalization* or a *right Bousfield localization* (insert future reference here). Our next goal is to show a similar result holds on the level of derived categories.

Lemma 79.12.5. *Let \mathcal{X} be an algebraic stack.*

- (1) $QCoh(\mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}})$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}})$.
- (2) $QCoh(\mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}})$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}})$.

Proof. We will verify conditions (1), (2), (3), (4) of Homology, Lemma 12.9.3. Since 0 is a quasi-coherent module on any ringed site we see that (1) holds. By definition $QCoh(\mathcal{O})$ is a strictly full subcategory $Mod(\mathcal{O})$, so (2) holds. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be a morphism of quasi-coherent modules on $\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}$ or $\mathcal{X}_{\text{flat},\text{fppf}}$. We have $g^*g_!\mathcal{F} = \mathcal{F}$ and similarly for \mathcal{G} and φ , see Lemma 79.11.3. By Lemma 79.12.2 we see that $g_!\mathcal{F}$ and $g_!\mathcal{G}$ are quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -modules. Hence we see that $\text{Ker}(g_!\varphi)$ and $\text{Coker}(g_!\varphi)$ are quasi-coherent modules on \mathcal{X} . Since g^* is exact (see Lemma 79.11.2) we see that $g^*\text{Ker}(g_!\varphi) = \text{Ker}(g^*g_!\varphi) = \text{Ker}(\varphi)$ and $g^*\text{Coker}(g_!\varphi) = \text{Coker}(g^*g_!\varphi) = \text{Coker}(\varphi)$ are quasi-coherent too (see Lemma 79.12.3). This proves (3).

Finally, suppose that

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0$$

is an extension of $\mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}}$ -modules (resp. $\mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}$ -modules) with \mathcal{F} and \mathcal{G} quasi-coherent. We have to show that \mathcal{E} is quasi-coherent on $\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}}$). We strongly urge the reader to write out what this means on a napkin and prove it him/herself rather than reading the somewhat labyrinthine proof that follows. By Lemma 79.12.3 this is true if and only if $g_!\mathcal{E}$ is quasi-coherent. By Lemmas 79.12.1 and Lemma 79.11.6 we may check this after replacing \mathcal{X} by a smooth (resp. fppf) cover. Choose a scheme U and a smooth surjective morphism $U \rightarrow \mathcal{X}$. By definition there exists an \'etale (resp. fppf) covering $\{U_i \rightarrow U\}_i$ such that \mathcal{G} has a global presentation over each U_i . Replacing \mathcal{X} by U_i (which is permissible by the discussion above) we may assume that the site $\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}}$) has a final object U (in other words \mathcal{X} is representable by the scheme U) and that \mathcal{G} has a global presentation

$$\bigoplus_{j \in J} \mathcal{O} \rightarrow \bigoplus_{i \in I} \mathcal{O} \rightarrow \mathcal{G} \rightarrow 0$$

of \mathcal{O} -modules where $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}}$ (resp. $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}$). Let \mathcal{E}' be the pullback of \mathcal{E} via the map $\bigoplus_{i \in I} \mathcal{O} \rightarrow \mathcal{G}$. Then we see that \mathcal{E} is the cokernel of a map $\bigoplus_{j \in J} \mathcal{O} \rightarrow \mathcal{E}'$ hence by property (3) which we proved above, it suffices to prove that \mathcal{E}' is quasi-coherent. Consider the exact sequence

$$L_1g_!\left(\bigoplus_{i \in I} \mathcal{O}\right) \rightarrow g_!\mathcal{F} \rightarrow g_!\mathcal{E}' \rightarrow g_!\left(\bigoplus_{i \in I} \mathcal{O}\right) \rightarrow 0$$

where $L_1g_!$ is the first left derived functor of $g_! : Mod(\mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\text{a}l\text{e}}}) \rightarrow Mod(\mathcal{X}_{\text{\'e}t\text{a}l\text{e}}, \mathcal{O}_{\mathcal{X}})$ (resp. $g_! : Mod(\mathcal{X}_{\text{flat},\text{fppf}}, \mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}) \rightarrow Mod(\mathcal{X}_{\text{fppf}}, \mathcal{O}_{\mathcal{X}})$). This derived functor exists by Cohomology on Sites, Lemma 21.27.1. Moreover, since $\mathcal{O} = j_{U!}\mathcal{O}_U$ we have $Lg_!\mathcal{O} = g_!\mathcal{O} = \mathcal{O}_{\mathcal{X}}$ also by Cohomology on Sites, Lemma 21.27.1. Thus the left hand term vanishes and we obtain a short exact sequence

$$0 \rightarrow g_!\mathcal{F} \rightarrow g_!\mathcal{E}' \rightarrow \bigoplus_{i \in I} \mathcal{O}_{\mathcal{X}} \rightarrow 0$$

By Proposition 79.7.4 it follows that $g_!\mathcal{E}'$ is locally quasi-coherent with the flat base change property. Finally, Lemma 79.12.3 implies that $\mathcal{E}' = g^{-1}g_!\mathcal{E}'$ is quasi-coherent as desired. \square

Derived Categories of Stacks

80.1. Introduction

In this chapter we write about derived categories associated to algebraic stacks. This means in particular derived categories of quasi-coherent sheaves, i.e., we prove analogues of the results on schemes (see Derived Categories of Schemes, Section 35.1) and algebraic spaces (see Derived Categories of Spaces, Section 57.1). The results in this chapter are different from those in [LMB00] mainly because we consistently use the “big sites”. Before reading this chapter please take a quick look at the chapters “Sheaves on Algebraic Stacks” and “Cohomology of Algebraic Stacks” where the terminology we use here is introduced.

80.2. Conventions, notation, and abuse of language

We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 77.2. We use notation as explained in Cohomology of Stacks, Section 79.3.

80.3. The lisse-étale and the flat-fppf sites

The section is the analogue of Cohomology of Stacks, Section 79.11 for derived categories.

Lemma 80.3.1. *Let \mathcal{X} be an algebraic stack. Notation as in Cohomology of Stacks, Lemmas 79.11.2 and 79.11.3.*

- (1) *The functor $g_! : Ab(\mathcal{X}_{\text{lisse},\text{étale}}) \rightarrow Ab(\mathcal{X}_{\text{étale}})$ has a left derived functor*

$$Lg_! : D(\mathcal{X}_{\text{lisse},\text{étale}}) \longrightarrow D(\mathcal{X}_{\text{étale}})$$

which is left adjoint to g^{-1} and such that $g^{-1}Lg_! = id$.

- (2) *The functor $g_! : Mod(\mathcal{X}_{\text{lisse},\text{étale}}, \mathcal{O}_{\mathcal{X}_{\text{lisse},\text{étale}}}) \rightarrow Mod(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$ has a left derived functor*

$$Lg_! : D(\mathcal{O}_{\mathcal{X}_{\text{lisse},\text{étale}}}) \longrightarrow D(\mathcal{X}_{\text{étale}}, \mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^ and such that $g^*Lg_! = id$.*

- (3) *The functor $g_! : Ab(\mathcal{X}_{\text{flat},\text{fppf}}) \rightarrow Ab(\mathcal{X}_{\text{fppf}})$ has a left derived functor*

$$Lg_! : D(\mathcal{X}_{\text{flat},\text{fppf}}) \longrightarrow D(\mathcal{X}_{\text{fppf}})$$

which is left adjoint to g^{-1} and such that $g^{-1}Lg_! = id$.

- (4) *The functor $g_! : Mod(\mathcal{X}_{\text{flat},\text{fppf}}, \mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}) \rightarrow Mod(\mathcal{X}_{\text{fppf}}, \mathcal{O}_{\mathcal{X}})$ has a left derived functor*

$$Lg_! : D(\mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}) \longrightarrow D(\mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^ and such that $g^*Lg_! = id$.*

Warning: It is not clear (a priori) that $Lg_!$ on modules agrees with $Lg_!$ on abelian sheaves, see Cohomology on Sites, Remark 21.27.2.

Proof. The existence of the functor $Lg_!$ and adjointness to g^* is Cohomology on Sites, Lemma 21.27.1. (For the case of abelian sheaves use the constant sheaf \mathbf{Z} as the structure sheaves.) Moreover, it is computed on a complex \mathcal{H}^\bullet by taking a suitable left resolution $\mathcal{K}^\bullet \rightarrow \mathcal{H}^\bullet$ and applying the functor $g_!$ to \mathcal{K}^\bullet . Since $g^{-1}g_!\mathcal{K}^\bullet = \mathcal{K}^\bullet$ by Cohomology of Stacks, Lemmas 79.11.3 and 79.11.2 we see that the final assertion holds in each case. \square

Lemma 80.3.2. *With assumptions and notation as in Cohomology of Stacks, Lemma 79.11.6. We have*

$$g^{-1} \circ Rf_* = Rf'_* \circ (g')^{-1} \quad \text{and} \quad L(g')_! \circ (f')^{-1} = f^{-1} \circ Lg_!$$

on unbounded derived categories (both for the case of modules and for the case of abelian sheaves).

Proof. Let \mathcal{F} be an abelian sheaf on $\mathcal{X}_{\acute{e}tale}$ (resp. \mathcal{X}_{fppf}). We first show that the canonical (base change) map

$$g^{-1}Rf_*\mathcal{F} \longrightarrow Rf'_*(g')^{-1}\mathcal{F}$$

is an isomorphism. To do this let y be an object of $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. $\mathcal{Y}_{flat,fppf}$). Say y lies over the scheme V such that $y : V \rightarrow \mathcal{Y}$ is smooth (resp. flat). Since g^{-1} is the restriction we find that

$$(g^{-1}R^p f_*\mathcal{F})(y) = H^p_\tau(V \times_{y,\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{F})$$

where $\tau = \acute{e}tale$ (resp. $\tau = fppf$), see Sheaves on Stacks, Lemma 73.20.2. By Cohomology of Stacks, Equation (79.11.6.1) for any sheaf \mathcal{H} on $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$)

$$f'_*\mathcal{H}(y) = \Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', (\text{pr}')^{-1}\mathcal{H})$$

An object of $(V \times_{y,\mathcal{Y}} \mathcal{X})'$ can be seen as a pair (x, φ) where x is an object of $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$) and $\varphi : f(x) \rightarrow y$ is a morphism in \mathcal{Y} . We can also think of φ as a section of $(f')^{-1}h_y$ over x . Thus $(V \times_{y,\mathcal{Y}} \mathcal{X})'$ is the localization of the site $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$) at the sheaf of sets $(f')^{-1}h_y$, see Sites, Lemma 7.29.3. The morphism

$$\text{pr}' : (V \times_{y,\mathcal{Y}} \mathcal{X})' \rightarrow \mathcal{X}_{lisse,\acute{e}tale} \quad (\text{resp.} \quad \text{pr}' : (V \times_{y,\mathcal{Y}} \mathcal{X})' \rightarrow \mathcal{X}_{flat,fppf})$$

is the localization morphism. In particular, the pullback $(\text{pr}')^{-1}$ preserves injective abelian sheaves, see Cohomology on Sites, Lemma 21.13.3. At this point exactly the same argument as in Sheaves on Stacks, Lemma 73.20.2 shows that

$$(80.3.2.1) \quad R^p f'_*\mathcal{H}(y) = H^p_\tau((V \times_{y,\mathcal{Y}} \mathcal{X})', (\text{pr}')^{-1}\mathcal{H})$$

where $\tau = \acute{e}tale$ (resp. $\tau = fppf$). Since $(g')^{-1}$ is given by restriction we conclude that

$$(R^p f'_*(g')^*\mathcal{F})(y) = H^p_\tau((V \times_{y,\mathcal{Y}} \mathcal{X})', \text{pr}^{-1}\mathcal{F}|_{(V \times_{y,\mathcal{Y}} \mathcal{X})'})$$

Finally, we can apply Sheaves on Stacks, Lemma 73.22.3 to see that

$$H^p_\tau((V \times_{y,\mathcal{Y}} \mathcal{X})', \text{pr}^{-1}\mathcal{F}|_{(V \times_{y,\mathcal{Y}} \mathcal{X})'}) = H^p_\tau(V \times_{y,\mathcal{Y}} \mathcal{X}, \text{pr}^{-1}\mathcal{F})$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \rightarrow \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.

The rest of the proof is formal. Since cohomology of abelian groups and sheaves of modules agree we also conclude that $g^{-1}Rf_*\mathcal{F} = Rf'_*(g')^{-1}\mathcal{F}$ when \mathcal{F} is a sheaf of modules on $\mathcal{X}_{\acute{e}tale}$ (resp. \mathcal{X}_{fppf}).

Next we show that for \mathcal{G} (either sheaf of modules or abelian groups) on $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. $\mathcal{Y}_{flat,fppf}$) the canonical map

$$L(g')_!(f')^{-1}\mathcal{G} \rightarrow f^{-1}Lg_!\mathcal{G}$$

is an isomorphism. To see this it is enough to prove for any injective sheaf \mathcal{I} on $\mathcal{X}_{\acute{e}tale}$ (resp. \mathcal{X}_{fppf}) that the induced map

$$\mathrm{Hom}(L(g')_!(f')^{-1}\mathcal{G}, \mathcal{I}[n]) \leftarrow \mathrm{Hom}(f^{-1}Lg_!\mathcal{G}, \mathcal{I}[n])$$

is an isomorphism for all $n \in \mathbf{Z}$. (Hom's taken in suitable derived categories.) By the adjointness of f^{-1} and Rf_* , the adjointness of $Lg_!$ and g^{-1} , and their “primed” versions this follows from the isomorphism $g^{-1}Rf_*\mathcal{I} \rightarrow Rf'_*(g')^{-1}\mathcal{I}$ proved above.

In the case of a bounded complex \mathcal{G}^\bullet (of modules or abelian groups) on $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. \mathcal{Y}_{fppf}) the canonical map

$$(80.3.2.2) \quad L(g')_!(f')^{-1}\mathcal{G}^\bullet \rightarrow f^{-1}Lg_!\mathcal{G}^\bullet$$

is an isomorphism as follows from the case of a sheaf by the usual arguments involving truncations and the fact that the functors $L(g')_!(f')^{-1}$ and $f^{-1}Lg_!$ are exact functors of triangulated categories.

Suppose that \mathcal{G}^\bullet is a bounded above complex (of modules or abelian groups) on $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. \mathcal{Y}_{fppf}). The canonical map (80.3.2.2) is an isomorphism because we can use the stupid truncations $\sigma_{\geq -n}$ (see Homology, Section 12.13) to write \mathcal{G}^\bullet as a colimit $\mathcal{G}^\bullet = \mathrm{colim} \mathcal{G}_n^\bullet$ of bounded complexes. This gives a distinguished triangle

$$\bigoplus_{n \geq 1} \mathcal{G}_n^\bullet \rightarrow \bigoplus_{n \geq 1} \mathcal{G}_n^\bullet \rightarrow \mathcal{G}^\bullet \rightarrow \dots$$

and each of the functors $L(g')_!$, $(f')^{-1}$, f^{-1} , $Lg_!$ commutes with direct sums (of complexes).

If \mathcal{G}^\bullet is an arbitrary complex (of modules or abelian groups) on $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. \mathcal{Y}_{fppf}) then we use the canonical truncations $\tau_{\leq n}$ (see Homology, Section 12.13) to write \mathcal{G}^\bullet as a colimit of bounded above complexes and we repeat the argument of the paragraph above.

Finally, by the adjointness of f^{-1} and Rf_* , the adjointness of $Lg_!$ and g^{-1} , and their “primed” versions we conclude that the first identity of the lemma follows from the second in full generality. \square

Lemma 80.3.3. *Let \mathcal{X} be an algebraic stack. Notation as in Cohomology of Stacks, Lemma 79.11.2.*

- (1) *Let \mathcal{H} be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{lisse,\acute{e}tale}}$ -module on the lisse-étale site of \mathcal{X} . For all $p \in \mathbf{Z}$ the sheaf $H^p(Lg_!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on \mathcal{X} .*
- (2) *Let \mathcal{H} be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{flat,fppf}}$ -module on the flat-fppf site of \mathcal{X} . For all $p \in \mathbf{Z}$ the sheaf $H^p(Lg_!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on \mathcal{X} .*

Proof. Pick a scheme U and a surjective smooth morphism $x : U \rightarrow \mathcal{X}$. By Modules on Sites, Definition 18.23.1 there exists an étale (resp. fppf) covering $\{U_i \rightarrow U\}_{i \in I}$ such that each pullback $f_i^{-1}\mathcal{H}$ has a global presentation (see Modules on Sites, Definition 18.17.1). Here $f_i : U_i \rightarrow \mathcal{X}$ is the composition $U_i \rightarrow U \rightarrow \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback “is” the restriction to \mathcal{X}/f_i , see Sheaves on Stacks, Definition 73.9.2 and the discussion following.) After refining the covering we may assume each U_i is an affine scheme. Since each f_i is smooth (resp. flat) by Lemma 80.3.2 we see that $f_i^{-1}Lg_!\mathcal{H} = Lg_{i,!}(f'_i)^{-1}\mathcal{H}$. Using Cohomology of Stacks, Lemma 79.7.5 we reduce the statement of the lemma to the case where \mathcal{H} has a global presentation and where $\mathcal{X} = (Sch/X)_{fppf}$ for some affine scheme $X = \text{Spec}(A)$.

Say our presentation looks like

$$\bigoplus_{j \in J} \mathcal{O} \rightarrow \bigoplus_{i \in I} \mathcal{O} \rightarrow \mathcal{H} \rightarrow 0$$

where $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{\text{lis\`e},\text{\'e}t\`a}l\`e}$ (resp. $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{\text{flat},\text{fppf}}}$). Note that the site $\mathcal{X}_{\text{lis\`e},\text{\'e}t\`a}l\`e$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}}$) has a final object, namely X/X which is quasi-compact (see Cohomology on Sites, Section 21.16). Hence we have

$$\Gamma(\bigoplus_{i \in I} \mathcal{O}) = \bigoplus_{i \in I} A$$

by Sites, Lemma 7.11.2. Hence the map in the presentation corresponds to a similar presentation

$$\bigoplus_{j \in J} A \rightarrow \bigoplus_{i \in I} A \rightarrow M \rightarrow 0$$

of an A -module M . Moreover, \mathcal{H} is equal to the restriction to the lisse-étale (resp. flat-fppf) site of the quasi-coherent sheaf M^a associated to M . Choose a resolution

$$\dots \rightarrow F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

by free A -modules. The complex

$$\dots \mathcal{O} \otimes_A F_2 \rightarrow \mathcal{O} \otimes_A F_1 \rightarrow \mathcal{O} \otimes_A F_0 \rightarrow \mathcal{H} \rightarrow 0$$

is a resolution of \mathcal{H} by free \mathcal{O} -modules because for each object U/X of $\mathcal{X}_{\text{lis\`e},\text{\'e}t\`a}l\`e$ (resp. $\mathcal{X}_{\text{flat},\text{fppf}}$) the structure morphism $U \rightarrow X$ is flat. Hence by construction the value of $Lg_!\mathcal{H}$ is

$$\dots \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_A F_2 \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_A F_1 \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_A F_0 \rightarrow 0 \rightarrow \dots$$

Since this is a complex of quasi-coherent modules on $\mathcal{X}_{\text{\'e}t\`a}l\`e$ (resp. $\mathcal{X}_{\text{fppf}}$) it follows from Cohomology of Stacks, Proposition 79.7.4 that $H^p(Lg_!\mathcal{H})$ is quasi-coherent. □

80.4. Derived categories of quasi-coherent modules

Let \mathcal{X} be an algebraic stack. As the inclusion functor $QCoh(\mathcal{O}_{\mathcal{X}}) \rightarrow Mod(\mathcal{O}_{\mathcal{X}})$ isn't exact, we cannot define $D_{QCoh}(\mathcal{O}_{\mathcal{X}})$ as the full subcategory of $D(\mathcal{O}_{\mathcal{X}})$ consisting of complexes with quasi-coherent cohomology sheaves. In stead we define the category as follows.

Definition 80.4.1. Let \mathcal{X} be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}} \subset Mod(\mathcal{O}_{\mathcal{X}})$ denote the category of locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -modules with the flat base change property. Let $\mathcal{P}_{\mathcal{X}} \subset \mathcal{M}_{\mathcal{X}}$ be the full subcategory consisting of parasitic objects. We define

the *derived category of $\mathcal{O}_{\mathcal{X}}$ -modules with quasi-coherent cohomology sheaves* as the Verdier quotient¹

$$D_{QCoh}(\mathcal{O}_{\mathcal{X}}) = D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})/D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$$

This definition makes sense: By Cohomology of Stacks, Proposition 79.7.4 we see that $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}})$ hence $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ is a strictly full, saturated triangulated subcategory of $D(\mathcal{O}_{\mathcal{X}})$, see Derived Categories, Lemma 13.13.1. Since parasitic modules form a Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}})$ (by Cohomology of Stacks, Lemma 79.8.2) we see that $\mathcal{P}_{\mathcal{X}} = Parasitic \cap \mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}})$ and hence $D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ is a strictly full, saturated triangulated subcategory of $D(\mathcal{O}_{\mathcal{X}})$. Since clearly

$$D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) \subset D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$$

we conclude that the first is a strictly full, saturated triangulated subcategory of the second. Hence the Verdier quotient exists. A morphism $a : E \rightarrow E'$ of $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ becomes an isomorphism in $D_{QCoh}(\mathcal{O}_{\mathcal{X}})$ if and only if the cone $C(a)$ has parasitic cohomology sheaves, see Derived Categories, Section 13.6 and especially Lemma 13.6.10.

Consider the functors

$$D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) \xrightarrow{H^i} \mathcal{M}_{\mathcal{X}} \xrightarrow{Q} QCoh(\mathcal{O}_{\mathcal{X}})$$

Note that Q annihilates the subcategory $\mathcal{P}_{\mathcal{X}}$, see Cohomology of Stacks, Lemma 79.9.2. By Derived Categories, Lemma 13.6.8 we obtain a cohomological functor

$$(80.4.1.1) \quad H^i : D_{QCoh}(\mathcal{O}_{\mathcal{X}}) \longrightarrow QCoh(\mathcal{O}_{\mathcal{X}})$$

Moreover, note that $E \in D_{QCoh}(\mathcal{O}_{\mathcal{X}})$ is zero if and only if $H^i(E) = 0$ for all $i \in \mathbf{Z}$.

Note that the categories $\mathcal{P}_{\mathcal{X}}$ and $\mathcal{M}_{\mathcal{X}}$ are also weak Serre subcategories of the abelian category $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ of modules in the étale topology, see Cohomology of Stacks, Proposition 79.7.4 and Lemma 79.8.2. Hence the statement of the following lemma makes sense.

Lemma 80.4.2. *Let \mathcal{X} be an algebraic stack. The comparison morphism $\epsilon : \mathcal{X}_{fppf} \rightarrow \mathcal{X}_{\acute{e}tale}$ induces a commutative diagram*

$$\begin{array}{ccccc} D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) & \longrightarrow & D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) & \longrightarrow & D(\mathcal{O}_{\mathcal{X}}) \\ \epsilon^* \uparrow & & \epsilon^* \uparrow & & \epsilon^* \uparrow \\ D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}}) & \longrightarrow & D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}}) & \longrightarrow & D(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}}) \end{array}$$

Moreover, the left two vertical arrows are equivalences of triangulated categories, hence we also obtain an equivalence

$$D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})/D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}}) \longrightarrow D_{QCoh}(\mathcal{O}_{\mathcal{X}})$$

Proof. Since ϵ^* is exact it is clear that we obtain a diagram as in the statement of the lemma. We will show the middle vertical arrow is an equivalence by applying Cohomology on Sites, Lemma 21.22.6 to the following situation: $\mathcal{C} = \mathcal{X}$, $\tau = fppf$, $\tau' = \acute{e}tale$, $\mathcal{O} = \mathcal{O}_{\mathcal{X}}$, $\mathcal{A} = \mathcal{M}_{\mathcal{X}}$, and \mathcal{B} is the set of objects of \mathcal{X} lying over affine schemes. To see the lemma applies we have to check conditions (1), (2), (3), (4).

¹This definition is different from the one in the literature, see [Ols07b, 6.3], but it agrees with that definition by Lemma 80.4.3.

Conditions (1) and (2) are clear from the discussion above (explicitly this follows from Cohomology of Stacks, Proposition 79.7.4). Condition (3) holds because every scheme has a Zariski open covering by affines. Condition (4) follows from Descent, Lemma 34.8.4.

We omit the verification that the equivalence of categories $\epsilon^* : D_{\mathcal{M}_X}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_X) \rightarrow D_{\mathcal{M}_X}(\mathcal{O}_X)$ induces an equivalence of the subcategories of complexes with parasitic cohomology sheaves. \square

It turns out that $D_{QCoh}(\mathcal{O}_X)$ is the same as the derived category of complexes of modules with quasi-coherent cohomology sheaves on the lisse-étale or flat-fppf site.

Lemma 80.4.3. *Let \mathcal{X} be an algebraic stack. Let \mathcal{F}^\bullet be an object of $D_{\mathcal{M}_X}(\mathcal{O}_X)$.*

- (1) *With g as in Cohomology of Stacks, Lemma 79.11.2 for the lisse-étale site we have*
 - (a) $g^{-1}\mathcal{F}^\bullet$ *is in* $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$,
 - (b) $g^{-1}\mathcal{F}^\bullet = 0$ *if and only if* \mathcal{F}^\bullet *is in* $D_{\mathcal{P}_X}(\mathcal{O}_X)$,
 - (c) $Lg_!\mathcal{H}^\bullet$ *is in* $D_{\mathcal{M}_X}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_X)$ *for* \mathcal{H}^\bullet *in* $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$, *and*
 - (d) *the functors* g^{-1} *and* $Lg_!$ *define mutually inverse functors*

$$D_{QCoh}(\mathcal{O}_X) \begin{array}{c} \xrightarrow{g^{-1}} \\ \xleftarrow{Lg_!} \end{array} D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$$

- (2) *With g as in Cohomology of Stacks, Lemma 79.11.2 for the flat-fppf site we have*
 - (a) $g^{-1}\mathcal{F}^\bullet$ *is in* $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$,
 - (b) $g^{-1}\mathcal{F}^\bullet = 0$ *if and only if* \mathcal{F}^\bullet *is in* $D_{\mathcal{P}_X}(\mathcal{O}_X)$,
 - (c) $Lg_!\mathcal{H}^\bullet$ *is in* $D_{\mathcal{M}_X}(\mathcal{O}_X)$ *for* \mathcal{H}^\bullet *in* $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat, fppf}})$, *and*
 - (d) *the functors* g^{-1} *and* $Lg_!$ *define mutually inverse functors*

$$D_{QCoh}(\mathcal{O}_X) \begin{array}{c} \xrightarrow{g^{-1}} \\ \xleftarrow{Lg_!} \end{array} D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat, fppf}})$$

Proof. The functor g^{-1} is exact, hence (a) and (b) follow from Cohomology of Stacks, Lemmas 79.12.3 and 79.11.5.

The construction of $Lg_!$ in Lemma 80.3.1 (via Cohomology on Sites, Lemma 21.27.1 which in turn uses Derived Categories, Proposition 13.28.2) shows that $Lg_!$ on any object \mathcal{H}^\bullet of $D(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$ is computed as

$$Lg_!\mathcal{H}^\bullet = \operatorname{colim} g_!\mathcal{K}_n^\bullet = g_! \operatorname{colim} \mathcal{K}_n^\bullet$$

(termwise colimits) where the quasi-isomorphism $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{H}^\bullet$ induces quasi-isomorphisms $\mathcal{K}_n^\bullet \rightarrow \tau_{\leq n}\mathcal{H}^\bullet$. Since $\mathcal{M}_X \subset \operatorname{Mod}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_X)$ (resp. $\mathcal{M}_X \subset \operatorname{Mod}(\mathcal{O}_X)$) is preserved under colimits we see that it suffices to prove (c) on bounded above complexes \mathcal{H}^\bullet in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$ (resp. $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat, fppf}})$). In this case to show that $H^n(Lg_!\mathcal{H}^\bullet)$ is in \mathcal{M}_X we can argue by induction on the integer m such that $\mathcal{H}^i = 0$ for $i > m$. If $m < n$, then $H^n(Lg_!\mathcal{H}^\bullet) = 0$ and the result holds. In general consider the distinguished triangle

$$\tau_{\leq m-1}\mathcal{H}^\bullet \rightarrow \mathcal{H}^\bullet \rightarrow H^m(\mathcal{H}^\bullet)[-m] \rightarrow \dots$$

(Derived Categories, Remark 13.12.4) and apply the functor $Lg_!$. Since \mathcal{M}_X is a weak Serre subcategory of the module category it suffices to prove (c) for two out

of three. We have the result for $Lg_! \tau_{\leq m-1} \mathcal{H}^\bullet$ by induction and we have the result for $Lg_! H^m(\mathcal{H}^\bullet)[-m]$ by Lemma 80.3.3. Whence (c) holds.

Let us prove (2)(d). By (a) and (b) the functor $g^{-1} = g^*$ induces a functor

$$c : D_{QCoh}(\mathcal{O}_{\mathcal{X}}) \longrightarrow D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat, fppf}})$$

see Derived Categories, Lemma 13.6.8. Thus we have the following diagram of triangulated categories

$$\begin{array}{ccc} D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) & \xrightarrow{q} & D_{QCoh}(\mathcal{O}_{\mathcal{X}}) \\ & \searrow^{g^{-1}} & \swarrow^c \\ & D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat, fppf}}) & \end{array}$$

Lg!

where q is the quotient functor, the inner triangle is commutative, and $g^{-1}Lg! = \text{id}$. For any object of E of $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ the map $a : Lg!g^{-1}E \rightarrow E$ maps to a quasi-isomorphism in $D(\mathcal{O}_{\mathcal{X}_{flat, fppf}})$. Hence the cone on a maps to zero under g^{-1} and by (b) we see that $q(a)$ is an isomorphism. Thus $q \circ Lg!$ is a quasi-inverse to c .

In the case of the lisse-étale site exactly the same argument as above proves that

$$D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}}) / D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$$

is equivalent to $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse, \acute{e}tale}})$. Applying the last equivalence of Lemma 80.4.2 finishes the proof. \square

The following lemma tells us that the quotient functor $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) \rightarrow D_{QCoh}(\mathcal{O}_{\mathcal{X}})$ is a Bousfield colocalization (insert future reference here).

Lemma 80.4.4. *Let \mathcal{X} be an algebraic stack. Let E be an object of $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$. There exists a canonical distinguished triangle*

$$E' \rightarrow E \rightarrow P \rightarrow E'[1]$$

in $D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ such that P is in $D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ and

$$\text{Hom}_{D(\mathcal{O}_{\mathcal{X}})}(E', P') = 0$$

for all P' in $D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$.

Proof. Consider the morphism of ringed topoi $g : Sh(\mathcal{X}_{flat, fppf}) \rightarrow Sh(\mathcal{X}_{fppf})$. Set $E' = Lg!g^{-1}E$ and let P be the cone on the adjunction map $E' \rightarrow E$. Since $g^{-1}E' \rightarrow g^{-1}E$ is an isomorphism we see that P is an object of $D_{\mathcal{P}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}})$ by Lemma 80.4.3 (2)(b). Finally, $\text{Hom}(E', P') = \text{Hom}(Lg!g^{-1}E, P') = \text{Hom}(g^{-1}E, g^{-1}P') = 0$ as $g^{-1}P' = 0$.

Uniqueness. Suppose that $E'' \rightarrow E \rightarrow P'$ is a second distinguished triangle as in the statement of the lemma. Since $\text{Hom}(E', P') = 0$ the morphism $E' \rightarrow E$ factors as $E' \rightarrow E'' \rightarrow E$, see Derived Categories, Lemma 13.4.2. Similarly, the morphism $E'' \rightarrow E$ factors as $E'' \rightarrow E' \rightarrow E$. Consider the composition $\varphi : E' \rightarrow E'$ of the maps $E' \rightarrow E''$ and $E'' \rightarrow E'$. Note that $\varphi - 1 : E' \rightarrow E'$ fits into the commutative diagram

$$\begin{array}{ccc} E' & \longrightarrow & E \\ \downarrow \varphi - 1 & & \downarrow 0 \\ E' & \longrightarrow & E \end{array}$$

hence factors through $P[-1] \rightarrow E$. Since $\text{Hom}(E', P[-1]) = 0$ we see that $\varphi = 1$. Whence the maps $E' \rightarrow E''$ and $E'' \rightarrow E'$ are inverse to each other. \square

80.5. Derived pushforward of quasi-coherent modules

As a first application of the material above we construct the derived pushforward. In Examples, Section 82.51 the reader can find an example of a quasi-compact and quasi-separated morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks such that the direct image functor Rf_* does not induce a functor $D_{Qcoh}(\mathcal{O}_{\mathcal{X}}) \rightarrow D_{Qcoh}(\mathcal{O}_{\mathcal{Y}})$. Thus restricting to bounded below complexes is necessary.

Proposition 80.5.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor Rf_* induces a commutative diagram*

$$\begin{CD} D_{\mathcal{P}_{\mathcal{X}}}^+(\mathcal{O}_{\mathcal{X}}) @>>> D_{\mathcal{M}_{\mathcal{X}}}^+(\mathcal{O}_{\mathcal{X}}) @>>> D(\mathcal{O}_{\mathcal{X}}) \\ @VV Rf_* V @VV Rf_* V @VV Rf_* V \\ D_{\mathcal{P}_{\mathcal{Y}}}^+(\mathcal{O}_{\mathcal{Y}}) @>>> D_{\mathcal{M}_{\mathcal{Y}}}^+(\mathcal{O}_{\mathcal{Y}}) @>>> D(\mathcal{O}_{\mathcal{Y}}) \end{CD}$$

and hence induces a functor

$$Rf_{Qcoh,*} : D_{Qcoh}^+(\mathcal{O}_{\mathcal{X}}) \longrightarrow D_{Qcoh}^+(\mathcal{O}_{\mathcal{Y}})$$

on quotient categories. Moreover, the functor $R^i f_{Qcoh}$ of Cohomology of Stacks, Proposition 79.10.1 are equal to $H^i \circ Rf_{Qcoh,*}$ with H^i as in (80.4.1.1).

Proof. We have to show that $Rf_* E$ is an object of $D_{\mathcal{M}_{\mathcal{Y}}}^+(\mathcal{O}_{\mathcal{Y}})$ for E in $D_{\mathcal{M}_{\mathcal{X}}}^+(\mathcal{O}_{\mathcal{X}})$. This follows from Cohomology of Stacks, Proposition 79.7.4 and the spectral sequence $R^i f_* H^j(E) \Rightarrow R^{i+j} f_* E$. The case of parasitic modules works the same way using Cohomology of Stacks, Lemma 79.8.3. The final statement is clear from the definition of H^i in (80.4.1.1). \square

80.6. Derived pullback of quasi-coherent modules

Derived pullback of complexes with quasi-coherent cohomology sheaves exists in general.

Proposition 80.6.1. *Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The exact functor f^* induces a commutative diagram*

$$\begin{CD} D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) @>>> D(\mathcal{O}_{\mathcal{X}}) \\ @A f^* AA @A f^* AA \\ D_{\mathcal{M}_{\mathcal{Y}}}(\mathcal{O}_{\mathcal{Y}}) @>>> D(\mathcal{O}_{\mathcal{Y}}) \end{CD}$$

The composition

$$D_{\mathcal{M}_{\mathcal{Y}}}(\mathcal{O}_{\mathcal{Y}}) \xrightarrow{f^*} D_{\mathcal{M}_{\mathcal{X}}}(\mathcal{O}_{\mathcal{X}}) \xrightarrow{q_{\mathcal{X}}} D_{Qcoh}(\mathcal{O}_{\mathcal{X}})$$

is left deriveable with respect to the localization $D_{\mathcal{M}_{\mathcal{Y}}}(\mathcal{O}_{\mathcal{Y}}) \rightarrow D_{Qcoh}(\mathcal{O}_{\mathcal{Y}})$ and we may define Lf_{Qcoh}^* as its left derived functor

$$Lf_{Qcoh}^* : D_{Qcoh}(\mathcal{O}_{\mathcal{Y}}) \longrightarrow D_{Qcoh}(\mathcal{O}_{\mathcal{X}})$$

(see *Derived Categories, Definitions 13.15.2 and 13.15.9*). If f is quasi-compact and quasi-separated, then $Lf_{Q\text{Coh}}^*$ and $Rf_{Q\text{Coh},*}$ satisfy the following adjointness:

$$\text{Hom}_{D_{Q\text{Coh}}(\mathcal{O}_X)}(Lf_{Q\text{Coh}}^*A, B) = \text{Hom}_{D_{Q\text{Coh}}(\mathcal{O}_Y)}(A, Rf_{Q\text{Coh},*}B)$$

for $A \in D_{Q\text{Coh}}(\mathcal{O}_Y)$ and $B \in D_{Q\text{Coh}}^+(\mathcal{O}_X)$.

Proof. To prove the first statement, we have to show that f^*E is an object of $D_{\mathcal{M}_X}(\mathcal{O}_X)$ for E in $D_{\mathcal{M}_Y}(\mathcal{O}_Y)$. Since $f^* = f^{-1}$ is exact this follows immediately from the fact that f^* maps \mathcal{M}_Y into \mathcal{M}_X .

Set $\mathcal{D} = D_{\mathcal{M}_Y}(\mathcal{O}_Y)$. Let S be the collection of morphisms in \mathcal{D} whose cone is an object of $D_{\mathcal{P}_Y}(\mathcal{O}_Y)$. Set $\mathcal{D}' = D_{Q\text{Coh}}(\mathcal{O}_X)$. Set $F = q_X \circ f^* : \mathcal{D} \rightarrow \mathcal{D}'$. Then $\mathcal{D}, S, \mathcal{D}', F$ are as in *Derived Categories, Situation 13.15.1 and Definition 13.15.2*. Let us prove that $LF(E)$ is defined for any object E of \mathcal{D} . Namely, consider the triangle

$$E' \rightarrow E \rightarrow P \rightarrow E'[1]$$

constructed in Lemma 80.4.4. Note that $s : E' \rightarrow E$ is an element of S . We claim that E' computes LF . Namely, suppose that $s' : E'' \rightarrow E$ is another element of S , i.e., fits into a triangle $E'' \rightarrow E \rightarrow P' \rightarrow E''[1]$ with P' in $D_{\mathcal{P}_Y}(\mathcal{O}_Y)$. By Lemma 80.4.4 (and its proof) we see that $E' \rightarrow E$ factors through $E'' \rightarrow E$. Thus we see that $E' \rightarrow E$ is cofinal in the system S/E . Hence it is clear that E' computes LF .

To see the final statement, write $B = q_X(H)$ and $A = q_Y(E)$. Choose $E' \rightarrow E$ as above. We will use on the one hand that $Rf_{Q\text{Coh},*}(B) = q_Y(Rf_*H)$ and on the other that $Lf_{Q\text{Coh}}^*(A) = q_X(f^*E')$.

$$\begin{aligned} \text{Hom}_{D_{Q\text{Coh}}(\mathcal{O}_X)}(Lf_{Q\text{Coh}}^*A, B) &= \text{Hom}_{D_{Q\text{Coh}}(\mathcal{O}_X)}(q_X(f^*E'), q_X(H)) \\ &= \text{colim}_{H \rightarrow H'} \text{Hom}_{D(\mathcal{O}_X)}(f^*E', H') \\ &= \text{colim}_{H \rightarrow H'} \text{Hom}_{D(\mathcal{O}_Y)}(E', Rf_*H') \\ &= \text{Hom}_{D(\mathcal{O}_Y)}(E', Rf_*H) \\ &= \text{Hom}_{D_{Q\text{Coh}}(\mathcal{O}_Y)}(A, Rf_{Q\text{Coh},*}B) \end{aligned}$$

Here the colimit is over morphisms $s : H \rightarrow H'$ in $D_{\mathcal{M}_X}^+(\mathcal{O}_X)$ whose cone $P(s)$ is an object of $D_{\mathcal{P}_X}^+(\mathcal{O}_X)$. The first equality we've seen above. The second equality holds by construction of the Verdier quotient. The third equality holds by Cohomology on Sites, Lemma 21.19.1. Since $Rf_*P(s)$ is an object of $D_{\mathcal{P}_Y}^+(\mathcal{O}_Y)$ by Proposition 80.5.1 we see that $\text{Hom}_{D(\mathcal{O}_Y)}(E', Rf_*P(s)) = 0$. Thus the fourth equality holds. The final equality holds by construction of E' . \square

Introducing Algebraic Stacks

81.1. Why read this?

We give a very informal introduction to algebraic stacks aimed at graduate students and advanced undergraduates. The goal is to quickly introduce a simple language which you can use to think about local and global properties of your favorite moduli problem. Having done this it should be possible to ask yourself well-posed questions about moduli problems and to start solving them, whilst assuming a general theory exists. If you end up with an interesting result, you can go back to the general theory in the other parts of the stacks project and fill in the gaps as needed.

The point of view we take here is very close to the point of view taken in [KM85] and [Mum65].

81.2. Preliminary

Let S be a scheme. An *elliptic curve* over S is a triple $(E, f, 0)$ where E is a scheme and $f : E \rightarrow S$ and $0 : S \rightarrow E$ are morphisms of schemes such that

- (1) $f : E \rightarrow S$ is proper, smooth of relative dimension 1,
- (2) for every $s \in S$ the fibre E_s is a connected curve of genus 1, i.e., $H^0(E_s, \mathcal{O})$ and $H^1(E_s, \mathcal{O})$ both are 1-dimensional $\kappa(s)$ -vector spaces, and
- (3) 0 is a section of f .

Given elliptic curves $(E, f, 0)/S$ and $(E', f', 0')/S'$ a *morphism of elliptic curves* over $a : S \rightarrow S'$ is a morphism $\alpha : E \rightarrow E'$ such that the diagram

$$\begin{array}{ccc}
 E & \xrightarrow{\quad \alpha \quad} & E' \\
 \downarrow f & & \downarrow f' \\
 S & \xrightarrow{\quad a \quad} & S'
 \end{array}$$

$\left(\begin{array}{c} \curvearrowright \\ 0 \\ \curvearrowleft \end{array} \right) \quad \left(\begin{array}{c} \curvearrowright \\ 0' \\ \curvearrowleft \end{array} \right)$

is commutative and the inner square is cartesian, in other words the morphism α induces an isomorphism $E \rightarrow S \times_{S'} E'$. We are going to define the stack of elliptic curves $\mathcal{M}_{1,1}$. In the rest of the stacks project we work out the method introduced in Deligne and Mumford's paper [DM69] which consists in presenting $\mathcal{M}_{1,1}$ as a category endowed with a functor

$$p : \mathcal{M}_{1,1} \longrightarrow \text{Sch}, \quad (E, f, 0)/S \longmapsto S$$

This means you work with fibred categories over the categories of schemes, topologies, stacks fibred in groupoids, coverings, etc, etc. In this chapter we throw all of that out of the window and we think about it a bit differently – probably closer to how the initiators of the theory started thinking about it themselves.

81.3. The moduli stack of elliptic curves

Here is what we are going to do:

- (1) Start with your favorite category of schemes Sch .
- (2) Add a new symbol $\mathcal{M}_{1,1}$.
- (3) A morphism $S \rightarrow \mathcal{M}_{1,1}$ is an elliptic curve $(E, f, 0)$ over S .
- (4) A diagram

is commutative if and only if there exists a morphism $\alpha : E \rightarrow E'$ of elliptic curves over $a : S \rightarrow S'$. We say α witnesses the commutativity of the diagram.

- (5) Note that commutative diagrams glue as follows

because $\alpha' \circ \alpha$ witnesses the commutativity of the outer triangle if α and α' witness the commutativity of the left and right triangles.

- (6) The composition

$$S \xrightarrow{a} S' \xrightarrow{(E', f', 0')} \mathcal{M}_{1,1}$$

is given by $(E' \times_{S'} S, f' \times_{S'} S, 0' \times_{S'} S)$.

At the end of this procedure we have enlarged the category Sch of schemes with exactly one object...

Except that we haven't defined what a morphism from $\mathcal{M}_{1,1}$ to a scheme T is. The answer is that it is the weakest possible notion such that compositions make sense. Thus a morphism $F : \mathcal{M}_{1,1} \rightarrow T$ is a rule which to every elliptic curve $(E, f, 0)/S$ associates a morphism $F(E, f, 0) : S \rightarrow T$ such that given any commutative diagram

the diagram

is commutative also. An example is the j -invariant

$$j : \mathcal{M}_{1,1} \rightarrow \mathbf{A}_{\mathbf{Z}}^1$$

which you may have heard of. Aha, so now we're done...

Except, no we're not! We still have to define a notion of morphisms $\mathcal{M}_{1,1} \rightarrow \mathcal{M}_{1,1}$. This we do in exactly the same way as before, i.e., a morphism $F : \mathcal{M}_{1,1} \rightarrow \mathcal{M}_{1,1}$ is a rule which to every elliptic curve $(E, f, 0)/S$ associates another elliptic curve $F(E, f, 0)$ preserving commutativity of diagrams as above. However, since I don't know of a nontrivial example of such a functor, I'll just define the set of morphisms from $\mathcal{M}_{1,1}$ to itself to consist of the identity for now.

I hope you see how to add other objects to this enlarged category. Somehow it seems intuitively clear that given any "well-behaved" moduli problem we can perform the construction above and add an object to our category. In fact, much of modern day algebraic geometry takes place in such a universe where Sch is enlarged with countably many (explicitly constructed) moduli stacks.

You may object that the category we obtain isn't a category because there is a "vagueness" about when diagrams commute and which combinations of diagrams continue to commute as we have to produce a witness to the commutativity. However, it turns out that this, the idea of having witnesses to commutativity, is a valid approach to 2-categories! Thus we stick with it.

81.4. Fibre products

The question we pose here is what should be the fibre product

The answer: A morphism from a scheme T into $?$ should be a triple (a, a', α) where $a : T \rightarrow S$, $a' : T \rightarrow S'$ are morphisms of schemes and where $\alpha : E \times_{S,a} T \rightarrow E' \times_{S',a'} T$ is an isomorphism of elliptic curves over T . This makes sense because of our definition of composition and commutative diagrams earlier in the discussion.

Lemma 81.4.1 (Key fact). *The functor $Sch^{opp} \rightarrow Sets, T \mapsto \{(a, a', \alpha) \text{ as above}\}$ is representable by a scheme $S \times_{\mathcal{M}_{1,1}} S'$.*

Proof. Idea of proof. Relate this functor to

$$Isom_{S \times S'}(E \times S', S \times E')$$

and use Grothendieck's theory of Hilbert schemes. □

Remark 81.4.2. We have the formula $S \times_{\mathcal{M}_{1,1}} S' = (S \times S') \times_{\mathcal{M}_{1,1} \times \mathcal{M}_{1,1}} \mathcal{M}_{1,1}$. Hence the key fact is a property of the diagonal $\Delta_{\mathcal{M}_{1,1}}$ of $\mathcal{M}_{1,1}$.

In any case the key fact allows us to make the following definition.

Definition 81.4.3. We say a morphism $S \rightarrow \mathcal{M}_{1,1}$ is *smooth* if for every morphism $S' \rightarrow \mathcal{M}_{1,1}$ the projection morphism

$$S \times_{\mathcal{M}_{1,1}} S' \longrightarrow S'$$

is smooth.

Note that this is compatible with the notion of a smooth morphism of schemes as the base change of a smooth morphism is smooth. Moreover, it is clear how to extend this definition to other properties of morphisms into $\mathcal{M}_{1,1}$ (or your own favorite moduli stack). In particular we will use it below for *surjective* morphisms.

81.5. The definition

We'll formulate it as a definition and not as a result since we expect the reader to try out other cases (not just the stack $\mathcal{M}_{1,1}$ and not just Sch the category of all schemes).

Definition 81.5.1. We say $\mathcal{M}_{1,1}$ is an *algebraic stack* if and only if

- (1) We have descent for objects for the étale topology on Sch .
- (2) The key fact holds.
- (3) there exists a surjective and smooth morphism $S \rightarrow \mathcal{M}_{1,1}$.

The first condition is a “sheaf property”. We're going to spell it out since there is a technical point we should make. Suppose given a scheme S and an étale covering $\{S_i \rightarrow S\}$ and morphisms $e_i : S_i \rightarrow \mathcal{M}_{1,1}$ such that the diagrams

$$\begin{array}{ccc} S_i \times_S S_j & \xrightarrow{\text{id}} & S_i \times_S S_j \\ & \searrow e_i \circ \text{pr}_1 & \swarrow e_j \circ \text{pr}_2 \\ & \mathcal{M}_{1,1} & \end{array}$$

commute. The sheaf condition does *not* guarantee the existence of a morphism $e : S \rightarrow \mathcal{M}_{1,1}$ in this situation. Namely, we need to pick witnesses α_{ij} for the diagrams above and require that

$$\text{pr}_{02}^* \alpha_{ik} = \text{pr}_{12} \alpha_{jk} \circ \text{pr}_{01}^* \alpha_{ij}$$

as witnesses over $S_i \times_S S_j \times_S S_k$. I think it is clear what this means... If not, then I'm afraid you'll have to read some of the material on categories fibred in groupoids, etc. In any case, the displayed equation is often called the *cocycle condition*. A more precise statement of the “sheaf property” is: given $\{S_i \rightarrow S\}$, $e_i : S_i \rightarrow \mathcal{M}_{1,1}$ and witnesses α_{ij} satisfying the cocycle condition, there exists a unique (up to unique isomorphism) $e : S \rightarrow \mathcal{M}_{1,1}$ with $e_i \cong e|_{S_i}$ recovering the α_{ij} .

As you can see even formulating a precise statement takes a bit of work. The proof of this “sheaf property” relies on a fundamental technique in algebraic geometry, namely descent theory. My suggestion is to initially simply accept the “sheaf property” holds, and see what it implies in practice. In fact, a certain amount of mental agility is required to boil the “sheaf property” down to a manageable statement that you can fit on a napkin. Perhaps the simplest variant which is already a bit interesting is the following: Suppose we have a Galois extension $K \subset L$ of fields with Galois group $G = \text{Gal}(L/K)$. Set $T = \text{Spec}(L)$ and $S = \text{Spec}(K)$. Then $\{T \rightarrow S\}$ is an étale covering. Let $(E, f, 0)$ be an elliptic curve over L . (Yes, this just means that $E \subset \mathbf{P}_L^2$ is given by a Weierstrass equation and 0 is the usual point at infinity.) Denote $E_\sigma = E \times_{T, \text{Spec}(\sigma)} T$ the base change. (Yes, this corresponds to applying σ to the coefficients of the Weierstrass equation, or is it σ^{-1} ?) Now, suppose moreover that for every $\sigma \in G$ we are given an isomorphism

$$\alpha_\sigma : E \longrightarrow E_\sigma$$

over T . The cocycle condition above means in this situation that

$$(\alpha_\tau)^\sigma \circ \alpha_\sigma = \alpha_{\tau\sigma}$$

for $\sigma, \tau \in G$. If you've ever done any group cohomology then this should be familiar. Anyway, the "glueing" condition on $\mathcal{M}_{1,1}$ says that if you have a solution to this set of equations, then there exists an elliptic curve E' over S such that $E \cong E \times_S T$ (it says a little bit more because it also tells you how to recover the α_σ).

Challenge: Can you prove this entirely using only elliptic curves defined in terms of Weierstrass equations?

81.6. A smooth cover

The last thing we have to do is find a smooth cover of $\mathcal{M}_{1,1}$. In fact, in some sense the existence of a smooth cover *implies*¹ the key fact! In the case of elliptic curves we use the Weierstrass equation to construct one.

Set

$$W = \text{Spec}(\mathbf{Z}[a_1, a_2, a_3, a_4, a_6, 1/\Delta])$$

where $\Delta \in \mathbf{Z}[a_1, a_2, a_3, a_4, a_6]$ is a certain polynomial (see below). Set

$$\mathbf{P}_W^2 \supset E_W : zy^2 + a_1xyz + a_3yz^2 = x^3 + a_2x^2z + a_4xz^3 + a_6z^3.$$

Denote $f_W : E_W \rightarrow W$ the projection. Finally, denote $0_W : W \rightarrow E_W$ the section of f_W given by $(0 : 1 : 0)$. It turns out that there is a degree 12 homogeneous polynomial Δ in a_i where $\deg(a_i) = i$ such that $E_W \rightarrow W$ is smooth. You can find it explicitly by computing partials of the Weierstrass equation – of course you can also look it up. You can also use pari/gp to compute it for you. Here it is

$$\begin{aligned} \Delta = & -a_6a_1^6 + a_4a_3a_1^5 + ((-a_3^2 - 12a_6)a_2 + a_4^2)a_1^4 + \\ & (8a_4a_3a_2 + (a_3^3 + 36a_6a_3))a_1^3 + \\ & ((-8a_3^2 - 48a_6)a_2^2 + 8a_4^2a_2 + (-30a_4a_3^2 + 72a_6a_4))a_1^2 + \\ & (16a_4a_3a_2^2 + (36a_3^3 + 144a_6a_3)a_2 - 96a_4^2a_3)a_1 + \\ & (-16a_3^2 - 64a_6)a_2^3 + 16a_4^2a_2^2 + (72a_4a_3^2 + 288a_6a_4)a_2 + \\ & -27a_3^4 - 216a_6a_3^2 - 64a_4^3 - 432a_6^2 \end{aligned}$$

You may recognize the last two terms from the case $y^2 = x^3 + Ax + B$ having discriminant $-64A^3 - 432B^2 = -16(4A^3 + 27B^2)$.

Lemma 81.6.1. *The morphism $W \xrightarrow{(E_W, f_W, 0_W)} \mathcal{M}_{1,1}$ is smooth and surjective.*

Proof. Surjectivity follows from the fact that every elliptic curve over a field has a Weierstrass equation. We give a very rough sketch of one way to prove smoothness. Consider the sub group scheme

$$H = \left\{ \left(\begin{array}{ccc} u^2 & s & 0 \\ 0 & u^3 & 0 \\ r & t & 1 \end{array} \right) \middle| \begin{array}{l} u \text{ unit} \\ s, r, t \text{ arbitrary} \end{array} \right\} \subset \text{GL}_{3, \mathbf{Z}}$$

¹This is a bit of a cheat because in checking the smoothness you have to prove something very close to the key fact – after all smoothness is defined in terms of fibre products. The advantage is that you only have to prove the existence of these fibre products in the case that on one side you have the morphism that you are trying to show provides the smooth cover.

There is an action $H \times W \rightarrow W$ of H on the Weierstrass scheme W . To find the equations for this action write out what a coordinate change given by a matrix in H does to the general Weierstrass equation. Then it turns out the following statements hold

- (1) any elliptic curve $(E, f, 0)/S$ has Zariski locally on S a Weierstrass equation,
- (2) any two Weierstrass equations for $(E, f, 0)$ differ (Zariski locally) by an element of H .

Considering the fibre product $S \times_{\mathcal{M}_{1,1}} W = \text{Isom}_{S \times W}(E \times W, S \times E_W)$ we conclude that this means that the morphism $W \rightarrow \mathcal{M}_{1,1}$ is an H -torsor. Since $H \rightarrow \text{Spec}(\mathbf{Z})$ is smooth, and since torsors over smooth group schemes are smooth we win. \square

Remark 81.6.2. The argument sketched above actually shows that $\mathcal{M}_{1,1} = [W/H]$ is a global quotient stack. It is true about 50% of the time that an argument proving a moduli stack is algebraic will show that it is a global quotient stack.

81.7. Properties of algebraic stacks

Ok, so now we know that $\mathcal{M}_{1,1}$ is an algebraic stack. What can we do with this? Well, it isn't so much the fact that it is an algebraic stack that helps us here, but more the point of view that properties of $\mathcal{M}_{1,1}$ should be encoded in the properties of morphisms $S \rightarrow \mathcal{M}_{1,1}$, i.e., in families of elliptic curves. We list some examples

Local properties:

$$\mathcal{M}_{1,1} \rightarrow \text{Spec}(\mathbf{Z}) \text{ is smooth} \Leftrightarrow W \rightarrow \text{Spec}(\mathbf{Z}) \text{ is smooth}$$

Idea. Local properties of an algebraic stack are encoded in the local properties of its smooth cover.

Global properties:

$$\begin{aligned} \mathcal{M}_{1,1} \text{ is quasi-compact} &\Leftrightarrow W \text{ is quasi-compact} \\ \mathcal{M}_{1,1} \text{ is irreducible} &\Leftrightarrow W \text{ is irreducible} \end{aligned}$$

Idea. Some global properties of an algebraic stack can be read off from the corresponding property of a *suitable*² smooth cover.

Quasi-coherent sheaves:

$$QCoh(\mathcal{O}_{\mathcal{M}_{1,1}}) = H\text{-equivariant quasi-coherent modules on } W$$

Idea. On the one hand a quasi-coherent module on $\mathcal{M}_{1,1}$ should correspond to a quasi-coherent sheaf $\mathcal{F}_{S,e}$ on S for each morphism $e : S \rightarrow \mathcal{M}_{1,1}$. In particular for the morphism $(E_W, f_W, 0_W) : W \rightarrow \mathcal{M}_{1,1}$. Since this morphism is H -equivariant we see the quasi-coherent module \mathcal{F}_W we obtain is H -equivariant. Conversely, given an H -equivariant module we can recover the sheaves $\mathcal{F}_{S,e}$ by descent theory starting with the observation that $S \times_{e, \mathcal{M}_{1,1}} W$ is an H -torsor.

Picard group:

$$\text{Pic}(\mathcal{M}_{1,1}) = \text{Pic}_H(W) = \mathbf{Z}/12\mathbf{Z}$$

²I suppose that it is possible an irreducible algebraic stack exists which doesn't have an irreducible smooth cover – but if so it is going to be quite nasty!

Idea. We have seen the first equality above. Note that $\text{Pic}(W) = 0$ because the ring $\mathbf{Z}[a_1, a_2, a_3, a_4, a_6, 1/\Delta]$ has trivial class group. There is an exact sequence

$$\mathbf{Z}\Delta \rightarrow \text{Pic}_H(\mathbf{A}_{\mathbf{Z}}^5) \rightarrow \text{Pic}_H(W) \rightarrow 0$$

The middle group equals $\text{Hom}(H, \mathbf{G}_m) = \mathbf{Z}$. The image Δ is 12 because Δ has degree 12. This argument is roughly correct, see [FO10].

Étale cohomology: Let Λ be a ring. There is a first quadrant spectral sequence converging to $H_{\text{étale}}^{p+q}(\mathcal{M}_{1,1}, \Lambda)$ with E_2 -page

$$E_2^{p,q} = H_{\text{étale}}^q(W \times H \times \dots \times H, \Lambda) \quad (p \text{ factors } H)$$

Idea. Note that

$$W \times_{\mathcal{M}_{1,1}} W \times_{\mathcal{M}_{1,1}} \dots \times_{\mathcal{M}_{1,1}} W = W \times H \times \dots \times H$$

because $W \rightarrow \mathcal{M}_{1,1}$ is a H -torsor. The spectral sequence is the Čech-to-cohomology spectral sequence for the smooth cover $\{W \rightarrow \mathcal{M}_{1,1}\}$. For example we see that $H_{\text{étale}}^0(\mathcal{M}_{1,1}, \Lambda) = \Lambda$ because W is connected, and $H_{\text{étale}}^1(\mathcal{M}_{1,1}, \Lambda) = 0$ because $H_{\text{étale}}^1(W, \Lambda) = 0$ (of course this requires a proof). Of course, the smooth covering $W \rightarrow \mathcal{M}_{1,1}$ may not be “optimal” for the computation of étale cohomology.

Examples

82.1. Introduction

This chapter will contain examples which illuminate the theory.

82.2. An empty limit

This example is due to Waterhouse, see [Wat72]. Let S be an uncountable set. For every finite subset $T \subset S$ consider the set M_T of injective maps $T \rightarrow \mathbf{N}$. For $T \subset T' \subset S$ finite the restriction $M_{T'} \rightarrow M_T$ is surjective. Thus we have a directed inverse system with surjective transition maps. But $\lim M_T = \emptyset$ as an element in the limit would define an injective map $S \rightarrow \mathbf{N}$.

82.3. A zero limit

Let $(S_i)_{i \in I}$ be a directed inverse system of nonempty sets with surjective transition maps and with $\lim S_i = \emptyset$, see Section 82.2. Let K be a field and set

$$V_i = \bigoplus_{s \in S_i} K$$

Then the transition maps $V_i \rightarrow V_j$ are surjective for $i \geq j$. However, $\lim V_i = 0$. Namely, if $v = (v_i)$ is an element of the limit, then the support of v_i would be a finite subset $T_i \subset S_i$ with $\lim T_i \neq \emptyset$, see Categories, Lemma 4.21.5.

For each i consider the unique K -linear map $V_i \rightarrow K$ which sends each basis vector $s \in S_i$ to 1. Let $W_i \subset V_i$ be the kernel. Then

$$0 \rightarrow (W_i) \rightarrow (V_i) \rightarrow (K) \rightarrow 0$$

is a nonsplit short exact sequence of inverse systems of vector spaces over the directed partially ordered set I . Hence W_i is a directed system of K -vector spaces with surjective transition maps, vanishing limit, and nonvanishing $R^1 \lim$.

82.4. Non-quasi-compact inverse limit of quasi-compact spaces

Let \mathbf{N} denote the set of natural numbers. For every integer n , let I_n denote the set of all natural numbers $> n$. Define T_n to be the unique topology on \mathbf{N} with basis $\{1\}, \dots, \{n\}, I_n$. Denote by X_n the topological space (\mathbf{N}, T_n) . For each $m < n$, the identity map,

$$f_{n,m} : X_n \longrightarrow X_m$$

is continuous. Obviously for $m < n < p$, the composition $f_{p,n} \circ f_{n,m}$ equals $f_{p,m}$. So $((X_n), (f_{n,m}))$ is a directed inverse system of quasi-compact topological spaces.

Let T be the discrete topology on \mathbf{N} , and let X be (\mathbf{N}, T) . Then for every integer n , the identity map,

$$f_n : X \longrightarrow X_n$$

is continuous. We claim that this is the inverse limit of the directed system above. Let (Y, S) be any topological space. For every integer n , let

$$g_n : (Y, S) \longrightarrow (\mathbf{N}, T_n)$$

be a continuous map. Assume that for every $m < n$ we have $f_{n,m} \circ g_n = g_m$, i.e., the system (g_n) is compatible with the directed system above. In particular, all of the set maps g_n are equal to a common set map

$$g : Y \longrightarrow \mathbf{N}.$$

Moreover, for every integer n , since $\{n\}$ is open in X_n , also $g^{-1}(\{n\}) = g_n^{-1}(\{n\})$ is open in Y . Therefore the set map g is continuous for the topology S on Y and the topology T on \mathbf{N} . Thus $(X, (f_n))$ is the inverse limit of the directed system above.

However, clearly X is not quasi-compact, since the infinite open covering by singleton sets has no inverse limit.

Lemma 82.4.1. *There exists an inverse system of quasi-compact topological spaces over \mathbf{N} whose limit is not quasi-compact.*

Proof. See discussion above. □

82.5. A nonintegral connected scheme whose local rings are domains

We give an example of an affine scheme $X = \text{Spec}(A)$ which is connected, all of whose local rings are domains, but which is not integral. Connectedness of X means A has no nontrivial idempotents, see Algebra, Lemma 10.20.3. The local rings of X are domains if, whenever $fg = 0$ in A , every point of X has a neighborhood where either f or g vanishes. As long as A is not a domain, then X is not integral (Properties, Definition 27.3.1).

Roughly speaking, the construction is as follows: let X_0 be the cross (the union of coordinate axes) on the affine plane. Then let X_1 be the (reduced) full preimage of X_0 on the blow-up of the plane (X_1 has three rational components forming a chain). Then blow up the resulting surface at the two singularities of X_1 , and let X_2 be the reduced preimage of X_1 (which has five rational components), etc. Take X to be the inverse limit. The only problem with this construction is that blow-ups glue in a projective line, so X_1 is not affine. Let us correct this by glueing in an affine line instead (so our scheme will be an open subset in what was described above).

Here is a completely algebraic construction: For every $k \geq 0$, let A_k be the following ring: its elements are collections of polynomials $p_i \in \mathbf{C}[x]$ where $i = 0, \dots, 2^k$ such that $p_i(1) = p_{i+1}(0)$. Set $X_k = \text{Spec}(A_k)$. Observe that X_k is a union of $2^k + 1$ affine lines that meet transversally in a chain. Define a ring homomorphism $A_k \rightarrow A_{k+1}$ by

$$(p_0, \dots, p_{2^k}) \longmapsto (p_0, p_0(1), p_1, p_1(1), \dots, p_{2^k}),$$

in other words, every other polynomial is constant. This identifies A_k with a subring of A_{k+1} . Let A be the direct limit of A_k (basically, their union). Set $X = \text{Spec}(A)$. For every k , we have a natural embedding $A_k \rightarrow A$, that is, a map $X \rightarrow X_k$. Each A_k is connected but not integral; this implies that A is connected but not integral. It remains to show that the local rings of A are domains.

Take $f, g \in A$ with $fg = 0$ and $x \in X$. Let us construct a neighborhood of x on which one of f and g vanishes. Choose k such that $f, g \in A_{k-1}$ (note the $k-1$ index). Let y be the image of x in X_k . It suffices to prove that y has a neighborhood on which either f or g viewed as sections of \mathcal{O}_{X_k} vanishes. If y is a smooth point of X_k , that is, it lies on only one of the $2^k + 1$ lines, this is obvious. We can therefore assume that y is one of the 2^k singular points, so two components of X_k pass through y . However, on one of these two components (the one with odd index), both f and g are constant, since they are pullbacks of functions on X_{k-1} . Since $fg = 0$ everywhere, either f or g (say, f) vanishes on the other component. This implies that f vanishes on both components, as required.

82.6. Noncomplete completion

Let R be a ring and let \mathfrak{m} be a maximal ideal. Consider the completion

$$R^\wedge = \lim R/\mathfrak{m}^n.$$

Note that R^\wedge is a local ring with maximal ideal $\mathfrak{m}' = \text{Ker}(R^\wedge \rightarrow R/\mathfrak{m})$. Namely, if $x = (x_n) \in R^\wedge$ is not in \mathfrak{m}' , then $y = (x_n^{-1}) \in R^\wedge$ satisfies $xy = 1$, whence R^\wedge is local by Algebra, Lemma 10.17.2. Now it is always true that R^\wedge complete in its limit topology (see the discussion in More on Algebra, Section 15.26). But beyond that, we have the following questions:

- (1) Is it true that $\mathfrak{m}R^\wedge = \mathfrak{m}'$?
- (2) Is R^\wedge viewed as an R^\wedge -module \mathfrak{m}' -adically complete?
- (3) Is R^\wedge viewed as an R -module \mathfrak{m} -adically complete?

It turns out that of these questions all have a negative answer. The example below was taken from an unpublished note of Bart de Smit and Hendrik Lenstra. See also [Bou61, Exercise III.2.12] and [Yek11, Example 1.8]

Let k be a field, $R = k[x_1, x_2, x_3, \dots]$, and $\mathfrak{m} = (x_1, x_2, x_3, \dots)$. We will think of an element f of R^\wedge as a (possibly) infinite sum

$$f = \sum a_I x^I$$

(using multi-index notation) such that for each $d \geq 0$ there are only finitely many nonzero a_I for $|I| = d$. The maximal ideal $\mathfrak{m}' \subset R^\wedge$ is the collection of f with zero constant term. In particular, the element

$$f = x_1 + x_2^2 + x_3^3 + \dots$$

is in \mathfrak{m}' but not in $\mathfrak{m}R^\wedge$ which shows that (1) is false in this example. Note that we do have $\mathfrak{m}R^\wedge \subset \mathfrak{m}'$. Hence, R^\wedge is not \mathfrak{m} -adically complete as an R -module, then it is also not \mathfrak{m}' -adically complete. To show that R^\wedge is not \mathfrak{m} -adically complete (as an R -module) it suffices to show that $K_2 = \text{Ker}(R^\wedge \rightarrow R/\mathfrak{m}^2)$ is not equal to $\mathfrak{m}^2 R^\wedge$, see Algebra, Lemma 10.93.6. Note that an element of $\mathfrak{m}^2 R^\wedge \subset (\mathfrak{m}')^2$ can be written as a finite sum

$$(82.6.0.1) \quad \sum_{i=1, \dots, t} f_i g_i$$

with $f_i, g_i \in R^\wedge$ having vanishing constant terms. To get an example we are going to choose an $z \in K_2$ of the form

$$z = z_1 + z_2 + z_3 + \dots$$

with the following properties

- (1) there exist sequences $1 < d_1 < d_2 < d_3 < \dots$ and $0 < n_1 < n_2 < n_3 < \dots$ such that $z_i \in k[x_{n_i}, x_{n_i+1}, \dots, x_{n_{i+1}-1}]$ homogeneous of degree d_i , and
- (2) in the ring $k[[x_{n_i}, x_{n_i+1}, \dots, x_{n_{i+1}-1}]]$ the element z_i cannot be written as a sum (82.6.0.1) with $t \leq i$.

Clearly this implies that z is not in $(\mathfrak{m}')^2$ because the image of the relation (82.6.0.1) in the ring $k[[x_{n_i}, x_{n_i+1}, \dots, x_{n_{i+1}-1}]]$ for i large enough would produce a contradiction. Hence it suffices to prove that for all $t > 0$ there exists a $d \gg 0$ and an integer n such that we can find an homogeneous element $z \in k[x_1, \dots, x_n]$ of degree d which cannot be written as a sum (82.6.0.1) for the given t in $k[[x_1, \dots, x_n]]$. Take $n > 2t$ and any $d > 1$ prime to the characteristic of p and set $z = \sum_{i=1, \dots, n} x_i^d$. Then the vanishing locus of the ideal

$$\left(\frac{\partial z}{\partial x_1}, \dots, \frac{\partial z}{\partial x_n} \right) = (dx_1^{d-1}, \dots, dx_n^{d-1})$$

consists of one point. On the other hand,

$$\frac{\partial(\sum_{i=1, \dots, t} f_i g_i)}{\partial x_j} \in (f_1, \dots, f_t, g_1, \dots, g_t)$$

by the Leibniz rule and hence the vanishing locus of these derivatives contains at least

$$V(f_1, \dots, f_t, g_1, \dots, g_t) \subset \text{Spec}(k[[x_1, \dots, x_n]]).$$

Hence this is a contradiction as the dimension of $V(f_1, \dots, f_t, g_1, \dots, g_t)$ is at least $n - 2t \geq 1$.

Lemma 82.6.1. *There exists a local ring R and a maximal ideal \mathfrak{m} such that the completion R^\wedge of R with respect to \mathfrak{m} has the following properties*

- (1) R^\wedge is local, but its maximal ideal is not equal to $\mathfrak{m}R^\wedge$,
- (2) R^\wedge is not a complete local ring, and
- (3) R^\wedge is not \mathfrak{m} -adically complete as an R -module.

Proof. This follows from the discussion above as (with $R = k[x_1, x_2, x_3, \dots]$) the completion of the localization $R_{\mathfrak{m}}$ is equal to the completion of R . \square

82.7. Noncomplete quotient

Let k be a field. Let

$$R = k[t, z_1, z_2, z_3, \dots, w_1, w_2, w_3, \dots, x] / (z_i t - x^i w_i, z_i w_j)$$

Note that in particular $z_i z_j t = 0$ in this ring. Any element f of R can be uniquely written as a finite sum

$$f = \sum_{i=0, \dots, d} f_i x^i$$

where each $f_i \in k[t, z_i, w_j]$ has no terms involving the products $z_i t$ or $z_i w_j$. Moreover, if f is written in this way, then $f \in (x^n)$ if and only if $f_i = 0$ for $i < n$. So x is a nonzerodivisor and $\bigcap (x^n) = 0$. Let R^\wedge be the completion of R with respect to the ideal (x) . Note that R^\wedge is (x) -adically complete, see Algebra, Lemma 10.93.7. By the above we see that an element of R^\wedge can be uniquely written as an infinite sum

$$f = \sum_{i=0}^{\infty} f_i x^i$$

where each $f_i \in k[t, z_i, w_j]$ has no terms involving the products $z_i t$ or $z_i w_j$. Consider the element

$$f = \sum_{i=1}^{\infty} x^i w_i = x w_1 + x^2 w_2 + x^3 w_3 + \dots$$

i.e., we have $f_n = w_n$. Note that $f \in (t, x^n)$ for every n because $x^m w_m \in (t)$ for all m . We claim that $f \notin (t)$. To prove this assume that $t g = f$ where $g = \sum g_l x^l$ in canonical form as above. Since $t z_i z_j = 0$ we may as well assume that none of the g_l have terms involving the products $z_i z_j$. Examining the process to get $t g$ in canonical form we see the following: Given any term $c m$ of g_l where $c \in k$ and m is a monomial in t, z_i, w_j and we make the following replacement

- (1) if the monomial m does not involve any z_i , then $c t m$ is a term of f_l , and
- (2) if the monomial m does involve a z_i then it is equal to $m = z_i$ and we see that $c w_i$ is term of f_{l+i} .

Since g_0 is a polynomial only finitely many of the variables z_i occur in it. Pick n such that z_n does not occur in g_0 . Then the rules above show that w_n does not occur in f_n which is a contradiction. It follows that $R^\wedge/(t)$ is not complete, see Algebra, Lemma 10.93.15.

Lemma 82.7.1. *There exists a ring R complete with respect to a principal ideal I and a principal ideal J such that R/J is not I -adically complete.*

Proof. See discussion above. □

82.8. Completion is not exact

A quick example is the following. Suppose that $R = k[t]$. Let $P = K = \bigoplus_{n \in \mathbf{N}} R$ and $M = \bigoplus_{n \in \mathbf{N}} R/(t^n)$. Then there is a short exact sequence $0 \rightarrow K \rightarrow P \rightarrow M \rightarrow 0$ where the first map is given by multiplication by t^n on the n th summand. We claim that $0 \rightarrow K^\wedge \rightarrow P^\wedge \rightarrow M^\wedge \rightarrow 0$ is not exact in the middle. Namely, $\xi = (t^2, t^3, t^4, \dots) \in P^\wedge$ maps to zero in M^\wedge but is not in the image of $K^\wedge \rightarrow P^\wedge$, because it would be the image of (t, t, t, \dots) which is not an element of K^\wedge .

A “smaller” example is the following. In the situation of Lemma 82.7.1 the short exact sequence $0 \rightarrow J \rightarrow R \rightarrow R/J \rightarrow 0$ does not remain exact after completion. Namely, if $f \in J$ is a generator, then $f : R \rightarrow J$ is surjective, hence $R \rightarrow J^\wedge$ is surjective, hence the image of $J^\wedge \rightarrow R$ is $(f) = J$ but the fact that R/J is noncomplete means that the kernel of the surjection $R \rightarrow (R/J)^\wedge$ is strictly bigger than J , see Algebra, Lemmas 10.93.1 and 10.93.15. By the same token the sequence $R \rightarrow R \rightarrow R/(f) \rightarrow 0$ does not remain exact on completion.

Lemma 82.8.1. *Completion is not an exact functor in general; it is not even right exact in general. This holds even when I is finitely generated on the category of finitely presented modules.*

Proof. See discussion above. □

82.9. The category of complete modules is not abelian

Let R be a ring and let $I \subset R$ be a finitely generated ideal. Consider the category \mathcal{A} of I -adically complete R -modules, see Algebra, Definition 10.93.5. Let $\varphi : M \rightarrow N$ be a morphism of \mathcal{A} . The cokernel of φ in \mathcal{A} is the completion $(\text{Coker}(\varphi))^\wedge$ of the usual cokernel (as I is finitely generated this completion is complete, see Algebra, Lemma 10.93.7). Let $K = \text{Ker}(\varphi)$. We claim that K is complete and hence is the

kernel of φ in \mathcal{A} . Namely, let K^\wedge be the completion. As M is complete we obtain a factorization

$$K \rightarrow K^\wedge \rightarrow M \xrightarrow{\varphi} N$$

Since φ is continuous for the I -adic topology, $K \rightarrow K^\wedge$ has dense image, and $K = \text{Ker}(\varphi)$ we conclude that K^\wedge maps into K . Thus $K^\wedge = K \oplus C$ and K is a direct summand of a complete module, hence complete.

We will give an example that shows that $\text{Im} \neq \text{Coim}$ in general. We take $R = \mathbf{Z}_p = \lim_n \mathbf{Z}/p^n \mathbf{Z}$ to be the ring of p -adic integers and we take $I = (p)$. Consider the map

$$\text{diag}(1, p, p^2, \dots) : \left(\bigoplus_{n \geq 1} \mathbf{Z}_p \right)^\wedge \longrightarrow \prod_{n \geq 1} \mathbf{Z}_p$$

where the left hand side is the p -adic completion of the direct sum. Hence an element of the left hand side is a vector (x_1, x_2, x_3, \dots) with $x_i \in \mathbf{Z}_p$ with p -adic valuation $v_p(x_i) \rightarrow \infty$ as $i \rightarrow \infty$. This maps to $(x_1, px_2, p^2x_3, \dots)$. Hence we see that $(1, p, p^2, \dots)$ is in the closure of the image but not in the image. By our description of kernels and cokernels above it is clear that $\text{Im} \neq \text{Coim}$ for this map.

Lemma 82.9.1. *Let R be a ring and let $I \subset R$ be a finitely generated ideal. The category of I -adically complete R -modules has kernels and cokernels but is not abelian in general.*

Proof. See above. □

82.10. The category of derived complete modules

Let A be a ring and let I be an ideal. Consider the category \mathcal{C} of derived complete modules as defined in More on Algebra, Definition 15.64.4. By More on Algebra, Lemma 15.64.6 we see that \mathcal{C} is abelian.

Let T be a set and let $M_t, t \in T$ be a family of derived complete modules. We claim that in general $\bigoplus M_t$ is not a complete module. For a specific example, let $A = \mathbf{Z}_p$ and $I = (p)$ and $M = \bigoplus_{n \in \mathbf{N}} \mathbf{Z}_p$. The map from M to its p -adic completion isn't surjective. This means that M cannot be derived complete as this would imply otherwise, see More on Algebra, Lemma 15.64.3.

Assume I is finitely generated. Let $\wedge : D(A) \rightarrow D(A)$ denote the **derived completion** functor, see More on Algebra, Lemma 15.64.9. We claim that

$$M = H^0\left(\left(\bigoplus M_t\right)^\wedge\right) \in \text{Ob}(\mathcal{C})$$

is a direct sum of M_t in the category \mathcal{C} . Note that for E a derived complete object of $D(A)$ we have

$$\text{Hom}_{D(A)}\left(\left(\bigoplus M_t\right)^\wedge, E\right) = \text{Hom}_{D(A)}\left(\bigoplus M_t, E\right) = \prod \text{Hom}_{D(A)}(M_t, E)$$

Note that the right hand side is zero if $H^i(E) = 0$ for $i < 1$. In particular, applying this with $E = \tau_{\geq 1}\left(\bigoplus M_t\right)^\wedge$ which is derived complete by More on Algebra, Lemma 15.64.6 we see that the canonical map $\left(\bigoplus M_t\right)^\wedge \rightarrow \tau_{\geq 1}\left(\bigoplus M_t\right)^\wedge$ is zero, in other

words, we have $H^i((\bigoplus M_t)^\wedge) = 0$ for $i \geq 1$. Then, for an object $N \in \mathcal{C}$ we see that

$$\begin{aligned} \mathrm{Hom}_{\mathcal{C}}(M, N) &= \mathrm{Hom}_{D(A)}((\bigoplus M_t)^\wedge, N) \\ &= \prod \mathrm{Hom}_A(M_t, N) \\ &= \prod \mathrm{Hom}_{\mathcal{C}}(M_t, N) \end{aligned}$$

as desired. This implies that \mathcal{C} has all colimits, see Categories, Lemma 4.14.11. In fact, arguing similarly as above we see that given a system M_t in \mathcal{C} over a partially ordered set T the colimit in \mathcal{C} is equal to $H^0((\mathrm{colim} M_t)^\wedge)$ where the inner colimit is the colimit in the category of A -modules.

However, we claim that filtered colimits are not exact in the category \mathcal{C} . Namely, suppose that $A = \mathbf{Z}_p$ and $I = (p)$. One has inclusions $f_n : \mathbf{Z}_p/p\mathbf{Z}_p \rightarrow \mathbf{Z}_p/p^n\mathbf{Z}_p$ of p -adically complete A -modules given by multiplication by p^{n-1} . There are commutative diagrams

$$\begin{array}{ccc} \mathbf{Z}_p/p\mathbf{Z}_p & \xrightarrow{f_n} & \mathbf{Z}_p/p^n\mathbf{Z}_p \\ \downarrow 1 & & \downarrow p \\ \mathbf{Z}_p/p\mathbf{Z}_p & \xrightarrow{f_{n+1}} & \mathbf{Z}_p/p^{n+1}\mathbf{Z}_p \end{array}$$

Now take the colimit of these inclusions in the category \mathcal{C} derived to get $\mathbf{Z}_p/p\mathbf{Z}_p \rightarrow 0$. Namely, the colimit in Mod_A of the system on the right is $\mathbf{Q}_p/\mathbf{Z}_p$. The reader can directly compute that $(\mathbf{Q}_p/\mathbf{Z}_p)^\wedge = \mathbf{Z}_p[1]$ in $D(A)$. Thus $H^0 = 0$ which proves our claim.

Lemma 82.10.1. *Let A be a ring and let $I \subset A$ be an ideal. The category \mathcal{C} of derived complete modules is abelian and the inclusion functor $F : \mathcal{C} \rightarrow \mathrm{Mod}_A$ is exact and commutes with arbitrary limits. If I is finitely generated, then \mathcal{C} has arbitrary direct sums and colimits, but F does not commute with these in general. Finally, filtered colimits are not exact in \mathcal{C} in general, hence \mathcal{C} is not a Grothendieck abelian category.*

Proof. See discussion above. \square

82.11. Nonflat completions

In this section we give some examples of completions which are not exact.

Lemma 82.11.1. *Let R be a ring. Let M be an R -module which is countable. Then M is a finite R -module if and only if $M \otimes_R R^\mathbf{N} \rightarrow M^\mathbf{N}$ is surjective.*

Proof. If M is a finite module, then the map is surjective by Algebra, Proposition 10.86.2. Conversely, assume the map is surjective. Let m_1, m_2, m_3, \dots be an enumeration of the elements of M . Let $\sum_{j=1, \dots, m} x_j \otimes a_j$ be an element of the tensor product mapping to the element $(m_n) \in M^\mathbf{N}$. Then we see that x_1, \dots, x_m generate M over R as in the proof of Algebra, Proposition 10.86.2. \square

Lemma 82.11.2. *Let R be a countable ring. Let M be a countable R -module. Then M is finitely presented if and only if the canonical map $M \otimes_R R^\mathbf{N} \rightarrow M^\mathbf{N}$ is an isomorphism.*

Proof. If M is a finitely presented module, then the map is an isomorphism by Algebra, Proposition 10.86.3. Conversely, assume the map is an isomorphism. By Lemma 82.11.1 the module M is finite. Choose a surjection $R^{\oplus m} \rightarrow M$ with kernel K . Then K is countable as a submodule of $R^{\oplus m}$. Arguing as in the proof of Algebra, Proposition 10.86.3 we see that $K \otimes_R R^{\mathbb{N}} \rightarrow K^{\mathbb{N}}$ is surjective. Hence we conclude that K is a finite R -module by Lemma 82.11.1. Thus M is finitely presented. \square

Lemma 82.11.3. *Let R be a countable ring. Then R is coherent if and only if $R^{\mathbb{N}}$ is a flat R -module.*

Proof. If R is coherent, then $R^{\mathbb{N}}$ is a flat module by Algebra, Proposition 10.87.5. Assume $R^{\mathbb{N}}$ is flat. Let $I \subset R$ be a finitely generated ideal. To prove the lemma we show that I is finitely presented as an R -module. Namely, the map $I \otimes_R R^{\mathbb{N}} \rightarrow R^{\mathbb{N}}$ is injective as $R^{\mathbb{N}}$ is flat and its image is $I^{\mathbb{N}}$ by Lemma 82.11.1. Thus we conclude by Lemma 82.11.2. \square

Let R be a countable ring. Observe that $R[[x]]$ is isomorphic to $R^{\mathbb{N}}$ as an R -module. By Lemma 82.11.3 we see that $R \rightarrow R[[x]]$ is flat if and only if R is coherent. There are plenty of noncoherent countable rings, for example

$$R = k[y, z, a_1, b_1, a_2, b_2, a_3, b_3, \dots] / (a_1y + b_1z, a_2y + b_2z, a_3y + b_3z, \dots)$$

where k is a countable field. This ring is not coherent because the ideal (y, z) of R is not a finitely presented R -module. Note that $R[[x]]$ is the completion of $R[x]$ by the principal ideal (x) .

Lemma 82.11.4. *There exists a ring such that the completion $R[[x]]$ of $R[x]$ at (x) is not flat over R and a fortiori not flat over $R[x]$.*

Proof. See discussion above. \square

Next, we will construct an example where the completion of a localization is nonflat. To do this consider the ring

$$R = k[y, z, a_1, a_2, a_3, \dots] / (ya_i, a_i a_j)$$

Denote $f \in R$ the residue class of z . We claim the ring map

$$(82.11.4.1) \quad R[[x]] \longrightarrow R_f[[x]]$$

isn't flat. Let I be the kernel of $y : R[[x]] \rightarrow R[[x]]$. A typical element g of I looks like $g = \sum g_{n,m} a_m x^n$ where $g_{n,m} \in k[z]$ and for a given n only a finite number of nonzero $g_{n,m}$. Let J be the kernel of $y : R_f[[x]] \rightarrow R_f[[x]]$. We claim that $J \neq IR_f[[x]]$. Namely, if this were true then we would have

$$\sum z^{-n} a_n x^n = \sum_{i=1, \dots, m} h_i g_i$$

for some $m \geq 1$, $g_i \in I$, and $h_i \in R_f[[x]]$. Say $h_i = \bar{h}_i \bmod (y, a_1, a_2, a_3, \dots)$ with $\bar{h}_i \in k[z, 1/z][[x]]$. Looking at the coefficient of a_n and using the description of the elements g_i above we would get

$$z^{-n} x^n = \sum \bar{h}_i \bar{g}_{i,n}$$

for some $\bar{g}_{i,n} \in k[z][[x]]$. This would mean that all $z^{-n} x^n$ are contained in the finite $k[z][[x]]$ -module generated by the elements \bar{h}_i . Since $k[z][[x]]$ is Noetherian this implies that the $R[z][[x]]$ -submodule of $k[z, 1/z][[x]]$ generated by $1, z^{-1}x, z^{-2}x^2, \dots$

is finite. By Algebra, Lemma 10.35.2 we would conclude that $z^{-1}x$ is integral over $k[z][[x]]$ which is absurd. On the other hand, if (82.11.4.1) were flat, then we would get $J = IR_f[[x]]$ by tensoring the exact sequence $0 \rightarrow I \rightarrow R[[x]] \xrightarrow{y} R[[x]]$ with $R_f[[x]]$.

Lemma 82.11.5. *There exists a ring A complete with respect to a principal ideal I and an element $f \in A$ such that the I -adic completion A_f^\wedge of A_f is not flat over A .*

Proof. Set $A = R[[x]]$ and $I = (x)$ and observe that $R_f[[x]]$ is the completion of $R[[x]]_f$. \square

82.12. Nonabelian category of quasi-coherent modules

In Sheaves on Stacks, Section 73.11 we defined the category of quasi-coherent modules on a category fibred in groupoids over Sch . Although we show in Sheaves on Stacks, Section 73.14 that this category is abelian for algebraic stacks, in this section we show that this is not the case for formal algebraic spaces.

Namely, consider \mathbf{Z}_p viewed as topological ring using the p -adic topology. Let $X = \mathrm{Spf}(\mathbf{Z}_p)$, see Formal Spaces, Definition 65.5.9. Then X is a sheaf in sets on $(Sch/\mathbf{Z})_{fppf}$ and gives rise to a stack in setoids \mathcal{X} , see Stacks, Lemma 8.6.2. Thus the discussion of Sheaves on Stacks, Section 73.14 applies.

Let \mathcal{F} be a quasi-coherent module on \mathcal{X} . Since $X = \mathrm{colim} \mathrm{Spec}(\mathbf{Z}/p^n\mathbf{Z})$ it is clear from Sheaves on Stacks, Lemma 73.11.5 that \mathcal{F} is given by a sequence (\mathcal{F}_n) where

- (1) \mathcal{F}_n is a quasi-coherent module on $\mathrm{Spec}(\mathbf{Z}/p^n\mathbf{Z})$, and
- (2) the transition maps give isomorphisms $\mathcal{F}_n = \mathcal{F}_{n+1}/p^n\mathcal{F}_{n+1}$.

Converting into modules we see that \mathcal{F} corresponds to a system (M_n) where each M_n is an abelian group annihilated by p^n and the transition maps induce isomorphisms $M_n = M_{n+1}/p^n M_{n+1}$. In this situation the module $M = \lim M_n$ is a p -adically complete module and $M_n = M/p^n M$, see Algebra, Lemma 10.94.1. We conclude that the category of quasi-coherent modules on X is equivalent to the category of p -adically complete abelian groups. This category is not abelian, see Section 82.9.

Lemma 82.12.1. *The category of quasi-coherent¹ modules on a formal algebraic space X is not abelian in general, even if X is a Noetherian affine formal algebraic space.*

Proof. See discussion above. \square

82.13. Regular sequences and base change

We are going to construct a ring R with a regular sequence (x, y, z) such that there exists a nonzero element $\delta \in R/zR$ with $x\delta = y\delta = 0$.

To construct our example we first construct a peculiar module E over the ring $k[x, y, z]$ where k is any field. Namely, E will be a push-out as in the following

¹With quasi-coherent modules as defined above. Due to how things are setup in the Stacks project, this is really the correct definition; as seen above our definition agrees with what one would naively have defined to be quasi-coherent modules on $\mathrm{Spf}(A)$, namely complete A -modules.

diagram

$$\begin{array}{ccccc}
 \frac{xk[x,y,z,y^{-1}]}{xyk[x,y,z]} & \longrightarrow & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]} & \longrightarrow & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]+xk[x,y,z,y^{-1}]} \\
 \downarrow z/x & & \downarrow & & \downarrow \\
 \frac{k[x,y,z,y^{-1}]}{yzk[x,y,z]} & \longrightarrow & E & \longrightarrow & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]+xk[x,y,z,y^{-1}]}
 \end{array}$$

where the rows are short exact sequences (we dropped the outer zeros due to type-setting problems). Another way to describe E is as

$$E = \{(f, g) \mid f \in k[x, y, z, x^{-1}, y^{-1}], g \in k[x, y, z, y^{-1}]\} / \sim$$

where $(f, g) \sim (f', g')$ if and only if there exists a $h \in k[x, y, z, y^{-1}]$ such that

$$f = f' + xh \pmod{yk[x, y, z, x^{-1}]}, \quad g = g' - zh \pmod{yzk[x, y, z]}$$

We claim: (a) $x : E \rightarrow E$ is injective, (b) $y : E/xE \rightarrow E/xE$ is injective, (c) $E/(x, y)E = 0$, (d) there exists a nonzero element $\delta \in E/zE$ such that $x\delta = y\delta = 0$.

To prove (a) suppose that (f, g) is a pair that gives rise to an element of E and that $(xf, xg) \sim 0$. Then there exists a $h \in k[x, y, z, y^{-1}]$ such that $xf + xh \in yk[x, y, z, x^{-1}]$ and $xg - zh \in yzk[x, y, z]$. We may assume that $h = \sum a_{i,j,k} x^i y^j z^k$ is a sum of monomials where only $j \leq 0$ occurs. Then $xg - zh \in yzk[x, y, z]$ implies that only $i > 0$ occurs, i.e., $h = xh'$ for some $h' \in k[x, y, z, y^{-1}]$. Then $(f, g) \sim (f + xh', g - zh')$ and we see that we may assume that $g = 0$ and $h = 0$. In this case $xf \in yk[x, y, z, x^{-1}]$ implies $f \in yk[x, y, z, x^{-1}]$ and we see that $(f, g) \sim 0$. Thus $x : E \rightarrow E$ is injective.

Since multiplication by x is an isomorphism on $\frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]}$ we see that E/xE is isomorphic to

$$\frac{k[x, y, z, y^{-1}]}{yzk[x, y, z] + xk[x, y, z, y^{-1}] + zk[x, y, z, y^{-1}]} = \frac{k[x, y, z, y^{-1}]}{xk[x, y, z, y^{-1}] + zk[x, y, z, y^{-1}]}$$

and hence multiplication by y is an isomorphism on E/xE . This clearly implies (b) and (c).

Let $e \in E$ be the equivalence class of $(1, 0)$. Suppose that $e \in zE$. Then there exist $f \in k[x, y, z, x^{-1}, y^{-1}]$, $g \in k[x, y, z, y^{-1}]$, and $h \in k[x, y, z, y^{-1}]$ such that

$$1 + zf + xh \in yk[x, y, z, x^{-1}], \quad 0 + zg - zh \in yzk[x, y, z].$$

This is impossible: the monomial 1 cannot occur in zf , nor in xh . On the other hand, we have $ye = 0$ and $xe = (x, 0) \sim (0, -z) = z(0, -1)$. Hence setting δ equal to the congruence class of e in E/zE we obtain (d).

Lemma 82.13.1. *There exists a local ring R and a regular sequence x, y, z (in the maximal ideal) such that there exists a nonzero element $\delta \in R/zR$ with $x\delta = y\delta = 0$.*

Proof. Let $R = k[x, y, z] \oplus E$ where E is the module above considered as a square zero ideal. Then it is clear that x, y, z is a regular sequence in R , and that the element $\delta \in E/zE \subset R/zR$ gives an element with the desired properties. To get a local example we may localize R at the maximal ideal $\mathfrak{m} = (x, y, z, E)$. The sequence x, y, z remains a regular sequence (as localization is exact), and the element δ remains nonzero as it is supported at \mathfrak{m} . \square

Lemma 82.13.2. *There exists a local homomorphism of local rings $A \rightarrow B$ and a regular sequence x, y in the maximal ideal of B such that $B/(x, y)$ is flat over A , but such that the images \bar{x}, \bar{y} of x, y in $B/\mathfrak{m}_A B$ do not form a regular sequence, nor even a Koszul-regular sequence.*

Proof. Set $A = k[z]_{(z)}$ and let $B = (k[x, y, z] \oplus E)_{(x, y, z, E)}$. Since x, y, z is a regular sequence in B , see proof of Lemma 82.13.1, we see that x, y is a regular sequence in B and that $B/(x, y)$ is a torsion free A -module, hence flat. On the other hand, there exists a nonzero element $\delta \in B/\mathfrak{m}_A B = B/zB$ which is annihilated by \bar{x}, \bar{y} . Hence $H_2(K_\bullet(B/\mathfrak{m}_A B, \bar{x}, \bar{y})) \neq 0$. Thus \bar{x}, \bar{y} is not Koszul-regular, in particular it is not a regular sequence, see More on Algebra, Lemma 15.21.2. \square

82.14. A Noetherian ring of infinite dimension

A Noetherian local ring has finite dimension as we saw in Algebra, Proposition 10.59.8. But there exist Noetherian rings of infinite dimension. See [Nag62b, Appendix, Example 1].

Namely, let k be a field, and consider the ring

$$R = k[x_1, x_2, x_3, \dots].$$

Let $\mathfrak{p}_i = (x_{2^{i-1}}, x_{2^{i-1}+1}, \dots, x_{2^i-1})$ for $i = 1, 2, \dots$ which are prime ideals of R . Let S be the multiplicative subset

$$S = \bigcap_{i \geq 1} (R \setminus \mathfrak{p}_i).$$

Consider the ring $A = S^{-1}R$. We claim that

- (1) The maximal ideals of the ring A are the ideals $\mathfrak{m}_i = \mathfrak{p}_i A$.
- (2) We have $A_{\mathfrak{m}_i} = R_{\mathfrak{p}_i}$ which is a Noetherian local ring of dimension 2^i .
- (3) The ring A is Noetherian.

Hence it is clear that this is the example we are looking for. Details omitted.

82.15. Local rings with nonreduced completion

In Algebra, Example 10.115.4 we gave an example of a characteristic p Noetherian local domain R of dimension 1 whose completion is nonreduced. In this section we present the example of [FR70, Proposition 3.1] which gives a similar ring in characteristic zero.

Let $\mathbf{C}\{x\}$ be the ring of convergent power series over the field \mathbf{C} of complex numbers. The ring of all power series $\mathbf{C}[[x]]$ is its completion. Let $K = \mathbf{C}\{x\}[1/x] = f.f.(B)$ be the field of convergent Laurent series. The K -module $\Omega_{K/\mathbf{C}}$ of algebraic differentials of K over \mathbf{C} is an infinite dimensional K -vector space (proof omitted). We may choose $f_n \in x\mathbf{C}\{x\}$, $n \geq 1$ such that dx, df_1, df_2, \dots are part of a basis of $\Omega_{K/\mathbf{C}}$. Thus we can find a \mathbf{C} -derivation

$$D : \mathbf{C}\{x\} \longrightarrow \mathbf{C}((x))$$

such that $D(x) = 0$ and $D(f_i) = x^{-n}$. Let

$$A = \{f \in \mathbf{C}\{x\} \mid D(f) \in \mathbf{C}[[x]]\}$$

We claim that

- (1) $\mathbf{C}\{x\}$ is integral over A ,
- (2) A is a local domain,

- (3) $\dim(A) = 1$,
- (4) the maximal ideal of A is generated by x and xf_1 ,
- (5) A is Noetherian, and
- (6) the completion of A is equal to the ring of dual numbers over $\mathbf{C}[[x]]$.

Since the dual numbers are nonreduced the ring A gives the example.

Note that if $0 \neq f \in x\mathbf{C}\{x\}$ then we may write $D(f) = h/f^n$ for some $n \geq 0$ and $h \in \mathbf{C}[[x]]$. Hence $D(f^{n+1}/(n+1)) \in \mathbf{C}[[x]]$ and $D(f^{n+2}/(n+2)) \in \mathbf{C}[[x]]$. Thus we see $f^{n+1}, f^{n+2} \in A!$ In particular we see (1) holds. We also conclude that the fraction field of A is equal to the fraction field of $\mathbf{C}\{x\}$. It also follows immediately that $A \cap x\mathbf{C}\{x\}$ is the set of nonunits of A , hence A is a local domain of dimension 1. If we can show (4) then it will follow that A is Noetherian (proof omitted). Suppose that $f \in A \cap x\mathbf{C}\{x\}$. Write $D(f) = h$, $h \in \mathbf{C}[[x]]$. Write $h = c + xh'$ with $c \in \mathbf{C}$, $h' \in \mathbf{C}[[x]]$. Then $D(f - cxf_1) = c + xh' - c = xh'$. On the other hand $f - cxf_1 = xg$ with $g \in \mathbf{C}\{x\}$, but by the computation above we have $D(g) = h' \in \mathbf{C}[[x]]$ and hence $g \in A$. Thus $f = cxf_1 + xg \in (x, xf_1)$ as desired.

Finally, why is the completion of A nonreduced? Denote \hat{A} the completion of A . Of course this maps surjectively to the completion $\mathbf{C}[[x]]$ of $\mathbf{C}\{x\}$ because $x \in A$. Denote this map $\psi : \hat{A} \rightarrow \mathbf{C}[[x]]$. Above we saw that $\mathfrak{m}_A = (x, xf_1)$ and hence $D(\mathfrak{m}_A^n) \subset (x^{n-1})$ by an easy computation. Thus $D : A \rightarrow \mathbf{C}[[x]]$ is continuous and gives rise to a continuous derivation $\hat{D} : \hat{A} \rightarrow \mathbf{C}[[x]]$ over ψ . Hence we get a ring map

$$\psi + \epsilon\hat{D} : \hat{A} \longrightarrow \mathbf{C}[[x]][\epsilon].$$

Since \hat{A} is a one dimensional Noetherian complete local ring, if we can show this arrow is surjective then it will follow that \hat{A} is nonreduced. Actually the map is an isomorphism but we omit the verification of this. The subring $\mathbf{C}[x]_{(x)} \subset A$ gives rise to a map $i : \mathbf{C}[[x]] \rightarrow \hat{A}$ on completions such that $i \circ \psi = \text{id}$ and such that $D \circ i = 0$ (as $D(x) = 0$ by construction). Consider the elements $x^n f_n \in A$. We have

$$(\psi + \epsilon D)(x^n f_n) = x^n f_n + \epsilon$$

for all $n \geq 1$. Surjectivity easily follows from these remarks.

82.16. A non catenary Noetherian local ring

Even though there is a successful dimension theory of Noetherian local rings there are non-catenary Noetherian local rings. An example may be found in [Nag62b, Appendix, Example 2]. In fact, we will present this example in the simplest case. Namely, we will construct a local Noetherian domain A of dimension 2 which is not universally catenary. (Note that A is automatically catenary, see Exercises, Exercise 83.12.2.) The existence of a Noetherian local ring which is not universally catenary implies the existence of a Noetherian local ring which is not catenary – and we spell this out at the end of this section in the particular example at hand.

Let k be a field, and consider the formal power series ring $k[[x]]$ in one variable over k . Let

$$z = \sum_{i=1}^{\infty} a_i x^i$$

be a formal power series. We assume z as an element of the Laurent series field $k((x)) = f.f.(k[[x]])$ is transcendental over $k(x)$. Put

$$z_j = x^{-j}(z - \sum_{i=1, \dots, j-1} a_i x^i) = \sum_{i=j}^{\infty} a_i x^{i-j} \in k[[x]].$$

Note that $z = z_1$. Let R be the subring of $k[[x]]$ generated by x , z and all of the z_j , in other words

$$R = k[x, z_1, z_2, z_3, \dots] \subset k[[x]].$$

Consider the ideals $\mathfrak{m} = (x)$ and $\mathfrak{n} = (x - 1, z_1, z_2, \dots)$ of R .

We have $x(z_{j+1} + a_j) = z_j$. Hence $R/\mathfrak{m} = k$ and \mathfrak{m} is a maximal ideal. Moreover, any element of R not in \mathfrak{m} maps to a unit in $k[[x]]$ and hence $R_{\mathfrak{m}} \subset k[[x]]$. In fact it is easy to deduce that $R_{\mathfrak{m}}$ is a discrete valuation ring and residue field k .

We claim that

$$R/(x - 1) = k[x, z_1, z_2, z_3, \dots]/(x - 1) \cong k[z].$$

Namely, the relation above implies that $(x - 1)(z_{j+1} + a_j) = -z_{j+1} - a_j + z_j$, and hence we may express the class of z_{j+1} in terms of z_j in the quotient $R/(x - 1)$. Since the fraction field of R has transcendence degree 2 over k by construction we see that z is transcendental over k in $R/(x - 1)$, whence the desired isomorphism. Hence $\mathfrak{n} = (x - 1, z)$ and is a maximal ideal. In fact the map

$$k[x, x^{-1}, z]_{(x-1, z)} \longrightarrow R_{\mathfrak{n}}$$

is an isomorphism (since x^{-1} is invertible in $R_{\mathfrak{n}}$ and since $z_{j+1} = x^{-1}z_j - a_j = \dots = f_j(x, x^{-1}, z)$). This shows that $R_{\mathfrak{n}}$ is a regular local ring of dimension 2 and residue field k .

Let S be the multiplicative subset

$$S = (R \setminus \mathfrak{m}) \cap (R \setminus \mathfrak{n}) = R \setminus (\mathfrak{m} \cup \mathfrak{n})$$

and set $B = S^{-1}R$. We claim that

- (1) The ring B is a k -algebra.
- (2) The maximal ideals of the ring B are the two ideals $\mathfrak{m}B$ and $\mathfrak{n}B$.
- (3) The residue fields at these maximal ideals is k .
- (4) We have $B_{\mathfrak{m}B} = R_{\mathfrak{m}}$ and $B_{\mathfrak{n}B} = R_{\mathfrak{n}}$ which are Noetherian regular local rings of dimensions 1 and 2.
- (5) The ring B is Noetherian.

We omit the details of the verifications.

Whenever given a k -algebra B with the properties listed above we get an example as follows. Take $A = k + \text{rad}(B) \subset B$, in our case $\text{rad}(B) = \mathfrak{m}B + \mathfrak{n}B$. It is easy to see that B is finite over A and hence A is Noetherian by Eakin's theorem (see [Eak68], or [Nag62b, Appendix A1], or insert future reference here). Also A is a local domain with the same fraction field as B and residue field k . Since the dimension of B is 2 we see that A has dimension 2 as well, by Algebra, Lemma 10.108.4.

If A were universally catenary then the dimension formula, Algebra, Lemma 10.109.1 would give $\dim(B_{\mathfrak{m}B}) = 2$ contradiction.

Note that B is generated by one element over A . Hence $B = A[x]/\mathfrak{p}$ for some prime \mathfrak{p} of $A[x]$. Let $\mathfrak{m}' \subset A[x]$ be the maximal ideal corresponding to $\mathfrak{m}B$. Then on the one hand $\dim(A[x]_{\mathfrak{m}'}) = 3$ and on the other hand

$$(0) \subset \mathfrak{p}A[x]_{\mathfrak{m}'} \subset \mathfrak{m}'A[x]_{\mathfrak{m}'}$$

is a maximal chain of primes. Hence $A[x]_{\mathfrak{m}'}$ is an example of a non catenary Noetherian local ring.

82.17. Existence of bad local Noetherian rings

Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian complete local ring. In [Lec86a] it was shown that A is the completion of a Noetherian local domain if $\text{depth}(A) \geq 1$ and A contains either \mathbf{Q} , or \mathbf{Z} , or \mathbf{F}_p as a subring. This produces many examples of Noetherian local domains with “bizarre” properties.

Applying this for example to $A = \mathbf{C}[[x, y]]/(y^2)$ we find a Noetherian local domain whose completion is nonreduced. Please compare with Section 82.15.

In [LLPY01] conditions were found that characterize when A is the completion of a reduced local Noetherian ring.

In [Hei93] it was shown that A is the completion of a local Noetherian UFD R if $\text{depth}(A) \geq 2$ and A contains either \mathbf{Q} , or \mathbf{Z} , or \mathbf{F}_p as a subring. In particular R is normal (Algebra, Lemma 10.116.8) hence the henselization of R is a normal domain too (More on Algebra, Lemma 15.34.6). Thus A as above is the completion of a henselian Noetherian local normal domain (because the completion of R and its henselization agree, see More on Algebra, Lemma 15.34.3).

Apply this to find a Noetherian local UFD R such that $R^\wedge \cong \mathbf{C}[[x, y, z, w]]/(wx, wy)$. Note that $\text{Spec}(R^\wedge)$ is the union of a regular 2-dimensional and a regular 3-dimensional component. The ring R cannot be universally catenary: Let

$$X \longrightarrow \text{Spec}(R)$$

be the blowing up of the maximal ideal. Then X is an integral scheme. There is a closed point $x \in X$ such that $\dim(\mathcal{O}_{X,x}) = 2$, namely, on the level of the complete local ring we pick x to lie on the strict transform of the 2-dimensional component and not on the strict transform of the 3-dimensional component. By Morphisms, Lemma 28.31.1 we see that R is not universally catenary. Please compare with Section 82.16.

The ring above is catenary (being a 3-dimensional local Noetherian UFD). However, in [Ogo80] the author constructs a normal local Noetherian domain R with $R^\wedge \cong \mathbf{C}[[x, y, z, w]]/(wx, wy)$ such that R is not catenary. See also [Hei82] and [Lec86b].

In [Hei94] it was shown that A is the completion of a local Noetherian ring R with an isolated singularity provided A contains either \mathbf{Q} , or \mathbf{Z} , or \mathbf{F}_p as a subring. Here we say a Noetherian local ring R has an isolated singularity if $R_{\mathfrak{p}}$ is a regular local ring for all nonmaximal primes $\mathfrak{p} \subset R$.

As an aside, in [Loe03] it was shown that A is the completion of an excellent Noetherian local domain if A is reduced, equidimensional, and no integer in A is a zero divisor. However, this doesn't lead to “bad” Noetherian local rings as we obtain excellent ones!

82.18. Non-quasi-affine variety with quasi-affine normalization

The existence of an example of this kind is mentioned in [DG67, II Remark 6.6.13]. They refer to the fifth volume of EGA for such an example, but the fifth volume did not appear.

Let k be a field. Let $Y = \mathbf{A}_k^2 \setminus \{(0, 0)\}$. We are going to construct a finite surjective birational morphism $\pi : Y \rightarrow X$ with X a variety over k such that X is not quasi-affine. Namely, consider the following curves in Y :

$$\begin{aligned} C_1 & : x = 0 \\ C_2 & : y = 0 \end{aligned}$$

Note that $C_1 \cap C_2 = \emptyset$. We choose the isomorphism $\varphi : C_1 \rightarrow C_2$, $(0, y) \mapsto (y^{-1}, 0)$. We claim there is a unique morphism $\pi : Y \rightarrow X$ as above such that

$$C_1 \begin{array}{c} \xrightarrow{\text{id}} \\ \xrightarrow{\varphi} \end{array} Y \xrightarrow{\pi} X$$

is a coequalizer diagram in the category of varieties (and even in the category of schemes). Accepting this for the moment let us show that such an X cannot be quasi-affine. Namely, it is clear that we would get

$$\Gamma(X, \mathcal{O}_X) = \{f \in k[x, y] \mid f(0, y) = f(y^{-1}, 0)\} = k \oplus (xy) \subset k[x, y].$$

In particular these functions do not separate the points $(1, 0)$ and $(-1, 0)$ whose images in X (we will see below) are distinct (if the characteristic of k is not 2).

To show that X exists consider the Zariski open $D(x + y) \subset Y$ of Y . This is the spectrum of the ring $k[x, y, 1/(x + y)]$ and the curves C_1, C_2 are completely contained in $D(x + y)$. Moreover the morphism

$$C_1 \coprod C_2 \rightarrow D(x + y) \cap Y = \text{Spec}(k[x, y, 1/(x + y)])$$

is a closed immersion. It follows from More on Algebra, Lemma 15.4.1 that the ring

$$A = \{f \in k[x, y, 1/(x + y)] \mid f(0, y) = f(y^{-1}, 0)\}$$

is of finite type over k . On the other hand we have the open $D(xy) \subset Y$ of Y which is disjoint from the curves C_1 and C_2 . It is the spectrum of the ring

$$B = k[x, y, 1/xy].$$

Note that we have $A_{xy} \cong B_{x+y}$ (since A clearly contains the elements $xyP(x, y)$ any polynomial P and the element $xy/(x + y)$). The scheme X is obtained by glueing the affine schemes $\text{Spec}(A)$ and $\text{Spec}(B)$ using the isomorphism $A_{xy} \cong B_{x+y}$ and hence is clearly of finite type over k . To see that it is separated one has to show that the ring map $A \otimes_k B \rightarrow B_{x+y}$ is surjective. To see this use that $A \otimes_k B$ contains the element $xy/(x + y) \otimes 1/xy$ which maps to $1/(x + y)$. The morphism $X \rightarrow Y$ is given by the natural maps $D(x + y) \rightarrow \text{Spec}(A)$ and $D(xy) \rightarrow \text{Spec}(B)$. Since these are both finite we deduce that $X \rightarrow Y$ is finite as desired. We omit the verification that X is indeed the coequalizer of the displayed diagram above, however, see (insert future reference for pushouts in the category of schemes here). Note that the morphism $\pi : Y \rightarrow X$ does map the points $(1, 0)$ and $(-1, 0)$ to distinct points in X because the function $(x + y^3)/(x + y)^2 \in A$ has value $1/1$, resp. $-1/(-1)^2 = -1$ which are always distinct (unless the characteristic is 2 – please

find your own points for characteristic 2). We summarize this discussion in the form of a lemma.

Lemma 82.18.1. *Let k be a field. There exists a variety X whose normalization is quasi-affine but which is itself not quasi-affine.*

Proof. See discussion above and (insert future reference on normalization here). \square

82.19. A locally closed subscheme which is not open in closed

This is a copy of Morphisms, Example 28.3.4. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let k be a field. Let $X = \text{Spec}(k[x_1, x_2, x_3, \dots])$. Let $U = \bigcup_{n=1}^{\infty} D(x_n)$. Then $U \rightarrow X$ is an open immersion. Consider the ideals

$$I_n = (x_1^n, x_2^n, \dots, x_{n-1}^n, x_n - 1, x_{n+1}, x_{n+2}, \dots) \subset k[x_1, x_2, x_3, \dots][1/x_n].$$

Note that $I_n k[x_1, x_2, x_3, \dots][1/x_n x_m] = (1)$ for any $m \neq n$. Hence the quasi-coherent ideals \tilde{I}_n on $D(x_n)$ agree on $D(x_n x_m)$, namely $\tilde{I}_n|_{D(x_n x_m)} = \mathcal{O}_{D(x_n x_m)}$ if $n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_U$. Let $Z \subset U$ be the closed subscheme corresponding to \mathcal{I} . Thus $Z \rightarrow X$ is an immersion.

We claim that we cannot factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z} \rightarrow X$, where $\bar{Z} \rightarrow X$ is closed and $Z \rightarrow \bar{Z}$ is open. Namely, \bar{Z} would have to be defined by an ideal $I \subset k[x_1, x_2, x_3, \dots]$ such that $I_n = Ik[x_1, x_2, x_3, \dots][1/x_n]$. But the only element $f \in k[x_1, x_2, x_3, \dots]$ which ends up in all I_n is 0! Hence I does not exist.

82.20. Nonexistence of suitable opens

This section complements the results of Properties, Section 27.27.

Let k be a field and let $A = k[z_1, z_2, z_3, \dots]/I$ where I is the ideal generated by all pairwise products $z_i z_j$, $i \neq j$, $i, j \in \mathbf{N}$. Set $S = \text{Spec}(A)$. Let $s \in S$ be the closed point corresponding to the maximal ideal (z_i) . We claim there is no quasi-compact open $V \subset S \setminus \{s\}$ which is dense in $S \setminus \{s\}$. Note that $S \setminus \{s\} = \bigcup D(z_i)$. Each $D(z_i)$ is open and irreducible with generic point η_i . We conclude that $\eta_i \in V$ for all i . However, a principal affine open of $S \setminus \{s\}$ is of the form $D(f)$ where $f \in (z_1, z_2, \dots)$. Then $f \in (z_1, \dots, z_n)$ for some n and we see that $D(f)$ contains only finitely many of the points η_i . Thus V cannot be quasi-compact.

Let k be a field and let $B = k[x, z_1, z_2, z_3, \dots]/J$ where J is the ideal generated by the products xz_i , $i \in \mathbf{N}$ and by all pairwise products $z_i z_j$, $i \neq j$, $i, j \in \mathbf{N}$. Set $T = \text{Spec}(B)$. Consider the principal open $U = D(x)$. We claim there is no quasi-compact open $V \subset S$ such that $V \cap U = \emptyset$ and $V \cup U$ is dense in S . Let $t \in T$ be the closed point corresponding to the maximal ideal (x, z_i) . The closure of U in T is $\bar{U} = U \cup \{t\}$. Hence $V \subset \bigcup_i D(z_i)$ is a quasi-compact open. By the arguments of the previous paragraph we see that V cannot be dense in $\bigcup D(z_i)$.

Lemma 82.20.1. *Nonexistence quasi-compact opens of affines:*

- (1) *There exist an affine scheme S and affine open $U \subset S$ such that there is no quasi-compact open $V \subset S$ with $U \cap V = \emptyset$ and $U \cup V$ dense in S .*
- (2) *There exists an affine scheme S and a closed point $s \in S$ such that $S \setminus \{s\}$ does not contain a quasi-compact dense open.*

Proof. See discussion above. □

Let X be the glueing of two copies of the affine scheme T (see above) along the affine open U . Thus there is a morphism $\pi : X \rightarrow T$ and $X = U_1 \cup U_2$ such that π maps U_i isomorphically to T and $U_1 \cap U_2$ isomorphically to U . Note that X is quasi-separated (by Schemes, Lemma 25.21.7) and quasi-compact. We claim there does not exist a separated, dense, quasi-compact open $W \subset X$. Namely, consider the two closed points $x_1 \in U_1, x_2 \in U_2$ mapping to the closed point $t \in T$ introduced above. Let $\tilde{\eta} \in U_1 \cap U_2$ be the generic point mapping to the (unique) generic point η of U . Note that $\tilde{\eta} \rightsquigarrow x_1$ and $\tilde{\eta} \rightsquigarrow x_2$ lying over the specialization $\eta \rightsquigarrow s$. Since $\pi|_W : W \rightarrow T$ is separated we conclude that we cannot have both x_1 and $x_2 \in W$ (by the valuative criterion of separatedness Schemes, Lemma 25.22.2). Say $x_1 \notin W$. Then $W \cap U_1$ is a quasi-compact (as X is quasi-separated) dense open of U_1 which does not contain x_1 . Now observe that there exists an isomorphism $(T, t) \cong (S, s)$ of schemes (by sending x to z_1 and z_i to z_{i+1}). Hence by the first paragraph of this section we arrive at a contradiction.

Lemma 82.20.2. *There exists a quasi-compact and quasi-separated scheme X which does not contain a separated quasi-compact dense open.*

Proof. See discussion above. □

82.21. Nonexistence of quasi-compact dense open subscheme

Let X be a quasi-compact and quasi-separated algebraic space over a field k . We know that the schematic locus $X' \subset X$ is a dense open subspace, see Properties of Spaces, Proposition 48.10.3. In fact, this result holds when X is reasonable, see Decent Spaces, Proposition 50.9.1. A natural question is whether one can find a quasi-compact dense open subscheme of X . It turns out this is not possible in general.

Assume the characteristic of k is not 2. Let $B = k[x, z_1, z_2, z_3, \dots]/J$ where J is the ideal generated by the products $xz_i, i \in \mathbf{N}$ and by all pairwise products $z_i z_j, i \neq j, i, j \in \mathbf{N}$. Set $U = \text{Spec}(B)$. Denote $0 \in U$ the closed point all of whose coordinates are zero. Set

$$j : R = \Delta \coprod \Gamma \longrightarrow U \times_k U$$

where Δ is the image of the diagonal morphism of U over k and

$$\Gamma = \{((x, 0, 0, 0, \dots), (-x, 0, 0, 0, \dots)) \mid x \in \mathbf{A}_k^1, x \neq 0\}.$$

It is clear that $s, t : R \rightarrow U$ are étale, and hence j is an étale equivalence relation. The quotient $X = U/R$ is an algebraic space (Spaces, Theorem 47.10.5). Note that j is not an immersion because $(0, 0) \in \Delta$ is in the closure of Γ . Hence X is not a scheme. On the other hand, X is quasi-separated as R is quasi-compact. Denote 0_X the image of the point $0 \in U$. We claim that $X \setminus \{0_X\}$ is a scheme, namely

$$X \setminus \{0_X\} = \text{Spec}(k[x^2, x^{-2}]) \coprod \text{Spec}(k[z_1, z_2, z_3, \dots]/(z_i z_j)) \setminus \{0\}$$

(details omitted). On the other hand, we have seen in Section 82.20 that the scheme on the right hand side does not contain a quasi-compact dense open.

Lemma 82.21.1. *There exists a quasi-compact and quasi-separated algebraic space which does not contain a quasi-compact dense open subscheme.*

Proof. See discussion above. \square

Using the construction of Spaces, Example 47.14.2 in the same manner as we used the construction of Spaces, Example 47.14.1 above, one obtains an example of a quasi-compact, quasi-separated, and locally separated algebraic space which does not contain a quasi-compact dense open subscheme.

82.22. Affines over algebraic spaces

Suppose that $f : Y \rightarrow X$ is a morphism of schemes with f locally of finite type and Y affine. Then there exists an immersion $Y \rightarrow \mathbf{A}_X^n$ of Y into affine n -space over X . See the slightly more general Morphisms, Lemma 28.40.2.

Now suppose that $f : Y \rightarrow X$ is a morphism of algebraic spaces with f locally of finite type and Y an affine scheme. Then it is not true in general that we can find an immersion of Y into affine n -space over X .

A first (nasty) counter example is $Y = \text{Spec}(k)$ and $X = [\mathbf{A}_k^1/\mathbf{Z}]$ where k is a field of characteristic zero and \mathbf{Z} acts on \mathbf{A}_k^1 by translation $(n, t) \mapsto t + n$. Namely, for any morphism $Y \rightarrow \mathbf{A}_X^n$ over X we can pullback to the covering \mathbf{A}_k^1 of X and we get an infinite disjoint union of \mathbf{A}_k^1 's mapping into \mathbf{A}_k^{n+1} which is not an immersion.

A second counter example is $Y = \mathbf{A}_k^1 \rightarrow X = \mathbf{A}_k^1/R$ with $R = \{(t, t)\} \coprod \{(t, -t), t \neq 0\}$. Namely, in this case the morphism $Y \rightarrow \mathbf{A}_X^n$ would be given by some regular functions f_1, \dots, f_n on Y and hence the fibre product of Y with the covering $\mathbf{A}_k^{n+1} \rightarrow \mathbf{A}_X^n$ would be the scheme

$$\{(f_1(t), \dots, f_n(t), t)\} \coprod \{(f_1(t), \dots, f_n(t), -t), t \neq 0\}$$

with obvious morphism to \mathbf{A}_k^{n+1} which is not an immersion. Note that this gives a counter example with X quasi-separated.

Lemma 82.22.1. *There exists a finite type morphism of algebraic spaces $Y \rightarrow X$ with Y affine and X quasi-separated, such that there does not exist an immersion $Y \rightarrow \mathbf{A}_X^n$ over X .*

Proof. See discussion above. \square

82.23. Pushforward of quasi-coherent modules

In Schemes, Lemma 25.24.1 we proved that f_* transforms quasi-coherent modules into quasi-coherent modules when f is quasi-compact and quasi-separated. Here are some examples to show that these conditions are both necessary.

Suppose that $Y = \text{Spec}(A)$ is an affine scheme and that $X = \coprod_{n \in \mathbf{N}} Y$. We claim that $f_*\mathcal{O}_X$ is not quasi-coherent where $f : X \rightarrow Y$ is the obvious morphism. Namely, for $a \in A$ we have

$$f_*\mathcal{O}_X(D(a)) = \prod_{n \in \mathbf{N}} A_a$$

Hence, in order for $f_*\mathcal{O}_X$ to be quasi-coherent we would need

$$\prod_{n \in \mathbf{N}} A_a = \left(\prod_{n \in \mathbf{N}} A \right)_a$$

for all $a \in A$. This isn't true in general, for example if $A = \mathbf{Z}$ and $a = 2$, then $(1, 1/2, 1/4, 1/8, \dots)$ is an element of the left hand side which is not in the right hand side. Note that f is a non-quasi-compact separated morphism.

Let k be a field. Set

$$A = k[t, z, x_1, x_2, x_3, \dots] / (tx_1z, t^2x_2^2z, t^3x_3^3z, \dots)$$

Let $Y = \text{Spec}(A)$. Let $V \subset Y$ be the open subscheme $V = D(x_1) \cup D(x_2) \cup \dots$. Let X be two copies of Y glued along V . Let $f : X \rightarrow Y$ be the obvious morphism. Then we have an exact sequence

$$0 \rightarrow f_*\mathcal{O}_X \rightarrow \mathcal{O}_Y \oplus \mathcal{O}_Y \xrightarrow{(1, -1)} j_*\mathcal{O}_V$$

where $j : V \rightarrow Y$ is the inclusion morphism. Since

$$A \longrightarrow \prod A_{x_n}$$

is injective (details omitted) we see that $\Gamma(Y, f_*\mathcal{O}_X) = A$. On the other hand, the kernel of the map

$$A_t \longrightarrow \prod A_{tx_n}$$

is nonzero because it contains the element z . Hence $\Gamma(D(t), f_*\mathcal{O}_X)$ is strictly bigger than A_t because it contains $(z, 0)$. Thus we see that $f_*\mathcal{O}_X$ is not quasi-coherent. Note that f is quasi-compact but non-quasi-separated.

Lemma 82.23.1. *Schemes, Lemma 25.24.1 is sharp in the sense that one can neither drop the assumption of quasi-compactness nor the assumption of quasi-separatedness.*

Proof. See discussion above. \square

82.24. A nonfinite module with finite free rank 1 stalks

Let $R = \mathbf{Q}[x]$. Set $M = \sum_{n \in \mathbf{N}} \frac{1}{x-n} R$ as a submodule of the fraction field of R . Then M is not finitely generated, but for every prime \mathfrak{p} of R we have $M_{\mathfrak{p}} \cong R_{\mathfrak{p}}$ as an $R_{\mathfrak{p}}$ -module.

82.25. A finite flat module which is not projective

This is a copy of Algebra, Remark 10.75.3. It is not true that a finite R -module which is R -flat is automatically projective. A counter example is where $R = \mathcal{C}^\infty(\mathbf{R})$ is the ring of infinitely differentiable functions on \mathbf{R} , and $M = R_{\mathfrak{m}} = R/I$ where $\mathfrak{m} = \{f \in R \mid f(0) = 0\}$ and $I = \{f \in R \mid \exists \epsilon, \epsilon > 0 : f(x) = 0 \forall x, |x| < \epsilon\}$.

The morphism $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$ is also an example of a flat closed immersion which is not open.

Lemma 82.25.1. *Strange flat modules.*

- (1) *There exists a ring R and a finite flat R -module M which is not projective.*
- (2) *There exists a closed immersion which is flat but not open.*

Proof. See discussion above. \square

82.26. A projective module which is not locally free

We give two examples. One where the rank is between 0 and 1 and one where the rank is \aleph_0 .

Lemma 82.26.1. *Let R be a ring. Let $I \subset R$ be an ideal generated by a countable collection of idempotents. Then I is projective as an R -module.*

Proof. Say $I = (e_1, e_2, e_3, \dots)$ with e_n an idempotent of R . After inductively replacing e_{n+1} by $e_n + (1 - e_n)e_{n+1}$ we may assume that $(e_1) \subset (e_2) \subset (e_3) \subset \dots$ and hence $I = \bigcup_{n \geq 1} (e_n) = \text{colim}_n e_n R$. In this case

$$\text{Hom}_R(I, M) = \text{Hom}_R(\text{colim}_n e_n R, M) = \lim_n \text{Hom}_R(e_n R, M) = \lim_n e_n M$$

Note that the transition maps $e_{n+1} M \rightarrow e_n M$ are given by multiplication by e_n and are surjective. Hence by Algebra, Lemma 10.83.4 the functor $\text{Hom}_R(I, M)$ is exact, i.e., I is a projective R -module. \square

Lemma 82.26.2. *Let R be a ring. Let $n \geq 1$. Let M be an R -module generated by $< n$ elements. Then any R -module map $f : R^{\oplus n} \rightarrow M$ has a nonzero kernel.*

Proof. Choose a surjection $R^{\oplus n-1} \rightarrow M$. We may lift the map f to a map $f' : R^{\oplus n} \rightarrow R^{\oplus n-1}$. It suffices to prove f' has a nonzero kernel. The map $f' : R^{\oplus n} \rightarrow R^{\oplus n-1}$ is given by a matrix $A = (a_{ij})$. If one of the a_{ij} is not nilpotent, say $a = a_{ij}$ is not, then we can replace A by the localization A_a and we may assume a_{ij} is a unit. Since if we find a nonzero kernel after localization then there was a nonzero kernel to start with as localization is exact, see Algebra, Proposition 10.9.12. In this case we can do a base change on both $R^{\oplus n}$ and $R^{\oplus n-1}$ and reduce to the case where

$$A = \begin{pmatrix} 1 & 0 & 0 & \dots & \\ 0 & a_{22} & a_{23} & \dots & \\ 0 & a_{32} & \dots & \dots & \\ \dots & \dots & \dots & \dots & \dots \end{pmatrix}$$

Hence in this case we win by induction on n . If not then each a_{ij} is nilpotent. Set $I = (a_{ij}) \subset R$. Note that $I^{m+1} = 0$ for some $m \geq 0$. Let m be the largest integer such that $I^m \neq 0$. Then we see that $(I^m)^{\oplus n}$ is contained in the kernel of the map and we win. \square

Suppose that $P \subset Q$ is an inclusion of R -modules with Q a finite R -module and P locally free, see Algebra, Definition 10.75.1. Suppose that Q can be generated by N elements as an R -module. Then it follows from Lemma 82.26.2 that P is finite locally free (with the free parts having rank at most N). And in this case P is a finite R -module, see Algebra, Lemma 10.75.2.

Combining this with the above we see that a non-finitely-generated ideal which is generated by a countable collection of idempotents is projective but not locally free. An explicit example is $R = \prod_{n \in \mathbf{N}} \mathbf{F}_2$ and I the ideal generated by the idempotents

$$e_n = (1, 1, \dots, 1, 0, \dots)$$

where the sequence of 1's has length n .

Lemma 82.26.3. *There exists a ring R and an ideal I such that I is projective as an R -module but not locally free as an R -module.*

Proof. See above. \square

Lemma 82.26.4. *Let K be a field. Let C_i , $i = 1, \dots, n$ be smooth, projective, geometrically irreducible curves over K . Let $P_i \in C_i(K)$ be a rational point and let $Q_i \in C_i$ be a point such that $[\kappa(Q_i) : K] = 2$. Then $[P_1 \times \dots \times P_n]$ is nonzero in $A_0(U_1 \times_K \dots \times_K U_n)$ where $U_i = C_i \setminus \{Q_i\}$.*

Proof. There is a degree map $\deg : A_0(C_1 \times_K \dots \times_K C_n) \rightarrow \mathbf{Z}$ Because each Q_i has degree 2 over K we see that any zero cycle supported on the “boundary”

$$C_1 \times_K \dots \times_K C_n \setminus U_1 \times_K \dots \times_K U_n$$

has degree divisible by 2. \square

We can construct another example of a projective but not locally free module using the lemma above as follows. Let C_n , $n = 1, 2, 3, \dots$ be smooth, projective, geometrically irreducible curves over \mathbf{Q} each with a pair of points $P_n, Q_n \in C_n$ such that $\kappa(P_n) = \mathbf{Q}$ and $\kappa(Q_n)$ is a quadratic extension of \mathbf{Q} . Set $U_n = C_n \setminus \{Q_n\}$; this is an affine curve. Let \mathcal{L}_n be the inverse of the ideal sheaf of P_n on U_n . Note that $c_1(\mathcal{L}_n) = [P_n]$ in the group of zero cycles $A_0(U_n)$. Set $A_n = \Gamma(U_n, \mathcal{O}_{U_n})$. Let $L_n = \Gamma(U_n, \mathcal{L}_n)$ which is a locally free module of rank 1 over A_n . Set

$$B_n = A_1 \otimes_{\mathbf{Q}} A_2 \otimes_{\mathbf{Q}} \dots \otimes_{\mathbf{Q}} A_n$$

so that $\text{Spec}(B_n) = U_1 \times \dots \times U_n$ all products over $\text{Spec}(\mathbf{Q})$. For $i \leq n$ we set

$$L_{n,i} = A_1 \otimes_{\mathbf{Q}} \dots \otimes_{\mathbf{Q}} M_i \otimes_{\mathbf{Q}} \dots \otimes_{\mathbf{Q}} A_n$$

which is a locally free B_n -module of rank 1. Note that this is also the global sections of $\text{pr}_i^* \mathcal{L}_n$. Set

$$B_\infty = \text{colim}_n B_n \quad \text{and} \quad L_{\infty,i} = \text{colim}_n L_{n,i}$$

Finally, set

$$M = \bigoplus_{i \geq 1} L_{\infty,i}.$$

This is a direct sum of finite locally free modules, hence projective. We claim that M is not locally free. Namely, suppose that $f \in B_\infty$ is a nonzero function such that M_f is free over $(B_\infty)_f$. Let e_1, e_2, \dots be a basis. Choose $n \geq 1$ such that $f \in B_n$. Choose $m \geq n + 1$ such that e_1, \dots, e_{n+1} are in

$$\bigoplus_{1 \leq i \leq m} L_{m,i}.$$

Because the elements e_1, \dots, e_{n+1} are part of a basis after a faithfully flat base change we conclude that the chern classes

$$c_i(\text{pr}_1^* \mathcal{L}_1 \oplus \dots \oplus \text{pr}_m^* \mathcal{L}_m), \quad i = m, m-1, \dots, m-n$$

are zero in the chow group of

$$D(f) \subset U_1 \times \dots \times U_m$$

Since f is the pullback of a function on $U_1 \times \dots \times U_n$ this implies in particular that

$$c_{m-n}(\mathcal{O}_W^{\oplus n} \oplus \text{pr}_1^* \mathcal{L}_{n+1} \oplus \dots \oplus \text{pr}_{m-n}^* \mathcal{L}_m) = 0.$$

on the variety

$$W = (C_{n+1} \times \dots \times C_m)_K$$

over the field $K = \mathbf{Q}(C_1 \times \dots \times C_n)$. In other words the cycle

$$[(P_{n+1} \times \dots \times P_m)_K]$$

is zero in the chow group of zero cycles on W . This contradicts Lemma 82.26.4 above because the points Q_i , $n + 1 \leq i \leq m$ induce corresponding points Q'_i on $(C_n)_K$ and as K/\mathbf{Q} is geometrically irreducible we have $[\kappa(Q'_i) : K] = 2$.

Lemma 82.26.5. *There exists a countable ring R and a projective module M which is a direct sum of countably many locally free rank 1 modules such that M is not locally free.*

Proof. See above. □

82.27. Zero dimensional local ring with nonzero flat ideal

In [Laz67] there is an example of a zero dimensional local ring with a nonzero flat ideal. Here is the construction. Let k be a field. Let X_i, Y_i , $i \geq 1$ be variables. Take $R = k[X_i, Y_i]/(X_i - Y_i X_{i+1}, Y_i^2)$. Denote x_i , resp. y_i the image of X_i , resp. Y_i in this ring. Note that

$$x_i = y_i x_{i+1} = y_i y_{i+1} x_{i+2} = y_i y_{i+1} y_{i+2} x_{i+3} = \dots$$

in this ring. The ring R has only one prime ideal, namely $\mathfrak{m} = (x_i, y_i)$. We claim that the ideal $I = (x_i)$ is flat as an R -module.

Note that the annihilator of x_i in R is the ideal $(x_1, x_2, x_3, \dots, y_i, y_{i+1}, y_{i+2}, \dots)$. Consider the R -module M generated by elements e_i , $i \geq 1$ and relations $e_i = y_i e_{i+1}$. Then M is flat as it is the colimit $\text{colim}_i R$ of copies of R with transition maps

$$R \xrightarrow{y_1} R \xrightarrow{y_2} R \xrightarrow{y_3} \dots$$

Note that the annihilator of e_i in M is the ideal $(x_1, x_2, x_3, \dots, y_i, y_{i+1}, y_{i+2}, \dots)$. Since every element of M , resp. I can be written as $f e_i$, resp. $h x_i$ for some $f, h \in R$ we see that the map $M \rightarrow I$, $e_i \rightarrow x_i$ is an isomorphism and I is flat.

Lemma 82.27.1. *There exists a local ring R with a unique prime ideal and a nonzero ideal $I \subset R$ which is a flat R -module*

Proof. See discussion above. □

82.28. An epimorphism of zero-dimensional rings which is not surjective

In [Laz69] one can find the following example. Let k be a field. Consider the ring homomorphism

$$k[x_1, x_2, \dots, z_1, z_2, \dots]/(x_i^{4^i}, z_i^{4^i}) \longrightarrow k[x_1, x_2, \dots, y_1, y_2, \dots]/(x_i^{4^i}, y_i - x_{i+1} y_{i+1}^2)$$

which maps x_i to x_i and z_i to $x_i y_i$. Note that $y_i^{4^{i+1}}$ is zero in the right hand side but that y_1 is not zero (details omitted). This map is not surjective: we can think of the above as a map of \mathbf{Z} -graded algebras by setting $\text{deg}(x_i) = -1$, $\text{deg}(z_i) = 0$, and $\text{deg}(y_i) = 1$ and then it is clear that y_1 is not in the image. Finally, the map is an epimorphism because

$$y_{i-1} \otimes 1 = x_i y_i^2 \otimes 1 = y_i \otimes x_i y_i = x_i y_i \otimes y_i = 1 \otimes x_i y_i^2.$$

hence the tensor product of the target over the source is isomorphic to the target.

Lemma 82.28.1. *There exists an epimorphism of local rings of dimension 0 which is not a surjection.*

Proof. See discussion above. □

82.29. Finite type, not finitely presented, flat at prime

Let k be a field. Consider the local ring $A_0 = k[x, y]_{(x, y)}$. Denote $\mathfrak{p}_{0, n} = (y + x^n + x^{2n+1})$. This is a prime ideal. Set

$$A = A_0[z_1, z_2, z_3, \dots] / (z_n z_m, z_n(y + x^n + x^{2n+1}))$$

Note that $A \rightarrow A_0$ is a surjection whose kernel is an ideal of square zero. Hence A is also a local ring and the prime ideals of A are in one-to-one correspondence with the prime ideals of A_0 . Denote \mathfrak{p}_n the prime ideal of A corresponding to $\mathfrak{p}_{0, n}$. Observe that \mathfrak{p}_n is the annihilator of z_n in A . Let

$$C = A[z] / (xz^2 + z + y) \left[\frac{1}{2zx + 1} \right]$$

Note that $A \rightarrow C$ is an étale ring map, see Algebra, Example 10.132.8. Let $\mathfrak{q} \subset C$ be the maximal ideal generated by x, y, z and all z_n . As $A \rightarrow C$ is flat we see that the annihilator of z_n in C is $\mathfrak{p}_n C$. We compute

$$\begin{aligned} C / \mathfrak{p}_n C &= A_0[z] / (xz^2 + z + y, y + x^n + x^{2n+1}) [1 / (2zx + 1)] \\ &= k[x]_{(x)}[z] / (xz^2 + z - x^n - x^{2n+1}) [1 / (2zx + 1)] \\ &= k[x]_{(x)}[z] / (z - x^n) \times k[x]_{(x)}[z] / (xz + x^{n+1} + 1) [1 / (2zx + 1)] \\ &= k[x]_{(x)} \times k(x) \end{aligned}$$

because $(z - x^n)(xz + x^{n+1} + 1) = xz^2 + z - x^n - x^{2n+1}$. Hence we see that $\mathfrak{p}_n C = \mathfrak{r}_n \cap \mathfrak{q}_n$ with $\mathfrak{r}_n = \mathfrak{p}_n C + (z - x^n)C$ and $\mathfrak{q}_n = \mathfrak{p}_n C + (xz + x^{n+1} + 1)C$. Since $\mathfrak{q}_n + \mathfrak{r}_n = C$ we also get $\mathfrak{p}_n C = \mathfrak{r}_n \mathfrak{q}_n$. It follows that \mathfrak{q}_n is the annihilator of $\xi_n = (z - x^n)z_n$. Observe that on the one hand $\mathfrak{r}_n \subset \mathfrak{q}$, and on the other hand $\mathfrak{q}_n + \mathfrak{q} = C$. This follows for example because \mathfrak{q}_n is a maximal ideal of C distinct from \mathfrak{q} . Similarly we have $\mathfrak{q}_n + \mathfrak{q}_m = C$ for $n \neq m$. At this point we let

$$B = \text{Im}(C \rightarrow C_{\mathfrak{q}})$$

We observe that the elements ξ_n map to zero in B as $xz + x^{n+1} + 1$ is not in \mathfrak{q} . Denote $\mathfrak{q}' \subset B$ the image of \mathfrak{q} . By construction B is a finite type A -algebra, with $B_{\mathfrak{q}'} \cong C_{\mathfrak{q}}$. In particular we see that $B_{\mathfrak{q}'}$ is flat over A .

We claim there does not exist an element $g' \in B$, $g' \notin \mathfrak{q}'$ such that $B_{g'}$ is of finite presentation over A . We sketch a proof of this claim. Choose an element $g \in C$ which maps to $g' \in B$. Consider the map $C_g \rightarrow B_{g'}$. By Algebra, Lemma 10.6.3 we see that B_g is finitely presented over A if and only if the kernel of $C_g \rightarrow B_{g'}$ is finitely generated. But the element $g \in C$ is not contained in \mathfrak{q} , hence maps to a nonzero element of $A_0[z] / (xz^2 + z + y)$. Hence g can only be contained in finitely many of the prime ideals \mathfrak{q}_n , because the primes $(y + x^n + x^{2n+1}, xz + x^{n+1} + 1)$ are an infinite collection of codimension 1 points of the 2-dimensional irreducible Noetherian space $\text{Spec}(k[x, y, z] / (xz^2 + z + y))$. The map

$$\bigoplus_{g \notin \mathfrak{q}_n} C / \mathfrak{q}_n \rightarrow C_g, \quad (c_n) \rightarrow \sum c_n \xi_n$$

is injective and its image is the kernel of $C_g \rightarrow B_{g'}$. We omit the proof of this statement. (Hint: Write $A = A_0 \oplus I$ as an A_0 -module where I is the kernel of $A \rightarrow A_0$. Similarly, write $C = C_0 \oplus IC$. Write $IC = \bigoplus C z_n \cong \bigoplus (C / \mathfrak{r}_n \oplus C / \mathfrak{q}_n)$ and study the effect of multiplication by g on the summands.) This concludes the sketch of the proof of the claim. This also proves that $B_{g'}$ is not flat over A for any

g' as above. Namely, if it were flat, then the annihilator of the image of z_n in $B_{g'}$ would be $\mathfrak{p}_n B_{g'}$, and would not contain $z - x^n$.

As a consequence we can answer (negatively) a question posed in [GR71, Part I, Remarques (3.4.7) (v)]. Here is a precise statement.

Lemma 82.29.1. *There exists a local ring A , a finite type ring map $A \rightarrow B$ and a prime \mathfrak{q} lying over \mathfrak{m}_A such that $B_{\mathfrak{q}}$ is flat over A , and for any element $g \in B$, $g \notin \mathfrak{q}$ the ring B_g is neither finitely presented over A nor flat over A .*

Proof. See discussion above. \square

82.30. Finite type, flat and not of finite presentation

In this section we give some examples of ring maps and morphisms which are of finite type and flat but not of finite presentation.

Let R be a ring which has an ideal I such that R/I is a finite flat module but not projective, see Section 82.25 for an explicit example. Note that this means that I is not finitely generated, see Algebra, Lemma 10.104.5. Note that $I = I^2$, see Algebra, Lemma 10.104.2. The base ring in our examples will be R and correspondingly the base scheme $S = \text{Spec}(R)$.

Consider the ring map $R \rightarrow R \oplus R/I\epsilon$ where $\epsilon^2 = 0$ by convention. This is a finite, flat ring map which is not of finite presentation. All the fibre rings are complete intersections and geometrically irreducible.

Let $A = R[x, y]/(xy, ay; a \in I)$. Note that as an R -module we have $A = \bigoplus_{i \geq 0} Ry^i \oplus \bigoplus_{j > 0} R/Ix^j$. Hence $R \rightarrow A$ is a flat finite type ring map which is not of finite presentation. Each fibre ring is isomorphic to either $\kappa(\mathfrak{p})[x, y]/(xy)$ or $\kappa(\mathfrak{p})[x]$.

We can turn the previous example into a projective morphism by taking $B = R[X_0, X_1, X_2]/(X_1X_2, aX_2; a \in I)$. In this case $X = \text{Proj}(B) \rightarrow S$ is a proper flat morphism which is not of finite presentation such that for each $s \in S$ the fibre X_s is isomorphic either to \mathbf{P}_s^1 or to the closed subscheme of \mathbf{P}_s^2 defined by the vanishing of X_1X_2 (this is a projective nodal curve of arithmetic genus 0).

Let $M = R \oplus R \oplus R/I$. Set $B = \text{Sym}_R(M)$ the symmetric algebra on M . Set $X = \text{Proj}(B)$. Then $X \rightarrow S$ is a proper flat morphism, not of finite presentation such that for $s \in S$ the geometric fibre is isomorphic to either \mathbf{P}_s^1 or \mathbf{P}_s^2 . In particular these fibres are smooth and geometrically irreducible.

Lemma 82.30.1. *There exist examples of*

- (1) *a flat finite type ring map with geometrically irreducible complete intersection fibre rings which is not of finite presentation,*
- (2) *a flat finite type ring map with geometrically connected, geometrically reduced, dimension 1, complete intersection fibre rings which is not of finite presentation,*
- (3) *a proper flat morphism of schemes $X \rightarrow S$ each of whose fibres is isomorphic to either \mathbf{P}_s^1 or to the vanishing locus of X_1X_2 in \mathbf{P}_s^2 which is not of finite presentation, and*
- (4) *a proper flat morphism of schemes $X \rightarrow S$ each of whose fibres is isomorphic to either \mathbf{P}_s^1 or \mathbf{P}_s^2 which is not of finite presentation.*

Proof. See discussion above. \square

82.31. Topology of a finite type ring map

Let $A \rightarrow B$ be a local map of local domains. If A is Noetherian, $A \rightarrow B$ is essentially of finite type, and $A/\mathfrak{m}_A \subset B/\mathfrak{m}_B$ is finite then there exists a prime $\mathfrak{q} \subset B$, $\mathfrak{q} \neq \mathfrak{m}_B$ such that $A \rightarrow B/\mathfrak{q}$ is the localization of a quasi-finite ring map. See More on Morphisms, Lemma 36.35.6.

In this section we give an example that shows this result is false A is no longer Noetherian. Namely, let k be a field and set

$$A = \{a_0 + a_1x + a_2x^2 + \dots \mid a_0 \in k, a_i \in k((y)) \text{ for } i \geq 1\}$$

and

$$C = \{a_0 + a_1x + a_2x^2 + \dots \mid a_0 \in k[y], a_i \in k((y)) \text{ for } i \geq 1\}.$$

The inclusion $A \rightarrow C$ is of finite type as C is generated by y over A . We claim that A is a local ring with maximal ideal $\mathfrak{m} = \{a_1x + a_2x^2 + \dots \in A\}$ and no prime ideals besides (0) and \mathfrak{m} . Namely, an element $f = a_0 + a_1x + a_2x^2 + \dots$ of A is invertible as soon as $a_0 \neq 0$. If $\mathfrak{q} \subset A$ is a nonzero prime ideal, and $f = a_ix^i + \dots \in \mathfrak{q}$, then using properties of power series one sees that for any $g \in k((y))$ the element $g^{i+1}x^{i+1} \in \mathfrak{q}$, i.e., $gx \in \mathfrak{q}$. This proves that $\mathfrak{q} = \mathfrak{m}$.

As to the spectrum of the ring C , arguing in the same way as above we see that any nonzero prime ideal contains the prime $\mathfrak{p} = \{a_1x + a_2x^2 + \dots \in C\}$ which lies over \mathfrak{m} . Thus the only prime of C which lies over (0) is (0) . Set $\mathfrak{m}_C = yC + \mathfrak{p}$ and $B = C_{\mathfrak{m}_C}$. Then $A \rightarrow B$ is the desired example.

Lemma 82.31.1. *There exists a local homomorphism $A \rightarrow B$ of local domains which is essentially of finite type and such that $A/\mathfrak{m}_A \rightarrow B/\mathfrak{m}_B$ is finite such that for every prime $\mathfrak{q} \neq \mathfrak{m}_B$ of B the ring map $A \rightarrow B/\mathfrak{q}$ is not the localization of a quasi-finite ring map.*

Proof. See the discussion above. □

82.32. Pure not universally pure

Let k be a field. Let

$$R = k[[x, xy, xy^2, \dots]] \subset k[[x, y]].$$

In other words, a power series $f \in k[[x, y]]$ is in R if and only if $f(0, y)$ is a constant. In particular $R[1/x] = k[[x, y]][1/x]$ and R/xR is a local ring with a maximal ideal whose square is zero. Denote $R[y] \subset k[[x, y]]$ the set of power series $f \in k[[x, y]]$ such that $f(0, y)$ is a polynomial in y . Then $R \rightarrow R[y]$ is a finite type but not finitely presented ring map which induces an isomorphism after inverting x . Also there is a surjection $R[y]/xR[y] \rightarrow k[y]$ whose kernel has square zero. Consider the finitely presented ring map $R \rightarrow S = R[t]/(xt - xy)$. Again $R[1/x] \rightarrow S[1/x]$ is an isomorphism and in this case $S/xS \cong (R/xR)[t]/(xy)$ maps onto $k[t]$ with nilpotent kernel. There is a surjection $S \rightarrow R[y]$, $t \mapsto y$ which induces an isomorphism on inverting x and a surjection with nilpotent kernel modulo x . Hence the kernel of $S \rightarrow R[y]$ is locally nilpotent. In particular $S \rightarrow R[y]$ is a universal homeomorphism.

First we claim that S is an S -module which is relatively pure over R . Since on inverting x we obtain an isomorphism we only need to check this at the maximal ideal $\mathfrak{m} \subset R$. Since R is complete with respect to its maximal ideal it is henselian

hence we need only check that every prime $\mathfrak{p} \subset R$, $\mathfrak{p} \neq \mathfrak{m}$, the unique prime \mathfrak{q} of S lying over \mathfrak{p} satisfies $\mathfrak{m}S + \mathfrak{q} \neq S$. Since $\mathfrak{p} \neq \mathfrak{m}$ it corresponds to a unique prime ideal of $k[[x, y]][1/x]$. Hence either $\mathfrak{p} = (0)$ or $\mathfrak{p} = (f)$ for some irreducible element $f \in k[[x, y]]$ which is not associated to x (here we use that $k[[x, y]]$ is a UFD – insert future reference here). In the first case $\mathfrak{q} = (0)$ and the result is clear. In the second case we may multiply f by a unit so that $f \in R[y]$ (Weierstrass preparation; details omitted). Then it is easy to see that $R[y]/fR[y] \cong k[[x, y]]/(f)$ hence f defines a prime ideal of $R[y]$ and $\mathfrak{m}R[y] + fR[y] \neq R[y]$. Since $S \rightarrow R[y]$ is a universal homeomorphism we deduce the desired result for S also.

Second we claim that S is not universally relatively pure over R . Namely, to see this it suffices to find a valuation ring \mathcal{O} and a local ring map $R \rightarrow \mathcal{O}$ such that $\text{Spec}(R[y] \otimes_R \mathcal{O}) \rightarrow \text{Spec}(\mathcal{O})$ does not hit the closed point of $\text{Spec}(\mathcal{O})$. Equivalently, we have to find $\varphi : R \rightarrow \mathcal{O}$ such that $\varphi(x) \neq 0$ and $v(\varphi(x)) > v(\varphi(xy))$ where v is the valuation of \mathcal{O} . (Because this means that the valuation of y is negative.) To do this consider the ring map

$$R \longrightarrow \{a_0 + a_1x + a_2x^2 + \dots \mid a_0 \in k[y^{-1}], a_i \in k((y))\}$$

defined in the obvious way. We can find a valuation ring \mathcal{O} dominating the localization of the right hand side at the maximal ideal (y^{-1}, x) and we win.

Lemma 82.32.1. *There exists a morphism of affine schemes of finite presentation $X \rightarrow S$ and an \mathcal{O}_X -module \mathcal{F} of finite presentation such that \mathcal{F} is pure relative to S , but not universally pure relative to S .*

Proof. See discussion above. \square

82.33. A formally smooth non-flat ring map

Let k be a field. Consider the k -algebra $k[\mathbf{Q}]$. This is the k -algebra with basis $x_\alpha, \alpha \in \mathbf{Q}$ and multiplication determined by $x_\alpha x_\beta = x_{\alpha+\beta}$. (In particular $x_0 = 1$.) Consider the k -algebra homomorphism

$$k[\mathbf{Q}] \longrightarrow k, \quad x_\alpha \longmapsto 1.$$

It is surjective with kernel J generated by the elements $x_\alpha - 1$. Let us compute J/J^2 . Note that multiplication by x_α on J/J^2 is the identity map. Denote z_α the class of $x_\alpha - 1$ modulo J^2 . These classes generate J/J^2 . Since

$$(x_\alpha - 1)(x_\beta - 1) = x_{\alpha+\beta} - x_\alpha - x_\beta + 1 = (x_{\alpha+\beta} - 1) - (x_\alpha - 1) - (x_\beta - 1)$$

we see that $z_{\alpha+\beta} = z_\alpha + z_\beta$ in J/J^2 . A general element of J/J^2 is of the form $\sum \lambda_\alpha z_\alpha$ with $\lambda_\alpha \in k$ (only finitely many nonzero). Note that if the characteristic of k is $p > 0$ then

$$0 = pz_{\alpha/p} = z_{\alpha/p} + \dots + z_{\alpha/p} = z_\alpha$$

and we see that $J/J^2 = 0$. If the characteristic of k is zero, then

$$J/J^2 = \mathbf{Q} \otimes_{\mathbf{Z}} k \cong k$$

(details omitted) is not zero.

We claim that $k[\mathbf{Q}] \rightarrow k$ is a formally smooth ring map if the characteristic of k is positive. Namely, suppose given a solid commutative diagram

$$\begin{array}{ccc} k & \longrightarrow & A \\ \uparrow & \searrow & \uparrow \\ k[\mathbf{Q}] & \xrightarrow{\varphi} & A' \end{array}$$

with $A' \rightarrow A$ a surjection whose kernel I has square zero. To show that $k[\mathbf{Q}] \rightarrow k$ is formally smooth we have to prove that φ factors through k . Since $\varphi(x_\alpha - 1)$ maps to zero in A we see that φ induces a map $\bar{\varphi} : J/J^2 \rightarrow I$ whose vanishing is the obstruction to the desired factorization. Since $J/J^2 = 0$ if the characteristic is $p > 0$ we get the result we want, i.e., $k[\mathbf{Q}] \rightarrow k$ is formally smooth in this case. Finally, this ring map is not flat, for example as the nonzerodivisor $x_2 - 1$ is mapped to zero.

Lemma 82.33.1. *There exists a formally smooth ring map which is not flat.*

Proof. See discussion above. \square

82.34. A formally étale non-flat ring map

In this section we give a counterexample to the final sentence in [DG67, 0, Example 19.10.3(i)] (this was not one of the items caught in their later errata lists). Consider $A \rightarrow A/J$ for a local ring A and a nonzero proper ideal J such that $J^2 = J$ (so J isn't finitely generated); the valuation ring of an algebraically closed non-archimedean field with J its maximal ideal is a source of such (A, J) . These non-flat quotient maps are formally étale. Namely, suppose given a commutative diagram

$$\begin{array}{ccc} A/J & \longrightarrow & R/I \\ \uparrow & & \uparrow \\ A & \xrightarrow{\varphi} & R \end{array}$$

where I is an ideal of the ring R with $I^2 = 0$. Then $A \rightarrow R$ factors uniquely through A/J because

$$\varphi(J) = \varphi(J^2) \subset (\varphi(J)A)^2 \subset I^2 = 0.$$

Hence this also provides a counterexample to the formally étale case of the “structure theorem” for locally finite type and formally étale morphisms in [DG67, IV, Theorem 18.4.6(i)] (but not a counterexample to part (ii), which is what people actually use in practice). The error in the proof of the latter is that the very last step of the proof is to invoke the incorrect [DG67, 0, Example 19.3.10(i)], which is how the counterexample just mentioned creeps in.

Lemma 82.34.1. *There exist formally étale nonflat ring maps.*

Proof. See discussion above. \square

82.35. A formally étale ring map with nontrivial cotangent complex

Let k be a field. Consider the ring

$$R = k[\{x_n\}_{n \geq 1}, \{y_n\}_{n \geq 1}] / (x_1 y_1, x_{nm}^m - x_n, y_{nm}^m - y_n)$$

Let A be the localization at the maximal ideal generated by all x_n, y_n and denote $J \subset A$ the maximal ideal. Set $B = A/J$. By construction $J^2 = J$ and hence $A \rightarrow B$ is formally étale (see Section 82.34). We claim that the element $x_1 \otimes y_1$ is a nonzero element in the kernel of

$$J \otimes_A J \longrightarrow J.$$

Namely, (A, J) is the colimit of the localizations (A_n, J_n) of the rings

$$R_n = k[x_n, y_n]/(x_n^n y_n^n)$$

at their corresponding maximal ideals. Then $x_1 \otimes y_1$ corresponds to the element $x_n^n \otimes y_n^n \in J_n \otimes_{A_n} J_n$ and is nonzero (by an explicit computation which we omit). Since \otimes commutes with colimits we conclude. By [III72, III Section 3.3] we see that J is not weakly regular. Hence by [III72, III Proposition 3.3.3] we see that the cotangent complex $L_{B/A}$ is not zero. In fact, we can be more precise. We have $H_0(L_{B/A}) = \Omega_{B/A}$ and $H_1(L_{B/A}) = 0$ because $J/J^2 = 0$. But from the five-term exact sequence of Quillen’s fundamental spectral sequence (see Cotangent, Remark 70.11.5 or [Rei, Corollary 8.2.6]) and the nonvanishing of $\text{Tor}_2^A(B, B) = \text{Ker}(J \otimes_A J \rightarrow J)$ we conclude that $H_2(L_{B/A})$ is nonzero.

Lemma 82.35.1. *There exists a formally étale surjective ring map $A \rightarrow B$ with $L_{B/A}$ not equal to zero.*

Proof. See discussion above. □

82.36. Ideals generated by sets of idempotents and localization

Let R be a ring. Consider the ring

$$B(R) = R[x_n; n \in \mathbf{Z}]/(x_n(x_n - 1), x_n x_m; n \neq m)$$

It is easy to show that every prime $\mathfrak{q} \subset B(R)$ is either of the form

$$\mathfrak{q} = \mathfrak{p}B(R) + (x_n; n \in \mathbf{Z})$$

or of the form

$$\mathfrak{q} = \mathfrak{p}B(R) + (x_n - 1) + (x_m; n \neq m, m \in \mathbf{Z}).$$

Hence we see that

$$\text{Spec}(B(R)) = \text{Spec}(R) \amalg \coprod_{n \in \mathbf{Z}} \text{Spec}(R)$$

where the topology is not just the disjoint union topology. It has the following properties: Each of the copies indexed by $n \in \mathbf{Z}$ is an open subscheme, namely it is the standard open $D(x_n)$. The "central" copy of $\text{Spec}(R)$ is in the closure of the union of any infinitely many of the other copies of $\text{Spec}(R)$. Note that this last copy of $\text{Spec}(R)$ is cut out by the ideal $(x_n, n \in \mathbf{Z})$ which is generated by the idempotents x_n . Hence we see that if $\text{Spec}(R)$ is connected, then the decomposition above is exactly the decomposition of $\text{Spec}(B(R))$ into connected components.

Next, let $A = \mathbf{C}[x, y]/((y - x^2 + 1)(y + x^2 - 1))$. The spectrum of A consists of two irreducible components $C_1 = \text{Spec}(A_1)$, $C_2 = \text{Spec}(A_2)$ with $A_1 = \mathbf{C}[x, y]/(y - x^2 + 1)$ and $A_2 = \mathbf{C}[x, y]/(y + x^2 - 1)$. Note that these are parametrized by $(x, y) = (t, t^2 - 1)$ and $(x, y) = (t, -t^2 + 1)$ which meet in $P = (-1, 0)$ and $Q = (1, 0)$. We can make a twisted version of $B(A)$ where we glue $B(A_1)$ to $B(A_2)$ in the following way: Above P we let $x_n \in B(A_1) \otimes \kappa(P)$ correspond to $x_n \in B(A_2) \otimes \kappa(P)$, but above Q we let $x_n \in B(A_1) \otimes \kappa(Q)$ correspond to $x_{n+1} \in B(A_2) \otimes \kappa(Q)$.

Let $B^{twist}(A)$ denote the resulting A -algebra. Details omitted. By construction $B^{twist}(A)$ is Zariski locally over A isomorphic to the untwisted version. Namely, this happens over both the principal open $\text{Spec}(A) \setminus \{P\}$ and the principal open $\text{Spec}(A) \setminus \{Q\}$. However, our choice of glueing produces enough "monodromy" such that $\text{Spec}(B^{twist}(A))$ is connected (details omitted). Finally, there is a central copy of $\text{Spec}(A) \rightarrow \text{Spec}(B^{twist}(A))$ which gives a closed subscheme whose ideal is Zariski locally on $B^{twist}(A)$ cut out by ideals generated by idempotents, but not globally (as $B^{twist}(A)$ has no nontrivial idempotents).

Lemma 82.36.1. *There exists an affine scheme $X = \text{Spec}(A)$ and a closed subscheme $T \subset X$ such that T is Zariski locally on X cut out by ideals generated by idempotents, but T is not cut out by an ideal generated by idempotents.*

Proof. See above. □

82.37. A ring map which identifies local rings which is not ind-étale

Note that the ring map $R \rightarrow B(R)$ constructed in Section 82.36 is a colimit of finite products of copies of R . Hence $R \rightarrow B(R)$ is ind-Zariski, see Pro-étale Cohomology, Definition 46.4.1. Next, consider the ring map $A \rightarrow B^{twist}(A)$ constructed in Section 82.36. Since this ring map is Zariski locally on $\text{Spec}(A)$ isomorphic to an ind-Zariski ring map $R \rightarrow B(R)$ we conclude that it identifies local rings (see Pro-étale Cohomology, Lemma 46.4.6). The discussion in Section 82.36 shows there is a section $B^{twist}(A) \rightarrow A$ whose kernel is not generated by idempotents. Now, if $A \rightarrow B^{twist}(A)$ were ind-étale, i.e., $B^{twist}(A) = \text{colim } A_i$ with $A \rightarrow A_i$ étale, then the kernel of $A_i \rightarrow A$ would be generated by an idempotent (Algebra, Lemmas 10.138.9 and 10.138.10). This would contradict the result mentioned above.

Lemma 82.37.1. *There is a ring map $A \rightarrow B$ which identifies local rings but which is not ind-étale. A fortiori it is not ind-Zariski.*

Proof. See discussion above. □

82.38. Non flasque quasi-coherent sheaf associated to injective module

For more examples of this type see [BGI71, Exposé II, Appendix I] where Illusie explains some examples due to Verdier.

Consider the affine scheme $X = \text{Spec}(A)$ where

$$A = k[x, y, z_1, z_2, \dots] / (x^n z_n)$$

is the ring from Properties, Example 27.23.2. Set $I = (x) \subset A$. Consider the quasi-compact open $U = D(x)$ of X . We have seen in loc. cit. that there is a section $s \in \mathcal{O}_X(U)$ which does not come from an A -module map $I^n \rightarrow A$ for any $n \geq 0$.

Let $\alpha : A \rightarrow J$ be the embedding of A into an injective A -module. Let $Q = J/\alpha(A)$ and denote $\beta : J \rightarrow Q$ the quotient map. We claim that the map

$$\Gamma(X, \tilde{J}) \longrightarrow \Gamma(U, \tilde{J})$$

is not surjective. Namely, we claim that $\alpha(s)$ is not in the image. To see this, we argue by contradiction. So assume that $x \in J$ is an element which restricts to $\alpha(s)$ over U . Then $\beta(x) \in Q$ is an element which restricts to 0 over U . Hence we know that $I^n \beta(x) = 0$ for some n , see Properties, Lemma 27.23.1. This implies that we get a morphism $\varphi : I^n \rightarrow A$, $h \mapsto \alpha^{-1}(hx)$. It is easy to see that this morphism

φ gives rise to the section s via the map of Properties, Lemma 27.23.1 which is a contradiction.

Lemma 82.38.1. *There exists an affine scheme $X = \text{Spec}(A)$ and an injective A -module J such that \tilde{J} is not a flasque sheaf on X . Even the restriction $\Gamma(X, \tilde{J}) \rightarrow \Gamma(U, \tilde{J})$ with U a standard open need not be surjective.*

Proof. See above. □

82.39. A non-separated flat group scheme

Every group scheme over a field is separated, see Groupoids, Lemma 38.7.2. This is not true for group schemes over a base.

Let k be a field. Let $S = \text{Spec}(k[x]) = \mathbf{A}_k^1$. Let G be the affine line with 0 doubled (see Schemes, Example 25.14.3) seen as a scheme over S . Thus a fibre of $G \rightarrow S$ is either a singleton or a set with two elements (one in U and one in V). Thus we can endow these fibres with the structure of a group (by letting the element in U be the zero of the group structure). More precisely, G has two opens U, V which map isomorphically to S such that $U \cap V$ is mapped isomorphically to $S \setminus \{0\}$. Then

$$G \times_S G = U \times_S U \cup V \times_S U \cup U \times_S V \cup V \times_S V$$

where each piece is isomorphic to S . Hence we can define a multiplication $m : G \times_S G \rightarrow G$ as the unique S -morphism which maps the first and the last piece into U and the two middle pieces into V . This matches the pointwise description given above. We omit the verification that this defines a group scheme structure.

Lemma 82.39.1. *There exists a flat group scheme of finite type over the affine line which is not separated.*

Proof. See the discussion above. □

Lemma 82.39.2. *There exists a flat group scheme of finite type over the infinite dimensional affine space which is not quasi-separated.*

Proof. The same construction as above can be carried out with the infinite dimensional affine space $S = \mathbf{A}_k^\infty = \text{Spec } k[x_1, x_2, \dots]$ as the base and the origin $0 \in S$ corresponding to the maximal ideal (x_1, x_2, \dots) as the closed point which is doubled in G . The resulting group scheme $G \rightarrow S$ is not quasi-separated as explained in Schemes, Example 25.21.4. □

82.40. A non-flat group scheme with flat identity component

Let $X \rightarrow S$ be a monomorphism of schemes. Let $G = S \amalg X$. Let $m : G \times_S G \rightarrow G$ be the S -morphism

$$G \times_S G = X \times_S X \amalg X \amalg X \amalg S \longrightarrow G = X \amalg S$$

which maps the summands $X \times_S X$ and S into S and maps the summands X into X by the identity morphism. This defines a group law. To see this we have to show that $m \circ (m \times \text{id}_G) = m \circ (\text{id}_G \times m)$ as maps $G \times_S G \times_S G \rightarrow G$. Decomposing $G \times_S G \times_S G$ into components as above, we see that we need to verify this for the restriction to each of the 8-pieces. Each piece is isomorphic to either $S, X, X \times_S X$, or $X \times_S X \times_S X$. Moreover, both maps map these pieces to S, X, S, X respectively. Having said this, the fact that $X \rightarrow S$ is a monomorphism implies

that $X \times_S X \cong X$ and $X \times_S X \times_S X \cong X$ and that there is in each case exactly one S -morphism $S \rightarrow S$ or $X \rightarrow X$. Thus we see that $m \circ (m \times \text{id}_G) = m \circ (\text{id}_G \times m)$. Thus taking $X \rightarrow S$ to be any nonflat monomorphism of schemes (e.g., a closed immersion) we get an example of a group scheme over a base S whose identity component is S (hence flat) but which is not flat.

Lemma 82.40.1. *There exists a group scheme G over a base S whose identity component is flat over S but which is not flat over S .*

Proof. See discussion above. □

82.41. A non-separated group algebraic space over a field

Every group scheme over a field is separated, see Groupoids, Lemma 38.7.2. This is not true for group algebraic spaces over a field (but see end of this section for positive results).

Let k be a field of characteristic zero. Consider the algebraic space $G = \mathbf{A}_k^1/\mathbf{Z}$ from Spaces, Example 47.14.8. By construction G is the fppf sheaf associated to the presheaf

$$T \longmapsto \Gamma(T, \mathcal{O}_T)/\mathbf{Z}$$

on the category of schemes over k . The obvious addition rule on the presheaf induces an addition $m : G \times G \rightarrow G$ which turns G into a group algebraic space over $\text{Spec}(k)$. Note that G is not separated (and not even quasi-separated or locally separated). On the other hand $G \rightarrow \text{Spec}(k)$ is of finite type!

Lemma 82.41.1. *There exists a group algebraic space of finite type over a field which is not separated (and not even quasi-separated or locally separated).*

Proof. See discussion above. □

Positive results: If the group algebraic space G is either quasi-separated, or locally separated, or more generally a decent algebraic space, then G is in fact separated, see More on Groupoids in Spaces, Lemma 61.7.4. Moreover, a finite type, separated group algebraic space over a field is in fact a scheme (insert future reference here). The idea of the proof is that the schematic locus is open dense, see Properties of Spaces, Proposition 48.10.3 or Decent Spaces, Theorem 50.9.2. By translating this open we see that every point of G has an open neighbourhood which is a scheme.

82.42. Specializations between points in fibre étale morphism

If $f : X \rightarrow Y$ is an étale, or more generally a locally quasi-finite morphism of schemes, then there are no specializations between points of fibres, see Morphisms, Lemma 28.21.8. However, for morphisms of algebraic spaces this doesn't hold in general.

To give an example, let k be a field. Set

$$P = k[u, u^{-1}, y, \{x_n\}_{n \in \mathbf{Z}}].$$

Consider the action of \mathbf{Z} on P by k -algebra maps generated by the automorphism τ given by the rules $\tau(u) = u$, $\tau(y) = uy$, and $\tau(x_n) = x_{n+1}$. For $d \geq 1$ set $I_d = ((1 - u^d)y, x_n - x_{n+d}, n \in \mathbf{Z})$. Then $V(I_d) \subset \text{Spec}(P)$ is the fix point locus of τ^d . Let $S \subset P$ be the multiplicative subset generated by y and all $1 - u^d$, $d \in \mathbf{N}$.

Then we see that \mathbf{Z} acts freely on $U = \text{Spec}(S^{-1}P)$. Let $X = U/\mathbf{Z}$ be the quotient algebraic space, see Spaces, Definition 47.14.4.

Consider the prime ideals $\mathfrak{p}_n = (x_n, x_{n+1}, \dots)$ in $S^{-1}P$. Note that $\tau(\mathfrak{p}_n) = \mathfrak{p}_{n+1}$. Hence each of these define point $\xi_n \in U$ whose image in X is the same point x of X . Moreover we have the specializations

$$\dots \rightsquigarrow \xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots$$

We conclude that $U \rightarrow X$ is an example of the promised type.

Lemma 82.42.1. *There exists an étale morphism of algebraic spaces $f : X \rightarrow Y$ and a nontrivial specialization of points $x \rightsquigarrow x'$ in $|X|$ with $f(x) = f(x')$ in $|Y|$.*

Proof. See discussion above. \square

82.43. A torsor which is not an fppf torsor

In Groupoids, Remark 38.9.5 we raise the question whether any G -torsor is a G -torsor for the fppf topology. In this section we show that this is not always the case.

Let k be a field. All schemes and stacks are over k in what follows. Let $G \rightarrow \text{Spec}(k)$ be the group scheme

$$G = (\mu_{2,k})^\infty = \mu_{2,k} \times_k \mu_{2,k} \times_k \mu_{2,k} \times_k \dots = \lim_n (\mu_{2,k})^n$$

where $\mu_{2,k}$ is the group scheme of second roots of unity over $\text{Spec}(k)$, see Groupoids, Example 38.5.2. As an inverse limit of affine schemes we see that G is an affine group scheme. In fact it is the spectrum of the ring $k[t_1, t_2, t_3, \dots]/(t_i^2 - 1)$. The multiplication map $m : G \times_k G \rightarrow G$ is on the algebra level given by $t_i \mapsto t_i \otimes t_i$.

We claim that any G -torsor over k is of the form

$$P = \text{Spec}(k[x_1, x_2, x_3, \dots]/(x_i^2 - a_i))$$

for certain $a_i \in k^*$ and with G -action $G \times_k P \rightarrow P$ given by $x_i \mapsto t_i \otimes x_i$ on the algebra level. We omit the proof. Actually for the example we only need that P is a G -torsor which is clear since over $k' = k(\sqrt{a_1}, \sqrt{a_2}, \dots)$ the scheme P becomes isomorphic to G in a G -equivariant manner. Note that P is trivial if and only if $k' = k$ since if P has a k -rational point then all of the a_i are squares.

We claim that P is an fppf torsor if and only if the field extension $k \subset k' = k(\sqrt{a_1}, \sqrt{a_2}, \dots)$ is finite. If k' is finite over k , then $\{\text{Spec}(k') \rightarrow \text{Spec}(k)\}$ is an fppf covering which trivializes P and we see that P is indeed an fppf torsor. Conversely, suppose that P is a G -torsor for the fppf topology. This means that there exists an fppf covering $\{S_i \rightarrow \text{Spec}(k)\}$ such that each P_{S_i} is trivial. Pick an i such that S_i is not empty. Let $s \in S_i$ be a closed point. By Varieties, Lemma 32.12.1 the field extension $k \subset \kappa(s)$ is finite, and by construction $P_{\kappa(s)}$ has a $\kappa(s)$ -rational point. Thus we see that $k \subset k' \subset \kappa(s)$ and k' is finite over k .

To get an explicit example take $k = \mathbf{Q}$ and $a_i = i$ for example (or a_i is the i th prime if you like).

Lemma 82.43.1. *Let S be a scheme. Let G be a group scheme over S . The stack G -Principal classifying principal homogeneous G -spaces (see Examples of Stacks, Subsection 72.13.5) and the stack G -Torsors classifying fppf G -torsors (see Examples of Stacks, Subsection 72.13.8) are not equivalent in general.*

Proof. The discussion above shows that the functor $G\text{-Torsors} \rightarrow G\text{-Principal}$ isn't essentially surjective in general. \square

82.44. Stack with quasi-compact flat covering which is not algebraic

In this section we briefly describe an example due to Brian Conrad. You can find the example online at this location. Our example is slightly different.

Let k be an algebraically closed field. All schemes and stacks are over k in what follows. Let $G \rightarrow \text{Spec}(k)$ be an affine group scheme. In Examples of Stacks, Proposition 72.14.3 we have seen that $\mathcal{X} = [\text{Spec}(k)/G]$ is a stack in groupoids over $(\text{Sch}/\text{Spec}(k))_{\text{fppf}}$ which can be described as follows. A 1-morphism $T \rightarrow \mathcal{X}$ corresponds by definition to an fppf G_T -torsor P over T . The diagonal 1-morphism

$$\Delta : \mathcal{X} \longrightarrow \mathcal{X} \times_{\text{Spec}(k)} \mathcal{X}$$

is representable and affine. The reason for this is that given any pair of G_T -torsors P_1, P_2 in the fppf topology over a scheme S/k the scheme $\text{Isom}(P_1, P_2)$ is affine over T . The trivial G -torsor over $\text{Spec}(k)$ defines a 1-morphism

$$f : \text{Spec}(k) \longrightarrow \mathcal{X}.$$

We claim that this is a surjective 1-morphism. The reason is simply that by definition for any 1-morphism $T \rightarrow \mathcal{X}$ there exists a fppf covering $\{T_i \rightarrow T\}$ such that P_{T_i} is isomorphic to the trivial G_{T_i} -torsor. Hence the compositions $T_i \rightarrow T \rightarrow \mathcal{X}$ factor through f . Thus it is clear that the projection $T \times_{\mathcal{X}} \text{Spec}(k) \rightarrow \mathcal{X}$ is surjective (which is how we define the property that f is surjective, see Algebraic Stacks, Definition 71.10.1). In a similar way you show that f is quasi-compact and flat (details omitted). We also record here the observation that

$$\text{Spec}(k) \times_{\mathcal{X}} \text{Spec}(k) \cong G$$

as schemes over k .

Suppose there exists a surjective smooth morphism $p : U \rightarrow \mathcal{X}$ where U is a scheme. Consider the fibre product

$$\begin{array}{ccc} W & \longrightarrow & U \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \longrightarrow & \mathcal{X} \end{array}$$

Then we see that W is a nonempty smooth scheme over k which hence has a k -point. This means that we can factor f through U . Hence we obtain

$$G \cong \text{Spec}(k) \times_{\mathcal{X}} \text{Spec}(k) \cong (\text{Spec}(k) \times_k \text{Spec}(k)) \times_{(U \times_k U)} (U \times_{\mathcal{X}} U)$$

and since the projections $U \times_{\mathcal{X}} U \rightarrow U$ were assumed smooth we conclude that $U \times_{\mathcal{X}} U \rightarrow U \times_k U$ is locally of finite type, see Morphisms, Lemma 28.16.8. It follows that in this case G is locally of finite type over k . Altogether we have proved the following lemma (which can be significantly generalized).

Lemma 82.44.1. *Let k be a field. Let G be an affine group scheme over k . If the stack $[\text{Spec}(k)/G]$ has a smooth covering by a scheme, then G is of finite type over k .*

Proof. See discussion above. \square

To get an explicit example as in the title of this section, take for example $G = (\mu_{2,k})^\infty$ the group scheme of Section 82.43, which is not locally of finite type over k . By the discussion above we see that $\mathcal{X} = [\mathrm{Spec}(k)/G]$ has properties (1) and (2) of Algebraic Stacks, Definition 71.12.1, but not property (3). Hence \mathcal{X} is not an algebraic stack. On the other hand, there does exist a scheme U and a surjective, flat, quasi-compact morphism $U \rightarrow \mathcal{X}$, namely the morphism $f : \mathrm{Spec}(k) \rightarrow \mathcal{X}$ we studied above.

82.45. Limit preserving on objects, not limit preserving

Let S be a nonempty scheme. Let \mathcal{G} be an injective abelian sheaf on $(\mathrm{Sch}/S)_{\mathrm{fppf}}$. We obtain a stack in groupoids

$$\mathcal{G}\text{-Torsors} \longrightarrow (\mathrm{Sch}/S)_{\mathrm{fppf}}$$

over S , see Examples of Stacks, Lemma 72.13.2. This stack is limit preserving on objects over $(\mathrm{Sch}/S)_{\mathrm{fppf}}$ (see Criteria for Representability, Section 74.5) because every \mathcal{G} -torsor is trivial. On the other hand, $\mathcal{G}\text{-Torsors}$ is in general not limit preserving (see Artin's Axioms, Definition 75.13.1) as \mathcal{G} need not be limit preserving as a sheaf. For example, take any nonzero injective sheaf \mathcal{I} and set $\mathcal{G} = \prod_{n \in \mathbf{Z}} \mathcal{I}$ to get an example.

Lemma 82.45.1. *Let S be a nonempty scheme. There exists a stack in groupoids $p : \mathcal{X} \rightarrow (\mathrm{Sch}/S)_{\mathrm{fppf}}$ such that p is limit preserving on objects, but \mathcal{X} is not limit preserving.*

Proof. See discussion above. \square

82.46. A non-algebraic classifying stack

Let $S = \mathrm{Spec}(\mathbf{F}_p)$ and let μ_p denote the group scheme of p th roots of unity over S . In Groupoids in Spaces, Section 60.19 we have introduced the quotient stack $[S/\mu_p]$ and in Examples of Stacks, Section 72.14 we have shown $[S/\mu_p]$ is the classifying stack for fppf μ_p -torsors: Given a scheme T over S the category $\mathrm{Mor}_S(T, [S/\mu_p])$ is canonically equivalent to the category of fppf μ_p -torsors over T . Finally, in Criteria for Representability, Theorem 74.17.2 we have seen that $[S/\mu_p]$ is an algebraic stack.

Now we can ask the question: “How about the category fibred in groupoids \mathcal{S} classifying étale μ_p -torsors?” (In other words \mathcal{S} is a category over Sch/S whose fibre category over a scheme T is the category of étale μ_p -torsors over T .)

The first objection is that this isn't a stack for the fppf topology, because descent for objects isn't going to hold. For example the μ_p -torsor $\mathrm{Spec}(\mathbf{F}_p(t)[x]/(x^p - t))$ over $T = \mathrm{Spec}(\mathbf{F}_p(T))$ is fppf locally trivial, but not étale locally trivial.

A fix for this first problem is to work with the étale topology and in this case descent for objects does work. Indeed it is true that \mathcal{S} is a stack in groupoids over $(\mathrm{Sch}/S)_{\mathrm{étale}}$. Moreover, it is also the case that the diagonal $\Delta : \mathcal{S} \rightarrow \mathcal{S} \times \mathcal{S}$ is representable (by schemes). This is true because given two μ_p -torsors (whether they be étale locally trivial or not) the sheaf of isomorphisms between them is representable by a scheme.

Thus we can finally ask if there exists a scheme U and a smooth and surjective 1-morphism $U \rightarrow \mathcal{S}$. We will show in two ways that this is impossible: by a direct

argument (which we advise the reader to skip) and by an argument using a general result.

Direct argument (sketch): Note that the 1-morphism $\mathcal{S} \rightarrow \mathrm{Spec}(\mathbf{F}_p)$ satisfies the infinitesimal lifting criterion for formal smoothness. This is true because given a first order infinitesimal thickening of schemes $T \rightarrow T'$ the kernel of $\mu_p(T') \rightarrow \mu_p(T)$ is isomorphic to the sections of the ideal sheaf of T in T' , and hence $H_{\acute{e}tale}^1(T, \mu_p) = H_{\acute{e}tale}^1(T', \mu_p)$. Moreover, \mathcal{S} is a limit preserving stack. Hence if $U \rightarrow \mathcal{S}$ is smooth, then $U \rightarrow \mathrm{Spec}(\mathbf{F}_p)$ is limit preserving and satisfies the infinitesimal lifting criterion for formal smoothness. This implies that U is smooth over \mathbf{F}_p . In particular U is reduced, hence $H_{\acute{e}tale}^1(U, \mu_p) = 0$. Thus $U \rightarrow \mathcal{S}$ factors as $U \rightarrow \mathrm{Spec}(\mathbf{F}_p) \rightarrow \mathcal{S}$ and the first arrow is smooth. By descent of smoothness, we see that $U \rightarrow \mathcal{S}$ being smooth would imply $\mathrm{Spec}(\mathbf{F}_p) \rightarrow \mathcal{S}$ is smooth. However, this is not the case as $\mathrm{Spec}(\mathbf{F}_p) \times_{\mathcal{S}} \mathrm{Spec}(\mathbf{F}_p)$ is μ_p which is not smooth over $\mathrm{Spec}(\mathbf{F}_p)$.

Structural argument: In Criteria for Representability, Section 74.19 we have seen that we can think of algebraic stacks as those stacks in groupoids for the étale topology with diagonal representable by algebraic spaces having a smooth covering. Hence if a smooth surjective $U \rightarrow \mathcal{S}$ exists then \mathcal{S} is an algebraic stack, and in particular satisfies descent in the fppf topology. But we've seen above that \mathcal{S} does not satisfy descent in the fppf topology.

Loosely speaking the arguments above show that the classifying stack in the étale topology for étale locally trivial torsors for a group scheme G over a base B is algebraic if and only if G is smooth over B . One of the advantages of working with the fppf topology is that it suffices to assume that $G \rightarrow B$ is flat and locally of finite presentation. In fact the quotient stack (for the fppf topology) $[B/G]$ is algebraic if and only if $G \rightarrow B$ is flat and locally of finite presentation, see Criteria for Representability, Lemma 74.18.3.

82.47. Sheaf with quasi-compact flat covering which is not algebraic

Consider the functor $F = (\mathbf{P}^1)^\infty$, i.e., for a scheme T the value $F(T)$ is the set of $f = (f_1, f_2, f_3, \dots)$ where each $f_i : T \rightarrow \mathbf{P}^1$ is a morphism of schemes. Note that \mathbf{P}^1 satisfies the sheaf property for fpqc coverings, see Descent, Lemma 34.9.3. A product of sheaves is a sheaf, so F also satisfies the sheaf property for the fpqc topology. The diagonal of F is representable: if $f : T \rightarrow F$ and $g : S \rightarrow F$ are morphisms, then $T \times_F S$ is the scheme theoretic intersection of the closed subschemes $T \times_{f_i, \mathbf{P}^1, g_i} S$ inside the scheme $T \times S$. Consider the group scheme SL_2 which comes with a surjective smooth affine morphism $\mathrm{SL}_2 \rightarrow \mathbf{P}^1$. Next, consider $U = (\mathrm{SL}_2)^\infty$ with its canonical (product) morphism $U \rightarrow F$. Note that U is an affine scheme. We claim the morphism $U \rightarrow F$ is flat, surjective, and universally open. Namely, suppose $f : T \rightarrow F$ is a morphism. Then $Z = T \times_F U$ is the infinite fibre product of the schemes $Z_i = T \times_{f_i, \mathbf{P}^1} \mathrm{SL}_2$ over T . Each of the morphisms $Z_i \rightarrow T$ is surjective smooth and affine which implies that

$$Z = Z_1 \times_T Z_2 \times_T Z_3 \times_T \dots$$

is a scheme flat and affine over Z . A simple limit argument shows that $Z \rightarrow T$ is open as well.

On the other hand, we claim that F isn't an algebraic space. Namely, if F were an algebraic space it would be a quasi-compact and separated (by our description of

fibre products over F) algebraic space. Hence cohomology of quasi-coherent sheaves would vanish above a certain cutoff (see Cohomology of Spaces, Proposition 51.6.2 and remarks preceding it). But clearly by taking the pullback of $\mathcal{O}(-2, -2, \dots, -2)$ under the projection

$$(\mathbf{P}^1)^\infty \longrightarrow (\mathbf{P}^1)^n$$

(which has a section) we can obtain a quasi-coherent sheaf whose cohomology is nonzero in degree n . Altogether we obtain an answer to a question asked by Anton Geraschenko on mathoverflow.

Lemma 82.47.1. *There exists a functor $F : Sch^{opp} \rightarrow Sets$ which satisfies the sheaf condition for the fpqc topology, has representable diagonal $\Delta : F \rightarrow F \times F$, and such that there exists a surjective, flat, universally open, quasi-compact morphism $U \rightarrow F$ where U is a scheme, but such that F is not an algebraic space.*

Proof. See discussion above. □

82.48. Sheaves and specializations

In the following we fix a big étale site $Sch_{\acute{e}tale}$ as constructed in Topologies, Definition 33.4.6. Moreover, a scheme will be an object of this site. Recall that if x, x' are points of a scheme X we say x is a *specialization* of x' or we write $x' \rightsquigarrow x$ if $x \in \overline{\{x'\}}$. This is true in particular if $x = x'$.

Consider the functor $F : Sch_{\acute{e}tale} \rightarrow Ab$ defined by the following rules:

$$F(X) = \prod_{x \in X} \prod_{x' \in X, x' \rightsquigarrow x, x' \neq x} \mathbf{Z}/2\mathbf{Z}$$

Given a scheme X we denote $|X|$ the underlying set of points. An element $a \in F(X)$ will be viewed as a map of sets $|X| \times |X| \rightarrow \mathbf{Z}/2\mathbf{Z}$, $(x, x') \mapsto a(x, x')$ which is zero if $x = x'$ or if x is not a specialization of x' . Given a morphism of schemes $f : X \rightarrow Y$ we define

$$F(f) : F(Y) \longrightarrow F(X)$$

by the rule that for $b \in F(Y)$ we set

$$F(f)(b)(x, x') = \begin{cases} 0 & \text{if } x \text{ is not a specialization of } x' \\ b(f(x), f(x')) & \text{else.} \end{cases}$$

Note that this really does define an element of $F(X)$. We claim that if $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are composable morphisms then $F(f) \circ F(g) = F(g \circ f)$. Namely, let $c \in F(Z)$ and let $x' \rightsquigarrow x$ be a specialization of points in X , then

$$F(g \circ f)(x, x') = c(g(f(x)), g(f(x'))) = F(g)(F(f)(c))(x, x')$$

because $f(x') \rightsquigarrow f(x)$. (This also works if $f(x) = f(x')$.)

Let G be the sheafification of F in the étale topology.

I claim that if X is a scheme and $x' \rightsquigarrow x$ is a specialization and $x' \neq x$, then $G(X) \neq 0$. Namely, let $a \in F(X)$ be an element such that when we think of a as a function $|X| \times |X| \rightarrow \mathbf{Z}/2\mathbf{Z}$ it is nonzero at (x, x') . Let $\{f_i : U_i \rightarrow X\}$ be an étale covering of X . Then we can pick an i and a point $u_i \in U_i$ with $f_i(u_i) = x$. Since generalizations lift along flat morphisms (see Morphisms, Lemma 28.26.8) we can find a specialization $u'_i \rightsquigarrow u_i$ with $f_i(u'_i) = x'$. By our construction above we see that $F(f_i)(a) \neq 0$. Hence a determines a nonzero element of $G(X)$.

Note that if $X = \text{Spec}(k)$ where k is a field (or more generally a ring all of whose prime ideals are maximal), then $F(X) = 0$ and for every étale morphism $U \rightarrow X$ we have $F(U) = 0$ because there are no specializations between distinct points in fibres of an étale morphism. Hence $G(X) = 0$.

Suppose that $X \subset X'$ is a thickening, see More on Morphisms, Definition 36.2.1. Then the category of schemes étale over X' is equivalent to the category of schemes étale over X by the base change functor $U' \mapsto U = U' \times_{X'} X$, see Étale Cohomology, Theorem 44.46.1. Since it is always the case that $F(U) = F(U')$ in this situation we see that also $G(X) = G(X')$.

As a variant we can consider the presheaf F_n which associates to a scheme X the collection of maps $a : |X|^{n+1} \rightarrow \mathbf{Z}/2\mathbf{Z}$ where $a(x_0, \dots, x_n)$ is nonzero only if $x_n \rightsquigarrow \dots \rightsquigarrow x_0$ is a sequence of specializations and $x_n \neq x_{n-1} \neq \dots \neq x_0$. Let G_n be the sheaf associated to F_n . In exactly the same way as above one shows that G_n is nonzero if $\dim(X) \geq n$ and is zero if $\dim(X) < n$.

Lemma 82.48.1. *There exists a sheaf of abelian groups G on $Sch_{\acute{e}tale}$ with the following properties*

- (1) $G(X) = 0$ whenever $\dim(X) < n$,
- (2) $G(X)$ is not zero if $\dim(X) \geq n$, and
- (3) if $X \subset X'$ is a thickening, then $G(X) = G(X')$.

Proof. See the discussion above. □

Remark 82.48.2. Here are some remarks:

- (1) The presheaves F and F_n are separated presheaves.
- (2) It turns out that F, F_n are not sheaves.
- (3) One can show that G, G_n is actually a sheaf for the fppf topology.

We will prove these results if we need them.

82.49. Sheaves and constructible functions

In the following we fix a big étale site $Sch_{\acute{e}tale}$ as constructed in Topologies, Definition 33.4.6. Moreover, a scheme will be an object of this site. In this section we say that a *constructible partition* of a scheme X is a locally finite disjoint union decomposition $X = \coprod_{i \in I} X_i$ such that each $X_i \subset X$ is a locally constructible subset of X . Locally finite means that for any quasi-compact open $U \subset X$ there are only finitely many $i \in I$ such that $X_i \cap U$ is not empty. Note that if $f : X \rightarrow Y$ is a morphism of schemes and $Y = \coprod Y_j$ is a constructible partition, then $X = \coprod f^{-1}(Y_j)$ is a constructible partition of X . Given a set S and a scheme X a *constructible function* $f : |X| \rightarrow S$ is a map such that $X = \coprod_{s \in S} f^{-1}(s)$ is a constructible partition of X . If G is an (abstract group) and $a, b : |X| \rightarrow G$ are constructible functions, then $ab : |X| \rightarrow G, x \mapsto a(x)b(x)$ is a constructible function too. The reason is that given any two constructible partitions there is a third one refining both.

Let A be any abelian group. For any scheme X we define

$$F(X) = \frac{\{a : |X| \rightarrow A \mid a \text{ is a constructible function}\}}{\{\text{locally constant functions } |X| \rightarrow A\}}$$

We think of an element a of $F(X)$ simply as a function well defined up to adding a locally constant one. Given a morphism of schemes $f : X \rightarrow Y$ and an element $b \in F(Y)$, then we define $F(f)(b) = b \circ f$. Thus F is a presheaf on $Sch_{\acute{e}tale}$.

Note that if $\{f_i : U_i \rightarrow X\}$ is an fppf covering, and $a \in F(X)$ is such that $F(f_i)(a) = 0$ in $F(U_i)$, then $a \circ f_i$ is a locally constant function for each i . This means in turn that a is a locally constant function as the morphisms f_i are open. Hence $a = 0$ in $F(X)$. Thus we see that F is a separated presheaf (in the fppf topology hence a fortiori in the étale topology).

Let G be the sheafification of F in the étale topology. Since F is separated, and since $F(X) \neq 0$ for example when X is the spectrum of a discrete valuation ring, we see that G is not zero.

Let $X = \text{Spec}(k)$ where k is a field. Then any étale covering of X can be dominated by a covering $\{\text{Spec}(k') \rightarrow \text{Spec}(k)\}$ with $k \subset k'$ a finite separable extension of fields. Since $F(\text{Spec}(k')) = 0$ we see that $G(X) = 0$.

Suppose that $X \subset X'$ is a thickening, see More on Morphisms, Definition 36.2.1. Then the category of schemes étale over X' is equivalent to the category of schemes étale over X by the base change functor $U' \mapsto U = U' \times_{X'} X$, see Étale Cohomology, Theorem 44.46.1. Since $F(U) = F(U')$ in this situation we see that also $G(X) = G(X')$.

The sheaf G is limit preserving, see Limits of Spaces, Definition 52.3.1. Namely, let R be a ring which is written as a directed colimit $R = \text{colim}_i R_i$ of rings. Set $X = \text{Spec}(R)$ and $X_i = \text{Spec}(R_i)$, so that $X = \lim_i X_i$. Then $G(X) = \text{colim}_i G(X_i)$. To prove this one first proves that a constructible partition of $\text{Spec}(R)$ comes from a constructible partitions of some $\text{Spec}(R_i)$. Hence the result for F . To get the result for the sheafification, use that any étale ring map $R \rightarrow R'$ comes from an étale ring map $R_i \rightarrow R'_i$ for some i . Details omitted.

Lemma 82.49.1. *There exists a sheaf of abelian groups G on $\text{Sch}_{\text{étale}}$ with the following properties*

- (1) $G(\text{Spec}(k)) = 0$ whenever k is a field,
- (2) G is limit preserving,
- (3) if $X \subset X'$ is a thickening, then $G(X) = G(X')$, and
- (4) G is not zero.

Proof. See discussion above. □

82.50. The lisse-étale site is not functorial

The *lisse-étale* site $X_{\text{lisse}, \text{étale}}$ of X is the category of schemes smooth over X endowed with (usual) étale coverings, see Cohomology of Stacks, Section 79.11. Let $f : X \rightarrow Y$ be a morphism of schemes. There is a functor

$$u : Y_{\text{lisse}, \text{étale}} \longrightarrow X_{\text{lisse}, \text{étale}}, \quad V/Y \longmapsto V \times_Y X$$

which is continuous. Hence we obtain an adjoint pair of functors

$$u^s : \text{Sh}(X_{\text{lisse}, \text{étale}}) \longrightarrow \text{Sh}(Y_{\text{lisse}, \text{étale}}), \quad u_s : \text{Sh}(Y_{\text{lisse}, \text{étale}}) \longrightarrow \text{Sh}(X_{\text{lisse}, \text{étale}}),$$

see Sites, Section 7.14. We claim that, in general, u does **not** define a morphism of sites, see Sites, Definition 7.15.1. In other words, we claim that u_s is not left exact in general. Note that representable presheaves are sheaves on lisse-étale sites.

Hence, by Sites, Lemma 7.14.5 we see that $u_s h_V = h_{V \times_Y X}$. Now consider two morphisms

$$\begin{array}{ccc} V_1 & \begin{array}{c} \xrightarrow{a} \\ \xrightarrow{b} \end{array} & V_2 \\ & \searrow & \swarrow \\ & Y & \end{array}$$

of schemes V_1, V_2 smooth over Y . Now if u_s is left exact, then we would have

$$u_s \text{Equalizer}(h_a, h_b : h_{V_1} \rightarrow h_{V_2}) = \text{Equalizer}(h_{a \times 1}, h_{b \times 1} : h_{V_1 \times_Y X} \rightarrow h_{V_2 \times_Y X})$$

We will take the morphisms $a, b : V_1 \rightarrow V_2$ such that there exists no morphism from a scheme smooth over Y into $(a = b) \subset V_1$, i.e., such that the left hand side is the empty sheaf, but such that after base change to X the equalizer is nonempty and smooth over X . A silly example is to take $X = \text{Spec}(\mathbf{F}_p)$, $Y = \text{Spec}(\mathbf{Z})$ and $V_1 = V_2 = \mathbf{A}_{\mathbf{Z}}^1$ with morphisms $a(x) = x$ and $b(x) = x + p$. Note that the equalizer of a and b is the fibre of $\mathbf{A}_{\mathbf{Z}}^1$ over (p) .

Lemma 82.50.1. *The lisse-étale site is not functorial, even for morphisms of schemes.*

Proof. See discussion above. □

82.51. Derived pushforward of quasi-coherent modules

Let k be a field of characteristic $p > 0$. Let $S = \text{Spec}(k[x])$. Let $G = \mathbf{Z}/p\mathbf{Z}$ viewed either as an abstract group or as a constant group scheme over S . Consider the algebraic stack $\mathcal{X} = [S/G]$ where G acts trivially on S , see Examples of Stacks, Remark 72.14.4 and Criteria for Representability, Lemma 74.18.3. Consider the structure morphism

$$f : \mathcal{X} \rightarrow S$$

This morphism is quasi-compact and quasi-separated. Hence we get a functor

$$Rf_{QCoh,*} : D_{QCoh}^+(\mathcal{O}_{\mathcal{X}}) \rightarrow D_{QCoh}^+(\mathcal{O}_S),$$

see Derived Categories of Stacks, Proposition 80.5.1. Let's compute $Rf_{QCoh,*}\mathcal{O}_{\mathcal{X}}$. Since $D_{QCoh}(\mathcal{O}_S)$ is equivalent to the derived category of $k[x]$ -modules (see Derived Categories of Schemes, Lemma 35.3.4) this is equivalent to computing $R\Gamma(\mathcal{X}, \mathcal{O}_{\mathcal{X}})$. For this we can use the covering $S \rightarrow \mathcal{X}$ and the spectral sequence

$$H^q(S \times_{\mathcal{X}} \dots \times_{\mathcal{X}} S, \mathcal{O}) \Rightarrow H^{p+q}(\mathcal{X}, \mathcal{O}_{\mathcal{X}})$$

see Cohomology of Stacks, Proposition 79.10.4. Note that

$$S \times_{\mathcal{X}} \dots \times_{\mathcal{X}} S = S \times G^p$$

which is affine. Thus the complex

$$k[x] \rightarrow \text{Map}(G, k[x]) \rightarrow \text{Map}(G^2, k[x]) \rightarrow \dots$$

computes $R\Gamma(\mathcal{X}, \mathcal{O}_{\mathcal{X}})$. Here for $\varphi \in \text{Map}(G^{p-1}, k[x])$ its differential is the map which sends (g_1, \dots, g_p) to

$$\varphi(g_2, \dots, g_p) + \sum_{i=1}^{p-1} (-1)^i \varphi(g_1, \dots, g_i + g_{i+1}, \dots, g_p) + (-1)^p \varphi(g_1, \dots, g_{p-1}).$$

This is just the complex computing the group cohomology of G acting trivially on $k[x]$ (insert future reference here). The cohomology of the cyclic group G on $k[x]$ is

exactly one copy of $k[x]$ in each cohomological degree ≥ 0 (insert future reference here). We conclude that

$$Rf_*\mathcal{O}_{\mathcal{X}} = \bigoplus_{n \geq 0} \mathcal{O}_S[-n]$$

Now, consider the complex

$$E = \bigoplus_{m \geq 0} \mathcal{O}_{\mathcal{X}}[m]$$

This is an object of $D_{QCoh}(\mathcal{O}_{\mathcal{X}})$. We interrupt the discussion for a general result.

Lemma 82.51.1. *Let \mathcal{X} be an algebraic stack. Let K be an object of $D(\mathcal{O}_{\mathcal{X}})$ whose cohomology sheaves are locally quasi-coherent (Sheaves on Stacks, Definition 73.11.4) and satisfy the flat base change property (Cohomology of Stacks, Definition 79.7.1). Then there exists a distinguished triangle*

$$K \rightarrow \prod_{n \geq 0} \tau_{\geq -n} K \rightarrow \prod_{n \geq 0} \tau_{\geq -n} K \rightarrow K[1]$$

in $D(\mathcal{O}_{\mathcal{X}})$. In other words, K is the derived limit of its canonical truncations.

Proof. Recall that we work on the “big fppf site” \mathcal{X}_{fppf} of \mathcal{X} (by our conventions for sheaves of $\mathcal{O}_{\mathcal{X}}$ -modules in the chapters Sheaves on Stacks and Cohomology on Stacks). Let \mathcal{B} be the set of objects x of \mathcal{X}_{fppf} which lie over an affine scheme U . Combining Sheaves on Stacks, Lemmas 73.22.2, 73.15.1, Descent, Lemma 34.8.4, and Cohomology of Schemes, Lemma 29.2.2 we see that $H^p(x, \mathcal{F}) = 0$ if \mathcal{F} is locally quasi-coherent and $x \in \mathcal{B}$. Now the claim follows from Cohomology on Sites, Lemma 21.22.4. \square

Lemma 82.51.2. *Let \mathcal{X} be an algebraic stack. If \mathcal{F}_n is a collection of locally quasi-coherent sheaves with the flat base change property on \mathcal{X} , then $\bigoplus_n \mathcal{F}_n[n] \rightarrow \prod_n \mathcal{F}_n[n]$ is an isomorphism in $D(\mathcal{O}_{\mathcal{X}})$.*

Proof. This is true because by Lemma 82.51.1 we see that the direct sum is isomorphic to the product. \square

We continue our discussion. Since a quasi-coherent module is locally quasi-coherent and satisfies the flat base change property (Sheaves on Stacks, Lemma 73.11.5) we get

$$E = \prod_{m \geq 0} \mathcal{O}_{\mathcal{X}}[m]$$

Since cohomology commutes with limits we see that

$$Rf_*E = \prod_{m \geq 0} \left(\bigoplus_{n \geq 0} \mathcal{O}_S[m-n] \right)$$

Note that this complex is not an object of $D_{QCoh}(\mathcal{O}_S)$ because the cohomology sheaf in degree 0 is an infinite product of copies of \mathcal{O}_S which is not even a locally quasi-coherent \mathcal{O}_S -module.

Lemma 82.51.3. *A quasi-compact and quasi-separated morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks need not induce a functor $Rf_* : D_{QCoh}(\mathcal{O}_{\mathcal{X}}) \rightarrow D_{QCoh}(\mathcal{O}_{\mathcal{Y}})$.*

Proof. See discussion above. \square

82.52. A big abelian category

The purpose of this section is to give an example of a “big” abelian category \mathcal{A} and objects M, N such that the collection of isomorphism classes of extensions $\text{Ext}_{\mathcal{A}}(M, N)$ is not a set. The example is due to Freyd, see [Fre64, page 131, Exercise A].

We define \mathcal{A} as follows. An object of \mathcal{A} consists of a triple (M, α, f) where M is an abelian group and α is an ordinal and $f : \alpha \rightarrow \text{End}(M)$ is a map. A morphism $(M, \alpha, f) \rightarrow (M', \alpha', f')$ is given by a homomorphism of abelian groups $\varphi : M \rightarrow M'$ such that for *any* ordinal β we have

$$\varphi \circ f(\beta) = f'(\beta) \circ \varphi$$

Here the rule is that we set $f(\beta) = 0$ if β is not in α and similarly we set $f'(\beta)$ equal to zero if β is not an element of α' . We omit the verification that the category so defined is abelian.

Consider the object $Z = (\mathbf{Z}, \emptyset, f)$, i.e., all the operators are zero. The observation is that computed in \mathcal{A} the group $\text{Ext}_{\mathcal{A}}^1(Z, Z)$ is a proper class and not a set. Namely, for each ordinal α we can find an extension $(M, \alpha+1, f)$ of Z by Z whose underlying group is $M = \mathbf{Z} \oplus \mathbf{Z}$ and where the value of f is always zero except for

$$f(\alpha) = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}.$$

This clearly produces a proper class of isomorphism classes of extensions. In particular, the derived category of \mathcal{A} has proper classes for its collections of morphism, see Derived Categories, Lemma 13.27.6. This means that some care has to be exercised when defining Verdier quotients of triangulated categories.

Lemma 82.52.1. *There exists a “big” abelian category \mathcal{A} whose Ext-groups are proper classes.*

Proof. See discussion above. □

82.53. Weakly associated points and scheme theoretic density

Let k be a field. Let $R = k[z, x_i, y_i]/(z^2, zx_iy_i)$ where i runs over the elements of \mathbf{N} . Note that $R = R_0 \oplus M_0$ where $R_0 = k[x_i, y_i]$ is a subring and M_0 is an ideal of square zero with $M_0 \cong R_0/(x_iy_i)$ as R_0 -module. The prime $\mathfrak{p} = (z, x_i)$ is weakly associated to R as an R -module (Algebra, Definition 10.65.1). Indeed, the element z in $R_{\mathfrak{p}}$ is nonzero but annihilated by $\mathfrak{p}R_{\mathfrak{p}}$. On the other hand, consider the open subscheme

$$U = \bigcup D(x_i) \subset \text{Spec}(R) = S$$

We claim that $U \subset S$ is scheme theoretically dense (Morphisms, Definition 28.7.1). To prove this it suffices to show that $\mathcal{O}_S \rightarrow j_*\mathcal{O}_U$ is injective where $j : U \rightarrow S$ is the inclusion morphism, see Morphisms, Lemma 28.7.5. Translated back into algebra, we have to show that for all $g \in R$ the map

$$R_g \longrightarrow \prod R_{x_i g}$$

is injective. Write $g = g_0 + m_0$ with $g_0 \in R_0$ and $m_0 \in M_0$. Then $R_g = R_{g_0}$ (details omitted). Hence we may assume $g \in R_0$. We may also assume g is not zero. Now $R_g = (R_0)_g \oplus (M_0)_g$. Since R_0 is a domain, the map $(R_0)_g \rightarrow \prod (R_0)_{x_i g}$ is injective.

If $g \in (x_i y_i)$ then $(M_0)_g = 0$ and there is nothing to prove. If $g \notin (x_i y_i)$ then, since $(x_i y_i)$ is a radical ideal of R_0 , we have to show that $M_0 \rightarrow \prod (M_0)_{x_i g}$ is injective. The kernel of $R_0 \rightarrow M_0 \rightarrow (M_0)_{x_n}$ is $(x_i y_i, y_n)$. Since $(x_i y_i, y_n)$ is a radical ideal, if $g \notin (x_i y_i, y_n)$ then the kernel of $R_0 \rightarrow M_0 \rightarrow (M_0)_{x_n g}$ is $(x_i y_i, y_n)$. As $g \notin (x_i y_i, y_n)$ for all $n \gg 0$ we conclude that the kernel is contained in $\bigcap_{n \gg 0} (x_i y_i, y_n) = (x_i y_i)$ as desired.

Second example due to Ofer Gabber. Let k be a field and let R , resp. R' be the ring of functions $\mathbf{N} \rightarrow k$, resp. the ring of eventually constant functions $\mathbf{N} \rightarrow k$. Then $\text{Spec}(R)$, resp. $\text{Spec}(R')$ is the Stone-Ćech compactification² $\beta\mathbf{N}$, resp. the one point compactification³ $\mathbf{N}^* = \mathbf{N} \cup \{\infty\}$. All points are weakly associated since all primes are minimal in the rings R and R' .

Lemma 82.53.1. *There exists a reduced scheme X and a schematically dense open $U \subset X$ such that some weakly associated point $x \in X$ is not in U .*

Proof. In the first example we have $\mathfrak{p} \notin U$ by construction. In Gabber's examples the schemes $\text{Spec}(R)$ or $\text{Spec}(R')$ are reduced. □

82.54. Example of non-additivity of traces

Let k be a field and let $R = k[\epsilon]$ be the ring of dual numbers over k . In other words, $R = k[x]/(x^2)$ and ϵ is the congruence class of x in R . Consider the short exact sequence of complexes

$$\begin{array}{ccccccc} 0 & \longrightarrow & R & \longrightarrow & R & & \\ & & \downarrow & & \downarrow & & \\ & & R & \xrightarrow{1} & R & \longrightarrow & 0 \end{array}$$

$\downarrow \epsilon$ \downarrow \downarrow

\downarrow \downarrow \downarrow

Here the columns are the complexes, the first row is placed in degree 0, and the second row in degree 1. Denote the first complex (i.e., the left column) by A^\bullet , the second by B^\bullet and the third C^\bullet . We claim that the diagram

(82.54.0.1)
$$\begin{array}{ccccc} A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \\ 1+\epsilon \downarrow & & \downarrow & & \downarrow \\ A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \end{array}$$

commutes in $K(R)$, i.e., is a diagram of complexes commuting up to homotopy. Namely, the square on the right commutes and the one on the left is off by the homotopy $1 : A^1 \rightarrow B^0$. On the other hand,

$$\text{Tr}_{A^\bullet}(1 + \epsilon) + \text{Tr}_{C^\bullet}(1) \neq \text{Tr}_{B^\bullet}(1).$$

Lemma 82.54.1. *There exists a ring R , a distinguished triangle $(K, L, M, \alpha, \beta, \gamma)$ in the homotopy category $K(R)$, and an endomorphism (a, b, c) of this distinguished triangle, such that K, L, M are perfect complexes and $\text{Tr}_K(a) + \text{Tr}_M(c) \neq \text{Tr}_L(b)$.*

²Every element $f \in R$ is of the form ue where u is a unit and e is an idempotent. Then Algebra, Lemma 10.25.5 shows $\text{Spec}(R)$ is Hausdorff. On the other hand, \mathbf{N} with the discrete topology can be viewed as a dense open subset. Given a set map $\mathbf{N} \rightarrow X$ to a Hausdorff, quasi-compact topological space X , we obtain a ring map $C^0(X; k) \rightarrow R$ where $C^0(X; k)$ is the k -algebra of locally constant maps $X \rightarrow k$. This gives $\text{Spec}(R) \rightarrow \text{Spec}(C^0(X; k)) = X$ proving the universal property.

³Here one argues that there is really only one extra maximal ideal in R' .

Proof. Consider the example above. The map $\gamma : C^\bullet \rightarrow A^\bullet[1]$ is given by multiplication by ϵ in degree 0, see Derived Categories, Definition 13.10.1. Hence it is also true that

$$\begin{array}{ccc} C^\bullet & \xrightarrow{\gamma} & A^\bullet[1] \\ \downarrow & & \downarrow \\ C^\bullet & \xrightarrow{\gamma} & A^\bullet[1] \end{array}$$

commutes in $K(R)$ as $\epsilon(1+\epsilon) = \epsilon$. Thus we indeed have a morphism of distinguished triangles. \square

82.55. Being projective is not local on the base

In the chapter on descent we have seen that many properties of morphisms are local on the base, even in the fpqc topology. See Descent, Sections 34.18, 34.19, and 34.20. This is not true for projectivity of morphisms.

Lemma 82.55.1. *The properties*

$$\begin{aligned} \mathcal{P}(f) &= \text{“}f \text{ is projective”}, \text{ and} \\ \mathcal{P}(f) &= \text{“}f \text{ is quasi-projective”} \end{aligned}$$

are not Zariski local on the base. A fortiori, they are not fpqc local on the base.

Proof. Following Hironaka [Har77, Example B.3.4.1], we define a proper morphism of smooth complex 3-folds $f : V_Y \rightarrow Y$ which is Zariski-locally projective, but not projective. Since f is proper and not projective, it is also not quasi-projective.

Let Y be projective 3-space over the complex numbers \mathbf{C} . Let C and D be smooth conics in Y such that the closed subscheme $C \cap D$ is reduced and consists of two complex points P and Q . (For example, let $C = \{[x, y, z, w] : xy = z^2, w = 0\}$, $D = \{[x, y, z, w] : xy = w^2, z = 0\}$, $P = [1, 0, 0, 0]$, and $Q = [0, 1, 0, 0]$.) On $Y - Q$, first blow up the curve C , and then blow up the strict transform of the curve D (Divisors, Definition 30.19.1). On $Y - P$, first blow up the curve D , and then blow up the strict transform of the curve C . Over $Y - P - Q$, the two varieties we have constructed are canonically isomorphic, and so we can glue them over $Y - P - Q$. The result is a smooth proper 3-fold V_Y over \mathbf{C} . The morphism $f : V_Y \rightarrow Y$ is proper and Zariski-locally projective (since it is a blow-up over $Y - P$ and over $Y - Q$), by Divisors, Lemma 30.18.11. We will show that V_Y is not projective over \mathbf{C} . That will imply that f is not projective.

To do this, let L be the inverse image in V_Y of a complex point of $C - P - Q$, and M the inverse image of a complex point of $D - P - Q$. Then L and M are isomorphic to the projective line $\mathbf{P}^1_{\mathbf{C}}$. Next, let E be the inverse image in V_Y of $C \cup D \subset Y$ in V_Y ; thus $E \rightarrow C \cup D$ is a proper morphism, with fibers isomorphic to \mathbf{P}^1 over $(C \cup D) - \{P, Q\}$. The inverse image of P in E is a union of two lines L_0 and M_0 , and we have rational equivalences of cycles $L \sim L_0 + M_0$ and $M \sim M_0$ on E (using that C and D are isomorphic to \mathbf{P}^1). Note the asymmetry resulting from the order in which we blew up the two curves. Near Q , the opposite happens. So the inverse image of Q is the union of two lines L'_0 and M'_0 , and we have rational equivalences $L \sim L'_0$ and $M \sim L'_0 + M'_0$ on E . Combining these equivalences, we find that $L_0 + M'_0 \sim 0$ on E and hence on V_Y . If V_Y were projective over \mathbf{C} , it would have an ample line bundle H , which would have degree > 0 on all curves in V_Y . In particular H would have positive degree on $L_0 + M'_0$, contradicting that the

degree of a line bundle is well-defined on 1-cycles modulo rational equivalence on a proper scheme over a field (Chow Homology, Lemma 41.20.2 and Lemma 41.29.2). So V_Y is not projective over \mathbf{C} . \square

In different terminology, Hironaka's 3-fold V_Y is a small resolution of the blow-up Y' of Y along the reduced subscheme $C \cup D$; here Y' has two node singularities. If we define Z by blowing up Y along C and then along the strict transform of D , then Z is a smooth projective 3-fold, and the non-projective 3-fold V_Y differs from Z by a "flop" over $Y - P$.

82.56. Descent data for schemes need not be effective, even for a projective morphism

In the chapter on descent we have seen that descent data for schemes relative to an fpqc morphism are effective for several classes of morphisms. In particular, affine morphisms and more generally quasi-affine morphisms satisfy descent for fpqc coverings (Descent, Lemma 34.34.1). This is not true for projective morphisms.

Lemma 82.56.1. *There is an étale covering $X \rightarrow S$ of schemes and a descent datum $(V/X, \varphi)$ relative to $X \rightarrow S$ such that $V \rightarrow X$ is projective, but the descent datum is not effective in the category of schemes.*

Proof. We imitate Hironaka's example of a smooth separated complex algebraic space of dimension 3 which is not a scheme [Har77, Example B.3.4.2].

Consider the action of the group $G = \mathbf{Z}/2 = \{1, g\}$ on projective 3-space \mathbf{P}^3 over the complex numbers by

$$g[x, y, z, w] = [y, x, w, z].$$

The action is free outside the two disjoint lines $L_1 = \{[x, x, z, z]\}$ and $L_2 = \{[x, -x, z, -z]\}$ in \mathbf{P}^3 . Let $Y = \mathbf{P}^3 - (L_1 \cup L_2)$. There is a smooth quasi-projective scheme $S = Y/G$ over \mathbf{C} such that $Y \rightarrow S$ is a G -torsor (Groupoids, Definition 38.9.3). Explicitly, we can define S as the image of the open subset Y in \mathbf{P}^3 under the morphism

$$\begin{aligned} \mathbf{P}^3 &\rightarrow \text{Proj } \mathbf{C}[x, y, z, w]^G \\ &= \text{Proj } \mathbf{C}[u_0, u_1, v_0, v_1, v_2]/(v_0v_1 = v_2^2), \end{aligned}$$

where $u_0 = x + y$, $u_1 = z + w$, $v_0 = (x - y)^2$, $v_1 = (z - w)^2$, and $v_2 = (x - y)(z - w)$, and the ring is graded with u_0, u_1 in degree 1 and v_0, v_1, v_2 in degree 2.

Let $C = \{[x, y, z, w] : xy = z^2, w = 0\}$ and $D = \{[x, y, z, w] : xy = w^2, z = 0\}$. These are smooth conic curves in \mathbf{P}^3 , contained in the G -invariant open subset Y , with $g(C) = D$. Also, $C \cap D$ consists of the two points $P := [1, 0, 0, 0]$ and $Q := [0, 1, 0, 0]$, and these two points are switched by the action of G .

Let $V_Y \rightarrow Y$ be the scheme which over $Y - P$ is defined by blowing up D and then the strict transform of C , and over $Y - Q$ is defined by blowing up C and then the strict transform of D . (This is the same construction as in the proof of Lemma 82.55.1, except that Y here denotes an open subset of \mathbf{P}^3 rather than all of \mathbf{P}^3 .) Then the action of G on Y lifts to an action of G on V_Y , which switches the inverse images of $Y - P$ and $Y - Q$. This action of G on V_Y gives a descent datum $(V_Y/Y, \varphi_Y)$ on V_Y relative to the G -torsor $Y \rightarrow S$. The morphism $V_Y \rightarrow Y$ is proper but not projective, as shown in the proof of Lemma 82.55.1.

Let X be the disjoint union of the open subsets $Y - P$ and $Y - Q$; then we have surjective étale morphisms $X \rightarrow Y \rightarrow S$. Let V be the pullback of $V_Y \rightarrow Y$ to X ; then the morphism $V \rightarrow X$ is projective, since $V_Y \rightarrow Y$ is a blow-up over each of the open subsets $Y - P$ and $Y - Q$. Moreover, the descent datum $(V_Y/Y, \varphi_Y)$ pulls back to a descent datum $(V/X, \varphi)$ relative to the étale covering $X \rightarrow S$.

Suppose that this descent datum is effective in the category of schemes. That is, there is a scheme $U \rightarrow S$ which pulls back to the morphism $V \rightarrow X$ together with its descent datum. Then U would be the quotient of V_Y by its G -action.

$$\begin{array}{ccc} V & \longrightarrow & X \\ \downarrow & & \downarrow \\ V_Y & \longrightarrow & Y \\ \downarrow & & \downarrow \\ U & \longrightarrow & S \end{array}$$

Let E be the inverse image of $C \cup D \subset Y$ in V_Y ; thus $E \rightarrow C \cup D$ is a proper morphism, with fibers isomorphic to \mathbf{P}^1 over $(C \cup D) - \{P, Q\}$. The inverse image of P in E is a union of two lines L_0 and M_0 . It follows that the inverse image of $Q = g(P)$ in E is the union of two lines $L'_0 = g(M_0)$ and $M'_0 = g(L_0)$. As shown in the proof of Lemma 82.55.1, we have a rational equivalence $L_0 + M'_0 = L_0 + g(L_0) \sim 0$ on E .

By descent of closed subschemes, there is a curve $L_1 \subset U$ (isomorphic to \mathbf{P}^1) whose inverse image in V_Y is $L_0 \cup g(L_0)$. (Use Descent, Lemma 34.33.1, noting that a closed immersion is an affine morphism.) Let R be a complex point of L_1 . Since we assumed that U is a scheme, we can choose a function f in the local ring $\mathcal{O}_{U,R}$ that vanishes at R but not on the whole curve L_1 . Let D_{loc} be an irreducible component of the closed subset $\{f = 0\}$ in $\text{Spec } \mathcal{O}_{U,R}$; then D_{loc} has codimension 1. The closure of D_{loc} in U is an irreducible divisor D_U in U which contains the point R but not the whole curve L_1 . The inverse image of D_U in V_Y is an effective divisor D which intersects $L_0 \cup g(L_0)$ but does not contain either curve L_0 or $g(L_0)$.

Since the complex 3-fold V_Y is smooth, $\mathcal{O}(D)$ is a line bundle on V_Y . (We use here that a regular local ring is factorial, or in other words is a UFD.) The restriction of $\mathcal{O}(D)$ to the proper surface $E \subset V_Y$ is a line bundle which has positive degree on the 1-cycle $L_0 + g(L_0)$, by our information on D . Since $L_0 + g(L_0) \sim 0$ on E , this contradicts that the degree of a line bundle is well-defined on 1-cycles modulo rational equivalence on a proper scheme over a field (Chow Homology, Lemma 41.20.2 and Lemma 41.29.2). Therefore the descent datum $(V/X, \varphi)$ is in fact not effective; that is, U does not exist as a scheme. \square

In this example, the descent datum *is* effective in the category of algebraic spaces. More precisely, U exists as a smooth separated algebraic space of dimension 3 over \mathbf{C} , for example by Algebraic Spaces, Lemma 47.14.3. Hironaka's 3-fold U is a small resolution of the blow-up S' of the smooth quasi-projective 3-fold S along the irreducible nodal curve $(C \cup D)/G$; the 3-fold S' has a node singularity. The other small resolution of S' (differing from U by a "flop") is again an algebraic space which is not a scheme.

82.57. Derived base change

Let $R \rightarrow A$ be a ring map. In More on Algebra, Section 15.46 we construct a derived base change functor $-\otimes_R^L A : D(R) \rightarrow D(A)$. Next, let $R \rightarrow B$ be a second ring map. Picture

$$\begin{array}{ccc} B & \longrightarrow & B \otimes_R A \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

Given a B -module M the tensor product $M \otimes_R A$ is a $B \otimes_R A$ -module. In this section we show there does not exist a “derived base change functor” $D(B) \rightarrow D(B \otimes_R A)$.

Let k be a field. Set $R = k[x, y]$. Set $A = R/(xy)$ and $B = R/(x^2)$. The object $B \otimes_R^L A$ in $D(A)$ is represented by

$$x^2 : A \rightarrow A$$

and we have $H^0(B \otimes_R^L A) = B \otimes_R A$. We claim that there does not exist an object E of $D(B \otimes_R A)$ mapping to $B \otimes_R^L A$ in $D(A)$. Namely, for such an E the module $H^0(E)$ would be free, hence E would decompose as $H^0(E)[0] \oplus H^{-1}(E)[1]$. But it is easy to see that $B \otimes_R^L A$ is not isomorphic to the sum of its cohomology groups in $D(A)$.

Lemma 82.57.1. *Let $R \rightarrow A$ and $R \rightarrow B$ be ring maps. In general there does not exist a functor $T : D(B) \rightarrow D(B \otimes_R A)$ of triangulated categories such that a B -module M gives an object $T(M)$ of $D(B \otimes_R A)$ which maps to $M \otimes_R^L A$ under the map $D(B \otimes_R A) \rightarrow D(A)$.*

Proof. See discussion above. □

82.58. An interesting compact object

Let R be a ring. Let (A, d) be a differential graded R -algebra. If $A = R$, then we know that every compact object of $D(A, d) = D(R)$ is represented by a finite complex of finite projective modules. In other words, compact objects are perfect, see More on Algebra, Proposition 15.57.2. The analogue in the language of differential graded modules would be the question: “Is every compact object of $D(A, d)$ represented by a differential graded A -module P which is finite and graded projective?”

For general differential graded algebras, this is not true. Namely, let k be a field of characteristic 2 (so we don’t have to worry about signs). Let $A = k[x, y]/(y^2)$ with

- (1) x of degree 0
- (2) y of degree -1 ,
- (3) $d(x) = 0$, and
- (4) $d(y) = x^2 + x$.

Then $x : A \rightarrow A$ is a projector in $K(A, d)$. Hence we see that

$$A = \text{Ker}(x) \oplus \text{Im}(1 - x)$$

in $K(A, d)$, see Differential Graded Algebra, Lemma 22.5.4 and Derived Categories, Lemma 13.4.12. It is clear that A is a compact object of $D(A, d)$ (see Differential Graded Algebra, Lemma 22.26.2 for a more general statement). Then $\text{Ker}(x)$ is a compact object of $D(A, d)$ as follows from Derived Categories, Lemma 13.34.2.

Next, suppose that M is a differential graded (right) A -module representing $\text{Ker}(x)$ and suppose that M is finite and projective as a graded A -module. Because every finite graded projective module over $k[x, y]/(y^2)$ is graded free, we see that M is finite free as a graded $k[x, y]/(y^2)$ -module (i.e., when we forget the differential). We set $N = M/M(x^2 + x)$. Consider the exact sequence

$$0 \rightarrow M \xrightarrow{x^2+x} M \rightarrow N \rightarrow 0$$

Since $x^2 + x$ is of degree 0, in the center of A , and $d(x^2 + x) = 0$ we see that this is a short exact sequence of differential graded A -modules. Moreover, as $d(y) = x^2 + x$ we see that the differential on N is linear. The maps

$$H^{-1}(N) \rightarrow H^0(M) \quad \text{and} \quad H^0(M) \rightarrow H^0(N)$$

are isomorphisms as $H^*(M) = H^0(M) = k$ since $M \cong \text{Ker}(x)$ in $D(A, d)$. A computation of the boundary map shows that $H^*(N) = k[x, y]/(x, y^2)$ as a graded module; we omit the details. Since N is a free $k[x, y]/(y^2, x^2 + x)$ -module we have a resolution

$$\dots \rightarrow N[2] \xrightarrow{y} N[1] \xrightarrow{y} N \rightarrow N/Ny \rightarrow 0$$

compatible with differentials. Since N is bounded and since $H^0(N) = k[x, y]/(x, y^2)$ it follows from Homology, Lemma 12.22.6 that $H^0(N/Ny) = k[x]/(x)$. But as N/Ny is a finite complex of free $k[x]/(x^2 + x) = k \times k$ -modules, we see that its cohomology has to have even dimension, a contradiction.

Lemma 82.58.1. *There exists a differential graded algebra (A, d) and a compact object E of $D(A, d)$ such that E cannot be represented by a finite and graded projective differential graded A -module.*

Proof. See discussion above. □

82.59. Two differential graded categories

In this section we construct two differential graded categories satisfying axioms (A), (B), and (C) as in Differential Graded Algebra, Situation 22.20.2 whose objects do not come with a \mathbf{Z} -grading.

Example I. Let X be a topological space. Denote $\underline{\mathbf{Z}}$ the constant sheaf with value \mathbf{Z} . Let A be an $\underline{\mathbf{Z}}$ -torsor. In this setting we say a sheaf of abelian groups \mathcal{F} is A -graded if given a local section $a \in A(U)$ there is a projector $p_a : \mathcal{F}|_U \rightarrow \mathcal{F}|_U$ such that whenever we have a local isomorphism $\underline{\mathbf{Z}}|_U \rightarrow A|_U$ then $\mathcal{F}|_U = \bigoplus_{n \in \mathbf{Z}} p_n(\mathcal{F})$. Another way to say this is that locally on X the abelian sheaf \mathcal{F} has a \mathbf{Z} -grading, but on overlaps the different choices of gradings differ by a shift in degree given by the transition functions for the torsor A . We say that a pair (\mathcal{F}, d) is an A -graded complex of abelian sheaves, if \mathcal{F} is an A -graded abelian sheaf and $d : \mathcal{F} \rightarrow \mathcal{F}$ is a differential, i.e., $d^2 = 0$ such that $p_{a+1} \circ d = d \circ p_a$ for every local section a of A . In other words, $d(p_a(\mathcal{F}))$ is contained in $p_{a+1}(\mathcal{F})$.

Next, consider the category \mathcal{A} with

- (1) objects are A -graded complexes of abelian sheaves, and
- (2) for objects (\mathcal{F}, d) , (\mathcal{G}, d) we set

$$\text{Hom}_{\mathcal{A}}((\mathcal{F}, d), (\mathcal{G}, d)) = \bigoplus \text{Hom}^n(\mathcal{F}, \mathcal{G})$$

where $\text{Hom}^n(\mathcal{F}, \mathcal{G})$ is the group of maps of abelian sheaves f such that $f(p_a(\mathcal{F})) \subset p_{a+n}(\mathcal{G})$ for all local sections a of A . As differential we take $d(f) = d \circ f - (-1)^n f \circ d$, see Differential Graded Algebra, Example 22.19.6.

We omit the verification that this is indeed a differential graded category satisfying (A), (B), and (C). All the properties may be verified locally on X where one just recovers the differential graded category of complexes of abelian sheaves. Thus we obtain a triangulated category $K(\mathcal{A})$.

Twisted derived category of X . Observe that given an object (\mathcal{F}, d) of \mathcal{A} , there is a well defined A -graded cohomology sheaf $H(\mathcal{F}, d)$. Hence it is clear what is meant by a quasi-isomorphism in $K(\mathcal{A})$. We can invert quasi-isomorphisms to obtain the *derived category $D(\mathcal{A})$ of complexes of A -graded sheaves*. If A is the trivial torsor, then $D(\mathcal{A})$ is equal to $D(X)$, but for nonzero torsors, one obtains a kind of *twisted* derived category of X .

Example II. Let C be a smooth curve over a perfect field k of characteristic 2. Then $\Omega_{C/k}$ comes endowed with a canonical square root. Namely, we can write $\Omega_{C/k} = \mathcal{L}^{\otimes 2}$ such that for every local function f on C the section $d(f)$ is equal to $s^{\otimes 2}$ for some local section s of \mathcal{L} . The “reason” is that

$$d(a_0 + a_1 t + \dots + a_d t^d) = \left(\sum_{i \text{ odd}} a_i^{1/2} t^{(i-1)/2} \right)^2 dt$$

(insert future reference here). This in particular determines a canonical connection

$$\nabla_{can} : \Omega_{C/k} \longrightarrow \Omega_{C/k} \otimes_{\mathcal{O}_C} \Omega_{C/k}$$

whose 2-curvature is zero (namely, the unique connection such that the squares have derivative equal to zero). Observe that the category of vector bundles with connections is a tensor category, hence we also obtain canonical connections ∇_{can} on the invertible sheaves $\Omega_{C/k}^{\otimes n}$ for all $n \in \mathbf{Z}$.

Let \mathcal{A} be the category with

- (1) objects are pairs (\mathcal{F}, ∇) consisting of a finite locally free sheaf \mathcal{F} endowed with a connection

$$\nabla : \mathcal{F} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_C} \Omega_{C/k}$$

whose 2-curvature is zero, and

- (2) morphisms between $(\mathcal{F}, \nabla_{\mathcal{F}})$ and $(\mathcal{G}, \nabla_{\mathcal{G}})$ are given by

$$\text{Hom}_{\mathcal{A}}((\mathcal{F}, \nabla_{\mathcal{F}}), (\mathcal{G}, \nabla_{\mathcal{G}})) = \bigoplus \text{Hom}_{\mathcal{O}_C}(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_C} \Omega_{C/k}^{\otimes n})$$

For an element $f : \mathcal{F} \rightarrow \mathcal{G} \otimes \Omega_{C/k}^{\otimes n}$ of degree n we set

$$d(f) = \nabla_{\mathcal{G} \otimes \Omega_{C/k}^{\otimes n}} \circ f + f \circ \nabla_{\mathcal{F}}$$

with suitable identifications.

We omit the verification that this forms a differential graded category with properties (A), (B), (C). Thus we obtain a triangulated homotopy category $K(\mathcal{A})$.

If $C = \mathbf{P}_k^1$, then $K(\mathcal{A})$ is the zero category. However, if C is a smooth proper curve of genus > 1 , then $K(\mathcal{A})$ is not zero. Namely, suppose that \mathcal{N} is an invertible sheaf

of degree $0 \leq d < g - 1$ with a nonzero section σ . Then set $(\mathcal{F}, \nabla_{\mathcal{F}}) = (\mathcal{O}_C, d)$ and $(\mathcal{G}, \nabla_{\mathcal{G}}) = (\mathcal{N}^{\otimes 2}, \nabla_{can})$. We see that

$$\mathrm{Hom}_{\mathcal{A}}^n((\mathcal{F}, \nabla_{\mathcal{F}}), (\mathcal{G}, \nabla_{\mathcal{G}})) = \begin{cases} 0 & \text{if } n < 0 \\ \Gamma(C, \mathcal{N}^{\otimes 2}) & \text{if } n = 0 \\ \Gamma(C, \mathcal{N}^{\otimes 2} \otimes \Omega_{C/k}) & \text{if } n = 1 \end{cases}$$

The first 0 because the degree of $\mathcal{N}^{\otimes 2} \otimes \Omega_{C/k}^{\otimes -1}$ is negative by the condition $d < g - 1$. Now, the section $\sigma^{\otimes 2}$ has derivative equal zero, hence the homomorphism group

$$\mathrm{Hom}_{K(\mathcal{A})}((\mathcal{F}, \nabla_{\mathcal{F}}), (\mathcal{G}, \nabla_{\mathcal{G}}))$$

is nonzero.

82.60. An example of a non-algebraic Hom-stack

Let \mathcal{Y}, \mathcal{Z} be algebraic stacks over a scheme S . The *Hom-stack* $\underline{\mathrm{Mor}}_S(\mathcal{Y}, \mathcal{Z})$ is the stack in groupoids over S whose category of sections over a scheme T is given by the category

$$\mathrm{Mor}_T(\mathcal{Y} \times_S T, \mathcal{Z} \times_S T)$$

whose objects are 1-morphisms and whose morphisms are 2-morphisms. We omit the proof this is indeed a stack in groupoids over $(Sch/S)_{fppf}$ (insert future reference here). Of course, in general the Hom-stack will not be algebraic. In this section we give an example where it is not true and where \mathcal{Y} is representable by a proper flat scheme over S and \mathcal{Z} is smooth and proper over S .

Let k be an algebraically closed field which is not the algebraic closure of a finite field. Let $S = \mathrm{Spec}(k[[t]])$ and $S_n = \mathrm{Spec}(k[t]/(t^n)) \subset S$. Let $f : X \rightarrow S$ be a map satisfying the following

- (1) f is projective and flat, and its fibres are geometrically connected curves,
- (2) the fibre $X_0 = X \times_S S_0$ is a nodal curve with smooth irreducible components whose dual graph has a loop consisting of rational curves,
- (3) X is a regular scheme.

To make such a surface X we can take for example

$$X \quad : \quad T_0 T_1 T_2 - t(T_0^3 + T_1^3 + T_2^3) = 0$$

in $\mathbf{P}_{k[[t]]}^2$. Let A_0 be a non-zero abelian variety over k for example an elliptic curve. Let $A = A_0 \times_{\mathrm{Spec}(k)} S$ be the constant abelian scheme over S associated to A_0 . We will show that the stack $\mathcal{X} = \underline{\mathrm{Mor}}_S(X, [S/A])$ is not algebraic.

Recall that $[S/A]$ is on the one hand the quotient stack of A acting trivially on S and on the other hand equal to the stack classifying fppf A -torsors, see Examples of Stacks, Proposition 72.14.3. Observe that $[S/A] = [\mathrm{Spec}(k)/A_0] \times_{\mathrm{Spec}(k)} S$. This allows us to describe the fibre category over a scheme T as follows

$$\begin{aligned} \mathcal{X}_T &= \underline{\mathrm{Mor}}_S(X, [S/A])_T \\ &= \mathrm{Mor}_T(X \times_S T, [S/A] \times_S T) \\ &= \mathrm{Mor}_S(X \times_S T, [S/A]) \\ &= \mathrm{Mor}_{\mathrm{Spec}(k)}(X \times_S T, [\mathrm{Spec}(k)/A_0]) \end{aligned}$$

for any S -scheme T . In other words, the groupoid \mathcal{X}_T is the groupoid of fppf A_0 -torsors on $X \times_S T$. Before we discuss why \mathcal{X} is not an algebraic stack, we need a few lemmas.

Lemma 82.60.1. *Let W be a two dimensional regular integral Noetherian scheme with function field K . Let $G \rightarrow W$ be an abelian scheme. Then the map $H_{fppf}^1(W, G) \rightarrow H_{fppf}^1(\text{Spec}(K), G)$ is injective.*

Sketch of proof. Let $P \rightarrow W$ be an fppf G -torsor which is trivial in the generic point. Then we have a morphism $\text{Spec}(K) \rightarrow P$ over W and we can take its scheme theoretic image $Z \subset P$. Since $P \rightarrow W$ is proper (as a torsor for a proper group algebraic space over W) we see that $Z \rightarrow W$ is a proper birational morphism. By Spaces over Fields, Lemma 54.4.4 the morphism $Z \rightarrow W$ is finite away from finitely many closed points of W . By (insert future reference on resolving indeterminacies of morphisms by blowing quadratic transformations for surfaces) the irreducible components of the geometric fibres of $Z \rightarrow W$ are rational curves. By More on Groupoids in Spaces, Lemma 61.8.3 there are no nonconstant morphisms from rational curves to group schemes or torsors over such. Hence $Z \rightarrow W$ is finite, whence Z is a scheme and $Z \rightarrow W$ is an isomorphism by Morphisms, Lemma 28.48.16. In other words, the torsor P is trivial. \square

Lemma 82.60.2. *Let G be a smooth commutative group algebraic space over a field K . Then $H_{fppf}^1(\text{Spec}(K), G)$ is torsion.*

Proof. Every G -torsor P over $\text{Spec}(K)$ is smooth over K as a form of G . Hence P has a point over a finite separable extension $K \subset L$. Say $[L : K] = n$. Let $[n](P)$ denote the G -torsor whose class is n times the class of P in $H_{fppf}^1(\text{Spec}(K), G)$. There is a canonical morphism

$$P \times_{\text{Spec}(K)} \cdots \times_{\text{Spec}(K)} P \rightarrow [n](P)$$

of algebraic spaces over K . This morphism is symmetric as G is abelian. Hence it factors through the quotient

$$(P \times_{\text{Spec}(K)} \cdots \times_{\text{Spec}(K)} P) / S_n$$

On the other hand, the morphism $\text{Spec}(L) \rightarrow P$ defines a morphism

$$(\text{Spec}(L) \times_{\text{Spec}(K)} \cdots \times_{\text{Spec}(K)} \text{Spec}(L)) / S_n \longrightarrow (P \times_{\text{Spec}(K)} \cdots \times_{\text{Spec}(K)} P) / S_n$$

and the reader can verify that the scheme on the left has a K -rational point. Thus we see that $[n](P)$ is the trivial torsor. \square

To prove $\mathcal{X} = \underline{\text{Mor}}_S(X, [S/A])$ is not an algebraic stack, by Artin's Axioms, Lemma 75.9.4, it is enough to show the following.

Lemma 82.60.3. *The canonical map $\mathcal{X}(S) \rightarrow \lim \mathcal{X}(S_n)$ is not essentially surjective.*

Sketch of proof. Unwinding definitions, it is enough to check that $H^1(X, A_0) \rightarrow \lim H^1(X_n, A_0)$ is not surjective. As X is regular and projective, by Lemmas 82.60.2 and 82.60.1 each A_0 -torsor over X is torsion. In particular, the group $H^1(X, A_0)$ is torsion. It is thus enough to show: (a) the group $H^1(X_0, A_0)$ is non-torsion, and (b) the maps $H^1(X_{n+1}, A_0) \rightarrow H^1(X_n, A_0)$ are surjective for all n .

Ad (a). One constructs a nontorsion A_0 -torsor P_0 on the nodal curve X_0 by glueing trivial A_0 -torsors on each component of X_0 using non-torsion points on A_0 as the isomorphisms over the nodes. More precisely, let $x \in X_0$ be a node which occurs in a loop consisting of rational curves. Let $X'_0 \rightarrow X_0$ be the normalization of X_0 in $X_0 \setminus \{x\}$. Let $x', x'' \in X'_0$ be the two points mapping to x_0 . Then we take

$A_0 \times_{\text{Spec}(k)} X'_0$ and we identify $A_0 \times x'$ with $A_0 \times \{x''\}$ using translation $A_0 \rightarrow A_0$ by a nontorsion point $a_0 \in A_0(k)$ (there is such a nontorsion point as k is algebraically closed and not the algebraic closure of a finite field – this is actually not trivial to prove). One can show that the glueing is an algebraic space (in fact one can show it is a scheme) and that it is an nontorsion A_0 -torsor over X_0 . The reason that it is nontorsion is that if $[n](P_0)$ has a section, then that section produces a morphism $s : X'_0 \rightarrow A_0$ such that $[n](a_0) = s(x') - s(x'')$ in the group law on $A_0(k)$. However, since the irreducible components of the loop are rational to section s is constant on them (More on Groupoids in Spaces, Lemma 61.8.3). Hence $s(x') = s(x'')$ and we obtain a contradiction.

Ad (b). Deformation theory shows that the obstruction to deforming an A_0 -torsor $P_n \rightarrow X_n$ to an A_0 -torsor $P_{n+1} \rightarrow X_{n+1}$ lies in $H^2(X_0, \omega)$ for a suitable vector bundle ω on X_0 . The latter vanishes as X_0 is a curve, proving the claim. \square

Proposition 82.60.4. *The stack $\mathcal{X} = \underline{\text{Mor}}_S(X, [S/A])$ is not algebraic.*

Proof. See discussion above. \square

Remark 82.60.5. Proposition 82.60.4 contradicts [Aok06b, Theorem 1.1]. The problem is the non-effectivity of formal objects for $\underline{\text{Mor}}_S(X, [S/A])$. The same problem is mentioned in the Erratum [Aok06a] to [Aok06b]. Unfortunately, the Erratum goes on the assert that $\underline{\text{Mor}}_S(\mathcal{Y}, \mathcal{Z})$ is algebraic if \mathcal{Z} is separated, which also contradicts Proposition 82.60.4 as $[S/A]$ is separated.

82.61. A counter example to Grothendieck’s existence theorem

Let k be a field and let $A = k[[t]]$. Let X be the glueing of $U = \text{Spec}(A[x])$ and $V = \text{Spec}(A[y])$ by the identification

$$U \setminus \{0_U\} \longrightarrow V \setminus \{0_V\}$$

sending x to y where $0_U \in U$ and $0_V \in V$ are the points corresponding to the maximal ideals (x, t) and (y, t) . Set $A_n = A/(t^n)$ and set $X_n = X \times_{\text{Spec}(A)} \text{Spec}(A_n)$. Let \mathcal{F}_n be the coherent sheaf on X_n corresponding to the $A_n[x]$ -module $A_n[x]/(x) \cong A_n$ and the $A_n[y]$ module 0 with obvious glueing. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals generate by t . Then (\mathcal{F}_n) is an object of the category $\text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$ defined in Cohomology of Schemes, Section 29.21. On the other hand, this object is not in the image of the functor Cohomology of Schemes, Equation 29.22.6.1. Namely, if it were there would be a finite $A[x]$ -module M , a finite $A[y]$ -module N and an isomorphism $M[1/t] \cong N[1/t]$ such that $M/t^n M \cong A_n[x]/(x)$ and $N/t^n N = 0$ for all n . It is easy to see that this is impossible.

Lemma 82.61.1. *Counter examples to algebraization of coherent sheaves.*

- (1) *Grothendieck’s existence theorem as stated in Cohomology of Schemes, Theorem 29.22.7 is false if we drop the assumption that $X \rightarrow \text{Spec}(A)$ is separated.*
- (2) *The stack of coherent sheaves $\text{Coh}_{X/B}$ of Quot, Theorems 76.6.5 and 76.5.12 is in general not algebraic if we drop the assumption that $X \rightarrow S$ is separated*
- (3) *The functor $\text{Quot}_{\mathcal{F}/X/B}$ of Quot, Proposition 76.9.3 is not an algebraic space in general if we drop the assumption that $X \rightarrow B$ is separated.*

Proof. Part (1) we saw above. This shows that $\text{Coh}_{X/A}$ fails axiom [4] of Artin's Axioms, Section 75.12. Hence it cannot be an algebraic stack by Artin's Axioms, Lemma 75.9.4. In this way we see that (2) is true. To see (3), note that there are compatible surjections $\mathcal{O}_{X_n} \rightarrow \mathcal{F}_n$ for all n . Thus we see that $\text{Quot}_{\mathcal{O}_X/X/A}$ fails axiom [4] and we see that (3) is true as before. \square

82.62. Affine formal algebraic spaces

Let K be a field and let $(V_i)_{i \in I}$ be a directed inverse system of nonzero vector spaces over K with surjective transition maps and with $\lim V_i = 0$, see Section 82.3. Let $R_i = K \oplus V_i$ as K -algebra where V_i is an ideal of square zero. Then R_i is an inverse system of K -algebras with surjective transition maps with nilpotent kernels and with $\lim R_i = K$. The affine formal algebraic space $X = \text{colim Spec}(R_i)$ is an example of an affine formal algebraic space which is not McQuillan.

Let $0 \rightarrow W_i \rightarrow V_i \rightarrow K \rightarrow 0$ be a system of exact sequences as in Section 82.3. Let $A_i = K[V_i]/(ww'; w, w' \in W_i)$. Then there is a compatible system of surjections $A_i \rightarrow K[t]$ with nilpotent kernels and the transition maps $A_i \rightarrow A_j$ are surjective with nilpotent kernels as well. Recall that V_i is free over K with basis given by $s \in S_i$. Then, if the characteristic of K is zero, the degree d part of A_i is free over K with basis given by s^d , $s \in S_i$ each of which map to t^d . Hence the inverse system of the degree d parts of the A_i is isomorphic to the inverse system of the vector spaces V_i . As $\lim V_i = 0$ we conclude that $\lim A_i = K$, at least when the characteristic of K is zero. This gives an example of a affine formal algebraic space whose "regular functions" do not separate points.

82.63. Flat maps are not directed limits of finitely presented flat maps

The goal of this section is to give an example of a flat ring map which is not a filtered colimit of flat and finitely presented ring maps. In [Gab96] it is shown that if A is a nonexcellent local ring of dimension 1 and residue characteristic zero, then the (flat) ring map $A \rightarrow A^\wedge$ to its completion is not a filtered colimit of finite type flat ring maps. The example in this section will have a source which is an excellent ring. We encourage the reader to submit other examples; please email stacks.project@gmail.com if you have one.

For the construction, fix a prime p , and let $A = \mathbf{F}_p[x_1, \dots, x_n]$. Choose an absolute integral closure A^+ of A , i.e., A^+ is the integral closure of A in an algebraic closure of its fraction field. In [HH92, §6.7] it is shown that $A \rightarrow A^+$ is flat.

We claim that the A -algebra A^+ is not a filtered colimit of finitely presented flat A -algebras if $n \geq 3$.

We sketch the argument in the case $n = 3$, and we leave the generalization to higher n to the reader. It is enough to prove the analogous statement for the map $R \rightarrow R^+$, where R is the strict henselization of A at the origin and R^+ is its absolute integral closure. Observe that R is a henselian regular local ring whose residue field k is an algebraic closure of \mathbf{F}_p .

Choose an ordinary abelian surface X over k and a very ample line bundle L on X . The section ring $\Gamma_*(X, L) = \bigoplus_n H^0(X, L^n)$ is the coordinate ring of the affine cone over X with respect to L . It is a normal ring for L sufficiently positive. Let S denote the henselization of $\Gamma_*(X, L)$ at vertex of the cone. Then S is a

henselian noetherian normal domain of dimension 3. We obtain a finite injective map $R \rightarrow S$ as the henselization of a Noether normalization for the finite type k -algebra $\Gamma_*(X, L)$. As R^+ is an absolute integral closure of R , we can also fix an embedding $S \rightarrow R^+$. Thus R^+ is also the absolute integral closure of S . To show R^+ is not a filtered colimit of flat R -algebras, it suffices to show:

- (1) If there exists a factorization $S \rightarrow P \rightarrow R^+$ with P flat and finite type over R , then there exists a factorization $S \rightarrow T \rightarrow R^+$ with T finite flat over R .
- (2) For any factorization $S \rightarrow T \rightarrow R^+$ with $S \rightarrow T$ finite, the ring T is not R -flat.

Indeed, since S is finitely presented over R , if one could write $R^+ = \operatorname{colim}_i P_i$ as a filtered colimit of finitely presented flat R -algebras P_i , then $S \rightarrow R^+$ would factor as $S \rightarrow P_i \rightarrow R^+$ for $i \gg 0$, which contradicts the above pair of assertions. Assertion (1) follows from the fact that R is henselian and a slicing argument, see More on Morphisms, Lemma 36.18.5. Part (2) was proven in [Bha12]; for the convenience of the reader, we recall the argument.

Let $U \subset \operatorname{Spec}(S)$ be the punctured spectrum, so there are natural maps $X \leftarrow U \subset \operatorname{Spec}(S)$. The first map gives an identification $H^1(U, \mathcal{O}_U) \simeq H^1(X, \mathcal{O}_X)$. By passing to the Witt vectors of the perfection and using the Artin-Schreier sequence⁴, this gives an identification $H^1_{\text{étale}}(U, \mathbf{Z}_p) \simeq H^1_{\text{étale}}(X, \mathbf{Z}_p)$. In particular, this group is a finite free \mathbf{Z}_p -module of rank 2 (since X is ordinary). To get a contradiction assume there exists an R -flat T as in (2) above. Let $V \subset \operatorname{Spec}(T)$ denote the preimage of U , and write $f : V \rightarrow U$ for the induced finite surjective map. Since U is normal, there is a trace map $f_* \mathbf{Z}_p \rightarrow \mathbf{Z}_p$ on $U_{\text{étale}}$ whose composition with the pullback $\mathbf{Z}_p \rightarrow f_* \mathbf{Z}_p$ is multiplication by $d = \deg(f)$. Passing to cohomology, and using that $H^1_{\text{étale}}(U, \mathbf{Z}_p)$ is nontorsion, then shows that $H^1_{\text{étale}}(V, \mathbf{Z}_p)$ is nonzero. Since $H^1_{\text{étale}}(V, \mathbf{Z}_p) \simeq \lim H^1_{\text{étale}}(V, \mathbf{Z}/p^n)$ as there is no R^1 lim interference, the group $H^1(V_{\text{étale}}, \mathbf{Z}/p)$ must be non-zero. Since T is R -flat we have $\Gamma(V, \mathcal{O}_V) = T$ which is strictly henselian and the Artin-Schreier sequence shows $H^1(V, \mathcal{O}_V) \neq 0$. This is equivalent to $H^2_{\mathfrak{m}}(T) \neq 0$, where $\mathfrak{m} \subset R$ is the maximal ideal. Thus, we obtain a contradiction since T is finite flat (i.e., finite free) as an R -module and $H^2_{\mathfrak{m}}(R) = 0$. This contradiction proves (2).

Lemma 82.63.1. *There exists a commutative ring A and a flat A -algebra B which cannot be written as a filtered colimit of finitely presented flat A -algebras. In fact, we may either choose A to be a finite type \mathbf{F}_p -algebra or a 1-dimensional Noetherian local ring with residue field of characteristic 0.*

Proof. See discussion above. □

⁴Here we use that S is a strictly henselian local ring of characteristic p and hence $S \rightarrow S$, $f \mapsto f^p - f$ is surjective. Also S is a normal domain and hence $\Gamma(U, \mathcal{O}_U) = S$. Thus $H^1_{\text{étale}}(U, \mathbf{Z}/p)$ is the kernel of the map $H^1(U, \mathcal{O}_U) \rightarrow H^1(U, \mathcal{O}_U)$ induced by $f \mapsto f^p - f$.

Exercises

83.1. Algebra

This first section just contains some assorted questions.

Exercise 83.1.1. Let A be a ring, and \mathfrak{m} a maximal ideal. In $A[X]$ let $\tilde{\mathfrak{m}}_1 = (\mathfrak{m}, X)$ and $\tilde{\mathfrak{m}}_2 = (\mathfrak{m}, X - 1)$. Show that

$$A[X]_{\tilde{\mathfrak{m}}_1} \cong A[X]_{\tilde{\mathfrak{m}}_2}.$$

Exercise 83.1.2. Find an example of a non Noetherian ring R such that every finitely generated ideal of R is finitely presented as an R -module. (A ring is said to be *coherent* if the last property holds.)

Exercise 83.1.3. Suppose that (A, \mathfrak{m}, k) is a Noetherian local ring. For any finite A -module M define $r(M)$ to be the minimum number of generators of M as an A -module. This number equals $\dim_k M/\mathfrak{m}M = \dim_k M \otimes_A k$ by NAK.

- (1) Show that $r(M \otimes_A N) = r(M)r(N)$.
- (2) Let $I \subset A$ be an ideal with $r(I) > 1$. Show that $r(I^2) < r(I)^2$.
- (3) Conclude that if every ideal in A is a flat module, then A is a PID (or a field).

Exercise 83.1.4. Let k be a field. Show that the following pairs of k -algebras are not isomorphic:

- (1) $k[x_1, \dots, x_n]$ and $k[x_1, \dots, x_{n+1}]$ for any $n \geq 1$.
- (2) $k[a, b, c, d, e, f]/(ab + cd + ef)$ and $k[x_1, \dots, x_n]$ for $n = 5$.
- (3) $k[a, b, c, d, e, f]/(ab + cd + ef)$ and $k[x_1, \dots, x_n]$ for $n = 6$.

Remark 83.1.5. Of course the idea of this exercise is to find a simple argument in each case rather than applying a “big” theorem. Nonetheless it is good to be guided by general principles.

Exercise 83.1.6. Algebra. (Silly and should be easy.)

- (1) Give an example of a ring A and a nonsplit short exact sequence of A -modules

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0.$$

- (2) Give an example of a nonsplit sequence of A -modules as above and a faithfully flat $A \rightarrow B$ such that

$$0 \rightarrow M_1 \otimes_A B \rightarrow M_2 \otimes_A B \rightarrow M_3 \otimes_A B \rightarrow 0.$$

is split as a sequence of B -modules.

Exercise 83.1.7. Suppose that k is a field having a primitive n th root of unity ζ . This means that $\zeta^n = 1$, but $\zeta^m \neq 1$ for $0 < m < n$.

- (1) Show that the characteristic of k is prime to n .
- (2) Suppose that $a \in k$ is an element of k which is not an d th power in k for any divisor d of n , $in \geq d > 1$. Show that $k[x]/(x^n - a)$ is a field. (Hint: Consider a splitting field for $x^n - a$ and use Galois theory.)

Exercise 83.1.8. Let $\nu : k[x] \setminus \{0\} \rightarrow \mathbf{Z}$ be a map with the following properties: $\nu(fg) = \nu(f) + \nu(g)$ whenever f, g not zero, and $\nu(f + g) \geq \min(\nu(f), \nu(g))$ whenever $f, g, f + g$ are not zero, and $\nu(c) = 0$ for all $c \in k^*$.

- (1) Show that if f, g , and $f + g$ are nonzero and $\nu(f) \neq \nu(g)$ then we have equality $\nu(f + g) = \min(\nu(f), \nu(g))$.
- (2) Show that if $f = \sum a_i x^i$, $f \neq 0$, then $\nu(f) \geq \min(\{i\nu(x)\}_{a_i \neq 0})$. When does equality hold?
- (3) Show that if ν attains a negative value then $\nu(f) = -n \deg(f)$ for some $n \in \mathbf{N}$.
- (4) Suppose $\nu(x) \geq 0$. Show that $\{f \mid f = 0, \text{ or } \nu(f) > 0\}$ is a prime ideal of $k[x]$.
- (5) Describe all possible ν .

Let A be a ring. An *idempotent* is an element $e \in A$ such that $e^2 = e$. The elements 1 and 0 are always idempotent. A *nontrivial idempotent* is an idempotent which is not equal to zero. Two idempotents $e, e' \in A$ are called *orthogonal* if $ee' = 0$.

Exercise 83.1.9. Let A be a ring. Show that A is a product of two nonzero rings if and only if A has a nontrivial idempotent.

Exercise 83.1.10. Let A be a ring and let $I \subset A$ be a locally nilpotent ideal. Show that the map $A \rightarrow A/I$ induces a bijection on idempotents. (Hint: It may be easier to prove this when I is nilpotent. Do this first. Then use “absolute Noetherian reduction” to reduce to the nilpotent case.)

83.2. Colimits

Definition 83.2.1. A *directed partially ordered set* is a nonempty set I endowed with a partial ordering \leq such that given any pair $i, j \in I$ there exists a $k \in I$ such that $i \leq k$ and $j \leq k$. A *system of rings* over I is given by a ring A_i for each $i \in I$ and a map of rings $\varphi_{ij} : A_i \rightarrow A_j$ whenever $i \leq j$ such that the composition $A_i \rightarrow A_j \rightarrow A_k$ is equal to $A_i \rightarrow A_k$ whenever $i \leq j \leq k$.

One similarly defines systems of groups, modules over a fixed ring, vector spaces over a field, etc.

Exercise 83.2.2. Let I be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I . Show that there exists a ring A and maps $\varphi_i : A_i \rightarrow A$ such that $\varphi_j \circ \varphi_{ij} = \varphi_i$ for all $i \leq j$ with the following universal property: Given any ring B and maps $\psi_i : A_i \rightarrow B$ such that $\psi_j \circ \varphi_{ij} = \psi_i$ for all $i \leq j$, then there exists a unique ring map $\psi : A \rightarrow B$ such that $\psi_i = \psi \circ \varphi_i$.

Definition 83.2.3. The ring A constructed in Exercise 83.2.2 is called the *colimit* of the system. Notation $\text{colim } A_i$.

Exercise 83.2.4. Let (I, \geq) be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I with colimit A . Prove that there is a bijection

$$\text{Spec}(A) = \{(\mathfrak{p}_i)_{i \in I} \mid \mathfrak{p}_i \subset A_i \text{ and } \mathfrak{p}_i = \varphi_{ij}^{-1}(\mathfrak{p}_j) \forall i \leq j\} \subset \prod_{i \in I} \text{Spec}(A_i)$$

The set on the right hand side is the limit of the sets $\text{Spec}(A_i)$. Notation $\lim \text{Spec}(A_i)$.

Exercise 83.2.5. Let (I, \geq) be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I with colimit A . Suppose that $\text{Spec}(A_j) \rightarrow \text{Spec}(A_i)$ is surjective for all $i \leq j$. Show that $\text{Spec}(A) \rightarrow \text{Spec}(A_i)$ is surjective for all i . (Hint: You can try to use Tychonoff, but there is also a basically trivial direct algebraic proof based on Algebra, Lemma 10.16.9.)

Exercise 83.2.6. Let $A \subset B$ be an integral ring extension. Prove that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is surjective. Use the exercises above, the fact that this holds for a finite ring extension (proved in the lectures), and by proving that $B = \text{colim } B_i$ is a directed colimit of finite extensions $A \subset B_i$.

Exercise 83.2.7. Let (I, \geq) be a partially ordered set which is directed. Let A be a ring and let $(N_i, \varphi_{i,i'})$ be a directed system of A -modules indexed by I . Suppose that M is another A -module. Prove that

$$\text{colim}_{i \in I} M \otimes_A N_i \cong M \otimes_A \left(\text{colim}_{i \in I} N_i \right).$$

Definition 83.2.8. A module M over R is said to be of *finite presentation* over R if it is isomorphic to the cokernel of a map of finite free modules $R^{\oplus n} \rightarrow R^{\oplus m}$.

Exercise 83.2.9. Prove that any module over any ring is

- (1) the colimit of its finitely generated submodules, and
- (2) in some way a colimit of finitely presented modules.

83.3. Additive and abelian categories

Exercise 83.3.1. Let k be a field. Let \mathcal{C} be the category of filtered vector spaces over k , see Homology, Definition 12.16.1 for the definition of a filtered object of any category.

- (1) Show that this is an additive category (explain carefully what the direct sum of two objects is).
- (2) Let $f : (V, F) \rightarrow (W, F)$ be a morphism of \mathcal{C} . Show that f has a kernel and cokernel (explain precisely what the kernel and cokernel of f are).
- (3) Give an example of a map of \mathcal{C} such that the canonical map $\text{Coim}(f) \rightarrow \text{Im}(f)$ is not an isomorphism.

Exercise 83.3.2. Let R be a Noetherian domain. Let \mathcal{C} be the category of finitely generated torsion free R -modules.

- (1) Show that this is an additive category.
- (2) Let $f : N \rightarrow M$ be a morphism of \mathcal{C} . Show that f has a kernel and cokernel (make sure you define precisely what the kernel and cokernel of f are).
- (3) Give an example of a Noetherian domain R and a map of \mathcal{C} such that the canonical map $\text{Coim}(f) \rightarrow \text{Im}(f)$ is not an isomorphism.

Exercise 83.3.3. Give an example of a category which is additive and has kernels and cokernels but which is not as in Exercises 83.3.1 and 83.3.2.

83.4. Flat ring maps

Exercise 83.4.1. Let S be a multiplicative subset of the ring A .

- (1) For an A -module M show that $S^{-1}M = S^{-1}A \otimes_A M$.
- (2) Show that $S^{-1}A$ is flat over A .

Exercise 83.4.2. Find an injection $M_1 \rightarrow M_2$ of A -modules such that $M_1 \otimes N \rightarrow M_2 \otimes N$ is not injective in the following cases:

- (1) $A = k[x, y]$ and $N = (x, y) \subset A$. (Here and below k is a field.)
- (2) $A = k[x, y]$ and $N = A/(x, y)$.

Exercise 83.4.3. Give an example of a ring A and a finite A -module M which is a flat but not a projective A -module.

Remark 83.4.4. If M is of finite presentation and flat over A , then M is projective over A . Thus your example will have to involve a ring A which is not Noetherian. I know of an example where A is the ring of C^∞ -functions on \mathbf{R} .

Exercise 83.4.5. Find a flat but not free module over $\mathbf{Z}_{(2)}$.

Exercise 83.4.6. Flat deformations.

- (1) Suppose that k is a field and $k[\epsilon]$ is the ring of dual numbers $k[\epsilon] = k[x]/(x^2)$ and $\epsilon = \bar{x}$. Show that for any k -algebra A there is a flat $k[\epsilon]$ -algebra B such that A is isomorphic to $B/\epsilon B$.
- (2) Suppose that $k = \mathbf{F}_p = \mathbf{Z}/p\mathbf{Z}$ and

$$A = k[x_1, x_2, x_3, x_4, x_5, x_6]/(x_1^p, x_2^p, x_3^p, x_4^p, x_5^p, x_6^p).$$

Show that there exists a flat $\mathbf{Z}/p^2\mathbf{Z}$ -algebra B such that B/pB is isomorphic to A . (So here p plays the role of ϵ .)

- (3) Now let $p = 2$ and consider the same question for $k = \mathbf{F}_2 = \mathbf{Z}/2\mathbf{Z}$ and

$$A = k[x_1, x_2, x_3, x_4, x_5, x_6]/(x_1^2, x_2^2, x_3^2, x_4^2, x_5^2, x_6^2, x_1x_2 + x_3x_4 + x_5x_6).$$

However, in this case show that there does *not* exist a flat $\mathbf{Z}/4\mathbf{Z}$ -algebra B such that $B/2B$ is isomorphic to A . (Find the trick! The same example works in arbitrary characteristic $p > 0$, except that the computation is more difficult.)

Exercise 83.4.7. Let (A, \mathfrak{m}, k) be a local ring and let $k \subset k'$ be a finite field extension. Show there exists a flat, local map of local rings $A \rightarrow B$ such that $\mathfrak{m}_B = \mathfrak{m}B$ and $B/\mathfrak{m}B$ is isomorphic to k' as k -algebra. (Hint: first do the case where $k \subset k'$ is generated by a single element.)

Remark 83.4.8. The same result holds for arbitrary field extensions $k \subset K$.

83.5. The Spectrum of a ring

Exercise 83.5.1. Compute $\text{Spec}(\mathbf{Z})$ as a set and describe its topology.

Exercise 83.5.2. Let A be any ring. For $f \in A$ we define $D(f) := \{\mathfrak{p} \subset A \mid f \notin \mathfrak{p}\}$. Prove that the open subsets $D(f)$ form a basis of the topology of $\text{Spec}(A)$.

Exercise 83.5.3. Prove that the map $I \mapsto V(I)$ defines a natural bijection

$$\{I \subset A \text{ with } I = \sqrt{I}\} \longrightarrow \{T \subset \text{Spec}(A) \text{ closed}\}$$

Definition 83.5.4. A topological space X is called *quasi-compact* if for any open covering $X = \bigcup_{i \in I} U_i$ there is a finite subset $\{i_1, \dots, i_n\} \subset I$ such that $X = U_{i_1} \cup \dots \cup U_{i_n}$.

Exercise 83.5.5. Prove that $\text{Spec}(A)$ is quasi-compact for any ring A .

Definition 83.5.6. A topological space X is said to verify the separation axiom T_0 if for any pair of points $x, y \in X$, $x \neq y$ there is an open subset of X containing one but not the other. We say that X is *Hausdorff* if for any pair $x, y \in X$, $x \neq y$ there are disjoint open subsets U, V such that $x \in U$ and $y \in V$.

Exercise 83.5.7. Show that $\text{Spec}(A)$ is **not** Hausdorff in general. Prove that $\text{Spec}(A)$ is T_0 . Give an example of a topological space X that is not T_0 .

Remark 83.5.8. Usually the word compact is reserved for quasi-compact and Hausdorff spaces.

Definition 83.5.9. A topological space X is called *irreducible* if X is not empty and if $X = Z_1 \cup Z_2$ with $Z_1, Z_2 \subset X$ closed, then either $Z_1 = X$ or $Z_2 = X$. A subset $T \subset X$ of a topological space is called *irreducible* if it is an irreducible topological space with the topology induced from X . This definition implies T is irreducible if and only if the closure \bar{T} of T in X is irreducible.

Exercise 83.5.10. Prove that $\text{Spec}(A)$ is irreducible if and only if $\text{Nil}(A)$ is a prime ideal and that in this case it is the unique minimal prime ideal of A .

Exercise 83.5.11. Prove that a closed subset $T \subset \text{Spec}(A)$ is irreducible if and only if it is of the form $T = V(\mathfrak{p})$ for some prime ideal $\mathfrak{p} \subset A$.

Definition 83.5.12. A point x of an irreducible topological space X is called a *generic point* of X if X is equal to the closure of the subset $\{x\}$.

Exercise 83.5.13. Show that in a T_0 space X every irreducible closed subset has at most one generic point.

Exercise 83.5.14. Prove that in $\text{Spec}(A)$ every irreducible closed subset *does* have a generic point. In fact show that the map $\mathfrak{p} \mapsto \overline{\{\mathfrak{p}\}}$ is a bijection of $\text{Spec}(A)$ with the set of irreducible closed subsets of X .

Exercise 83.5.15. Give an example to show that an irreducible subset of $\text{Spec}(\mathbf{Z})$ does not necessarily have a generic point.

Definition 83.5.16. A topological space X is called *Noetherian* if any decreasing sequence $Z_1 \supset Z_2 \supset Z_3 \supset \dots$ of closed subsets of X stabilizes. (It is called *Artinian* if any increasing sequence of closed subsets stabilizes.)

Exercise 83.5.17. Show that if the ring A is Noetherian then the topological space $\text{Spec}(A)$ is Noetherian. Give an example to show that the converse is false. (The same for Artinian if you like.)

Definition 83.5.18. A maximal irreducible subset $T \subset X$ is called an *irreducible component* of the space X . Such an irreducible component of X is automatically a closed subset of X .

Exercise 83.5.19. Prove that any irreducible subset of X is contained in an irreducible component of X .

Exercise 83.5.20. Prove that a Noetherian topological space X has only finitely many irreducible components, say X_1, \dots, X_n , and that $X = X_1 \cup X_2 \cup \dots \cup X_n$. (Note that any X is always the union of its irreducible components, but that if $X = \mathbf{R}$ with its usual topology for instance then the irreducible components of X are the one point subsets. This is not terribly interesting.)

Exercise 83.5.21. Show that irreducible components of $\text{Spec}(A)$ correspond to minimal primes of A .

Definition 83.5.22. A point $x \in X$ is called *closed* if $\overline{\{x\}} = \{x\}$. Let x, y be points of X . We say that x is a *specialization* of y , or that y is a *generalization* of x if $x \in \overline{\{y\}}$.

Exercise 83.5.23. Show that closed points of $\text{Spec}(A)$ correspond to maximal ideals of A .

Exercise 83.5.24. Show that \mathfrak{p} is a generalization of \mathfrak{q} in $\text{Spec}(A)$ if and only if $\mathfrak{p} \subset \mathfrak{q}$. Characterize closed points, maximal ideals, generic points and minimal prime ideals in terms of generalization and specialization. (Here we use the terminology that a point of a possibly reducible topological space X is called a generic point if it is a generic points of one of the irreducible components of X .)

Exercise 83.5.25. Let I and J be ideals of A . What is the condition for $V(I)$ and $V(J)$ to be disjoint?

Definition 83.5.26. A topological space X is called *connected* if it is nonempty and not the union of two nonempty disjoint open subsets. A *connected component* of X is a maximal connected subset. Any point of X is contained in a connected component of X and any connected component of X is closed in X . (But in general a connected component need not be open in X .)

Exercise 83.5.27. Let A be a nonzero ring. Show that $\text{Spec}(A)$ is disconnected iff $A \cong B \times C$ for certain nonzero rings B, C .

Exercise 83.5.28. Let T be a connected component of $\text{Spec}(A)$. Prove that T is stable under generalization. Prove that T is an open subset of $\text{Spec}(A)$ if A is Noetherian. (Remark: This is wrong when A is an infinite product of copies of \mathbf{F}_2 for example. The spectrum of this ring consists of infinitely many closed points.)

Exercise 83.5.29. Compute $\text{Spec}(k[x])$, i.e., describe the prime ideals in this ring, describe the possible specializations, and describe the topology. (Work this out when k is algebraically closed but also when k is not.)

Exercise 83.5.30. Compute $\text{Spec}(k[x, y])$, where k is algebraically closed. [Hint: use the morphism $\varphi : \text{Spec}(k[x, y]) \rightarrow \text{Spec}(k[x])$; if $\varphi(\mathfrak{p}) = (0)$ then localize with respect to $S = \{f \in k[x] \mid f \neq 0\}$ and use result of lecture on localization and Spec .] (Why do you think algebraic geometers call this affine 2-space?)

Exercise 83.5.31. Compute $\text{Spec}(\mathbf{Z}[y])$. [Hint: as above.] (Affine 1-space over \mathbf{Z} .)

83.6. Localization

Exercise 83.6.1. Let A be a ring. Let $S \subset A$ be a multiplicative subset. Let M be an A -module. Let $N \subset S^{-1}M$ be an $S^{-1}A$ -submodule. Show that there exists

an A -submodule $N' \subset M$ such that $N = S^{-1}N'$. (This useful result applies in particular to ideals of $S^{-1}A$.)

Exercise 83.6.2. Let A be a ring. Let M be an A -module. Let $m \in M$.

- (1) Show that $I = \{a \in A \mid am = 0\}$ is an ideal of A .
- (2) For a prime \mathfrak{p} of A show that the image of m in $M_{\mathfrak{p}}$ is zero if and only if $I \not\subset \mathfrak{p}$.
- (3) Show that m is zero if and only if the image of m is zero in $M_{\mathfrak{p}}$ for all primes \mathfrak{p} of A .
- (4) Show that m is zero if and only if the image of m is zero in $M_{\mathfrak{m}}$ for all maximal ideals \mathfrak{m} of A .
- (5) Show that $M = 0$ if and only if $M_{\mathfrak{m}}$ is zero for all maximal ideals \mathfrak{m} .

Exercise 83.6.3. Find a pair (A, f) where A is a domain with three or more pairwise distinct primes and $f \in A$ is an element such that the principal localization $A_f = \{1, f, f^2, \dots\}^{-1}A$ is a field.

Exercise 83.6.4. Let A be a ring. Let M be a finite A -module. Let $S \subset A$ be a multiplicative set. Assume that $S^{-1}M = 0$. Show that there exists an $f \in S$ such that the principal localization $M_f = \{1, f, f^2, \dots\}^{-1}M$ is zero.

Exercise 83.6.5. Give an example of a triple (A, I, S) where A is a ring, $0 \neq I \neq A$ is a proper nonzero ideal, and $S \subset A$ is a multiplicative subset such that $A/I \cong S^{-1}A$ as A -algebras.

83.7. Nakayama's Lemma

Exercise 83.7.1. Let A be a ring. Let I be an ideal of A . Let M be an A -module. Let $x_1, \dots, x_n \in M$. Assume that

- (1) M/IM is generated by x_1, \dots, x_n ,
- (2) M is a finite A -module,
- (3) I is contained in every maximal ideal of A .

Show that x_1, \dots, x_n generate M . (Suggested solution: Reduce to a localization at a maximal ideal of A using Exercise 83.6.2 and exactness of localization. Then reduce to the statement of Nakayama's lemma in the lectures by looking at the quotient of M by the submodule generated by x_1, \dots, x_n .)

83.8. Length

Definition 83.8.1. Let A be a ring. Let M be an A -module. The *length* of M as an R -module is

$$\text{length}_A(M) = \sup\{n \mid \exists 0 = M_0 \subset M_1 \subset \dots \subset M_n = M, M_i \neq M_{i+1}\}.$$

In other words, the supremum of the lengths of chains of submodules.

Exercise 83.8.2. Show that a module M over a ring A has length 1 if and only if it is isomorphic to A/\mathfrak{m} for some maximal ideal \mathfrak{m} in A .

Exercise 83.8.3. Compute the length of the following modules over the following rings. Briefly(!) explain your answer. (Please feel free to use additivity of the length function in short exact sequences, see Algebra, Lemma 10.50.3).

- (1) The length of $\mathbf{Z}/120\mathbf{Z}$ over \mathbf{Z} .
- (2) The length of $\mathbf{C}[x]/(x^{100} + x + 1)$ over $\mathbf{C}[x]$.

(3) The length of $\mathbf{R}[x]/(x^4 + 2x^2 + 1)$ over $\mathbf{R}[x]$.

Exercise 83.8.4. Let $A = k[x, y]_{(x, y)}$ be the local ring of the affine plane at the origin. Make any assumption you like about the field k . Suppose that $f = x^3 + x^2y^2 + y^{100}$ and $g = y^3 - x^{999}$. What is the length of $A/(f, g)$ as an A -module? (Possible way to proceed: think about the ideal that f and g generate in quotients of the form $A/\mathfrak{m}_A^n = k[x, y]/(x, y)^n$ for varying n . Try to find n such that $A/(f, g) + \mathfrak{m}_A^n \cong A/(f, g) + \mathfrak{m}_A^{n+1}$ and use NAK.)

83.9. Singularities

Exercise 83.9.1. Let k be any field. Suppose that $A = k[[x, y]]/(f)$ and $B = k[[u, v]]/(g)$, where $f = xy$ and $g = uv + \delta$ with $\delta \in (u, v)^3$. Show that A and B are isomorphic rings.

Remark 83.9.2. A singularity on a curve over a field k is called an ordinary double point if the complete local ring of the curve at the point is of the form $k'[[x, y]]/(f)$, where (a) k' is a finite separable extension of k , (b) the initial term of f has degree two, i.e., it looks like $q = ax^2 + bxy + cy^2$ for some $a, b, c \in k'$ not all zero, and (c) q is a nondegenerate quadratic form over k' (in char 2 this means that b is not zero). In general there is one isomorphism class of such rings for each isomorphism class of pairs (k', q) .

83.10. Hilbert Nullstellensatz

Exercise 83.10.1. A silly argument using the complex numbers! Let \mathbf{C} be the complex number field. Let V be a vector space over \mathbf{C} . The spectrum of a linear operator $T : V \rightarrow V$ is the set of complex numbers $\lambda \in \mathbf{C}$ such that the operator $T - \lambda \text{id}_V$ is not invertible.

- (1) Show that $\mathbf{C}(X) = f.f.(\mathbf{C}[X])$ has uncountable dimension over \mathbf{C} .
- (2) Show that any linear operator on V has a nonempty spectrum if the dimension of V is finite or countable.
- (3) Show that if a finitely generated \mathbf{C} -algebra R is a field, then the map $\mathbf{C} \rightarrow R$ is an isomorphism.
- (4) Show that any maximal ideal \mathfrak{m} of $\mathbf{C}[x_1, \dots, x_n]$ is of the form $(x_1 - \alpha_1, \dots, x_n - \alpha_n)$ for some $\alpha_i \in \mathbf{C}$.

Remark 83.10.2. Let k be a field. Then for every integer $n \in \mathbf{N}$ and every maximal ideal $\mathfrak{m} \subset k[x_1, \dots, x_n]$ the quotient $k[x_1, \dots, x_n]/\mathfrak{m}$ is a finite field extension of k . This will be shown later in the course. Of course (please check this) it implies a similar statement for maximal ideals of finitely generated k -algebras. The exercise above proves it in the case $k = \mathbf{C}$.

Exercise 83.10.3. Let k be a field. Please use Remark 83.10.2.

- (1) Let R be a k -algebra. Suppose that $\dim_k R < \infty$ and that R is a domain. Show that R is a field.
- (2) Suppose that R is a finitely generated k -algebra, and $f \in R$ not nilpotent. Show that there exists a maximal ideal $\mathfrak{m} \subset R$ with $f \notin \mathfrak{m}$.
- (3) Show by an example that this statement fails when R is not of finite type over a field.
- (4) Show that any radical ideal $I \subset \mathbf{C}[x_1, \dots, x_n]$ is the intersection of the maximal ideals containing it.

Remark 83.10.4. This is the Hilbert Nullstellensatz. Namely it says that the closed subsets of $\text{Spec}(k[x_1, \dots, x_n])$ (which correspond to radical ideals by a previous exercise) are determined by the closed points contained in them.

Exercise 83.10.5. Let $A = \mathbf{C}[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]$. Let I be the ideal of A generated by the entries of the matrix XY , with

$$X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix} \quad \text{and} \quad Y = \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix}.$$

Find the irreducible components of the closed subset $V(I)$ of $\text{Spec}(A)$. (I mean describe them and give equations for each of them. You do not have to prove that the equations you write down define prime ideals.) Hints:

- (1) You may use the Hilbert Nullstellensatz, and it suffices to find irreducible locally closed subsets which cover the set of closed points of $V(I)$.
- (2) There are two easy components.
- (3) An image of an irreducible set under a continuous map is irreducible.

83.11. Dimension

Exercise 83.11.1. Construct a ring A with finitely many prime ideals having dimension > 1 .

Exercise 83.11.2. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that $\mathbf{C}[x, y]/(f)$ has dimension 1.

Exercise 83.11.3. Let (R, \mathfrak{m}) be a Noetherian local ring. Let $n \geq 1$. Let $\mathfrak{m}' = (\mathfrak{m}, x_1, \dots, x_n)$ in the polynomial ring $R[x_1, \dots, x_n]$. Show that

$$\dim(R[x_1, \dots, x_n]_{\mathfrak{m}'}) = \dim(R) + n.$$

83.12. Catenary rings

Definition 83.12.1. A Noetherian ring A is said to be *catenary* if for any triple of prime ideals $\mathfrak{p}_1 \subset \mathfrak{p}_2 \subset \mathfrak{p}_3$ we have

$$ht(\mathfrak{p}_3/\mathfrak{p}_1) = ht(\mathfrak{p}_3/\mathfrak{p}_2) + ht(\mathfrak{p}_2/\mathfrak{p}_1).$$

Here $ht(\mathfrak{p}/\mathfrak{q})$ means the height of $\mathfrak{p}/\mathfrak{q}$ in the ring A/\mathfrak{q} .

Exercise 83.12.2. Show that a Noetherian local domain of dimension 2 is catenary.

Exercise 83.12.3. Let k be a field. Show that a finite type k -algebra is catenary.

83.13. Fraction fields

Exercise 83.13.1. Consider the domain

$$\mathbf{Q}[r, s, t]/(s^2 - (r-1)(r-2)(r-3), t^2 - (r+1)(r+2)(r+3)).$$

Find a domain of the form $\mathbf{Q}[x, y]/(f)$ with isomorphic field of fractions.

83.14. Transcendence degree

Exercise 83.14.1. Let $k \subset K \subset K'$ be field extensions with K' algebraic over K . Prove that $\text{trdeg}_k(K) = \text{trdeg}_k(K')$. (Hint: Show that if $x_1, \dots, x_d \in K$ are algebraically independent over k and $d < \text{trdeg}_k(K')$ then $k(x_1, \dots, x_d) \subset K$ cannot be algebraic.)

83.15. Finite locally free modules

Definition 83.15.1. Let A be a ring. Recall that a *finite locally free* A -module M is a module such that for every $\mathfrak{p} \in \text{Spec}(A)$ there exists an $f \in A$, $f \notin \mathfrak{p}$ such that M_f is a finite free A_f -module. We say M is an *invertible module* if M is finite locally free of rank 1, i.e., for every $\mathfrak{p} \in \text{Spec}(A)$ there exists an $f \in A$, $f \notin \mathfrak{p}$ such that $M_f \cong A_f$ as an A_f -module.

Exercise 83.15.2. Prove that the tensor product of finite locally free modules is finite locally free. Prove that the tensor product of two invertible modules is invertible.

Definition 83.15.3. Let A be a ring. The *class group of* A , sometimes called the *Picard group of* A is the set $\text{Pic}(A)$ of isomorphism classes of invertible A -modules endowed with a group operation defined by tensor product (see Exercise 83.15.2).

Note that the class group of A is trivial exactly when every invertible module is isomorphic to a free module of rank 1.

Exercise 83.15.4. Show that the class groups of the following rings are trivial

- (1) a polynomial ring $A = k[x]$ where k is a field,
- (2) the integers $A = \mathbf{Z}$,
- (3) a polynomial ring $A = k[x, y]$ where k is a field, and
- (4) the quotient $k[x, y]/(xy)$ where k is a field.

Exercise 83.15.5. Show that the class group of the ring $A = k[x, y]/(y^2 - f(x))$ where k is a field of characteristic not 2 and where $f(x) = (x - t_1) \cdots (x - t_n)$ with $t_1, \dots, t_n \in k$ distinct and $n \geq 3$ an odd integer is not trivial. (Hint: Show that the ideal $(y, x - t_1)$ defines a nontrivial element of $\text{Pic}(A)$.)

Exercise 83.15.6. Let A be a ring.

- (1) Suppose that M is a finite locally free A -module, and suppose that $\varphi : M \rightarrow M$ is an endomorphism. Define/construct the *trace* and *determinant* of φ and prove that your construction is “functorial in the triple (A, M, φ) ”.
- (2) Show that if M, N are finite locally free A -modules, and if $\varphi : M \rightarrow N$ and $\psi : N \rightarrow M$ then $\text{Trace}(\varphi \circ \psi) = \text{Trace}(\psi \circ \varphi)$ and $\text{Det}(\varphi \circ \psi) = \text{Det}(\psi \circ \varphi)$.
- (3) In case M is finite locally free show that Det defines a multiplicative map $\text{End}_A(M) \rightarrow A$.

Exercise 83.15.7. Now suppose that B is an A -algebra which is finite locally free as an A -module, in other words B is a finite locally free A -algebra.

- (1) Define $\text{Trace}_{B/A}$ and $\text{Norm}_{B/A}$ using Trace and Det as defined above.
- (2) Let $b \in B$ and let $\pi : \text{Spec}(B) \rightarrow \text{Spec}(A)$ be the induced morphism. Show that $\pi(V(b)) = V(\text{Norm}_{B/A}(b))$. (Recall that $V(f) = \{\mathfrak{p} \mid f \in \mathfrak{p}\}$.)
- (3) (Base change.) Suppose that $i : A \rightarrow A'$ is a ring map. Set $B' = B \otimes_A A'$. Indicate why $i(\text{Norm}_{B/A}(b))$ equals $\text{Norm}_{B'/A'}(b \otimes 1)$.
- (4) Compute $\text{Norm}_{B/A}(b)$ when $B = A \times A \times A \times \cdots \times A$ and $b = (a_1, \dots, a_n)$.
- (5) Compute the norm of $y - y^3$ under the finite flat map $\mathbf{Q}[x] \rightarrow \mathbf{Q}[y]$, $x \rightarrow y^n$. (Hint: use the “base change” $A = \mathbf{Q}[x] \subset A' = \mathbf{Q}(\zeta_n)(x^{1/n})$.)

83.16. Glueing

Exercise 83.16.1. Suppose that A is a ring and M is an A -module. Let $f_i, i \in I$ be a collection of elements of A such that

$$\operatorname{Spec}(A) = \bigcup D(f_i).$$

- (1) Show that if M_{f_i} is a finite A_{f_i} -module, then M is a finite A -module.
- (2) Show that if M_{f_i} is a flat A_{f_i} -module, then M is a flat A -module. (This is kind of silly if you think about it right.)

Remark 83.16.2. In algebraic geometric language this means that the property of “being finitely generated” or “being flat” is local for the Zariski topology (in a suitable sense). You can also show this for the property “being of finite presentation”.

Exercise 83.16.3. Suppose that $A \rightarrow B$ is a ring map. Let $f_i \in A, i \in I$ and $g_j \in B, j \in J$ be collections of elements such that

$$\operatorname{Spec}(A) = \bigcup D(f_i) \quad \text{and} \quad \operatorname{Spec}(B) = \bigcup D(g_j).$$

Show that if $A_{f_i} \rightarrow B_{f_i g_j}$ is of finite type for all i, j then $A \rightarrow B$ is of finite type.

83.17. Going up and going down

Definition 83.17.1. Let $\phi : A \rightarrow B$ be a homomorphism of rings. We say that the *going-up theorem* holds for ϕ if the following condition is satisfied:

- (GU) for any $\mathfrak{p}, \mathfrak{p}' \in \operatorname{Spec}(A)$ such that $\mathfrak{p} \subset \mathfrak{p}'$, and for any $P \in \operatorname{Spec}(B)$ lying over \mathfrak{p} , there exists $P' \in \operatorname{Spec}(B)$ lying over \mathfrak{p}' such that $P \subset P'$.

Similarly, we say that the *going-down theorem* holds for ϕ if the following condition is satisfied:

- (GD) for any $\mathfrak{p}, \mathfrak{p}' \in \operatorname{Spec}(A)$ such that $\mathfrak{p} \subset \mathfrak{p}'$, and for any $P' \in \operatorname{Spec}(B)$ lying over \mathfrak{p}' , there exists $P \in \operatorname{Spec}(B)$ lying over \mathfrak{p} such that $P \subset P'$.

Exercise 83.17.2. In each of the following cases determine whether (GU), (GD) holds, and explain why. (Use any Prop/Thm/Lemma you can find, but check the hypotheses in each case.)

- (1) k is a field, $A = k, B = k[x]$.
- (2) k is a field, $A = k[x], B = k[x, y]$.
- (3) $A = \mathbf{Z}, B = \mathbf{Z}[1/11]$.
- (4) k is an algebraically closed field, $A = k[x, y], B = k[x, y, z]/(x^2 - y, z^2 - x)$.
- (5) $A = \mathbf{Z}, B = \mathbf{Z}[i, 1/(2 + i)]$.
- (6) $A = \mathbf{Z}, B = \mathbf{Z}[i, 1/(14 + 7i)]$.
- (7) k is an algebraically closed field, $A = k[x], B = k[x, y, 1/(xy - 1)]/(y^2 - y)$.

Exercise 83.17.3. Let k be an algebraically closed field. Compute the image in $\operatorname{Spec}(k[x, y])$ of the following maps:

- (1) $\operatorname{Spec}(k[x, yx^{-1}]) \rightarrow \operatorname{Spec}(k[x, y])$, where $k[x, y] \subset k[x, yx^{-1}] \subset k[x, y, x^{-1}]$. (Hint: To avoid confusion, give the element yx^{-1} another name.)
- (2) $\operatorname{Spec}(k[x, y, a, b]/(ax - by - 1)) \rightarrow \operatorname{Spec}(k[x, y])$.
- (3) $\operatorname{Spec}(k[t, 1/(t - 1)]) \rightarrow \operatorname{Spec}(k[x, y])$, induced by $x \mapsto t^2$, and $y \mapsto t^3$.
- (4) $k = \mathbf{C}$ (complex numbers), $\operatorname{Spec}(k[s, t]/(s^3 + t^3 - 1)) \rightarrow \operatorname{Spec}(k[x, y])$, where $x \mapsto s^2, y \mapsto t^2$.

Remark 83.17.4. Finding the image as above usually is done by using elimination theory.

83.18. Fitting ideals

Exercise 83.18.1. Let R be a ring and let M be a finite R -module. Choose a presentation

$$\bigoplus_{j \in J} R \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0.$$

of M . Note that the map $R^{\oplus n} \rightarrow M$ is given by a sequence of elements x_1, \dots, x_n of M . The elements x_i are *generators* of M . The map $\bigoplus_{j \in J} R \rightarrow R^{\oplus n}$ is given by a $n \times J$ matrix A with coefficients in R . In other words, $A = (a_{ij})_{i=1, \dots, n, j \in J}$. The columns (a_{1j}, \dots, a_{nj}) , $j \in J$ of A are said to be the *relations*. Any vector $(r_i) \in R^{\oplus n}$ such that $\sum r_i x_i = 0$ is a linear combination of the columns of A . Of course any finite R -module has a lot of different presentations.

- (1) Show that the ideal generated by the $(n - k) \times (n - k)$ minors of A is independent of the choice of the presentation. This ideal is the *kth fitting ideal* of M . Notation $Fit_k(M)$.
- (2) Show that $Fit_0(M) \subset Fit_1(M) \subset Fit_2(M) \subset \dots$ (Hint: Use that a determinant can be computed by expanding along a column.)
- (3) Show that the following are equivalent:
 - (a) $Fit_{r-1}(M) = (0)$ and $Fit_r(M) = R$, and
 - (b) M is locally free of rank r .

83.19. Hilbert functions

Definition 83.19.1. A *numerical polynomial* is a polynomial $f(x) \in \mathbf{Q}[x]$ such that $f(n) \in \mathbf{Z}$ for every integer n .

Definition 83.19.2. A *graded module* M over a ring A is an A -module M endowed with a direct sum decomposition $\bigoplus_{n \in \mathbf{Z}} M_n$ into A -submodules. We will say that M is *locally finite* if all of the M_n are finite A -modules. Suppose that A is a Noetherian ring and that φ is a *Euler-Poincaré function* on finite A -modules. This means that for every finitely generated A -module M we are given an integer $\varphi(M) \in \mathbf{Z}$ and for every short exact sequence

$$0 \longrightarrow M' \longrightarrow M \longrightarrow M'' \longrightarrow 0$$

we have $\varphi(M) = \varphi(M') + \varphi(M'')$. The *Hilbert function* of a locally finite graded module M (with respect to φ) is the function $\chi_\varphi(M, n) = \varphi(M_n)$. We say that M has a *Hilbert polynomial* if there is some numerical polynomial P_φ such that $\chi_\varphi(M, n) = P_\varphi(n)$ for all sufficiently large integers n .

Definition 83.19.3. A *graded A -algebra* is a graded A -module $B = \bigoplus_{n \geq 0} B_n$ together with an A -bilinear map

$$B \times B \longrightarrow B, (b, b') \longmapsto bb'$$

that turns B into an A -algebra so that $B_n \cdot B_m \subset B_{n+m}$. Finally, a *graded module* M over a graded A -algebra B is given by a graded A -module M together with a (compatible) B -module structure such that $B_n \cdot M_d \subset M_{n+d}$. Now you can define *homomorphisms of graded modules/rings, graded submodules, graded ideals, exact sequences of graded modules*, etc, etc.

Exercise 83.19.4. Let $A = k$ a field. What are all possible Euler-Poincaré functions on finite A -modules in this case?

Exercise 83.19.5. Let $A = \mathbf{Z}$. What are all possible Euler-Poincaré functions on finite A -modules in this case?

Exercise 83.19.6. Let $A = k[x, y]/(xy)$ with k algebraically closed. What are all possible Euler-Poincaré functions on finite A -modules in this case?

Exercise 83.19.7. Suppose that A is Noetherian. Show that the kernel of a map of locally finite graded A -modules is locally finite.

Exercise 83.19.8. Let k be a field and let $A = k$ and $B = k[x, y]$ with grading determined by $\deg(x) = 2$ and $\deg(y) = 3$. Let $\varphi(M) = \dim_k(M)$. Compute the Hilbert function of B as a graded k -module. Is there a Hilbert polynomial in this case?

Exercise 83.19.9. Let k be a field and let $A = k$ and $B = k[x, y]/(x^2, xy)$ with grading determined by $\deg(x) = 2$ and $\deg(y) = 3$. Let $\varphi(M) = \dim_k(M)$. Compute the Hilbert function of B as a graded k -module. Is there a Hilbert polynomial in this case?

Exercise 83.19.10. Let k be a field and let $A = k$. Let $\varphi(M) = \dim_k(M)$. Fix $d \in \mathbf{N}$. Consider the graded A -algebra $B = k[x, y, z]/(x^d + y^d + z^d)$, where x, y, z each have degree 1. Compute the Hilbert function of B . Is there a Hilbert polynomial in this case?

83.20. Proj of a ring

Definition 83.20.1. Let R be a graded ring. A *homogeneous* ideal is simply an ideal $I \subset R$ which is also a graded submodule of R . Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$f = f_0 + f_1 + \dots + f_n$$

is the decomposition of f into homogeneous pieces in R then $f_i \in I$ for each i .

Definition 83.20.2. We define the *homogeneous spectrum* $\text{Proj}(R)$ of the graded ring R to be the set of homogeneous, prime ideals \mathfrak{p} of R such that $R_+ \not\subset \mathfrak{p}$. Note that $\text{Proj}(R)$ is a subset of $\text{Spec}(R)$ and hence has a natural induced topology.

Definition 83.20.3. Let $R = \bigoplus_{d \geq 0} R_d$ be a graded ring, let $f \in R_d$ and assume that $d \geq 1$. We define $R_{(f)}$ to be the subring of R_f consisting of elements of the form r/f^n with r homogeneous and $\deg(r) = nd$. Furthermore, we define

$$D_+(f) = \{\mathfrak{p} \in \text{Proj}(R) \mid f \notin \mathfrak{p}\}.$$

Finally, for a homogeneous ideal $I \subset R$ we define $V_+(I) = V(I) \cap \text{Proj}(R)$.

Exercise 83.20.4. On the topology on $\text{Proj}(R)$. With definitions and notation as above prove the following statements.

- (1) Show that $D_+(f)$ is open in $\text{Proj}(R)$.
- (2) Show that $D_+(ff') = D_+(f) \cap D_+(f')$.
- (3) Let $g = g_0 + \dots + g_m$ be an element of R with $g_i \in R_i$. Express $D(g) \cap \text{Proj}(R)$ in terms of $D_+(g_i)$, $i \geq 1$ and $D(g_0) \cap \text{Proj}(R)$. No proof necessary.

- (4) Let $g \in R_0$ be a homogeneous element of degree 0. Express $D(g) \cap \text{Proj}(R)$ in terms of $D_+(f_\alpha)$ for a suitable family $f_\alpha \in R$ of homogeneous elements of positive degree.
- (5) Show that the collection $\{D_+(f)\}$ of opens forms a basis for the topology of $\text{Proj}(R)$.
- (6) Show that there is a canonical bijection $D_+(f) \rightarrow \text{Spec}(R_{(f)})$. (Hint: Imitate the proof for Spec but at some point thrown in the radical of an ideal.)
- (7) Show that the map from (6) is a homeomorphism.
- (8) Give an example of an R such that $\text{Proj}(R)$ is not quasi-compact. No proof necessary.
- (9) Show that any closed subset $T \subset \text{Proj}(R)$ is of the form $V_+(I)$ for some homogeneous ideal $I \subset R$.

Remark 83.20.5. There is a continuous map $\text{Proj}(R) \rightarrow \text{Spec}(R_0)$.

Exercise 83.20.6. If $R = A[X]$ with $\deg(X) = 1$, show that the natural map $\text{Proj}(R) \rightarrow \text{Spec}(A)$ is a bijection and in fact a homeomorphism.

Exercise 83.20.7. Blowing up: part I. In this exercise $R = Bl_I(A) = A \oplus I \oplus I^2 \oplus \dots$. Consider the natural map $b : \text{Proj}(R) \rightarrow \text{Spec}(A)$. Set $U = \text{Spec}(A) - V(I)$. Show that

$$b : b^{-1}(U) \rightarrow U$$

is a homeomorphism. Thus we may think of U as an open subset of $\text{Proj}(R)$. Let $Z \subset \text{Spec}(A)$ be an irreducible closed subscheme with generic point $\xi \in Z$. Assume that $\xi \notin V(I)$, in other words $Z \not\subset V(I)$, in other words $\xi \in U$, in other words $Z \cap U \neq \emptyset$. We define the *strict transform* Z' of Z to be the closure of the unique point ξ' lying above ξ . Another way to say this is that Z' is the closure in $\text{Proj}(R)$ of the locally closed subset $Z \cap U \subset U \subset \text{Proj}(R)$.

Exercise 83.20.8. Blowing up: Part II. Let $A = k[x, y]$ where k is a field, and let $I = (x, y)$. Let R be the blow up algebra for A and I .

- (1) Show that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{y\})$ are disjoint.
- (2) Show that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{x - y^2\})$ are not disjoint.
- (3) Find an ideal $J \subset A$ such that $V(J) = V(I)$ and such that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{x - y^2\})$ are disjoint.

Exercise 83.20.9. Let R be a graded ring.

- (1) Show that $\text{Proj}(R)$ is empty if $R_n = (0)$ for all $n \gg 0$.
- (2) Show that $\text{Proj}(R)$ is an irreducible topological space if R is a domain and R_+ is not zero. (Recall that the empty topological space is not irreducible.)

Exercise 83.20.10. Blowing up: Part III. Consider A, I and U, Z as in the definition of strict transform. Let $Z = V(\mathfrak{p})$ for some prime ideal \mathfrak{p} . Let $\bar{A} = A/\mathfrak{p}$ and let \bar{I} be the image of I in \bar{A} .

- (1) Show that there exists a surjective ring map $R := Bl_I(A) \rightarrow \bar{R} := Bl_{\bar{I}}(\bar{A})$.
- (2) Show that the ring map above induces a bijective map from $\text{Proj}(\bar{R})$ onto the strict transform Z' of Z . (This is not so easy. Hint: Use 5(b) above.)

- (3) Conclude that the strict transform $Z' = V_+(P)$ where $P \subset R$ is the homogeneous ideal defined by $P_d = I^d \cap \mathfrak{p}$.
- (4) Suppose that $Z_1 = V(\mathfrak{p})$ and $Z_2 = V(\mathfrak{q})$ are irreducible closed subsets defined by prime ideals such that $Z_1 \not\subset Z_2$, and $Z_2 \not\subset Z_1$. Show that blowing up the ideal $I = \mathfrak{p} + \mathfrak{q}$ separates the strict transforms of Z_1 and Z_2 , i.e., $Z'_1 \cap Z'_2 = \emptyset$. (Hint: Consider the homogeneous ideal P and Q from part (c) and consider $V(P + Q)$.)

83.21. Cohen-Macaulay rings of dimension 1

Definition 83.21.1. A Noetherian local ring A is said to be *Cohen-Macaulay* of dimension d if it has dimension d and there exists a system of parameters x_1, \dots, x_d for A such that x_i is a nonzerodivisor in $A/(x_1, \dots, x_{i-1})$ for $i = 1, \dots, d$.

Exercise 83.21.2. Cohen-Macaulay rings of dimension 1. Part I: Theory.

- (1) Let (A, \mathfrak{m}) be a local Noetherian with $\dim A = 1$. Show that if $x \in \mathfrak{m}$ is not a zerodivisor then
- $\dim A/xA = 0$, in other words A/xA is Artinian, in other words $\{x\}$ is a system of parameters for A .
 - A has no embedded prime.
- (2) Conversely, let (A, \mathfrak{m}) be a local Noetherian ring of dimension 1. Show that if A has no embedded prime then there exists a nonzerodivisor in \mathfrak{m} .

Exercise 83.21.3. Cohen-Macaulay rings of dimension 1. Part II: Examples.

- (1) Let A be the local ring at (x, y) of $k[x, y]/(x^2, xy)$.
- Show that A has dimension 1.
 - Prove that every element of $\mathfrak{m} \subset A$ is a zerodivisor.
 - Find $z \in \mathfrak{m}$ such that $\dim A/zA = 0$ (no proof required).
- (2) Let A be the local ring at (x, y) of $k[x, y]/(x^2)$. Find a nonzerodivisor in \mathfrak{m} (no proof required).

Exercise 83.21.4. Local rings of embedding dimension 1. Suppose that (A, \mathfrak{m}, k) is a Noetherian local ring of embedding dimension 1, i.e.,

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 1.$$

Show that the function $f(n) = \dim_k \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is either constant with value 1, or its values are

$$1, 1, \dots, 1, 0, 0, 0, 0, \dots$$

Exercise 83.21.5. Regular local rings of dimension 1. Suppose that (A, \mathfrak{m}, k) is a regular Noetherian local ring of dimension 1. Recall that this means that A has dimension 1 and embedding dimension 1, i.e.,

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 1.$$

Let $x \in \mathfrak{m}$ be any element whose class in $\mathfrak{m}/\mathfrak{m}^2$ is not zero.

- Show that for every element y of \mathfrak{m} there exists an integer n such that y can be written as $y = ux^n$ with $u \in A^*$ a unit.
- Show that x is a nonzerodivisor in A .
- Conclude that A is a domain.

Exercise 83.21.6. Let (A, \mathfrak{m}, k) be a Noetherian local ring with associated graded $Gr_{\mathfrak{m}}(A)$.

- (1) Suppose that $x \in \mathfrak{m}^d$ maps to a nonzero divisor $\bar{x} \in \mathfrak{m}^d/\mathfrak{m}^{d+1}$ in degree d of $Gr_{\mathfrak{m}}(A)$. Show that x is a nonzerodivisor.
- (2) Suppose the depth of A is at least 1. Namely, suppose that there exists a nonzerodivisor $y \in \mathfrak{m}$. In this case we can do better: assume just that $x \in \mathfrak{m}^d$ maps to the element $\bar{x} \in \mathfrak{m}^d/\mathfrak{m}^{d+1}$ in degree d of $Gr_{\mathfrak{m}}(A)$ which is a nonzerodivisor on sufficiently high degrees: $\exists N$ such that for all $n \geq N$ the map of multiplication by \bar{x}

$$\mathfrak{m}^n/\mathfrak{m}^{n+1} \longrightarrow \mathfrak{m}^{n+d}/\mathfrak{m}^{n+d+1}$$

is injective. Then show that x is a nonzerodivisor.

Exercise 83.21.7. Suppose that (A, \mathfrak{m}, k) is a Noetherian local ring of dimension 1. Assume also that the embedding dimension of A is 2, i.e., assume that

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 2.$$

Notation: $f(n) = \dim_k \mathfrak{m}^n/\mathfrak{m}^{n+1}$. Pick generators $x, y \in \mathfrak{m}$ and write $Gr_{\mathfrak{m}}(A) = k[\bar{x}, \bar{y}]/I$ for some homogeneous ideal I .

- (1) Show that there exists a homogeneous element $F \in k[\bar{x}, \bar{y}]$ such that $I \subset (F)$ with equality in all sufficiently high degrees.
- (2) Show that $f(n) \leq n + 1$.
- (3) Show that if $f(n) < n + 1$ then $n \geq \deg(F)$.
- (4) Show that if $f(n) < n + 1$, then $f(n + 1) \leq f(n)$.
- (5) Show that $f(n) = \deg(F)$ for all $n \gg 0$.

Exercise 83.21.8. Cohen-Macaulay rings of dimension 1 and embedding dimension 2. Suppose that (A, \mathfrak{m}, k) is a Noetherian local ring which is Cohen-Macaulay of dimension 1. Assume also that the embedding dimension of A is 2, i.e., assume that

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 2.$$

Notations: $f, F, x, y \in \mathfrak{m}, I$ as in Ex. 6 above. Please use any results from the problems above.

- (1) Suppose that $z \in \mathfrak{m}$ is an element whose class in $\mathfrak{m}/\mathfrak{m}^2$ is a linear form $\alpha\bar{x} + \beta\bar{y} \in k[\bar{x}, \bar{y}]$ which is coprime with f .
 - (a) Show that z is a nonzerodivisor on A .
 - (b) Let $d = \deg(F)$. Show that $\mathfrak{m}^n = z^{n+1-d}\mathfrak{m}^{d-1}$ for all sufficiently large n . (Hint: First show $z^{n+1-d}\mathfrak{m}^{d-1} \rightarrow \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is surjective by what you know about $Gr_{\mathfrak{m}}(A)$. Then use NAK.)
- (2) What condition on k guarantees the existence of such a z ? (No proof required; it's too easy.)

Now we are going to assume there exists a z as above. This turns out to be a harmless assumption (in the sense that you can reduce to the situation where it holds in order to obtain the results in parts (d) and (e) below).

- (3) Now show that $\mathfrak{m}^\ell = z^{\ell-d+1}\mathfrak{m}^{d-1}$ for all $\ell \geq d$.
- (4) Conclude that $I = (F)$.
- (5) Conclude that the function f has values

$$2, 3, 4, \dots, d - 1, d, d, d, d, d, d, \dots$$

Remark 83.21.9. This suggests that a local Noetherian Cohen-Macaulay ring of dimension 1 and embedding dimension 2 is of the form B/FB , where B is a 2-dimensional regular local ring. This is more or less true (under suitable “niceness” properties of the ring).

83.22. Infinitely many primes

A section with a collection of strange questions on rings where infinitely many primes are not invertible.

Exercise 83.22.1. Give an example of a finite type \mathbf{Z} -algebra R with the following two properties:

- (1) There is no ring map $R \rightarrow \mathbf{Q}$.
- (2) For every prime p there exists a maximal ideal $\mathfrak{m} \subset R$ such that $R/\mathfrak{m} \cong \mathbf{F}_p$.

Exercise 83.22.2. For $f \in \mathbf{Z}[x, u]$ we define $f_p(x) = f(x, x^p) \bmod p \in \mathbf{F}_p[x]$. Give an example of an $f \in \mathbf{Z}[x, u]$ such that the following two properties hold:

- (1) There exist infinitely many p such that f_p does not have a zero in \mathbf{F}_p .
- (2) For all $p \gg 0$ the polynomial f_p either has a linear or a quadratic factor.

Exercise 83.22.3. For $f \in \mathbf{Z}[x, y, u, v]$ we define $f_p(x, y) = f(x, y, x^p, y^p) \bmod p \in \mathbf{F}_p[x, y]$. Give an “interesting” example of an f such that f_p is reducible for all $p \gg 0$. For example, $f = xv - yu$ with $f_p = xy^p - x^p y = xy(x^{p-1} - y^{p-1})$ is “uninteresting”; any f depending only on x, u is “uninteresting”, etc.

Remark 83.22.4. Let $h \in \mathbf{Z}[y]$ be a monic polynomial of degree d . Then:

- (1) The map $A = \mathbf{Z}[x] \rightarrow B = \mathbf{Z}[y]$, $x \mapsto h$ is finite locally free of rank d .
- (2) For all primes p the map $A_p = \mathbf{F}_p[x] \rightarrow B_p = \mathbf{F}_p[y]$, $y \mapsto h(y) \bmod p$ is finite locally free of rank d .

Exercise 83.22.5. Let h, A, B, A_p, B_p be as in the remark. For $f \in \mathbf{Z}[x, u]$ we define $f_p(x) = f(x, x^p) \bmod p \in \mathbf{F}_p[x]$. For $g \in \mathbf{Z}[y, v]$ we define $g_p(y) = g(y, y^p) \bmod p \in \mathbf{F}_p[y]$.

- (1) Give an example of a h and g such that there does not exist a f with the property

$$f_p = \text{Norm}_{B_p/A_p}(g_p).$$

- (2) Show that for any choice of h and g as above there exists a nonzero f such that for all p we have

$$\text{Norm}_{B_p/A_p}(g_p) \text{ divides } f_p.$$

If you want you can restrict to the case $h = y^n$, even with $n = 2$, but it is true in general.

- (3) Discuss the relevance of this to Exercises 6 & 7 of the previous set.

Exercise 83.22.6. Unsolved problems. They may be really hard or they may be easy. I don’t know.

- (1) Is there any $f \in \mathbf{Z}[x, u]$ such that f_p is irreducible for an infinite number of p ? (Hint: Yes, this happens for $f(x, u) = u - x - 1$ and also for $f(x, u) = u^2 - x^2 + 1$.)

- (2) Let $f \in \mathbf{Z}[x, u]$ nonzero, and suppose $\deg_x(f_p) = dp + d'$ for all large p . (In other words $\deg_u(f) = d$ and the coefficient c of u^d in f has $\deg_x(c) = d'$.) Suppose we can write $d = d_1 + d_2$ and $d' = d'_1 + d'_2$ with $d_1, d_2 > 0$ and $d'_1, d'_2 \geq 0$ such that for all sufficiently large p there exists a factorization

$$f_p = f_{1,p} f_{2,p}$$

with $\deg_x(f_{1,p}) = d_1 p + d'_1$. Is it true that f comes about via a norm construction as in Exercise 4? (More precisely, are there a h and g such that $\text{Norm}_{B_p/A_p}(g_p)$ divides f_p for all $p \gg 0$.)

- (3) Analogous question to the one in (b) but now with $f \in \mathbf{Z}[x_1, x_2, u_1, u_2]$ irreducible and just assuming that $f_p(x_1, x_2) = f(x_1, x_2, x_1^p, x_2^p) \pmod{p}$ factors for all $p \gg 0$.

83.23. Filtered derived category

In order to do the exercises in this section, please read the material in Homology, Section 12.16. We will say A is a filtered object of \mathcal{A} , to mean that A comes endowed with a filtration F which we omit from the notation.

Exercise 83.23.1. Let \mathcal{A} be an abelian category. Let I be a filtered object of \mathcal{A} . Assume that the filtration on I is finite and that each $\text{gr}^p(I)$ is an injective object of \mathcal{A} . Show that there exists an isomorphism $I \cong \bigoplus \text{gr}^p(I)$ with filtration $F^p(I)$ corresponding to $\bigoplus_{p' \geq p} \text{gr}^{p'}(I)$.

Exercise 83.23.2. Let \mathcal{A} be an abelian category. Let I be a filtered object of \mathcal{A} . Assume that the filtration on I is finite. Show the following are equivalent:

- (1) For any solid diagram

$$\begin{array}{ccc} A & \xrightarrow{\alpha} & B \\ \downarrow & \swarrow \text{dotted} & \\ I & & \end{array}$$

of filtered objects with (i) the filtrations on A and B are finite, and (ii) $\text{gr}(\alpha)$ injective the dotted arrow exists making the diagram commute.

- (2) Each $\text{gr}^p I$ is injective.

Note that given a morphism $\alpha : A \rightarrow B$ of filtered objects with finite filtrations to say that $\text{gr}(\alpha)$ injective is the same thing as saying that α is a *strict monomorphism* in the category $\text{Fil}(\mathcal{A})$. Namely, being a monomorphism means $\text{Ker}(\alpha) = 0$ and strict means that this also implies $\text{Ker}(\text{gr}(\alpha)) = 0$. See Homology, Lemma 12.16.13. (We only use the term “injective” for a morphism in an abelian category, although it makes sense in any additive category having kernels.) The exercises above justifies the following definition.

Definition 83.23.3. Let \mathcal{A} be an abelian category. Let I be a filtered object of \mathcal{A} . Assume the filtration on I is finite. We say I is *filtered injective* if each $\text{gr}^p(I)$ is an injective object of \mathcal{A} .

We make the following definition to avoid having to keep saying “with a finite filtration” everywhere.

Definition 83.23.4. Let \mathcal{A} be an abelian category. We denote $Fil^f(\mathcal{A})$ the full subcategory of $Fil(\mathcal{A})$ whose objects consist of those $A \in \text{Ob}(Fil(\mathcal{A}))$ whose filtration is finite.

Exercise 83.23.5. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. Let A be an object of $Fil^f(\mathcal{A})$. Show that there exists a strict monomorphism $\alpha : A \rightarrow I$ of A into a filtered injective object I of $Fil^f(\mathcal{A})$.

Definition 83.23.6. Let \mathcal{A} be an abelian category. Let $\alpha : K^\bullet \rightarrow L^\bullet$ be a morphism of complexes of $Fil(\mathcal{A})$. We say that α is a *filtered quasi-isomorphism* if for each $p \in \mathbf{Z}$ the morphism $\text{gr}^p(K^\bullet) \rightarrow \text{gr}^p(L^\bullet)$ is a quasi-isomorphism.

Definition 83.23.7. Let \mathcal{A} be an abelian category. Let K^\bullet be a complex of $Fil^f(\mathcal{A})$. We say that K^\bullet is *filtered acyclic* if for each $p \in \mathbf{Z}$ the complex $\text{gr}^p(K^\bullet)$ is acyclic.

Exercise 83.23.8. Let \mathcal{A} be an abelian category. Let $\alpha : K^\bullet \rightarrow L^\bullet$ be a morphism of bounded below complexes of $Fil^f(\mathcal{A})$. (Note the superscript f .) Show that the following are equivalent:

- (1) α is a filtered quasi-isomorphism,
- (2) for each $p \in \mathbf{Z}$ the map $\alpha : F^p K^\bullet \rightarrow F^p L^\bullet$ is a quasi-isomorphism,
- (3) for each $p \in \mathbf{Z}$ the map $\alpha : K^\bullet / F^p K^\bullet \rightarrow L^\bullet / F^p L^\bullet$ is a quasi-isomorphism, and
- (4) the cone of α (see Derived Categories, Definition 13.9.1) is a filtered acyclic complex.

Moreover, show that if α is a filtered quasi-isomorphism then α is also a usual quasi-isomorphism.

Exercise 83.23.9. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. Let A be an object of $Fil^f(\mathcal{A})$. Show there exists a complex I^\bullet of $Fil^f(\mathcal{A})$, and a morphism $A[0] \rightarrow I^\bullet$ such that

- (1) each I^p is filtered injective,
- (2) $I^p = 0$ for $p < 0$, and
- (3) $A[0] \rightarrow I^\bullet$ is a filtered quasi-isomorphism.

Exercise 83.23.10. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. Let K^\bullet be a bounded below complex of objects of $Fil^f(\mathcal{A})$. Show there exists a filtered quasi-isomorphism $\alpha : K^\bullet \rightarrow I^\bullet$ with I^\bullet a complex of $Fil^f(\mathcal{A})$ having filtered injective terms I^n , and bounded below. In fact, we may choose α such that each α^n is a strict monomorphism.

Exercise 83.23.11. Let \mathcal{A} be an abelian category. Consider a solid diagram

$$\begin{array}{ccc} K^\bullet & \xrightarrow{\alpha} & L^\bullet \\ \gamma \downarrow & \swarrow \beta & \downarrow \\ I^\bullet & & \end{array}$$

of complexes of $Fil^f(\mathcal{A})$. Assume K^\bullet , L^\bullet and I^\bullet are bounded below and assume each I^n is a filtered injective object. Also assume that α is a filtered quasi-isomorphism.

- (1) There exists a map of complexes β making the diagram commute up to homotopy.

- (2) If α is a strict monomorphism in every degree then we can find a β which makes the diagram commute.

Exercise 83.23.12. Let \mathcal{A} be an abelian category. Let K^\bullet, L^\bullet be complexes of $\text{Fil}^f(\mathcal{A})$. Assume

- (1) K^\bullet bounded below and filtered acyclic, and
- (2) I^\bullet bounded below and consisting of filtered injective objects.

Then any morphism $K^\bullet \rightarrow I^\bullet$ is homotopic to zero.

Exercise 83.23.13. Let \mathcal{A} be an abelian category. Consider a solid diagram

$$\begin{array}{ccc} K^\bullet & \xrightarrow{\alpha} & L^\bullet \\ \gamma \downarrow & \nearrow \beta_i & \\ I^\bullet & & \end{array}$$

of complexes of $\text{Fil}^f(\mathcal{A})$. Assume K^\bullet, L^\bullet and I^\bullet bounded below and each I^n a filtered injective object. Also assume α a filtered quasi-isomorphism. Any two morphisms β_1, β_2 making the diagram commute up to homotopy are homotopic.

83.24. Regular functions

Exercise 83.24.1. In this exercise we try to see what happens with regular functions over non-algebraically closed fields. Let k be a field. Let $Z \subset k^n$ be a Zariski locally closed subset, i.e., there exist ideals $I \subset J \subset k[x_1, \dots, x_n]$ such that

$$Z = \{a \in k^n \mid f(a) = 0 \forall f \in I, \exists g \in J, g(a) \neq 0\}.$$

A function $\varphi : Z \rightarrow k$ is said to be *regular* if for every $z \in Z$ there exists a Zariski open neighbourhood $z \in U \subset Z$ and polynomials $f, g \in k[x_1, \dots, x_n]$ such that $g(u) \neq 0$ for all $u \in U$ and such that $\varphi(u) = f(u)/g(u)$ for all $u \in U$.

- (1) If $k = \bar{k}$ and $Z = k^n$ show that regular functions are given by polynomials. (Only do this if you haven't seen this argument before.)
- (2) If k is finite show that (a) every function φ is regular, (b) the ring of regular functions is finite dimensional over k . (If you like you can take $Z = k^n$ and even $n = 1$.)
- (3) If $k = \mathbf{R}$ give an example of a regular function on $Z = \mathbf{R}$ which is not given by a polynomial.
- (4) If $k = \mathbf{Q}_p$ give an example of a regular function on $Z = \mathbf{Q}_p$ which is not given by a polynomial.

83.25. Sheaves

A morphism $f : X \rightarrow Y$ of a category \mathcal{C} is an *monomorphism* if for every pair of morphisms $a, b : W \rightarrow X$ we have $f \circ a = f \circ b \Rightarrow a = b$. A monomorphism in the category of sets is an injective map of sets.

Exercise 83.25.1. Carefully prove that a map of sheaves of sets is an monomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are injective.

A morphism $f : X \rightarrow Y$ of a category \mathcal{C} is an *isomorphism* if there exists a morphism $g : Y \rightarrow X$ such that $f \circ g = \text{id}_Y$ and $g \circ f = \text{id}_X$. An isomorphism in the category of sets is a bijective map of sets.

Exercise 83.25.2. Carefully prove that a map of sheaves of sets is an isomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are bijective.

A morphism $f : X \rightarrow Y$ of a category \mathcal{C} is an *epimorphism* if for every pair of morphisms $a, b : Y \rightarrow Z$ we have $a \circ f = b \circ f \Rightarrow a = b$. An epimorphism in the category of sets is a surjective map of sets.

Exercise 83.25.3. Carefully prove that a map of sheaves of sets is an epimorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are surjective.

Exercise 83.25.4. Let $f : X \rightarrow Y$ be a map of topological spaces. Prove pushforward f_* and pullback f^{-1} for sheaves of **sets** form an adjoint pair of functors.

Exercise 83.25.5. Let $j : U \rightarrow X$ be an open immersion. Show that j^{-1} has a left adjoint $j_!$ on the category of sheaves of sets. Characterize the stalks of $j_!(\mathcal{G})$. (Hint: $j_!$ is called extension by zero when you do this for abelian sheaves...)

Exercise 83.25.6. Let $X = \mathbf{R}$ with the usual topology. Let $\mathcal{O}_X = \underline{\mathbf{Z}/2\mathbf{Z}}_X$. Let $i : Z = \{0\} \rightarrow X$ be the inclusion and let $\mathcal{O}_Z = \underline{\mathbf{Z}/2\mathbf{Z}}_Z$. Prove the following (the first three follow from the definitions but if you are not clear on the definitions you should elucidate them):

- (1) $i_*\mathcal{O}_Z$ is a skyscraper sheaf.
- (2) There is a canonical surjective map from $\underline{\mathbf{Z}/2\mathbf{Z}}_X \rightarrow i_*\underline{\mathbf{Z}/2\mathbf{Z}}_Z$. Denote the kernel $\mathcal{I} \subset \mathcal{O}_X$.
- (3) \mathcal{I} is an ideal sheaf of \mathcal{O}_X .
- (4) The sheaf \mathcal{I} on X cannot be locally generated by sections (as in Modules, Definition 17.8.1.)

Exercise 83.25.7. Let X be a topological space. Let \mathcal{F} be an abelian sheaf on X . Show that \mathcal{F} is the quotient of a (possibly very large) direct sum of sheaves all of whose terms are of the form

$$j_!(\underline{\mathbf{Z}}_U)$$

where $U \subset X$ is open and $\underline{\mathbf{Z}}_U$ denotes the constant sheaf with value \mathbf{Z} on U .

Remark 83.25.8. Let X be a topological space. In the category of abelian sheaves the direct sum of a family of sheaves $\{\mathcal{F}_i\}_{i \in I}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus \mathcal{F}_i(U)$. Consequently the stalk of the direct sum at a point x is the direct sum of the stalks of the \mathcal{F}_i at x .

Exercise 83.25.9. Let X be a topological space. Suppose we are given a collection of abelian groups A_x indexed by $x \in X$. Show that the rule $U \mapsto \prod_{x \in U} A_x$ with obvious restriction mappings defines a sheaf \mathcal{G} of abelian groups. Show, by an example, that usually it is not the case that $\mathcal{G}_x = A_x$ for $x \in X$.

Exercise 83.25.10. Let X, A_x, \mathcal{G} be as in Exercise 83.25.9. Let \mathcal{B} be a basis for the topology of X , see Topology, Definition 5.4.1. For $U \in \mathcal{B}$ let A_U be a subgroup $A_U \subset \mathcal{G}(U) = \prod_{x \in U} A_x$. Assume that for $U \subset V$ with $U, V \in \mathcal{B}$ the restriction maps A_V into A_U . For $U \subset X$ open set

$$\mathcal{F}(U) = \left\{ (s_x)_{x \in U} \left| \begin{array}{l} \text{for every } x \text{ in } U \text{ there exists } V \in \mathcal{B} \\ x \in V \subset U \text{ such that } (s_y)_{y \in V} \in A_V \end{array} \right. \right\}$$

Show that \mathcal{F} defines a sheaf of abelian groups on X . Show, by an example, that it is usually not the case that $\mathcal{F}(U) = A_U$ for $U \in \mathcal{B}$.

83.26. Schemes

Let LRS be the category of locally ringed spaces. An affine scheme is an object in LRS isomorphic in LRS to a pair of the form $(\text{Spec}(A), \mathcal{O}_{\text{Spec}(A)})$. A scheme is an object (X, \mathcal{O}_X) of LRS such that every point $x \in X$ has an open neighbourhood $U \subset X$ such that the pair $(U, \mathcal{O}_X|_U)$ is an affine scheme.

Exercise 83.26.1. Find a 1-point locally ringed space which is not a scheme.

Exercise 83.26.2. Suppose that X is a scheme whose underlying topological space has 2 points. Show that X is an affine scheme.

Exercise 83.26.3. Suppose that X is a scheme whose underlying topological space is a finite discrete set. Show that X is an affine scheme.

Exercise 83.26.4. Show that there exists a non-affine scheme having three points.

Exercise 83.26.5. Suppose that X is a quasi-compact scheme. Show that X has a closed point.

Remark 83.26.6. When (X, \mathcal{O}_X) is a ringed space and $U \subset X$ is an open subset then $(U, \mathcal{O}_X|_U)$ is a ringed space. Notation: $\mathcal{O}_U = \mathcal{O}_X|_U$. There is a canonical morphism of ringed spaces

$$j : (U, \mathcal{O}_U) \longrightarrow (X, \mathcal{O}_X).$$

If (X, \mathcal{O}_X) is a locally ringed space, so is (U, \mathcal{O}_U) and j is a morphism of locally ringed spaces. If (X, \mathcal{O}_X) is a scheme so is (U, \mathcal{O}_U) and j is a morphism of schemes. We say that (U, \mathcal{O}_U) is an *open subscheme* of (X, \mathcal{O}_X) and that j is an *open immersion*. More generally, any morphism $j' : (V, \mathcal{O}_V) \rightarrow (X, \mathcal{O}_X)$ that is *isomorphic* to a morphism $j : (U, \mathcal{O}_U) \rightarrow (X, \mathcal{O}_X)$ as above is called an open immersion.

Exercise 83.26.7. Give an example of an affine scheme (X, \mathcal{O}_X) and an open $U \subset X$ such that $(U, \mathcal{O}_X|_U)$ is not an affine scheme.

Exercise 83.26.8. Given an example of a pair of affine schemes $(X, \mathcal{O}_X), (Y, \mathcal{O}_Y)$, an open subscheme $(U, \mathcal{O}_X|_U)$ of X and a morphism of schemes $(U, \mathcal{O}_X|_U) \rightarrow (Y, \mathcal{O}_Y)$ that does not extend to a morphism of schemes $(X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$.

Exercise 83.26.9. (This is pretty hard.) Given an example of a scheme X , and open subscheme $U \subset X$ and a closed subscheme $Z \subset U$ such that Z does not extend to a closed subscheme of X .

Exercise 83.26.10. Give an example of a scheme X , a field K , and a morphism of ringed spaces $\text{Spec}(K) \rightarrow X$ which is NOT a morphism of schemes.

Exercise 83.26.11. Do all the exercises in [Har77, Chapter II], Sections 1 and 2... Just kidding!

Definition 83.26.12. A scheme X is called *integral* if X is nonempty and for every nonempty affine open $U \subset X$ the ring $\Gamma(U, \mathcal{O}_X) = \mathcal{O}_X(U)$ is a domain.

Exercise 83.26.13. Give an example of a morphism of *integral* schemes $f : X \rightarrow Y$ such that the induced maps $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ are surjective for all $x \in X$, but f is not a closed immersion.

Exercise 83.26.14. Give an example of a fibre product $X \times_S Y$ such that X and Y are affine but $X \times_S Y$ is not.

Remark 83.26.15. It turns out this cannot happen with S separated. Do you know why?

Exercise 83.26.16. Give an example of a scheme V which is integral 1-dimensional scheme of finite type over \mathbf{Q} such that $\mathrm{Spec}(\mathbf{C}) \times_{\mathrm{Spec}(\mathbf{Q})} V$ is not integral.

Exercise 83.26.17. Give an example of a scheme V which is integral 1-dimensional scheme of finite type over a field k such that $\mathrm{Spec}(k') \times_{\mathrm{Spec}(k)} V$ is not reduced for some finite field extension $k \subset k'$.

Remark 83.26.18. If your scheme is affine then dimension is the same as the Krull dimension of the underlying ring. So you can use last semesters results to compute dimension.

83.27. Morphisms

An important question is, given a morphism $\pi : X \rightarrow S$, whether the morphism has a section or a rational section. Here are some example exercises.

Exercise 83.27.1. Consider the morphism of schemes

$$\pi : X = \mathrm{Spec}(\mathbf{C}[x, t, 1/xt]) \longrightarrow S = \mathrm{Spec}(\mathbf{C}[t]).$$

- (1) Show there does not exist a morphism $\sigma : S \rightarrow X$ such that $\pi \circ \sigma = \mathrm{id}_U$.
- (2) Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma : U \rightarrow X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 83.27.2. Consider the morphism of schemes

$$\pi : X = \mathrm{Spec}(\mathbf{C}[x, t]/(x^2 + t)) \longrightarrow S = \mathrm{Spec}(\mathbf{C}[t]).$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \rightarrow X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 83.27.3. Let $A, B, C \in \mathbf{C}[t]$ be nonzero polynomials. Consider the morphism of schemes

$$\pi : X = \mathrm{Spec}(\mathbf{C}[x, y, t]/(A + Bx^2 + Cy^2)) \longrightarrow S = \mathrm{Spec}(\mathbf{C}[t]).$$

Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma : U \rightarrow X$ such that $\pi \circ \sigma = \mathrm{id}_U$. (Hint: Symbolically, write $x = X/Z$, $y = Y/Z$ for some $X, Y, Z \in \mathbf{C}[t]$ of degree $\leq d$ for some d , and work out the condition that this solves the equation. Then show, using dimension theory, that if $d \gg 0$ you can find nonzero X, Y, Z solving the equation.)

Remark 83.27.4. Exercise 83.27.3 is a special case of “Tsen’s theorem”. Exercise 83.27.5 shows that the method is limited to low degree equations (conics when the base and fibre have dimension 1).

Exercise 83.27.5. Consider the morphism of schemes

$$\pi : X = \mathrm{Spec}(\mathbf{C}[x, y, t]/(1 + tx^3 + t^2y^3)) \longrightarrow S = \mathrm{Spec}(\mathbf{C}[t]).$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \rightarrow X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 83.27.6. Consider the schemes

$$X = \operatorname{Spec}(\mathbf{C}[\{x_i\}_{i=1}^8, s, t]/(1 + sx_1^3 + s^2x_2^3 + tx_3^3 + stx_4^3 + s^2tx_5^3 + t^2x_6^3 + st^2x_7^3 + s^2t^2x_8^3))$$

and

$$S = \operatorname{Spec}(\mathbf{C}[s, t])$$

and the morphism of schemes

$$\pi : X \longrightarrow S$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \rightarrow X$ such that $\pi \circ \sigma = \operatorname{id}_U$.

Exercise 83.27.7. (For the number theorists.) Give an example of a closed subscheme

$$Z \subset \operatorname{Spec}\left(\mathbf{Z}[x, \frac{1}{x(x-1)(2x-1)}]\right)$$

such that the morphism $Z \rightarrow \operatorname{Spec}(\mathbf{Z})$ is finite and surjective.

Exercise 83.27.8. If you do not like number theory, you can try the variant where you look at

$$\operatorname{Spec}\left(\mathbf{F}_p[t, x, \frac{1}{x(x-t)(tx-1)}]\right) \longrightarrow \operatorname{Spec}(\mathbf{F}_p[t])$$

and you try to find a closed subscheme of the top scheme which maps finite surjectively to the bottom one. (There is a theoretical reason for having a finite ground field here; although it may not be necessary in this particular case.)

Remark 83.27.9. The interpretation of the results of Exercise 83.27.7 and 83.27.8 is that given the morphism $X \rightarrow S$ all of whose fibres are nonempty, there exists a finite surjective morphism $S' \rightarrow S$ such that the base change $X_{S'} \rightarrow S'$ does have a section. This is not a general fact, but it holds if the base is the spectrum of a dedekind ring with finite residue fields at closed points, and the morphism $X \rightarrow S$ is flat with geometrically irreducible generic fibre. See Exercise 83.27.10 below for an example where it doesn't work.

Exercise 83.27.10. Prove there exist a $f \in \mathbf{C}[x, t]$ which is not divisible by $t - \alpha$ for any $\alpha \in \mathbf{C}$ such that there does not exist any $Z \subset \operatorname{Spec}(\mathbf{C}[x, t, 1/f])$ which maps finite surjectively to $\operatorname{Spec}(\mathbf{C}[t])$. (I think that $f(x, t) = (xt - 2)(x - t + 3)$ works. To show any candidate has the required property is not so easy I think.)

83.28. Tangent Spaces

Definition 83.28.1. For any ring R we denote $R[\epsilon]$ the ring of *dual numbers*. As an R -module it is free with basis $1, \epsilon$. The ring structure comes from setting $\epsilon^2 = 0$.

Exercise 83.28.2. Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point, let $s = f(x)$. Consider the solid commutative diagram

$$\begin{array}{ccccc} \operatorname{Spec}(\kappa(x)) & \longrightarrow & \operatorname{Spec}(\kappa(x)[\epsilon]) & \cdots \twoheadrightarrow & X \\ & \searrow & \downarrow & & \downarrow \\ & & \operatorname{Spec}(\kappa(s)) & \longrightarrow & S \end{array}$$

with the curved arrow being the canonical morphism of $\text{Spec}(\kappa(x))$ into X . If $\kappa(x) = \kappa(s)$ show that the set of dotted arrows which make the diagram commute are in one to one correspondence with the set of linear maps

$$\text{Hom}_{\kappa(x)}\left(\frac{\mathfrak{m}_x}{\mathfrak{m}_x^2 + \mathfrak{m}_s \mathcal{O}_{X,x}}, \kappa(x)\right)$$

In other words: describe such a bijection. (This works more generally if $\kappa(x) \supset \kappa(s)$ is a separable algebraic extension.)

Definition 83.28.3. Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. We dub the set of dotted arrows of Exercise 83.28.2 the *tangent space of X over S* and we denote it $T_{X/S,x}$. An element of this space is called a *tangent vector* of X/S at x .

Exercise 83.28.4. For any field K prove that the diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & \text{Spec}(K[\epsilon_1]) \\ \downarrow & & \downarrow \\ \text{Spec}(K[\epsilon_2]) & \longrightarrow & \text{Spec}(K[\epsilon_1, \epsilon_2]/(\epsilon_1 \epsilon_2)) \end{array}$$

is a pushout diagram in the category of schemes. (Here $\epsilon_i^2 = 0$ as before.)

Exercise 83.28.5. Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Define addition of tangent vectors, using Exercise 83.28.4 and a suitable morphism

$$\text{Spec}(K[\epsilon]) \longrightarrow \text{Spec}(K[\epsilon_1, \epsilon_2]/(\epsilon_1 \epsilon_2)).$$

Similarly, define scalar multiplication of tangent vectors (this is easier). Show that $T_{X/S,x}$ becomes a $\kappa(x)$ -vector space with your constructions.

Exercise 83.28.6. Let k be a field. Consider the structure morphism $f : X = \mathbf{A}_k^1 \rightarrow \text{Spec}(k) = S$.

- (1) Let $x \in X$ be a closed point. What is the dimension of $T_{X/S,x}$?
- (2) Let $\eta \in X$ be the generic point. What is the dimension of $T_{X/S,\eta}$?
- (3) Consider now X as a scheme over $\text{Spec}(\mathbf{Z})$. What are the dimensions of $T_{X/\mathbf{Z},x}$ and $T_{X/\mathbf{Z},\eta}$?

Remark 83.28.7. Exercise 83.28.6 explains why it is necessary to consider the tangent space of X over S to get a good notion.

Exercise 83.28.8. Consider the morphism of schemes

$$f : X = \text{Spec}(\mathbf{F}_p[t]) \longrightarrow \text{Spec}(\mathbf{F}_p[t^p]) = S$$

Compute the tangent space of X/S at the unique point of X . Isn't that weird? What do you think happens if you take the morphism of schemes corresponding to $\mathbf{F}_p[t^p] \rightarrow \mathbf{F}_p[t]$?

Exercise 83.28.9. Let k be a field. Compute the tangent space of X/k at the point $x = (0, 0)$ where $X = \text{Spec}(k[x, y]/(x^2 - y^3))$.

Exercise 83.28.10. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Let $x \in X$ be a point. Set $y = f(x)$. Assume that the natural map $\kappa(y) \rightarrow \kappa(x)$ is bijective. Show, using the definition, that f induces a natural linear map

$$df : T_{X/S,x} \longrightarrow T_{Y/S,y}.$$

Match it with what happens on local rings via Exercise 83.28.2 in case $\kappa(x) = \kappa(s)$.

Exercise 83.28.11. Let k be an algebraically closed field. Let

$$\begin{aligned} f : \mathbf{A}_k^n &\longrightarrow \mathbf{A}_k^m \\ (x_1, \dots, x_n) &\longmapsto (f_1(x_i), \dots, f_m(x_i)) \end{aligned}$$

be a morphism of schemes over k . This is given by m polynomials f_1, \dots, f_m in n variables. Consider the matrix

$$A = \left(\frac{\partial f_j}{\partial x_i} \right)$$

Let $x \in \mathbf{A}_k^n$ be a closed point. Set $y = f(x)$. Show that the map on tangent spaces $T_{\mathbf{A}_k^n/k, x} \rightarrow T_{\mathbf{A}_k^m/k, y}$ is given by the value of the matrix A at the point x .

83.29. Quasi-coherent Sheaves

Definition 83.29.1. Let X be a scheme. A sheaf \mathcal{F} of \mathcal{O}_X -modules is *quasi-coherent* if for every affine open $\text{Spec}(R) = U \subset X$ the restriction $\mathcal{F}|_U$ is of the form \widetilde{M} for some R -module M .

It is enough to check this conditions on the members of an affine open covering of X . See Schemes, Section 25.24 for more results.

Definition 83.29.2. Let X be a topological space. Let $x, x' \in X$. We say x is a *specialization* of x' if and only if $x \in \overline{\{x'\}}$.

Exercise 83.29.3. Let X be a scheme. Let $x, x' \in X$. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Suppose that (a) x is a specialization of x' and (b) $\mathcal{F}_{x'} \neq 0$. Show that $\mathcal{F}_x \neq 0$.

Exercise 83.29.4. Find an example of a scheme X , points $x, x' \in X$, a sheaf of \mathcal{O}_X -modules \mathcal{F} such that (a) x is a specialization of x' and (b) $\mathcal{F}_{x'} \neq 0$ and $\mathcal{F}_x = 0$.

Definition 83.29.5. A scheme X is called *locally Noetherian* if and only if for every point $x \in X$ there exists an affine open $\text{Spec}(R) = U \subset X$ such that R is Noetherian. A scheme is *Noetherian* if it is locally Noetherian and quasi-compact.

If X is locally Noetherian then any affine open of X is the spectrum of a Noetherian ring, see Properties, Lemma 27.5.2.

Definition 83.29.6. Let X be a locally Noetherian scheme. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. We say \mathcal{F} is *coherent* if for every point $x \in X$ there exists an affine open $\text{Spec}(R) = U \subset X$ such that $\mathcal{F}|_U$ is isomorphic to \widetilde{M} for some finite R -module M .

Exercise 83.29.7. Let $X = \text{Spec}(R)$ be an affine scheme.

- (1) Let $f \in R$. Let \mathcal{G} be a quasi-coherent sheaf of $\mathcal{O}_{D(f)}$ -modules on the open subscheme $D(f)$. Show that $\mathcal{G} = \mathcal{F}|_U$ for some quasi-coherent sheaf of \mathcal{O}_X -modules \mathcal{F} .
- (2) Let $I \subset R$ be an ideal. Let $i : Z \rightarrow X$ be the closed subscheme of X corresponding to I . Let \mathcal{G} be a quasi-coherent sheaf of \mathcal{O}_Z -modules on the closed subscheme Z . Show that $\mathcal{G} = i^*\mathcal{F}$ for some quasi-coherent sheaf of \mathcal{O}_X -modules \mathcal{F} . (Why is this silly?)
- (3) Assume that R is Noetherian. Let $f \in R$. Let \mathcal{G} be a coherent sheaf of $\mathcal{O}_{D(f)}$ -modules on the open subscheme $D(f)$. Show that $\mathcal{G} = \mathcal{F}|_U$ for some coherent sheaf of \mathcal{O}_X -modules \mathcal{F} .

Remark 83.29.8. If $U \rightarrow X$ is a quasi-compact immersion then any quasi-coherent sheaf on U is the restriction of a quasi-coherent sheaf on X . If X is a Noetherian scheme, and $U \subset X$ is open, then any coherent sheaf on U is the restriction of a coherent sheaf on X . Of course the exercise above is easier, and shouldn't use these general facts.

83.30. Proj and projective schemes

Exercise 83.30.1. Give examples of graded rings S such that

- (1) $\text{Proj}(S)$ is affine and nonempty, and
- (2) $\text{Proj}(S)$ is integral, nonempty but not isomorphic to \mathbf{P}_A^n for any $n \geq 0$, any ring A .

Exercise 83.30.2. Give an example of a nonconstant morphism of schemes $\mathbf{P}_{\mathbf{C}}^1 \rightarrow \mathbf{P}_{\mathbf{C}}^5$ over $\text{Spec}(\mathbf{C})$.

Exercise 83.30.3. Give an example of an isomorphism of schemes

$$\mathbf{P}_{\mathbf{C}}^1 \rightarrow \text{Proj}(\mathbf{C}[X_0, X_1, X_2]/(X_0^2 + X_1^2 + X_2^2))$$

Exercise 83.30.4. Give an example of a morphism of schemes $f : X \rightarrow \mathbf{A}_{\mathbf{C}}^1 = \text{Spec}(\mathbf{C}[T])$ such that the (scheme theoretic) fibre X_t of f over $t \in \mathbf{A}_{\mathbf{C}}^1$ is (a) isomorphic to $\mathbf{P}_{\mathbf{C}}^1$ when t is a closed point not equal to 0, and (b) not isomorphic to $\mathbf{P}_{\mathbf{C}}^1$ when $t = 0$. We will call X_0 the *special fibre* of the morphism. This can be done in many, many ways. Try to give examples that satisfy (each of) the following additional restraints (unless it isn't possible):

- (1) Can you do it with special fibre projective?
- (2) Can you do it with special fibre irreducible and projective?
- (3) Can you do it with special fibre integral and projective?
- (4) Can you do it with special fibre smooth and projective?
- (5) Can you do it with f a flat morphism? This just means that for every affine open $\text{Spec}(A) \subset X$ the induced ring map $\mathbf{C}[t] \rightarrow A$ is flat, which in this case means that any nonzero polynomial in t is a nonzerodivisor on A .
- (6) Can you do it with f a flat and projective morphism?
- (7) Can you do it with f flat, projective and special fibre reduced?
- (8) Can you do it with f flat, projective and special fibre irreducible?
- (9) Can you do it with f flat, projective and special fibre integral?

What do you think happens when you replace $\mathbf{P}_{\mathbf{C}}^1$ with another variety over \mathbf{C} ? (This can get very hard depending on which of the variants above you ask for.)

Exercise 83.30.5. Let $n \geq 1$ be any positive integer. Give an example of a surjective morphism $X \rightarrow \mathbf{P}_{\mathbf{C}}^n$ with X affine.

Exercise 83.30.6. Maps of Proj. Let R and S be graded rings. Suppose we have a ring map

$$\psi : R \rightarrow S$$

and an integer $e \geq 1$ such that $\psi(R_d) \subset S_{de}$ for all $d \geq 0$. (By our conventions this is not a homomorphism of graded rings, unless $e = 1$.)

- (1) For which elements $\mathfrak{p} \in \text{Proj}(S)$ is there a well-defined corresponding point in $\text{Proj}(R)$? In other words, find a suitable open $U \subset \text{Proj}(S)$ such that ψ defines a continuous map $r_\psi : U \rightarrow \text{Proj}(R)$.

- (2) Give an example where $U \neq \text{Proj}(S)$.
 (3) Give an example where $U = \text{Proj}(S)$.
 (4) (Do not write this down.) Convince yourself that the continuous map $U \rightarrow \text{Proj}(R)$ comes canonically with a map on sheaves so that r_ψ is a morphism of schemes:

$$\text{Proj}(S) \supset U \longrightarrow \text{Proj}(R).$$

- (5) What can you say about this map if $R = \bigoplus_{d \geq 0} S_{de}$ (as a graded ring with S_e, S_{2e} , etc in degree 1, 2, etc) and ψ is the inclusion mapping?

Notation. Let R be a graded ring as above and let $n \geq 0$ be an integer. Let $X = \text{Proj}(R)$. Then there is a unique quasi-coherent \mathcal{O}_X -module $\mathcal{O}_X(n)$ on X such that for every homogeneous element $f \in R$ of positive degree we have $\mathcal{O}_X|_{D_+(f)}$ is the quasi-coherent sheaf associated to the $R_{(f)} = (R_f)_0$ -module $(R_f)_n$ (=elements homogeneous of degree n in $R_f = R[1/f]$). See [Har77, page 116+]. Note that there are natural maps

$$\mathcal{O}_X(n_1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(n_2) \longrightarrow \mathcal{O}_X(n_1 + n_2)$$

Exercise 83.30.7. Pathologies in Proj. Give examples of R as above such that

- (1) $\mathcal{O}_X(1)$ is not an invertible \mathcal{O}_X -module.
 (2) $\mathcal{O}_X(1)$ is invertible, but the natural map $\mathcal{O}_X(1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(1) \rightarrow \mathcal{O}_X(2)$ is NOT an isomorphism.

Exercise 83.30.8. Let S be a graded ring. Let $X = \text{Proj}(S)$. Show that any finite set of points of X is contained in a standard affine open.

Exercise 83.30.9. Let S be a graded ring. Let $X = \text{Proj}(S)$. Let $Z, Z' \subset X$ be two closed subschemes. Let $\varphi : Z \rightarrow Z'$ be an isomorphism. Assume $Z \cap Z' = \emptyset$. Show that for any $z \in Z$ there exists an affine open $U \subset X$ such that $z \in U$, $\varphi(z) \in U$ and $\varphi(Z \cap U) = Z' \cap U$. (Hint: Use Exercise 83.30.8 and something akin to Schemes, Lemma 25.11.5.)

83.31. Morphisms from surfaces to curves

Exercise 83.31.1. Let R be a ring. Let $R \rightarrow k$ be a map from R to a field. Let $n \geq 0$. Show that

$$\text{Mor}_{\text{Spec}(R)}(\text{Spec}(k), \mathbf{P}_R^n) = (k^{n+1} \setminus \{0\})/k^*$$

where k^* acts via scalar multiplication on k^{n+1} . From now on we denote $(x_0 : \dots : x_n)$ the morphism $\text{Spec}(k) \rightarrow \mathbf{P}_k^n$ corresponding to the equivalence class of the element $(x_0, \dots, x_n) \in k^{n+1} \setminus \{0\}$.

Exercise 83.31.2. Let k be a field. Let $Z \subset \mathbf{P}_k^2$ be an irreducible closed subscheme. Show that either (a) Z is a closed point, or (b) there exists a homogeneous irreducible $F \in k[X_0, X_1, X_2]$ of degree > 0 such that $Z = V_+(F)$, or (c) $Z = \mathbf{P}_k^2$. (Hint: Look on a standard affine open.)

Exercise 83.31.3. Let k be a field. Let $Z_1, Z_2 \subset \mathbf{P}_k^2$ be irreducible closed subschemes of the form $V_+(F)$ for some homogeneous irreducible $F_i \in k[X_0, X_1, X_2]$ of degree > 0 . Show that $Z_1 \cap Z_2$ is not empty. (Hint: Use dimension theory to estimate the dimension of the local ring of $k[X_0, X_1, X_2]/(F_1, F_2)$ at 0.)

Exercise 83.31.4. Show there does not exist a nonconstant morphism of schemes $\mathbf{P}_{\mathbf{C}}^2 \rightarrow \mathbf{P}_{\mathbf{C}}^1$ over $\text{Spec}(\mathbf{C})$. Here a *constant morphism* is one whose image is a single point. (Hint: If the morphism is not constant consider the fibres over 0 and ∞ and argue that they have to meet to get a contradiction.)

Exercise 83.31.5. Let k be a field. Suppose that $X \subset \mathbf{P}_k^3$ is a closed subscheme given by a single homogeneous equation $F \in k[X_0, X_1, X_2, X_3]$. In other words,

$$X = \text{Proj}(k[X_0, X_1, X_2, X_3]/(F)) \subset \mathbf{P}_k^3$$

as explained in the course. Assume that

$$F = X_0G + X_1H$$

for some homogeneous polynomials $G, H \in k[X_0, X_1, X_2, X_3]$ of positive degree. Show that if X_0, X_1, G, H have no common zeros then there exists a nonconstant morphism

$$X \longrightarrow \mathbf{P}_k^1$$

of schemes over $\text{Spec}(k)$ which on field points (see Exercise 83.31.1) looks like $(x_0 : x_1 : x_2 : x_3) \mapsto (x_0 : x_1)$ whenever x_0 or x_1 is not zero.

83.32. Invertible sheaves

Definition 83.32.1. Let X be a locally ringed space. An *invertible \mathcal{O}_X -module* on X is a sheaf of \mathcal{O}_X -modules \mathcal{L} such that every point has an open neighbourhood $U \subset X$ such that $\mathcal{L}|_U$ is isomorphic to \mathcal{O}_U as \mathcal{O}_U -module. We say that \mathcal{L} is trivial if it is isomorphic to \mathcal{O}_X as a \mathcal{O}_X -module.

Exercise 83.32.2. General facts.

- (1) Show that an invertible \mathcal{O}_X -module on a scheme X is quasi-coherent.
- (2) Suppose $X \rightarrow Y$ is a morphism of ringed spaces, and \mathcal{L} an invertible \mathcal{O}_Y -module. Show that $f^*\mathcal{L}$ is an invertible \mathcal{O}_X module.

Exercise 83.32.3. Algebra.

- (1) Show that an invertible \mathcal{O}_X -module on an affine scheme $\text{Spec}(A)$ corresponds to an A -module M which is (i) finite, (ii) projective, (iii) locally free of rank 1, and hence (iv) flat, and (v) finitely presented. (Feel free to quote things from last semesters course; or from algebra books.)
- (2) Suppose that A is a domain and that M is a module as in (a). Show that M is isomorphic as an A -module to an ideal $I \subset A$ such that $IA_{\mathfrak{p}}$ is principal for every prime \mathfrak{p} .

Definition 83.32.4. Let R be a ring. An *invertible module* M is an R -module M such that \widetilde{M} is an invertible sheaf on the spectrum of R . We say M is *trivial* if $M \cong R$ as an R -module.

In other words, M is invertible if and only if it satisfies all of the following conditions: it is flat, of finite presentation, projective, and locally free of rank 1. (Of course it suffices for it to be locally free of rank 1).

Exercise 83.32.5. Simple examples.

- (1) Let k be a field. Let $A = k[x]$. Show that $X = \text{Spec}(A)$ has only trivial invertible \mathcal{O}_X -modules. In other words, show that every invertible A -module is free of rank 1.

- (2) Let A be the ring

$$A = \{f \in k[x] \mid f(0) = f(1)\}.$$

Show there exists a nontrivial invertible A -module, unless $k = \mathbf{F}_2$. (Hint: Think about $\text{Spec}(A)$ as identifying 0 and 1 in $\mathbf{A}_k^1 = \text{Spec}(k[x])$.)

- (3) Same question as in (2) for the ring $A = k[x^2, x^3] \subset k[x]$ (except now $k = \mathbf{F}_2$ works as well).

Exercise 83.32.6. Higher dimensions.

- (1) Prove that every invertible sheaf on two dimensional affine space is trivial. More precisely, let $\mathbf{A}_k^2 = \text{Spec}(k[x, y])$ where k is a field. Show that every invertible sheaf on \mathbf{A}_k^2 is trivial. (Hint: One way to do this is to consider the corresponding module M , to look at $M \otimes_{k[x, y]} k(x)[y]$, and then use Exercise 83.32.5 (1) to find a generator for this; then you still have to think. Another way to is to use Exercise 83.32.3 and use what we know about ideals of the polynomial ring: primes of height one are generated by an irreducible polynomial; then you still have to think.)
- (2) Prove that every invertible sheaf on any open subscheme of two dimensional affine space is trivial. More precisely, let $U \subset \mathbf{A}_k^2$ be an open subscheme where k is a field. Show that every invertible sheaf on U is trivial. Hint: Show that every invertible sheaf on U extends to one on \mathbf{A}_k^2 . Not easy; but you can find it in [Har77].
- (3) Find an example of a nontrivial invertible sheaf on a punctured cone over a field. More precisely, let k be a field and let $C = \text{Spec}(k[x, y, z]/(xy - z^2))$. Let $U = C \setminus \{(x, y, z)\}$. Find a nontrivial invertible sheaf on U . Hint: It may be easier to compute the group of isomorphism classes of invertible sheaves on U than to just find one. Note that U is covered by the opens $\text{Spec}(k[x, y, z, 1/x]/(xy - z^2))$ and $\text{Spec}(k[x, y, z, 1/y]/(xy - z^2))$ which are “easy” to deal with.

Definition 83.32.7. Let X be a locally ringed space. The *Picard group* of X is the set $\text{Pic}(X)$ of isomorphism classes of invertible \mathcal{O}_X -modules with addition given by tensor product. See Modules, Definition 17.21.6. For a ring R we set $\text{Pic}(R) = \text{Pic}(\text{Spec}(R))$.

Exercise 83.32.8. Let R be a ring.

- (1) Show that if R is a Noetherian normal domain, then $\text{Pic}(R) = \text{Pic}(R[t])$. [Hint: There is a map $R[t] \rightarrow R$, $t \mapsto 0$ which is a left inverse to the map $R \rightarrow R[t]$. Hence it suffices to show that any invertible $R[t]$ -module M such that $M/tM \cong R$ is free of rank 1. Let $K = f.f.(R)$. Pick a trivialization $K[t] \rightarrow M \otimes_{R[t]} K[t]$ which is possible by Exercise 83.32.5 (1). Adjust it so it agrees with the trivialization of M/tM above. Show that it is in fact a trivialization of M over $R[t]$ (this is where normality comes in).]
- (2) Let k be a field. Show that $\text{Pic}(k[x^2, x^3, t]) \neq \text{Pic}(k[x^2, x^3])$.

83.33. Čech Cohomology

Exercise 83.33.1. Čech cohomology. Here k is a field.

- (1) Let X be a scheme with an open covering $\mathcal{U} : X = U_1 \cup U_2$, with $U_1 = \text{Spec}(k[x])$, $U_2 = \text{Spec}(k[y])$ with $U_1 \cap U_2 = \text{Spec}(k[z, 1/z])$ and with open immersions $U_1 \cap U_2 \rightarrow U_1$ resp. $U_1 \cap U_2 \rightarrow U_2$ determined by $x \mapsto z$ resp. $y \mapsto z$ (and I really mean this). (We've seen in the lectures that such an X exists; it is the affine line with zero doubled.) Compute $\check{H}^1(\mathcal{U}, \mathcal{O})$; eg. give a basis for it as a k -vector space.
- (2) For each element in $\check{H}^1(\mathcal{U}, \mathcal{O})$ construct an exact sequence of sheaves of \mathcal{O}_X -modules

$$0 \rightarrow \mathcal{O}_X \rightarrow E \rightarrow \mathcal{O}_X \rightarrow 0$$

such that the boundary $\delta(1) \in \check{H}^1(\mathcal{U}, \mathcal{O})$ equals the given element. (Part of the problem is to make sense of this. See also below. It is also OK to show abstractly such a thing has to exist.)

Definition 83.33.2. (Definition of delta.) Suppose that

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

is a short exact sequence of abelian sheaves on any topological space X . The boundary map $\delta : H^0(X, \mathcal{F}_3) \rightarrow \check{H}^1(X, \mathcal{F}_1)$ is defined as follows. Take an element $\tau \in H^0(X, \mathcal{F}_3)$. Choose an open covering $\mathcal{U} : X = \bigcup_{i \in I} U_i$ such that for each i there exists a section $\tilde{\tau}_i \in \mathcal{F}_2$ lifting the restriction of τ to U_i . Then consider the assignment

$$(i_0, i_1) \mapsto \tilde{\tau}_{i_0}|_{U_{i_0 i_1}} - \tilde{\tau}_{i_1}|_{U_{i_0 i_1}}.$$

This is clearly a 1-coboundary in the Čech complex $\check{C}^*(\mathcal{U}, \mathcal{F}_2)$. But we observe that (thinking of \mathcal{F}_1 as a subsheaf of \mathcal{F}_2) the RHS always is a section of \mathcal{F}_1 over $U_{i_0 i_1}$. Hence we see that the assignment defines a 1-cochain in the complex $\check{C}^*(\mathcal{U}, \mathcal{F}_2)$. The cohomology class of this 1-cochain is by definition $\delta(\tau)$.

83.34. Divisors

We collect all relevant definitions here in one spot for convenience.

Definition 83.34.1. Throughout, let S be any scheme and let X be a Noetherian, integral scheme.

- (1) A *Weil divisor* on X is a formal linear combination $\sum n_i [Z_i]$ of prime divisors Z_i with integer coefficients.
- (2) A *prime divisor* is a closed subscheme $Z \subset X$, which is integral with generic point $\xi \in Z$ such that $\mathcal{O}_{X, \xi}$ has dimension 1. We will use the notation $\mathcal{O}_{X, Z} = \mathcal{O}_{X, \xi}$ when $\xi \in Z \subset X$ is as above. Note that $\mathcal{O}_{X, Z} \subset K(X)$ is a subring of the function field of X .
- (3) The *Weil divisor associated to a rational function* $f \in K(X)^*$ is the sum $\sum v_Z(f) [Z]$. Here $v_Z(f)$ is defined as follows
 - (a) If $f \in \mathcal{O}_{X, Z}^*$ then $v_Z(f) = 0$.
 - (b) If $f \in \mathcal{O}_{X, Z}$ then

$$v_Z(f) = \text{length}_{\mathcal{O}_{X, Z}}(\mathcal{O}_{X, Z}/(f)).$$

- (c) If $f = \frac{a}{b}$ with $a, b \in \mathcal{O}_{X, Z}$ then

$$v_Z(f) = \text{length}_{\mathcal{O}_{X, Z}}(\mathcal{O}_{X, Z}/(a)) - \text{length}_{\mathcal{O}_{X, Z}}(\mathcal{O}_{X, Z}/(b)).$$

- (4) An *effective Cartier divisor* on a scheme S is a closed subscheme $D \subset S$ such that every point $d \in D$ has an affine open neighbourhood $\text{Spec}(A) = U \subset S$ in S so that $D \cap U = \text{Spec}(A/(f))$ with $f \in A$ a nonzerodivisor.
- (5) The *Weil divisor* $[D]$ associated to an *effective Cartier divisor* $D \subset X$ of our Noetherian integral scheme X is defined as the sum $\sum v_Z(D)[Z]$ where $v_Z(D)$ is defined as follows
- If the generic point ξ of Z is not in D then $v_Z(D) = 0$.
 - If the generic point ξ of Z is in D then

$$v_Z(D) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(f))$$

where $f \in \mathcal{O}_{X,Z} = \mathcal{O}_{X,\xi}$ is the nonzerodivisor which defines D in an affine neighbourhood of ξ (as in (4) above).

- (6) Let S be a scheme. The *sheaf of total quotient rings* \mathcal{K}_S is the sheaf of \mathcal{O}_S -algebras which is the sheafification of the pre-sheaf \mathcal{K}' defined as follows. For $U \subset S$ open we set $\mathcal{K}'(U) = S_U^{-1}\mathcal{O}_S(U)$ where $S_U \subset \mathcal{O}_S(U)$ is the multiplicative subset consisting of sections $f \in \mathcal{O}_S(U)$ such that the germ of f in $\mathcal{O}_{S,u}$ is a nonzerodivisor for every $u \in U$. In particular the elements of S_U are all nonzerodivisors. Thus \mathcal{O}_S is a subsheaf of \mathcal{K}_S , and we get a short exact sequence

$$0 \rightarrow \mathcal{O}_S^* \rightarrow \mathcal{K}_S^* \rightarrow \mathcal{K}_S^*/\mathcal{O}_S^* \rightarrow 0.$$

- (7) A *Cartier divisor* on a scheme S is a global section of the quotient sheaf $\mathcal{K}_S^*/\mathcal{O}_S^*$.
- (8) The *Weil divisor associated to a Cartier divisor* $\tau \in \Gamma(X, \mathcal{K}_X^*/\mathcal{O}_X^*)$ over our Noetherian integral scheme X is the sum $\sum v_Z(\tau)[Z]$ where $v_Z(\tau)$ is defined as by the following recipe
- If the germ of τ at the generic point ξ of Z is zero – in other words the image of τ in the stalk $(\mathcal{K}^*/\mathcal{O}^*)_\xi$ is “zero” – then $v_Z(\tau) = 0$.
 - Find an affine open neighbourhood $\text{Spec}(A) = U \subset X$ so that $\tau|_U$ is the image of a section $f \in \mathcal{K}(U)$ and moreover $f = a/b$ with $a, b \in A$. Then we set

$$v_Z(f) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(a)) - \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(b)).$$

Remarks 83.34.2. Here are some trivial remarks.

- On a Noetherian integral scheme X the sheaf \mathcal{K}_X is constant with value the function field $K(X)$.
- To make sense out of the definitions above one needs to show that

$$\text{length}_{\mathcal{O}}(\mathcal{O}/(ab)) = \text{length}_{\mathcal{O}}(\mathcal{O}/(a)) + \text{length}_{\mathcal{O}}(\mathcal{O}/(b))$$

for any pair (a, b) of nonzero elements of a Noetherian 1-dimensional local domain \mathcal{O} . This will be done in the lectures.

Exercise 83.34.3. (On any scheme.) Describe how to assign a Cartier divisor to an effective Cartier divisor.

Exercise 83.34.4. (On an integral scheme.) Describe how to assign a Cartier divisor D to a rational function f such that the Weil divisor associated to D and to f agree. (This is silly.)

Exercise 83.34.5. Give an example of a Weil divisor on a variety which is not the Weil divisor associated to any Cartier divisor.

Exercise 83.34.6. Give an example of a Weil divisor D on a variety which is not the Weil divisor associated to any Cartier divisor but such that nD is the Weil divisor associated to a Cartier divisor for some $n > 1$.

Exercise 83.34.7. Give an example of a Weil divisor D on a variety which is not the Weil divisor associated to any Cartier divisor and such that nD is NOT the Weil divisor associated to a Cartier divisor for any $n > 1$. (Hint: Consider a cone, for example $X : xy - zw = 0$ in \mathbf{A}_k^4 . Try to show that $D = [x = 0, z = 0]$ works.)

Exercise 83.34.8. On a separated scheme X of finite type over a field: Give an example of a Cartier divisor which is not the difference of two effective Cartier divisors. Hint: Find some X which does not have any nonempty effective Cartier divisors for example the scheme constructed in [Har77, III Exercise 5.9]. There is even an example with X a variety – namely the variety of Exercise 83.34.9.

Exercise 83.34.9. Example of a nonprojective proper variety. Let k be a field. Let $L \subset \mathbf{P}_k^3$ be a line and let $C \subset \mathbf{P}_k^3$ be a nonsingular conic. Assume that $C \cap L = \emptyset$. Choose an isomorphism $\varphi : L \rightarrow C$. Let X be the k -variety obtained by glueing C to L via φ . In other words there is a surjective proper birational morphism

$$\pi : \mathbf{P}_k^3 \longrightarrow X$$

and an open $U \subset X$ such that $\pi : \pi^{-1}(U) \rightarrow U$ is an isomorphism, $\pi^{-1}(U) = \mathbf{P}_k^3 \setminus (L \cup C)$ and such that $\pi|_L = \pi|_C \circ \varphi$. (These conditions do not yet uniquely define X . In order to do this you need to specify the structure sheaf of X along points of $Z = X \setminus U$.) Show X exists, is a proper variety, but is not projective. (Hint: For existence use the result of Exercise 83.30.9. For non-projectivity use that $\text{Pic}(\mathbf{P}_k^3) = \mathbf{Z}$ to show that X cannot have an ample invertible sheaf.)

83.35. Differentials

Definitions and results. Kähler differentials.

- (1) Let $R \rightarrow A$ be a ring map. The *module of Kähler differentials of A over R* is denoted $\Omega_{A/R}$. It is generated by the elements da , $a \in A$ subject to the relations:

$$d(a_1 + a_2) = da_1 + da_2, \quad d(a_1 a_2) = a_1 da_2 + a_2 da_1, \quad dr = 0$$

The canonical universal R -derivation $d : A \rightarrow \Omega_{A/R}$ maps $a \mapsto da$.

- (2) Consider the short exact sequence

$$0 \rightarrow I \rightarrow A \otimes_R A \rightarrow A \rightarrow 0$$

which defines the ideal I . There is a canonical derivation $d : A \rightarrow I/I^2$ which maps a to the class of $a \otimes 1 - 1 \otimes a$. This is another presentation of the module of derivations of A over R , in other words

$$(I/I^2, d) \cong (\Omega_{A/R}, d).$$

- (3) For multiplicative subsets $S_R \subset R$ and $S_A \subset A$ such that S_R maps into S_A we have

$$\Omega_{S_A^{-1}A/S_R^{-1}R} = S_A^{-1}\Omega_{A/R}.$$

- (4) If A is a finitely presented R -algebra then $\Omega_{A/R}$ is a finitely presented A -module. Hence in this case the *fitting* ideals of $\Omega_{A/R}$ are defined. (See exercise set 6 of last semester.)

- (5) Let $f : X \rightarrow S$ be a morphism of schemes. There is a quasi-coherent sheaf of \mathcal{O}_X -modules $\Omega_{X/S}$ and a \mathcal{O}_S -linear derivation

$$d : \mathcal{O}_X \longrightarrow \Omega_{X/S}$$

such that for any affine opens $\text{Spec}(A) = U \subset X$, $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ we have

$$\Gamma(\text{Spec}(A), \Omega_{X/S}) = \Omega_{A/R}$$

compatibly with d .

Exercise 83.35.1. Let $k[\epsilon]$ be the ring of dual numbers over the field k , i.e., $\epsilon^2 = 0$.

- (1) Consider the ring map

$$R = k[\epsilon] \rightarrow A = k[x, \epsilon]/(\epsilon x)$$

Show that the fitting ideals of $\Omega_{A/R}$ are (starting with the zeroth fitting ideal)

$$(\epsilon), A, A, \dots$$

- (2) Consider the map $R = k[t] \rightarrow A = k[x, y, t]/(x(y-t)(y-1), x(x-t))$. Show that the fitting ideals of $\Omega_{A/R}$ in A are (assume characteristic k is zero for simplicity)

$$x(2x-t)(2y-t-1)A, (x, y, t) \cap (x, y-1, t), A, A, \dots$$

So the 0-th fitting ideal is cut out by a single element of A , the 1st fitting ideal defines two closed points of $\text{Spec}(A)$, and the others are all trivial.

- (3) Consider the map $R = k[t] \rightarrow A = k[x, y, t]/(xy - t^n)$. Compute the fitting ideals of $\Omega_{A/R}$.

Remark 83.35.2. The k th fitting ideal of $\Omega_{X/S}$ is commonly used to define the singular scheme of the morphism $X \rightarrow S$ when X has relative dimension k over S . But as part (a) shows, you have to be careful doing this when your family does not have “constant” fibre dimension, e.g., when it is not flat. As part (b) shows, flatness doesn’t guarantee it works either (and yes this is a flat family). In “good cases” – such as in (c) – for families of curves you expect the 0-th fitting ideal to be zero and the 1st fitting ideal to define (scheme-theoretically) the singular locus.

Exercise 83.35.3. Suppose that R is a ring and

$$A = k[x_1, \dots, x_n]/(f_1, \dots, f_n).$$

Note that we are assuming that A is presented by the same number of equations as variables. Thus the matrix of partial derivatives

$$(\partial f_i / \partial x_j)$$

is $n \times n$, i.e., a square matrix. Assume that its determinant is invertible as an element in A . Note that this is exactly the condition that says that $\Omega_{A/R} = (0)$ in this case of n -generators and n relations. Let $\pi : B' \rightarrow B$ be a surjection of R -algebras whose kernel J has square zero (as an ideal in B'). Let $\varphi : A \rightarrow B$ be a homomorphism of R -algebras. Show there exists a unique homomorphism of R -algebras $\varphi' : A \rightarrow B'$ such that $\varphi = \pi \circ \varphi'$.

Exercise 83.35.4. Find a generalization of the result of the previous exercise to the case where $A = R[x, y]/(f)$.

83.36. Schemes, Final Exam, Fall 2007

These were the questions in the final exam of a course on Schemes, in the Spring of 2007 at Columbia University.

Exercise 83.36.1 (Definitions). Provide definitions of the following concepts.

- (1) X is a *scheme*
- (2) the morphism of schemes $f : X \rightarrow Y$ is *finite*
- (3) the morphism of schemes $f : X \rightarrow Y$ is *of finite type*
- (4) the scheme X is *Noetherian*
- (5) the \mathcal{O}_X -module \mathcal{L} on the scheme X is *invertible*
- (6) the *genus* of a nonsingular projective curve over an algebraically closed field

Exercise 83.36.2. Let $X = \text{Spec}(\mathbf{Z}[x, y])$, and let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Suppose that \mathcal{F} is zero when restricted to the standard affine open $D(x)$.

- (1) Show that every global section s of \mathcal{F} is killed by some power of x , i.e., $x^n s = 0$ for some $n \in \mathbf{N}$.
- (2) Do you think the same is true if we do not assume that \mathcal{F} is quasi-coherent?

Exercise 83.36.3. Suppose that $X \rightarrow \text{Spec}(R)$ is a proper morphism and that R is a discrete valuation ring with residue field k . Suppose that $X \times_{\text{Spec}(R)} \text{Spec}(k)$ is the empty scheme. Show that X is the empty scheme.

Exercise 83.36.4. Consider the projective¹ variety

$$\mathbf{P}^1 \times \mathbf{P}^1 = \mathbf{P}_{\mathbf{C}}^1 \times_{\text{Spec}(\mathbf{C})} \mathbf{P}_{\mathbf{C}}^1$$

over the field of complex numbers \mathbf{C} . It is covered by four affine pieces, corresponding to pairs of standard affine pieces of $\mathbf{P}_{\mathbf{C}}^1$. For example, suppose we use homogeneous coordinates X_0, X_1 on the first factor and Y_0, Y_1 on the second. Set $x = X_1/X_0$, and $y = Y_1/Y_0$. Then the 4 affine open pieces are the spectra of the rings

$$\mathbf{C}[x, y], \quad \mathbf{C}[x^{-1}, y], \quad \mathbf{C}[x, y^{-1}], \quad \mathbf{C}[x^{-1}, y^{-1}].$$

Let $X \subset \mathbf{P}^1 \times \mathbf{P}^1$ be the closed subscheme which is the closure of the closed subset of the first affine piece given by the equation

$$y^3(x^4 + 1) = x^4 - 1.$$

- (1) Show that X is contained in the union of the first and the last of the 4 affine open pieces.
- (2) Show that X is a nonsingular projective curve.
- (3) Consider the morphism $pr_2 : X \rightarrow \mathbf{P}^1$ (projection onto the first factor). On the first affine piece it is the map $(x, y) \mapsto x$. Briefly explain why it has degree 3.
- (4) Compute the ramification points and ramification indices for the map $pr_2 : X \rightarrow \mathbf{P}^1$.
- (5) Compute the genus of X .

Exercise 83.36.5. Let $X \rightarrow \text{Spec}(\mathbf{Z})$ be a morphism of finite type. Suppose that there is an infinite number of primes p such that $X \times_{\text{Spec}(\mathbf{Z})} \text{Spec}(\mathbf{F}_p)$ is not empty.

¹The projective embedding is $((X_0, X_1), (Y_0, Y_1)) \mapsto (X_0 Y_0, X_0 Y_1, X_1 Y_0, X_1 Y_1)$ in other words $(x, y) \mapsto (1, y, x, xy)$.

- (1) Show that $X \times_{\text{Spec}(\mathbf{Z})} \text{Spec}(\mathbf{Q})$ is not empty.
- (2) Do you think the same is true if we replace the condition “finite type” by the condition “locally of finite type”?

83.37. Schemes, Final Exam, Spring 2009

These were the questions in the final exam of a course on Schemes, in the Spring of 2009 at Columbia University.

Exercise 83.37.1. Let X be a Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . Let $x \in X$ be a point. Assume that $\text{Supp}(\mathcal{F}) = \{x\}$.

- (1) Show that x is a closed point of X .
- (2) Show that $H^0(X, \mathcal{F})$ is not zero.
- (3) Show that \mathcal{F} is generated by global sections.
- (4) Show that $H^p(X, \mathcal{F}) = 0$ for $p > 0$.

Remark 83.37.2. Let k be a field. Let $\mathbf{P}_k^2 = \text{Proj}(k[X_0, X_1, X_2])$. Any invertible sheaf on \mathbf{P}_k^2 is isomorphic to $\mathcal{O}_{\mathbf{P}_k^2}(n)$ for some $n \in \mathbf{Z}$. Recall that

$$\Gamma(\mathbf{P}_k^2, \mathcal{O}_{\mathbf{P}_k^2}(n)) = k[X_0, X_1, X_2]_n$$

is the degree n part of the polynomial ring. For a quasi-coherent sheaf \mathcal{F} on \mathbf{P}_k^2 set $\mathcal{F}(n) = \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}_k^2}} \mathcal{O}_{\mathbf{P}_k^2}(n)$ as usual.

Exercise 83.37.3. Let k be a field. Let \mathcal{E} be a vector bundle on \mathbf{P}_k^2 , i.e., a finite locally free $\mathcal{O}_{\mathbf{P}_k^2}$ -module. We say \mathcal{E} is *split* if \mathcal{E} is isomorphic to a direct sum of invertible $\mathcal{O}_{\mathbf{P}_k^2}$ -modules.

- (1) Show that \mathcal{E} is split if and only if $\mathcal{E}(n)$ is split.
- (2) Show that if \mathcal{E} is split then $H^1(\mathbf{P}_k^2, \mathcal{E}(n)) = 0$ for all $n \in \mathbf{Z}$.
- (3) Let

$$\varphi : \mathcal{O}_{\mathbf{P}_k^2} \longrightarrow \mathcal{O}_{\mathbf{P}_k^2}(1) \oplus \mathcal{O}_{\mathbf{P}_k^2}(1) \oplus \mathcal{O}_{\mathbf{P}_k^2}(1)$$

be given by linear forms $L_0, L_1, L_2 \in \Gamma(\mathbf{P}_k^2, \mathcal{O}_{\mathbf{P}_k^2}(1))$. Assume $L_i \neq 0$ for some i . What is the condition on L_0, L_1, L_2 such that the cokernel of φ is a vector bundle? Why?

- (4) Given an example of such a φ .
- (5) Show that $\text{Coker}(\varphi)$ is not split (if it is a vector bundle).

Remark 83.37.4. Freely use the following facts on dimension theory (and add more if you need more).

- (1) The dimension of a scheme is the supremum of the length of chains of irreducible closed subsets.
- (2) The dimension of a finite type scheme over a field is the maximum of the dimensions of its affine opens.
- (3) The dimension of a Noetherian scheme is the maximum of the dimensions of its irreducible components.
- (4) The dimension of an affine scheme coincides with the dimension of the corresponding ring.
- (5) Let k be a field and let A be a finite type k -algebra. If A is a domain, and $x \neq 0$, then $\dim(A) = \dim(A/xA) + 1$.

Exercise 83.37.5. Let k be a field. Let X be a projective, reduced scheme over k . Let $f : X \rightarrow \mathbf{P}_k^1$ be a morphism of schemes over k . Assume there exists an integer $d \geq 0$ such that for every point $t \in \mathbf{P}_k^1$ the fibre $X_t = f^{-1}(t)$ is irreducible of dimension d . (Recall that an irreducible space is not empty.)

- (1) Show that $\dim(X) = d + 1$.
- (2) Let $X_0 \subset X$ be an irreducible component of X of dimension $d + 1$. Prove that for every $t \in \mathbf{P}_k^1$ the fibre $X_{0,t}$ has dimension d .
- (3) What can you conclude about X_t and $X_{0,t}$ from the above?
- (4) Show that X is irreducible.

Remark 83.37.6. Given a projective scheme X over a field k and a coherent sheaf \mathcal{F} on X we set

$$\chi(X, \mathcal{F}) = \sum_{i \geq 0} (-1)^i \dim_k H^i(X, \mathcal{F}).$$

Exercise 83.37.7. Let k be a field. Write $\mathbf{P}_k^3 = \text{Proj}(k[X_0, X_1, X_2, X_3])$. Let $C \subset \mathbf{P}_k^3$ be a *type (5, 6) complete intersection curve*. This means that there exist $F \in k[X_0, X_1, X_2, X_3]_5$ and $G \in k[X_0, X_1, X_2, X_3]_6$ such that

$$C = \text{Proj}(k[X_0, X_1, X_2, X_3]/(F, G))$$

is a variety of dimension 1. (Variety implies reduced and irreducible, but feel free to assume C is nonsingular if you like.) Let $i : C \rightarrow \mathbf{P}_k^3$ be the corresponding closed immersion. Being a complete intersection also implies that

$$0 \longrightarrow \mathcal{O}_{\mathbf{P}_k^3}(-11) \xrightarrow{\begin{pmatrix} -G \\ F \end{pmatrix}} \mathcal{O}_{\mathbf{P}_k^3}(-5) \oplus \mathcal{O}_{\mathbf{P}_k^3}(-6) \xrightarrow{(F, G)} \mathcal{O}_{\mathbf{P}_k^3} \longrightarrow i_* \mathcal{O}_C \longrightarrow 0$$

is an exact sequence of sheaves. Please use these facts to:

- (1) compute $\chi(C, i^* \mathcal{O}_{\mathbf{P}_k^3}(n))$ for any $n \in \mathbf{Z}$, and
- (2) compute the dimension of $H^1(C, \mathcal{O}_C)$.

Exercise 83.37.8. Let k be a field. Consider the rings

$$\begin{aligned} A &= k[x, y]/(xy) \\ B &= k[u, v]/(uv) \\ C &= k[t, t^{-1}] \times k[s, s^{-1}] \end{aligned}$$

and the k -algebra maps

$$\begin{aligned} A &\longrightarrow C, & x &\mapsto (t, 0), & y &\mapsto (0, s) \\ B &\longrightarrow C, & u &\mapsto (t^{-1}, 0), & v &\mapsto (0, s^{-1}) \end{aligned}$$

It is a true fact that these maps induce isomorphisms $A_{x+y} \rightarrow C$ and $B_{u+v} \rightarrow C$. Hence the maps $A \rightarrow C$ and $B \rightarrow C$ identify $\text{Spec}(C)$ with open subsets of $\text{Spec}(A)$ and $\text{Spec}(B)$. Let X be the scheme obtained by glueing $\text{Spec}(A)$ and $\text{Spec}(B)$ along $\text{Spec}(C)$:

$$X = \text{Spec}(A) \coprod_{\text{Spec}(C)} \text{Spec}(B).$$

As we saw in the course such a scheme exists and there are affine opens $\text{Spec}(A) \subset X$ and $\text{Spec}(B) \subset X$ whose overlap is exactly $\text{Spec}(C)$ identified with an open of each of these using the maps above.

- (1) Why is X separated?

- (2) Why is X of finite type over k ?
- (3) Compute $H^1(X, \mathcal{O}_X)$, or what is its dimension?
- (4) What is a more geometric way to describe X ?

83.38. Schemes, Final Exam, Fall 2010

These were the questions in the final exam of a course on Schemes, in the Fall of 2010 at Columbia University.

Exercise 83.38.1 (Definitions). Provide definitions of the following concepts.

- (1) a separated scheme,
- (2) a quasi-compact morphism of schemes,
- (3) an affine morphism of schemes,
- (4) a multiplicative subset of a ring,
- (5) a Noetherian scheme,
- (6) a variety.

Exercise 83.38.2. Prime avoidance.

- (1) Let A be a ring. Let $I \subset A$ be an ideal and let $\mathfrak{q}_1, \mathfrak{q}_2$ be prime ideals such that $I \not\subset \mathfrak{q}_i$. Show that $I \not\subset \mathfrak{q}_1 \cup \mathfrak{q}_2$.
- (2) What is a geometric interpretation of (1)?
- (3) Let $X = \text{Proj}(S)$ for some graded ring S . Let $x_1, x_2 \in X$. Show that there exists a standard open $D_+(F)$ which contains both x_1 and x_2 .

Exercise 83.38.3. Why is a composition of affine morphisms affine?

Exercise 83.38.4 (Examples). Give examples of the following:

- (1) A reducible projective scheme over a field k .
- (2) A scheme with 100 points.
- (3) A non-affine morphism of schemes.

Exercise 83.38.5. Chevalley's theorem and the Hilbert Nullstellensatz.

- (1) Let $\mathfrak{p} \subset \mathbf{Z}[x_1, \dots, x_n]$ be a maximal ideal. What does Chevalley's theorem imply about $\mathfrak{p} \cap \mathbf{Z}$?
- (2) In turn, what does the Hilbert Nullstellensatz imply about $\kappa(\mathfrak{p})$?

Exercise 83.38.6. Let A be a ring. Let $S = A[X]$ as a graded A -algebra where X has degree 1. Show that $\text{Proj}(S) \cong \text{Spec}(A)$ as schemes over A .

Exercise 83.38.7. Let $A \rightarrow B$ be a finite ring map. Show that $\text{Spec}(B)$ is a H-projective scheme over $\text{Spec}(A)$.

Exercise 83.38.8. Give an example of a scheme X over a field k such that X is irreducible and such that for some finite extension $k \subset k'$ the base change $X_{k'} = X \times_{\text{Spec}(k)} \text{Spec}(k')$ is connected but reducible.

83.39. Schemes, Final Exam, Spring 2011

These were the questions in the final exam of a course on Schemes, in the Spring of 2011 at Columbia University.

Exercise 83.39.1 (Definitions). Provide definitions of the italicized concepts.

- (1) a *separated* scheme,
- (2) a *universally closed* morphism of schemes,

- (3) A dominates B for local rings A, B contained in a common field,
- (4) the *dimension* of a scheme X ,
- (5) the *codimension* of an irreducible closed subscheme Y of a scheme X ,

Exercise 83.39.2 (Results). State something formally equivalent to the fact discussed in the course.

- (1) The valuative criterion of properness for a morphism $X \rightarrow Y$ of varieties for example.
- (2) The relationship between $\dim(X)$ and the function field $k(X)$ of X for a variety X over a field k .
- (3) Fill in the blank: The category of nonsingular projective curves over k and nonconstant morphisms is anti-equivalent to
- (4) Noether normalization.
- (5) Jacobian criterion.

Exercise 83.39.3. Let k be a field. Let $F \in k[X_0, X_1, X_2]$ be a homogeneous form of degree d . Assume that $C = V_+(F) \subset \mathbf{P}_k^2$ is a smooth curve over k . Denote $i : C \rightarrow \mathbf{P}_k^2$ the corresponding closed immersion.

- (1) Show that there is a short exact sequence

$$0 \rightarrow \mathcal{O}_{\mathbf{P}_k^2}(-d) \rightarrow \mathcal{O}_{\mathbf{P}_k^2} \rightarrow i_*\mathcal{O}_C \rightarrow 0$$

of coherent sheaves on \mathbf{P}_k^2 : tell me what the maps are and briefly why it is exact.

- (2) Conclude that $H^0(C, \mathcal{O}_C) = k$.
- (3) Compute the genus of C .
- (4) Assume now that $P = (0 : 0 : 1)$ is not on C . Prove that $\pi : C \rightarrow \mathbf{P}_k^1$ given by $(a_0 : a_1 : a_2) \mapsto (a_0 : a_1)$ has degree d .
- (5) Assume k is algebraically closed, assume all ramification indices (the “ e_i ”) are 1 or 2, and assume the characteristic of k is not equal to 2. How many ramification points does $\pi : C \rightarrow \mathbf{P}_k^1$ have?
- (6) In terms of F , what do you think is a set of equations of the set of ramification points of π ?
- (7) Can you guess K_C ?

Exercise 83.39.4. Let k be a field. Let X be a “triangle” over k , i.e., you get X by glueing three copies of \mathbf{A}_k^1 to each other by identifying 0 on the first copy to 1 on the second copy, 0 on the second copy to 1 on the first copy, and 0 on the third copy to 1 on the first copy. It turns out that X is isomorphic to $\text{Spec}(k[x, y]/(xy(x+y+1)))$; feel free to use this. Compute the Picard group of X .

Exercise 83.39.5. Let k be a field. Let $\pi : X \rightarrow Y$ be a finite birational morphism of curves with X a projective nonsingular curve over k . It follows from the material in the course that Y is a proper curve and that π is the normalization morphism of Y . We have also seen in the course that there exists a dense open $V \subset Y$ such that $U = \pi^{-1}(V)$ is a dense open in X and $\pi : U \rightarrow V$ is an isomorphism.

- (1) Show that there exists an effective Cartier divisor $D \subset X$ such that $D \subset U$ and such that $\mathcal{O}_X(D)$ is ample on X .
- (2) Let D be as in (1). Show that $E = \pi(D)$ is an effective Cartier divisor on Y .
- (3) Briefly indicate why

- (a) the map $\mathcal{O}_Y \rightarrow \pi_*\mathcal{O}_X$ has a coherent cokernel Q which is supported in $Y \setminus V$, and
 - (b) for every n there is a corresponding map $\mathcal{O}_Y(nE) \rightarrow \pi_*\mathcal{O}_X(nD)$ whose cokernel is isomorphic to Q .
- (4) Show that $\dim_k H^0(X, \mathcal{O}_X(nD)) - \dim_k H^0(Y, \mathcal{O}_Y(nE))$ is bounded (by what?) and conclude that the invertible sheaf $\mathcal{O}_Y(nE)$ has lots of sections for large n (why?).

83.40. Schemes, Final Exam, Fall 2011

These were the questions in the final exam of a course on Commutative Algebra, in the Fall of 2011 at Columbia University.

Exercise 83.40.1 (Definitions). Provide definitions of the italicized concepts.

- (1) a *Noetherian* ring,
- (2) a *Noetherian* scheme,
- (3) a *finite* ring homomorphism,
- (4) a *finite* morphism of schemes,
- (5) the *dimension* of a ring.

Exercise 83.40.2 (Results). State something formally equivalent to the fact discussed in the course.

- (1) Zariski's Main Theorem.
- (2) Noether normalization.
- (3) Chinese remainder theorem.
- (4) Going up for finite ring maps.

Exercise 83.40.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring whose residue field has characteristic not 2. Suppose that \mathfrak{m} is generated by three elements x, y, z and that $x^2 + y^2 + z^2 = 0$ in A .

- (1) What are the possible values of $\dim(A)$?
- (2) Give an example to show that each value is possible.
- (3) Show that A is a domain if $\dim(A) = 2$. (Hint: look at $\bigoplus_{n \geq 0} \mathfrak{m}^n / \mathfrak{m}^{n+1}$.)

Exercise 83.40.4. Let A be a ring. Let $S \subset T \subset A$ be multiplicative subsets. Assume that

$$\{\mathfrak{q} \mid \mathfrak{q} \cap S = \emptyset\} = \{\mathfrak{q} \mid \mathfrak{q} \cap T = \emptyset\}.$$

Show that $S^{-1}A \rightarrow T^{-1}A$ is an isomorphism.

Exercise 83.40.5. Let k be an algebraically closed field. Let

$$V_0 = \{A \in \text{Mat}(3 \times 3, k) \mid \text{rank}(A) = 1\} \subset \text{Mat}(3 \times 3, k) = k^9.$$

- (1) Show that V_0 is the set of closed points of a (Zariski) locally closed subset $V \subset \mathbf{A}_k^9$.
- (2) Is V irreducible?
- (3) What is $\dim(V)$?

Exercise 83.40.6. Prove that the ideal (x^2, xy, y^2) in $\mathbf{C}[x, y]$ cannot be generated by 2 elements.

Exercise 83.40.7. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that for some $\alpha, \beta \in \mathbf{C}$ the \mathbf{C} -algebra map

$$\mathbf{C}[t] \longrightarrow \mathbf{C}[x, y]/(f), \quad t \longmapsto \alpha x + \beta y$$

is finite.

Exercise 83.40.8. Show that given finitely many points $p_1, \dots, p_n \in \mathbf{C}^2$ the scheme $\mathbf{A}_{\mathbf{C}}^2 \setminus \{p_1, \dots, p_n\}$ is a union of two affine opens.

Exercise 83.40.9. Show that there exists a surjective morphism of schemes $\mathbf{A}_{\mathbf{C}}^1 \rightarrow \mathbf{P}_{\mathbf{C}}^1$. (Surjective just means surjective on underlying sets of points.)

Exercise 83.40.10. Let k be an algebraically closed field. Let $A \subset B$ be an extension of domains which are both finite type k -algebras. Prove that the image of $\text{Spec}(B) \rightarrow \text{Spec}(A)$ contains a nonempty open subset of $\text{Spec}(A)$ using the following steps:

- (1) Prove it if $A \rightarrow B$ is also finite.
- (2) Prove it in case the fraction field of B is a finite extension of the fraction field of A .
- (3) Reduce the statement to the previous case.

83.41. Schemes, Final Exam, Fall 2013

These were the questions in the final exam of a course on Commutative Algebra, in the Fall of 2013 at Columbia University.

Exercise 83.41.1 (Definitions). Provide definitions of the italicized concepts.

- (1) a *radical ideal* of a ring,
- (2) a *finite type* ring homomorphism,
- (3) a *differential a la Weil*,
- (4) a *scheme*.

Exercise 83.41.2 (Results). State something formally equivalent to the fact discussed in the course.

- (1) result on hilbert polynomials of graded modules.
- (2) dimension of a Noetherian local ring (R, \mathfrak{m}) and $\bigoplus_{n \geq 0} \mathfrak{m}^n / \mathfrak{m}^{n+1}$.
- (3) Riemann-Roch.
- (4) Clifford's theorem.
- (5) Chevalley's theorem.

Exercise 83.41.3. Let $A \rightarrow B$ be a ring map. Let $S \subset A$ be a multiplicative subset. Assume that $A \rightarrow B$ is of finite type and $S^{-1}A \rightarrow S^{-1}B$ is surjective. Show that there exists an $f \in S$ such that $A_f \rightarrow B_f$ is surjective.

Exercise 83.41.4. Give an example of an injective local homomorphism $A \rightarrow B$ of local rings, such that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is not surjective.

Situation 83.41.5 (Notation plane curve). Let k be an algebraically closed field. Let $F(X_0, X_1, X_2) \in k[X_0, X_1, X_2]$ be an irreducible polynomial homogenous of degree d . We let

$$D = V(F) \subset \mathbf{P}^2$$

be the projective plane curve given by the vanishing of F . Set $x = X_1/X_0$ and $y = X_2/X_0$ and $f(x, y) = X_0^{-d}F(X_0, X_1, X_2) = F(1, x, y)$. We denote K the fraction

field of the domain $k[x, y]/(f)$. We let C be the abstract curve corresponding to K . Recall (from the lectures) that there is a surjective map $C \rightarrow D$ which is bijective over the nonsingular locus of D and an isomorphism if D is nonsingular. Set $f_x = \partial f/\partial x$ and $f_y = \partial f/\partial y$. Finally, we denote $\omega = dx/f_y = -dy/f_x$ the element of $\Omega_{K/k}$ discussed in the lectures. Denote K_C the divisor of zeros and poles of ω .

Exercise 83.41.6. In Situation 83.41.5 assume $d \geq 3$ and that the curve D has exactly one singular point, namely $P = (1 : 0 : 0)$. Assume further that we have the expansion

$$f(x, y) = xy + h.o.t$$

around $P = (0, 0)$. Then C has two points v and w lying over P characterized by

$$v(x) = 1, v(y) > 1 \quad \text{and} \quad w(x) > 1, w(y) = 1$$

- (1) Show that the element $\omega = dx/f_y = -dy/f_x$ of $\Omega_{K/k}$ has a first order pole at both v and w . (The behaviour of ω at nonsingular points is as discussed in the lectures.)
- (2) In the lectures we have shown that ω vanishes to order $d-3$ at the divisor $X_0 = 0$ pulled back to C under the map $C \rightarrow D$. Combined with the information of (1) what is the degree of the divisor of zeros and poles of ω on C ?
- (3) What is the genus of the curve C ?

Exercise 83.41.7. In Situation 83.41.5 assume $d = 5$ and that the curve $C = D$ is nonsingular. In the lectures we have shown that the genus of C is 6 and that the linear system K_C is given by

$$L(K_C) = \{h\omega \mid h \in k[x, y], \deg(h) \leq 2\}$$

where \deg indicates total degree². Let $P_1, P_2, P_3, P_4, P_5 \in D$ be pairwise distinct points lying in the affine open $X_0 \neq 0$. We denote $\sum P_i = P_1 + P_2 + P_3 + P_4 + P_5$ the corresponding divisor of C .

- (1) Describe $L(K_C - \sum P_i)$ in terms of polynomials.
- (2) What are the possibilities for $l(\sum P_i)$?

Exercise 83.41.8. Write down an F as in Situation 83.41.5 with $d = 100$ such that the genus of C is 0.

Exercise 83.41.9. Let k be an algebraically closed field. Let K/k be finitely generated field extension of transcendence degree 1. Let C be the abstract curve corresponding to K . Let $V \subset K$ be a g_d^r and let $\Phi : C \rightarrow \mathbf{P}^r$ be the corresponding morphism. Show that the image of C is contained in a quadric³ if d is large enough relative to the genus of C . (Extra credit: good bound on the degree needed.)

Exercise 83.41.10. Notation as in Situation 83.41.5. Let $U \subset \mathbf{P}_k^2$ be the open subscheme whose complement is D . Describe the k -algebra $A = \mathcal{O}_{\mathbf{P}_k^2}(U)$. Give an upper bound for the number of generators of A as a k -algebra.

²We get ≤ 2 because $d - 3 = 5 - 3 = 2$.

³A quadric is a degree 2 hypersurface, i.e., the zero set in \mathbf{P}^r of a degree 2 homogeneous polynomial.

83.42. Schemes, Final Exam, Spring 2014

These were the questions in the final exam of a course on Schemes, in the Fall of 2014 at Columbia University.

Exercise 83.42.1 (Definitions). Let (X, \mathcal{O}_X) be a scheme. Provide definitions of the italicized concepts.

- (1) the *local ring of X at a point x* ,
- (2) a *quasi-coherent* sheaf of \mathcal{O}_X -modules,
- (3) a *coherent* sheaf of \mathcal{O}_X -modules (please assume X is locally Noetherian),
- (4) an *affine open* of X ,
- (5) a *finite morphism of schemes $X \rightarrow Y$* .

Exercise 83.42.2 (Theorems). Precisely state a nontrivial fact discussed in the lectures related to each item.

- (1) on birational invariance of pluri-genera of varieties,
- (2) being an affine morphism is a local property,
- (3) the topology of a scheme theoretic fibre of a morphism, and
- (4) valuative criterion of properness.

Exercise 83.42.3. Let $X = \mathbf{A}_{\mathbf{C}}^2$ where \mathbf{C} is the field of complex numbers. A *line* will mean a closed subscheme of X defined by one linear equation $ax + by + c = 0$ for some $a, b, c \in \mathbf{C}$ with $(a, b) \neq (0, 0)$. A *curve* will mean an irreducible (so nonempty) closed subscheme $C \subset X$ of dimension 1. A *quadric* will mean a curve defined by one quadratic equation $ax^2 + bxy + cy^2 + dx + ey + f = 0$ for some $a, b, c, d, e, f \in \mathbf{C}$ and $(a, b, c) \neq (0, 0, 0)$.

- (1) Find a curve C such that every line has nonempty intersection with C .
- (2) Find a curve C such that every line and every quadric has nonempty intersection with C .
- (3) Show that for every curve C there exists another curve such that $C \cap C' = \emptyset$.

Exercise 83.42.4. Let k be a field. Let $b : X \rightarrow \mathbf{A}_k^2$ be the blow up of the affine plane in the origin. In other words, if $\mathbf{A}_k^2 = \text{Spec}(k[x, y])$, then $X = \text{Proj}(\bigoplus_{n \geq 0} \mathfrak{m}^n)$ where $\mathfrak{m} = (x, y) \subset k[x, y]$. Prove the following statements

- (1) the scheme theoretic fibre E of b over the origin is isomorphic to \mathbf{P}_k^1 ,
- (2) E is an effective Cartier divisor on X ,
- (3) the restriction of $\mathcal{O}_X(-E)$ to E is a line bundle of degree 1.

(Recall that $\mathcal{O}_X(-E)$ is the ideal sheaf of E in X .)

Exercise 83.42.5. Let k be a field. Let X be a projective variety over k . Show there exists an affine variety U over k and a surjective morphism of varieties $U \rightarrow X$.

Exercise 83.42.6. Let k be a field of characteristic $p > 0$ different from 2, 3. Consider the closed subscheme X of \mathbf{P}_k^n defined by

$$\sum_{i=0, \dots, n} X_i = 0, \quad \sum_{i=0, \dots, n} X_i^2 = 0, \quad \sum_{i=0, \dots, n} X_i^3 = 0$$

For which pairs (n, p) is this variety singular?

A Guide to the Literature

84.1. Short introductory articles

- Barbara Fantechi: *Stacks for Everybody* [Fan01]
- Dan Edidin: *What is a stack?* [Edi03]
- Dan Edidin: *Notes on the construction of the moduli space of curves* [Edi00]
- Angelo Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces*, and especially the appendix. [Vis89]

84.2. Classic references

- Mumford: *Picard groups of moduli problems* [Mum65]
Mumford never uses the term “stack” here but the concept is implicit in the paper; he computes the picard group of the moduli stack of elliptic curves.
- Deligne, Mumford: *The irreducibility of the space of curves of given genus* [DM69]
This influential paper introduces “algebraic stacks” in the sense which are now universally called Deligne–Mumford stacks (stacks with representable diagonal which admit étale presentations by schemes). There are many foundational results *without proof*. The paper uses stacks to give two proofs of the irreducibility of the moduli space of curves of genus g .
- Artin: *Versal deformations and algebraic stacks* [Art74]
This paper introduces “algebraic stacks” which generalize Deligne–Mumford stacks and are now commonly referred to as *Artin stacks*, stacks with representable diagonal which admit smooth presentations by schemes. This paper gives deformation-theoretic criterion known as Artin’s criterion which allows one to prove that a given moduli stack is an Artin stack without explicitly exhibiting a presentation.

84.3. Books and online notes

- Laumon, Moret-Bailly: *Champs Algébriques* [LMB00]
This book is currently the most exhaustive reference on stacks containing many foundational results. It assumes the reader is familiar with algebraic spaces and frequently references Knutson’s book [Knu71]. There is an error in chapter 12 concerning the functoriality of the lisse-étale site of an algebraic stack. One doesn’t need to worry about this as the error has been patched

by Martin Olsson (see [Ols07b]) and the results in the remaining chapters (after perhaps slight modification) are correct.

- The Stacks Project Authors: *Stacks Project* [Sta].
You are reading it!
- Anton Geraschenko: *Lecture notes for Martin Olsson’s class on stacks* [Ols07a]
This course systematically develops the theory of algebraic spaces before introducing algebraic stacks (first defined in Lecture 27!). In addition to basic properties, the course covers the equivalence between being Deligne-Mumford and having unramified diagonal, the lisse-étale site on an Artin stack, the theory of quasi-coherent sheaves, the Keel-Mori theorem, cohomological descent, and gerbes (and their relation to the Brauer group). There are also some exercises.
- Behrend, Conrad, Edidin, Fantechi, Fulton, Göttsche, and Kresch: *Algebraic stacks*, online notes for a book being currently written [BCE⁺07]
The aim of this book is to give a friendly introduction to stacks without assuming a sophisticated background with a focus on examples and applications. Unlike [LMB00], it is not assumed that the reader has digested the theory of algebraic spaces. Instead, Deligne-Mumford stacks are introduced with algebraic spaces being a special case with part of the goal being to develop enough theory to prove the assertions in [DM69]. The general theory of Artin stacks is to be developed in the second part. Only a fraction of the book is now available on Kresch’s website.

84.4. Related references on foundations of stacks

- Vistoli: *Notes on Grothendieck topologies, fibered categories and descent theory* [Vis05]
Contains useful facts on fibered categories, stacks and descent theory in the fpqc topology as well as rigorous proofs.
- Knutson: *Algebraic Spaces* [Knu71]
This book, which evolved from his PhD thesis under Michael Artin, contains the foundations of the theory of algebraic spaces. The book [LMB00] frequently references this text. See also Artin’s papers on algebraic spaces: [Art69a], [Art69b], [Art69c], [Art70], [Art71b], [Art71a], [Art73], and [Art74]
- Grothendieck et al, *Théorie des Topos et Cohomologie Étale des Schémas I, II, III* also known as SGA4 [AGV71]
Volume 1 contains many general facts on universes, sites and fibered categories. The word “champ” (French for “stack”) appears in Deligne’s Exposé XVIII.
- Jean Giraud: *Cohomologie non abélienne* [Gir65]
The book discusses fibered categories, stacks, torsors and gerbes over general sites but does not discuss algebraic stacks. For instance, if G is a sheaf of abelian groups on X , then in the same way $H^1(X, G)$ can be identified with G -torsors, $H^2(X, G)$

can be identified with an appropriately defined set of G -gerbes. When G is not abelian, then $H^2(X, G)$ is defined as the set of G -gerbes.

- Kelly and Street: *Review of the elements of 2-categories* [KS74]
The category of stacks form a 2-category although a simple type of 2-category where 2-morphisms are invertible. This is a reference on general 2-categories. I have never used this so I cannot say how useful it is. Also note that [Sta] contains some basics on 2-categories.

84.5. Papers in the literature

Below is a list of research papers which contain fundamental results on stacks and algebraic spaces. The intention of the summaries is to indicate only the results of the paper which contribute toward stack theory; in many cases these results are subsidiary to the main goals of the paper. We divide the papers into categories with some papers falling into multiple categories.

84.5.1. Deformation theory and algebraic stacks. The first three papers by Artin do not contain anything on stacks but they contain powerful results with the first two papers being essential for [Art74].

- Artin: *Algebraic approximation of structures over complete local rings* [Art69a]

It is proved that under mild hypotheses any effective formal deformation can be approximated: if $F : (Sch/S) \rightarrow (Sets)$ is a contravariant functor locally of finite presentation with S finite type over a field or excellent DVR, $s \in S$, and $\hat{\xi} \in F(\hat{\mathcal{O}}_{S,s})$ is an effective formal deformation, then for any $n > 0$, there exists an residually trivial étale neighborhood $(S', s') \rightarrow (S, s)$ and $\xi' \in F(S')$ such that ξ' and $\hat{\xi}$ agree up to order n (ie. have the same restriction in $F(\mathcal{O}_{S,s}/\mathfrak{m}^n)$).

- Artin: *Algebraization of formal moduli I* [Art69b]

It is proved that under mild hypotheses any effective formal versal deformation is algebraizable. Let $F : (Sch/S) \rightarrow (Sets)$ be a contravariant functor locally of finite presentation with S finite type over a field or excellent DVR, $s \in S$ be a locally closed point, \hat{A} be a complete noetherian local \mathcal{O}_S -algebra with residue field k' a finite extension of $k(s)$, and $\hat{\xi} \in F(\hat{A})$ be an effective formal versal deformation of an element $\xi_0 \in F(k')$. Then there is a scheme X finite type over S and a closed point $x \in X$ with residue field $k(x) = k'$ and an element $\xi \in F(X)$ such that there is an isomorphism $\hat{\mathcal{O}}_{X,x} \cong \hat{A}$ identifying the restrictions of ξ and $\hat{\xi}$ in each $F(\hat{A}/\mathfrak{m}^n)$. The algebraization is unique if $\hat{\xi}$ is a universal deformation. Applications are given to the representability of the Hilbert and Picard schemes.

- Artin: *Algebraization of formal moduli. II* [Art70]

Vaguely, it is shown that if one can contract a closed subset $Y' \subset X'$ formally locally around Y' , then exists a global morphism $X' \rightarrow X$ contracting Y with X an algebraic space.

- Artin: *Versal deformations and algebraic stacks* [**Art74**]
 This momentous paper builds on his work in [**Art69a**] and [**Art69b**]. This paper introduces Artin’s criterion which allows one to prove algebraicity of a stack by verifying deformation-theoretic properties. More precisely (but not very precisely), Artin constructs a presentation of a limit preserving stack \mathcal{X} locally around a point $x \in \mathcal{X}(k)$ as follows: assuming the stack \mathcal{X} satisfies Schlessinger’s criterion ([**Sch68**]), there exists a formal versal deformation $\hat{\xi} \in \lim \mathcal{X}(\hat{A}/\mathfrak{m}^n)$ of x . Assuming that formal deformations are effective (i.e., $\mathcal{X}(\hat{A}) \rightarrow \lim \mathcal{X}(\hat{A}/\mathfrak{m}^n)$ is bijective), then one obtains an effective formal versal deformation $\xi \in \mathcal{X}(\hat{A})$. Using results in [**Art69b**], one produces a finite type scheme U and an element $\xi_U : U \rightarrow \mathcal{X}$ which is formally versal at a point $u \in U$ over x . Then if we assume \mathcal{X} admits a deformation and obstruction theory satisfying certain conditions (ie. compatibility with étale localization and completion as well as constructibility condition), then it is shown in section 4 that formal versality is an open condition so that after shrinking U , $U \rightarrow \mathcal{X}$ is smooth. Artin also presents a proof that any stack admitting an fppf presentation by a scheme admits a smooth presentation by a scheme so that in particular one can form quotient stacks by flat, separated, finitely presented group schemes.
- Conrad, de Jong: *Approximation of Versal Deformations* [**CdJ02**]
 This paper offers an approach to Artin’s algebraization result by applying Popescu’s powerful result: if A is a noetherian ring and B a noetherian A -algebra, then the map $A \rightarrow B$ is a regular morphism if and only if B is a direct limit of smooth A -algebras. It is not hard to see that Popescu’s result implies Artin’s approximation over an arbitrary excellent scheme (the excellence hypothesis implies that for a local ring A , the map $A^h \rightarrow \hat{A}$ from the henselization to the completion is regular). The paper uses Popescu’s result to give a “groupoid” generalization of the main theorem in [**Art69b**] which is valid over arbitrary excellent base schemes and for arbitrary points $s \in S$. In particular, the results in [**Art74**] hold under an arbitrary excellent base. They discuss the étale-local uniqueness of the algebraization and whether the automorphism group of the object acts naturally on the henselization of the algebraization.
- Jason Starr: *Artin’s axioms, composition, and moduli spaces* [**Sta06**]
 The paper establishes that Artin’s axioms for algebraization are compatible with the composition of 1-morphisms.
- Martin Olsson: *Deformation theory of representable morphism of algebraic stacks* [**Ols06a**]
 This generalizes standard deformation theory results for morphisms of schemes to representable morphisms of algebraic stacks in terms of the cotangent complex. These results cannot be

viewed as consequences of Illusie’s general theory as the cotangent complex of a representable morphism $X \rightarrow \mathcal{X}$ is not defined in terms of cotangent complex of a morphism of ringed topoi (because the lisse-étale site is not functorial).

84.5.2. Coarse moduli spaces.

- Keel, Mori: *Quotients in Groupoids* [KM97]
It had apparently long been “folklore” that separated Deligne-Mumford stacks admitted coarse moduli spaces. A rigorous (although terse) proof of the following theorem is presented here: if \mathcal{X} is an Artin stack locally of finite type over a noetherian base scheme such that the inertia stack $I_{\mathcal{X}} \rightarrow \mathcal{X}$ is finite, then there exists a coarse moduli space $\phi : \mathcal{X} \rightarrow Y$ with ϕ separated and Y an algebraic space locally of finite type over S . The hypothesis that the inertia is finite is precisely the right condition: there exists a coarse moduli space $\phi : \mathcal{X} \rightarrow Y$ with ϕ separated if and only if the inertia is finite.
- Conrad: *The Keel-Mori Theorem via Stacks* [Con05b]
Keel and Mori’s paper [KM97] is written in the groupoid language and some find it challenging to grasp. Brian Conrad presents a stack-theoretic version of the proof which is quite transparent although it uses the sophisticated language of stacks. Conrad also removes the noetherian hypothesis.
- Rydh: *Existence of quotients by finite groups and coarse moduli spaces* [Ryd07]
Rydh removes the hypothesis from [KM97] and [Con05b] that \mathcal{X} be finitely presented over some base.
- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* [AOV08]
They define a *tame Artin stack* as an Artin stack with finite inertia such that if $\phi : \mathcal{X} \rightarrow Y$ is the coarse moduli space, ϕ_* is exact on quasi-coherent sheaves. They prove that for an Artin stack with finite inertia, the following are equivalent: \mathcal{X} is tame if and only if the stabilizers of \mathcal{X} are linearly reductive if and only if \mathcal{X} is étale locally on the coarse moduli space a quotient of an affine scheme by a linearly reductive group scheme. For a tame Artin stack, the coarse moduli space is particularly nice. For instance, the coarse moduli space commutes with arbitrary base change while a general coarse moduli space for an Artin stack with finite inertia will only commute with flat base change.
- Alper: *Good moduli spaces for Artin stacks* [Alp08]
For general Artin stacks with infinite affine stabilizer groups (which are necessarily non-separated), coarse moduli spaces often do not exist. The simplest example is $[\mathbf{A}^1/\mathbf{G}_m]$. It is defined here that a quasi-compact morphism $\phi : \mathcal{X} \rightarrow Y$ is a *good moduli space* if $\mathcal{O}_Y \rightarrow \phi_*\mathcal{O}_{\mathcal{X}}$ is an isomorphism and ϕ_* is exact on quasi-coherent sheaves. This notion generalizes a tame Artin stack in [AOV08] as well as encapsulates Mumford’s geometric invariant theory: if G is a reductive group acting linearly on $X \subset \mathbf{P}^n$, then the morphism from the quotient stack of the

semi-stable locus to the GIT quotient $[X^{ss}/G] \rightarrow X//G$ is a good moduli space. The notion of a good moduli space has many nice geometric properties: (1) ϕ is surjective, universally closed, and universally submersive, (2) ϕ identifies points in Y with points in \mathcal{X} up to closure equivalence, (3) ϕ is universal for maps to algebraic spaces, (4) good moduli spaces are stable under arbitrary base change, and (5) a vector bundle on an Artin stack descends to the good moduli space if and only if the representations are trivial at closed points.

84.5.3. Intersection theory.

- Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces* [Vis89]

This paper develops the foundations for intersection theory with rational coefficients for Deligne-Mumford stacks. If \mathcal{X} is a separated Deligne-Mumford stack, the chow group $A_*(\mathcal{X})$ with rational coefficients is defined as the free abelian group of integral closed substacks of dimension k up to rational equivalence. There is a flat pullback, a proper push-forward and a generalized Gysin homomorphism for regular local embeddings. If $\phi : \mathcal{X} \rightarrow Y$ is a moduli space (ie. a proper morphism with isomorphic geometric points), there is an induced push-forward $A_*(\mathcal{X}) \rightarrow A_*(Y)$ which is an isomorphism.

- Edidin, Graham: *Equivariant Intersection Theory* [EG98]

The purpose of this article is to develop intersection theory with integral coefficients for a quotient stack $[X/G]$ of an action of an algebraic group G on an algebraic space X or, in other words, to develop a G -equivariant intersection theory of X . Equivariant chow groups defined using only invariant cycles does not produce a theory with nice properties. Instead, generalizing Totaro's definition in the case of BG and motivated by the fact that if $V \rightarrow X$ is a vector bundle then $A_i(X) \cong A_i(V)$ naturally, the authors define $A_i^G(X)$ as follows: Let $\dim(X) = n$ and $\dim(G) = g$. For each i , choose a l -dimensional G -representation V where G acts freely on an open subset $U \subset V$ whose complement has codimension $d > n - i$. So $X_G = [X \times U/G]$ is an algebraic space (it can even be chosen to be a scheme). Then they define $A_i^G(X) = A_{i+l-g}(X_G)$. For the quotient stack, one defines $A_i([X/G]) := A_{i+g}^G(X) = A_{i+l}(X_G)$. In particular, $A_i([X/G]) = 0$ for $i > \dim[X/G] = n - g$ but can be non-zero for $i < 0$ (eg. $A_i(B\mathbf{G}_m) = \mathbf{Z}$ for $i \leq 0$). They establish that these equivariant Chow groups enjoy the same functorial properties as ordinary Chow groups. Furthermore, they establish that if $[X/G] \cong [Y/H]$ that $A_i([X/G]) = A_i([Y/H])$ so that the definition is independent on how the stack is presented as a quotient stack.

- Kresch: *Cycle Groups for Artin Stacks* [Kre99]

Kresch defines Chow groups for arbitrary Artin stacks agreeing with Edidin and Graham's definition in [EG98] in the case of

quotient stack. For algebraic stacks with affine stabilizer groups, the theory satisfies the usual properties.

- Behrend and Fantechi: *The intrinsic normal cone* [BF97]
Generalizing a construction due to Li and Tian, Behrend and Fantechi construct a virtual fundamental class for a Deligne-Mumford stack.

84.5.4. Quotient stacks. Quotient stacks¹ form a very important subclass of Artin stacks which include almost all moduli stacks studied by algebraic geometers. The geometry of a quotient stack $[X/G]$ is the G -equivariant geometry of X . It is often easier to show properties are true for quotient stacks and some results are only known to be true for quotient stacks. The following papers address: When is an algebraic stack a global quotient stack? Is an algebraic stack “locally” a quotient stack?

- Laumon, Moret-Bailly: [LMB00, Chapter 6]
Chapter 6 contains several facts about the local and global structure of algebraic stacks. It is proved that an algebraic stack \mathcal{X} over S is a quotient stack $[Y/G]$ with Y an algebraic space (resp. scheme, resp. affine scheme) and G a finite group if and only if there exists an algebraic space (resp. scheme, resp. affine scheme) Y' and an finite étale morphism $Y' \rightarrow \mathcal{X}$. It is shown that any Deligne-Mumford stack over S and $x : \text{Spec}(K) \rightarrow \mathcal{X}$ admits a representable, étale and separated morphism $\phi : [X/G] \rightarrow \mathcal{X}$ where G is a finite group acting on an affine scheme over S such that $\text{Spec}(K) = [X/G] \times_{\mathcal{X}} \text{Spec}(K)$. The existence of presentations with geometrically connected fibers is also discussed in detail.
- Edidin, Hassett, Kresch, Vistoli: *Brauer Groups and Quotient stacks* [EHKV01]
First, they establish some fundamental (although not very difficult) facts concerning when a given algebraic stack (always assumed finite type over a noetherian scheme in this paper) is a quotient stack. For an algebraic stack \mathcal{X} : \mathcal{X} is a quotient stack if and only if there exists a vector bundle $V \rightarrow \mathcal{X}$ such that for every geometric point, the stabilizer acts faithfully on the fiber if and only if there exists a vector bundle $V \rightarrow \mathcal{X}$ and a locally closed substack $V^0 \subset V$ such that V^0 is representable and surjects onto F . They establish that an algebraic stack is a quotient stack if there exists finite flat cover by an algebraic space. Any smooth Deligne-Mumford stack with generically trivial stabilizer is a quotient stack. They show that a \mathbf{G}_m -gerbe over a noetherian scheme X corresponding to $\beta \in H^2(X, \mathbf{G}_m)$ is a quotient stack if and only if β is in the image of the Brauer map $\text{Br}(X) \rightarrow \text{Br}'(X)$. They use this to produce a non-separated Deligne-Mumford stack that is not a quotient stack.
- Totaro: *The resolution property for schemes and stacks* [Tot04]

¹In the literature, *quotient stack* often means a stack of the form $[X/G]$ with X an algebraic space and G a subgroup scheme of GL_n rather than an arbitrary flat group scheme.

A stack has the resolution property if every coherent sheaf is the quotient of a vector bundle. The first main theorem is that if \mathcal{X} is a normal noetherian algebraic stack with affine stabilizer groups at closed points, then the following are equivalent: (1) \mathcal{X} has the resolution property and (2) $\mathcal{X} = [Y/\mathrm{GL}_n]$ with Y quasi-affine. In the case \mathcal{X} is finite type over a field, then (1) and (2) are equivalent to: (3) $\mathcal{X} = [\mathrm{Spec}(A)/G]$ with G an affine group scheme finite type over k . The implication that quotient stacks have the resolution property was proven by Thomason. The second main theorem is that if \mathcal{X} is a smooth Deligne-Mumford stack over a field which has a finite and generically trivial stabilizer group $I_{\mathcal{X}} \rightarrow \mathcal{X}$ and whose coarse moduli space is a scheme with affine diagonal, then \mathcal{X} has the resolution property. Another cool result states that if \mathcal{X} is a noetherian algebraic stack satisfying the resolution property, then \mathcal{X} has affine diagonal if and only if the closed points have affine stabilizer.

- Kresch: *On the Geometry of Deligne-Mumford Stacks* [Kre09]

This article summarizes general structure results of Deligne-Mumford stacks (of finite type over a field) and contains some interesting results concerning quotient stacks. It is shown that any smooth, separated, generically tame Deligne-Mumford stack with quasi-projective coarse moduli space is a quotient stack $[Y/G]$ with Y quasi-projective and G an algebraic group. If \mathcal{X} is a Deligne-Mumford stack whose coarse moduli space is a scheme, then \mathcal{X} is Zariski-locally a quotient stack if and only if it admits a Zariski-open covering by stack quotients of schemes by finite groups. If \mathcal{X} is a Deligne-Mumford stack proper over a field of characteristic 0 with coarse moduli space Y , then: Y is projective and \mathcal{X} is a quotient stack if and only if Y is projective and \mathcal{X} possesses a generating sheaf if and only if \mathcal{X} admits a closed embedding into a smooth proper DM stack with projective coarse moduli space. This motivates a definition that a Deligne-Mumford stack is *projective* if there exists a closed embedding into a smooth, proper Deligne-Mumford stack with projective coarse moduli space.
- Kresch, Vistoli *On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map* [KV04]

It is shown that in characteristic 0 and for a fixed n , the following two statements are equivalent: (1) every smooth Deligne-Mumford stack of dimension n is a quotient stack and (2) the Azumaya Brauer group coincides with the cohomological Brauer group for smooth schemes of dimension n .
- Kresch: *Cycle Groups for Artin Stacks* [Kre99]

It is shown that a reduced Artin stack finite type over a field with affine stabilizer groups admits a stratification by quotient stacks.
- Abramovich-Vistoli: *Compactifying the space of stable maps* [AV02]

Lemma 2.2.3 establishes that for any separated Deligne-Mumford stack is étale-locally on the coarse moduli space a quotient stack $[U/G]$ where U affine and G a finite group. [Ols06b, Theorem 2.12] shows in this argument G is even the stabilizer group.

- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* [AOV08] This paper shows that a tame Artin stack is étale locally on the coarse moduli space a quotient stack of an affine by the stabilizer group.
- Alper: *On the local quotient structure of Artin stacks* [Alp10] It is conjectured that for an Artin stack \mathcal{X} and a closed point $x \in \mathcal{X}$ with linearly reductive stabilizer, then there is an étale morphism $[V/G_x] \rightarrow \mathcal{X}$ with V an algebraic space. Some evidence for this conjecture is given. A simple deformation theory argument (based on ideas in [AOV08]) shows that it is true formally locally. A stack-theoretic proof of Luna's étale slice theorem is presented proving that for stacks $\mathcal{X} = [\text{Spec}(A)/G]$ with G linearly reductive, then étale locally on the GIT quotient $\text{Spec}(A^G)$, \mathcal{X} is a quotient stack by the stabilizer.

84.5.5. Cohomology.

- Olsson: *Sheaves on Artin stacks* [Ols07b] This paper develops the theory of quasi-coherent and constructible sheaves proving basic cohomological properties. This paper corrects a mistake in [LMB00] in the functoriality of the lisse-étale site. The cotangent complex is constructed. In addition, the following theorems are proved: Grothendieck's Fundamental Theorem for proper morphisms, Grothendieck's Existence Theorem, Zariski's Connectedness Theorem and finiteness theorem for proper pushforwards of coherent and constructible sheaves.
- Behrend: *Derived l -adic categories for algebraic stacks* [Beh03] Proves the Lefschetz trace formula for algebraic stacks.
- Behrend: *Cohomology of stacks* [Beh04] Defines the de Rham cohomology for differentiable stacks and singular cohomology for topological stacks.
- Faltings: *Finiteness of coherent cohomology for proper fppf stacks* [Fal03] Proves coherence for direct images of coherent sheaves for proper morphisms.
- Abramovich, Corti, Vistoli: *Twisted bundles and admissible covers* [ACV03] The appendix contains the proper base change theorem for étale cohomology for tame Deligne-Mumford stacks.

84.5.6. Existence of finite covers by schemes. The existence of finite covers of Deligne-Mumford stacks by schemes is an important result. In intersection theory on Deligne-Mumford stacks, it is an essential ingredient in defining proper push-forward for non-representable morphisms. There are several results about \mathcal{M}_g relying on the existence of a finite cover by a *smooth* scheme which was proven by Looijenga. Perhaps the first result in this direction is [Ses72, Theorem 6.1] which treats the equivariant setting.

- Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces* [Vis89]
If \mathcal{X} is a Deligne-Mumford stack with a moduli space (ie. a proper morphism which is bijective on geometric points), then there exists a finite morphism $X \rightarrow \mathcal{X}$ from a scheme X .
- Laumon, Moret-Bailly: [LMB00, Chapter 16]
As an application of Zariski's main theorem, Theorem 16.6 establishes: if \mathcal{X} is a Deligne-Mumford stack finite type over a noetherian scheme, then there exists a finite, surjective, generically étale morphism $Z \rightarrow \mathcal{X}$ with Z a scheme. It is also shown in Corollary 16.6.2 that any noetherian normal algebraic space is isomorphic to the algebraic space quotient X'/G for a finite group G acting a normal scheme X .
- Edidin, Hassett, Kresch, Vistoli: *Brauer Groups and Quotient stacks* [EHKV01]
Theorem 2.7 states: if \mathcal{X} is an algebraic stack of finite type over a noetherian ground scheme S , then the diagonal $\mathcal{X} \rightarrow \mathcal{X} \times_S \mathcal{X}$ is quasi-finite if and only if there exists a finite surjective morphism $X \rightarrow F$ from a scheme X .
- Kresch, Vistoli: *On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map* [KV04]
It is proved here that any smooth, separated Deligne-Mumford stack finite type over a field with quasi-projective coarse moduli space admits a finite, flat cover by a smooth quasi-projective scheme.
- Olsson: *On proper coverings of Artin stacks* [Ols05]
Proves that if \mathcal{X} is an Artin stack separated and finite type over S , then there exists a proper surjective morphism $X \rightarrow \mathcal{X}$ from a scheme X quasi-projective over S . As an application, Olsson proves coherence and constructibility of direct image sheaves under proper morphisms. As an application, he proves Grothendieck's existence theorem for proper Artin stacks.

84.5.7. Rigidification. Rigidification is a process for removing a flat subgroup from the inertia. For example, if X is a projective variety, the morphism from the Picard stack to the Picard scheme is a rigidification of the group of automorphism \mathbf{G}_m .

- Abramovich, Corti, Vistoli: *Twisted bundles and admissible covers* [ACV03]
Let \mathcal{X} be an algebraic stack over S and H be a flat, finitely presented separated group scheme over S . Assume that for every object $\xi \in \mathcal{X}(T)$ there is an embedding $H(S) \hookrightarrow \text{Aut}_{\mathcal{X}(T)}(\xi)$ which is compatible under pullbacks in the sense that for every arrow $\phi : \xi \rightarrow \xi'$ over $f : T \rightarrow T'$ and $g \in H(T)$, $g \circ \phi = \phi \circ f^*g$. Then there exists an algebraic stack \mathcal{X}/H and a morphism $\rho : \mathcal{X} \rightarrow \mathcal{X}/H$ which is an fppf gerbe such that for every $\xi \in \mathcal{X}(T)$, the morphism $\text{Aut}_{\mathcal{X}(T)}(\xi) \rightarrow \text{Aut}_{\mathcal{X}/H(T)}(\xi)$ is surjective with kernel $H(T)$.
- Romagny: *Group actions on stacks and applications* [Rom05]

Discusses how group actions behave with respect to rigidifications.

- Abramovich, Graber, Vistoli: *Gromov-Witten theory for Deligne-Mumford stacks* [AGV08]
The appendix gives a summary of rigidification as in [ACV03] with two alternative interpretations. This paper also contains constructions for gluing algebraic stacks along closed substacks and for taking roots of line bundles.
- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* ([AOV08])
The appendix handles the more complicated situation where the flat subgroup stack of the inertia $H \subset I_{\mathcal{X}}$ is normal but not necessarily central.

84.5.8. Stacky curves.

- Abramovich, Vistoli: *Compactifying the space of stable maps* [AV02]
This paper introduces *twisted curves*. The moduli space of stable maps from stable curves into an algebraic stack is typically not compact. By using maps from twisted curves, the authors construct a moduli stack which is proper when the target is a tame Deligne-Mumford stack whose coarse moduli space is projective.
- Behrend, Noohi: *Uniformization of Deligne-Mumford curves* [BN06]
Proves a uniformization theorem of Deligne-Mumford analytic curves.

84.5.9. Hilbert, Quot, Hom and branchvariety stacks.

- Vistoli: *The Hilbert stack and the theory of moduli of families* [Vis91]
If \mathcal{X} is an algebraic stack separated and locally of finite type over a locally noetherian and locally separated algebraic space S , Vistoli defines the Hilbert stack $\mathcal{Hilb}(\mathcal{F}/S)$ parameterizing finite and unramified morphisms from proper schemes. It is claimed without proof that $\mathcal{Hilb}(\mathcal{F}/S)$ is an algebraic stack. As a consequence, it is proved that with \mathcal{X} as above, the Hom stack $\mathcal{H}om_S(T, \mathcal{X})$ is an algebraic stack if T is proper and flat over S .
- Olsson, Starr: *Quot functors for Deligne-Mumford stacks* [OS03]
If \mathcal{X} is a Deligne-Mumford stack separated and locally of finite presentation over an algebraic space S and \mathcal{F} is a locally finitely-presented $\mathcal{O}_{\mathcal{X}}$ -module, the quot functor $\text{Quot}(\mathcal{F}/\mathcal{X}/S)$ is represented by an algebraic space separated and locally of finite presentation over S . This paper also defines generating sheaves and proves existence of a generating sheaf for tame, separated Deligne-Mumford stacks which are global quotient stacks of a scheme by a finite group.
- Olsson: *Hom-stacks and Restrictions of Scalars* [Ols06b]
Suppose \mathcal{X} and \mathcal{Y} are Artin stacks locally of finite presentation over an algebraic space S with finite diagonal with \mathcal{X} proper and flat over S such that fppf-locally on S , \mathcal{X} admits a finite finitely presented flat cover by an algebraic space (eg. \mathcal{X} is Deligne-Mumford or a tame Artin stack). Then $\text{Hom}_S(\mathcal{X}, \mathcal{Y})$ is an Artin stack locally of finite presentation over S .

- Alexeev and Knutson: *Complete moduli spaces of branchvarieties* ([**AK10**])
They define a branchvariety of \mathbf{P}^n as a finite morphism $X \rightarrow \mathbf{P}^n$ from a *reduced* scheme X . They prove that the moduli stack of branchvarieties with fixed Hilbert polynomial and total degrees of i -dimensional components is a proper Artin stack with finite stabilizer. They compare the stack of branchvarieties with the Hilbert scheme, Chow scheme and moduli space of stable maps.
- Lieblich: *Remarks on the stack of coherent algebras* [**Lie06b**]
This paper constructs a generalization of Alexeev and Knutson's stack of branch-varieties over a scheme Y by building the stack as a stack of algebras over the structure sheaf of Y . Existence proofs of Quot and Hom spaces are given.
- Starr: *Artin's axioms, composition, and moduli spaces* [**Sta06**]
As an application of the main result, a common generalization of Vistoli's Hilbert stack [**Vis91**] and Alexeev and Knutson's stack of branchvarieties [**AK10**] is provided. If \mathcal{X} is an algebraic stack locally of finite type over an excellent scheme S with finite diagonal, then the stack \mathcal{H} parameterizing morphisms $g : T \rightarrow \mathcal{X}$ from a proper algebraic space T with a G -ample line bundle L is an Artin stack locally of finite type over S .
- Lundkvist and Skjelnes: *Non-effective deformations of Grothendieck's Hilbert functor* [**LS08**]
Shows that the Hilbert functor of a non-separated scheme is not represented since there are non-effective deformations.

84.5.10. Toric stacks. Toric stacks provide a great class of examples and a natural testing ground for conjectures due to the dictionary between the geometry of a toric stack and the combinatorics of its stacky fan in a similar way that toric varieties provide examples and counterexamples in scheme theory.

- Borisov, Chen and Smith: *The orbifold Chow ring of toric Deligne-Mumford stacks* [**BCS05**]
Inspired by Cox's construction for toric varieties, this paper defines smooth toric DM stacks as explicit quotient stacks associated to a combinatorial object called a *stacky fan*.
- Iwanari: *The category of toric stacks* [**Iwa09**]
This paper defines a *toric triple* as a smooth Deligne-Mumford stack \mathcal{X} with an open immersion $\mathbf{G}_m \hookrightarrow \mathcal{X}$ with dense image (and therefore \mathcal{X} is an orbifold) and an action $\mathcal{X} \times \mathbf{G}_m \rightarrow \mathcal{X}$. It is shown that there is an equivalence between the 2-category of toric triples and the 1-category of stacky fans. The relationship between toric triples and the definition of smooth toric DM stacks in [**BCS05**] is discussed.
- Iwanari: *Integral Chow rings for toric stacks* [**Iwa07**]
Generalizes Cox's Δ -collections for toric varieties to toric orbifolds.
- Perroni: *A note on toric Deligne-Mumford stacks* [**Per08**]
Generalizes Cox's Δ -collections and Iwanari's paper [**Iwa07**] to general smooth toric DM stacks.
- Fantechi, Mann, and Nironi: *Smooth toric DM stacks* [**FMN07**]

This paper defines a smooth toric DM stack as a smooth DM stack \mathcal{X} with the action of a DM torus \mathcal{T} (ie. a Picard stack isomorphic to $T \times BG$ with G finite) having an open dense orbit isomorphic to \mathcal{T} . They give a “bottom-up description” and prove an equivalence between smooth toric DM stacks and stacky fans.

- Geraschenko and Satriano: *Toric Stacks I and II* [GS11a] and [GS11b]
These papers define a toric stack as the stack quotient of a toric variety by a subgroup of its torus. A generically stacky toric stack is defined as a torus invariant substack of a toric stack. This definition encompasses and extends previous definitions of toric stacks. The first paper develops a dictionary between the combinatorics of stacky fans and the geometry of the corresponding stacks. It also gives a moduli interpretation of smooth toric stacks, generalizing the one in [Per08]. The second paper proves an intrinsic characterization of toric stacks.

84.5.11. Theorem on formal functions and Grothendieck’s Existence Theorem. These papers give generalizations of the theorem on formal functions [DG67, III.4.1.5] (sometimes referred to Grothendieck’s Fundamental Theorem for proper morphisms) and Grothendieck’s Existence Theorem [DG67, III.5.1.4].

- Knutson: *Algebraic spaces* [Knu71, Chapter V]
Generalizes these theorems to algebraic spaces.
- Abramovich-Vistoli: *Compactifying the space of stable maps* [AV02, A.1.1]
Generalizes these theorems to tame Deligne-Mumford stacks
- Olsson and Starr: *Quot functors for Deligne-Mumford stacks* [OS03]
Generalizes these theorems to separated Deligne-Mumford stacks.
- Olsson: *On proper coverings of Artin stacks* [Ols05]
Provides a generalization to proper Artin stacks.
- Conrad: *Formal GAGA on Artin stacks* [Con05a]
Provides a generalization to proper Artin stacks and proves a formal GAGA theorem.
- Olsson: *Sheaves on Artin stacks* [Ols07b]
Provides another proof for the generalization to proper Artin stacks.

84.5.12. Group actions on stacks. Actions of groups on algebraic stacks naturally appear. For instance, symmetric group S_n acts on $\overline{\mathcal{M}}_{g,n}$ and for an action of a group G on a scheme X , the normalizer of G in $\text{Aut}(X)$ acts on $[X/G]$. Furthermore, torus actions on stacks often appear in Gromov-Witten theory.

- Romagny: *Group actions on stacks and applications* [Rom05]
This paper makes precise what it means for a group to act on an algebraic stack and proves existence of fixed points as well as existence of quotients for actions of group schemes on algebraic stacks. See also Romagny’s earlier note [Rom03].

84.5.13. Taking roots of line bundles. This useful construction was discovered independently by Cadman and by Abramovich, Graber and Vistoli. Given a scheme X with an effective Cartier divisor D , the r th root stack is an Artin stack branched over X at D with a μ_r stabilizer over D and scheme-like away from D .

CHAPTER 85

Desirables

85.1. Introduction

This is basically just a list of things that we want to put in the stacks project. As we add material to the project continuously this is always somewhat behind the current state of the project. In fact, it may have been a mistake to try and list things we should add, because it seems impossible to keep it up to date.

Last updated: Thursday, May 9, 2013.

85.2. Conventions

We should have a chapter with a short list of conventions used in the document. This chapter already exists, see Conventions, Section 2.1, but a lot more could be added there. Especially useful would be to find “hidden” conventions and tacit assumptions and put those there.

85.3. Sites and Topoi

We have a chapter on sites and sheaves, see Sites, Section 7.1. We have a chapter on ringed sites (and topoi) and modules on them, see Modules on Sites, Section 18.1. We have a chapter on cohomology in this setting, see Cohomology on Sites, Section 21.1. But a lot more could be added, especially in the chapter on cohomology.

85.4. Stacks

We have a chapter on (abstract) stacks, see Stacks, Section 8.1. It would be nice if

- (1) improve the discussion on “stackyfication”,
- (2) give examples of stackyfication,
- (3) more examples in general,
- (4) improve the discussion of gerbes.

Example result which has not been added yet: Given a sheaf of abelian groups \mathcal{F} over \mathcal{C} the set of equivalence classes of gerbes with “group” \mathcal{F} is bijective to $H^2(\mathcal{C}, \mathcal{F})$.

85.5. Simplicial methods

We have a chapter on simplicial methods, see Simplicial, Section 14.1. This has to be reviewed and improved. The discussion of the relationship between simplicial homotopy (also known as combinatorial homotopy) and Kan complexes should be improved upon. Moreover, there should be a chapter on “simplicial algebraic geometry”, where we discuss simplicial schemes, and how to think of their geometry,

cohomology, etc. Then this should be tied into the chapter on hypercoverings to “explain” the results of this chapter in the new language.

85.6. Cohomology of schemes

There is already a chapter on cohomology of quasi-coherent sheaves, see Cohomology of Schemes, Section 29.1. We also have chapters on étale cohomology of schemes, crystalline cohomology of schemes, derived categories of schemes. But most of the material is very basic and a lot more could be added here.

85.7. Deformation theory à la Schlessinger

We have a chapter on this material, see Formal Deformation Theory, Section 68.1. What is needed is worked out examples of the general theory, for example the case of representations of a fixed abstract group.

85.8. Definition of algebraic stacks

An algebraic stack is a stack in groupoids over the category of schemes with the fppf topology that has a diagonal representable by algebraic spaces and is the target of a surjective smooth morphism from a scheme. The notion “Deligne-Mumford stack” will be reserved for a stack as in [DM69]. We will reserve the term “Artin stack” for a stack such as in the papers by Artin [Art69b], and [Art74]. (See also [CdJ02].) In other words, an Artin stack will be an algebraic stack with some reasonable finiteness and separatedness conditions.

85.9. Examples of schemes, algebraic spaces, algebraic stacks

It really is not that hard to show that \mathcal{M}_g is an algebraic stack for $g \geq 2$. We should really have a long list of moduli problems here and prove they are all algebraic stacks. Some of them we can prove are algebraic using Artin approximation. For example the Kontsevich moduli space in characteristic $p > 0$.

Here are some items for the list of moduli problems mentioned above.

- (1) \mathcal{M}_g , i.e., moduli of smooth projective curves of genus g ,
- (2) $\overline{\mathcal{M}}_g$, i.e., moduli of stable genus g curves,
- (3) \mathcal{A}_g , i.e., principally polarized abelian schemes of genus g ,
- (4) $\mathcal{M}_{1,1}$, i.e., 1-pointed smooth projective genus 1 curves,
- (5) $\mathcal{M}_{g,n}$, i.e., smooth projective genus g -curves with n pairwise distinct labeled points,
- (6) $\overline{\mathcal{M}}_{g,n}$, i.e., stable n -pointed nodal projective genus g -curves,
- (7) $\mathcal{H}om_S(\mathcal{X}, \mathcal{Y})$, moduli of morphisms (with suitable conditions on the stacks \mathcal{X} , \mathcal{Y} and the base scheme S),
- (8) $Bun_G(X) = \mathcal{H}om_S(X, BG)$, the stack of G -bundles of the geometric Langlands programme (with suitable conditions on the scheme X , the group scheme G , and the base scheme S),
- (9) $Pic_{\mathcal{X}/S}$, i.e., the Picard stack associated to an algebraic stack over a base scheme (or space).

How about the algebraic space you get from the deformation theory of a general surface in \mathbf{P}^3 with a node? (I mean where you deform it to a general smooth surface in \mathbf{P}^3 .) Perhaps we can talk about some small dimensional examples here too. For

example the stack where you have \mathbf{A}^1 with a $B(\mathbf{Z}/2)$ sitting at 0. Bugeyed covers. And so on.

85.10. Properties of algebraic stacks

This is perhaps one of the easier projects to work on, as most of the basic theory is there now. An interesting project is discussing the various ways of defining what a proper algebraic stack is. Of course these things are really properties of morphisms of stacks. We can define singularities (up to smooth factors) etc. Prove that a connected normal stack is irreducible, etc.

85.11. Lisse étale site of an algebraic stack

This has been introduced in Cohomology of Stacks, Section 79.11. An example to show that it is not functorial with respect to 1-morphisms of algebraic stacks is discussed in Examples, Section 82.50. Of course a lot more could be said about this, but it turns out to be very useful to prove things using the “big” étale site as much as possible.

85.12. Things you always wanted to know but were afraid to ask

There are going to be lots of lemmas that you use over and over again that are useful but aren't really mentioned specifically in the literature, or it isn't easy to find references for. Bag of tricks.

Example: Given two groupoids in schemes $R \rightrightarrows U$ and $R' \rightrightarrows U'$ what does it mean to have a 1-morphism $[U/R] \rightarrow [U'/R']$ purely in terms of groupoids in schemes.

85.13. Quasi-coherent sheaves on stacks

These are defined and discussed in the chapter Cohomology of Stacks, Section 79.1. Derived categories of modules are discussed in the chapter Derived Categories of Stacks, Section 80.1. A lot more could be added to these chapters.

85.14. Flat and smooth

Artin's theorem that having a flat surjection from a scheme is a replacement for the smooth surjective condition. This is now available as Criteria for Representability, Theorem 74.16.1.

85.15. Artin's representability theorem

This is discussed in the chapter Artin's Axioms, Section 75.1. We also have an application, see Quot, Theorem 76.5.12. There should be a lot more applications and the chapter itself has to be cleaned up as well.

85.16. DM stacks are finitely covered by schemes

This all begins with Gabber's lemma I think. Somewhere in Asterisque about Faltings proof of Mordell?

85.17. Martin Olsson's paper on properness

This proves two notions of proper are the same. We can also discuss Faltings result that it suffices to use DVR's in certain cases.

85.18. Proper pushforward of coherent sheaves

No comments yet.

85.19. Keel and Mori

See [KM97]. This material has been incorporated throughout the Stacks project. See for example More on Groupoids, Section 39.12 and More on Groupoids in Spaces, Section 61.12.

85.20. Add more here

Please.

Coding Style

86.1. List of style comments

These will be changed over time, but having some here now will hopefully encourage a consistent LaTeX style. We will call “code¹” the contents of the source files.

- (1) Keep all lines in all tex files to at most 80 characters.
- (2) Do not use indentation in the tex file. Use syntax highlighting in your editor, instead of indentation, to visualize environments, etc.
- (3) Use

```
\medskip\noindent
```

 to start a new paragraph, and use

```
\noindent
```

 to start a new paragraph just after an environment.
- (4) Do not break the code for mathematical formulas across lines if possible. If the complete code complete with enclosing dollar signs does not fit on the line, then start with the first dollar sign on the first character of the next line. If it still does not fit, find a mathematically reasonable spot to break the code.
- (5) Displayed math equations should be coded as follows

```
$$
...
$$
```

 In other words, start with a double dollar sign on a line by itself and end similarly.
- (6) *Do not use any macros.* Rationale: This makes it easier to read the tex file, and start editing an arbitrary part without having to learn innumerable macros. And it doesn’t make it harder or more timeconsuming to write. Of course the disadvantage is that the same mathematical object may be TeXed differently in different places in the text, but this should be easy to spot.
- (7) The theorem environments we use are: “theorem”, “proposition”, “lemma” (plain), “definition”, “example”, “exercise”, “situation” (definition), “remark”, “remarks” (remark). Of course there is also a “proof” environment.
- (8) An environment “foo” should be coded as follows

```
\begin{foo}
```

¹It is all Knuth’s fault. See [Knu79].

```
...
...
\end{foo}
```

similarly to the way displayed equations are coded.

- (9) Instead of a “corollary”, just use “lemma” environment since likely the result will be used to prove the next bigger theorem anyway.
- (10) Directly following each lemma, proposition, or theorem is the proof of said lemma, proposition, or theorem. No nested proofs please.
- (11) The files `preamble.tex`, `chapters.tex` and `fdl.tex` are special tex files. Apart from these, each tex file has the following structure

```
\input{preamble}
\begin{document}
\title{Title}
\maketitle
\tableofcontents
...
...
\input{chapters}
\bibliography{my}
\bibliographystyle{amsalpha}
\end{document}
```

- (12) Try to add labels to lemmas, propositions, theorems, and even remarks, exercise, and other environments. If labelling a lemma use something like

```
\begin{lemma}
\label{lemma-bar}
...
\end{lemma}
```

Similarly for all other environments. In other words, the label of a environment named “foo” starts with “foo-”. In addition to this please make all labels consist only of lower case letters, digits, and the symbol “-”.

- (13) Never refer to “the lemma above” (or proposition, etc). Instead use:

```
Lemma \ref{lemma-bar} above
```

This means that later moving lemmas around is basically harmless.

- (14) Cross-file referencing. To reference a lemma labeled “lemma-bar” in the file `foo.tex` which has title “Foo”, please use the following code

```
Foo, Lemma \ref{foo-lemma-bar}
```

If this does not work, then take a look at the file `preamble.tex` to find the correct expression to use. This will produce the “Foo, Lemma <link>” in the output file so it will be clear that the link points out of the file.

- (15) If at all possible avoid forward references in proof environments. (It should be possible to write an automated test for this.)
- (16) Do not start any sentence with a mathematical symbol.
- (17) Do not have a sentence of the type “This follows from the following” just before a lemma, proposition, or theorem. Every sentence ends with a period.

- (18) State all hypotheses in each lemma, proposition, theorem. This makes it easier for readers to see if a given lemma, proposition, or theorem applies to their particular problem.
- (19) Keep proofs short; less than 1 page in pdf or dvi. You can always achieve this by splitting out the proof in lemmas etc.
- (20) In a defining property foobar use `{\it foobar}` in the code inside the definition environment. Similarly if the definition occurs in the text of the document. This will make it easier for the reader to see what it is that is being defined.
- (21) Put any definition that will be used outside the section it is in, in its own definition environment. Temporary definitions may be made in the text. A tricky case is that of mathematical constructions (which are often definitions involving interrelated lemmas). Maybe a good solution is to have them in their own short section so users can refer to the section instead of a definition.
- (22) Do not number equations unless they are actually being referenced somewhere in the text. We can always add labels later.
- (23) In statements of lemmas, propositions and theorems and in proofs keep the sentences short. For example, instead of “Let R be a ring and let M be an R -module.” write “Let R be a ring. Let M be an R -module.”. Rationale: This makes it easier to parse the trickier parts of proofs and statements.
- (24) Use the `\section` command to make sections, but try to avoid using subsections and sub-subsections.
- (25) Avoid using complicated latex constructions.

Obsolete

87.1. Introduction

In this chapter we put some lemmas that have become “obsolete” (see [Mil17]).

87.2. Obsolete algebra lemmas

Lemma 87.2.1. *Let M be an R -module of finite presentation. For any surjection $\alpha : R^{\oplus n} \rightarrow M$ the kernel of α is a finite R -module.*

Proof. This is a special case of Algebra, Lemma 10.5.3. □

The following technical lemma says that you can lift any sequence of relations from a fibre to the whole space of a ring map which is essentially of finite type, in a suitable sense.

Lemma 87.2.2. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Let $\mathfrak{q} \subset S$ be a prime lying over \mathfrak{p} . Assume $S_{\mathfrak{q}}$ is essentially of finite type over $R_{\mathfrak{p}}$. Assume given*

- (1) *an integer $n \geq 0$,*
- (2) *a prime $\mathfrak{a} \subset \kappa(\mathfrak{p})[x_1, \dots, x_n]$,*
- (3) *a surjective $\kappa(\mathfrak{p})$ -homomorphism*

$$\psi : (\kappa(\mathfrak{p})[x_1, \dots, x_n])_{\mathfrak{a}} \longrightarrow S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}},$$

and

- (4) *elements $\bar{f}_1, \dots, \bar{f}_e$ in $\text{Ker}(\psi)$.*

Then there exist

- (1) *an integer $m \geq 0$,*
- (2) *and element $g \in S$, $g \notin \mathfrak{q}$,*
- (3) *a map*

$$\Psi : R[x_1, \dots, x_n, x_{n+1}, \dots, x_{n+m}] \longrightarrow S_g,$$

and

- (4) *elements $f_1, \dots, f_e, f_{e+1}, \dots, f_{e+m}$ of $\text{Ker}(\Psi)$*

such that

- (1) *the following diagram commutes*

$$\begin{array}{ccc} R[x_1, \dots, x_{n+m}] & \xrightarrow{x_{n+j} \mapsto 0} & (\kappa(\mathfrak{p})[x_1, \dots, x_n])_{\mathfrak{a}}, \\ \Psi \downarrow & & \downarrow \psi \\ S_g & \longrightarrow & S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \end{array}$$

- (2) *the element f_i , $i \leq n$ maps to a unit times \bar{f}_i in the local ring*

$$(\kappa(\mathfrak{p})[x_1, \dots, x_{n+m}]_{(\mathfrak{a}, x_{n+1}, \dots, x_{n+m})},$$

- (3) the element f_{e+j} maps to a unit times x_{n+j} in the same local ring, and
- (4) the induced map $R[x_1, \dots, x_{n+m}]_{\mathfrak{b}} \rightarrow S_{\mathfrak{q}}$ is surjective, where $\mathfrak{b} = \Psi^{-1}(\mathfrak{q}S_g)$.

Proof. We claim that it suffices to prove the lemma in case R and S are local with maximal ideals \mathfrak{p} and \mathfrak{q} . Namely, suppose we have constructed

$$\Psi' : R_{\mathfrak{p}}[x_1, \dots, x_{n+m}] \longrightarrow S_{\mathfrak{q}}$$

and $f'_1, \dots, f'_{e+m} \in R_{\mathfrak{p}}[x_1, \dots, x_{n+m}]$ with all the required properties. Then there exists an element $f \in R$, $f \notin \mathfrak{p}$ such that each ff'_k comes from an element $f_k \in R[x_1, \dots, x_{n+m}]$. Moreover, for a suitable $g \in S$, $g \notin \mathfrak{q}$ the elements $\Psi'(x_i)$ are the image of elements $y_i \in S_g$. Let Ψ be the R -algebra map defined by the rule $\Psi(x_i) = y_i$. Since $\Psi(f_i)$ is zero in the localization $S_{\mathfrak{q}}$ we may after possibly replacing g assume that $\Psi(f_i) = 0$. This proves the claim.

Thus we may assume R and S are local with maximal ideals \mathfrak{p} and \mathfrak{q} . Pick $y_1, \dots, y_n \in S$ such that $y_i \bmod \mathfrak{p}S = \psi(x_i)$. Let $y_{n+1}, \dots, y_{n+m} \in S$ be elements which generate an R -subalgebra of which S is the localization. These exist by the assumption that S is essentially of finite type over R . Since ψ is surjective we may write $y_{n+j} \bmod \mathfrak{p}S = \psi(h_j)$ for some $h_j \in \kappa(\mathfrak{p})[x_1, \dots, x_n]_{\mathfrak{a}}$. Write $h_j = g_j/d$, $g_j \in \kappa(\mathfrak{p})[x_1, \dots, x_n]$ for some common denominator $d \in \kappa(\mathfrak{p})[x_1, \dots, x_n]$, $d \notin \mathfrak{a}$. Choose lifts $G_j, D \in R[x_1, \dots, x_n]$ of g_j and d . Set $y'_{n+j} = D(y_1, \dots, y_n)y_{n+j} - G_j(y_1, \dots, y_n)$. By construction $y'_{n+j} \in \mathfrak{p}S$. It is clear that $y_1, \dots, y_n, y'_1, \dots, y'_{n+m}$ generate an R -subalgebra of S whose localization is S . We define

$$\Psi : R[x_1, \dots, x_{n+m}] \rightarrow S$$

to be the map that sends x_i to y_i for $i = 1, \dots, n$ and x_{n+j} to y'_{n+j} for $j = 1, \dots, m$. Properties (1) and (4) are clear by construction. Moreover the ideal \mathfrak{b} maps onto the ideal $(\mathfrak{a}, x_{n+1}, \dots, x_{n+m})$ in the polynomial ring $\kappa(\mathfrak{p})[x_1, \dots, x_{n+m}]$.

Denote $J = \text{Ker}(\Psi)$. We have a short exact sequence

$$0 \rightarrow J_{\mathfrak{b}} \rightarrow R[x_1, \dots, x_{n+m}]_{\mathfrak{b}} \rightarrow S_{\mathfrak{q}} \rightarrow 0.$$

The surjectivity comes from our choice of $y_1, \dots, y_n, y'_1, \dots, y'_{n+m}$ above. This implies that

$$J_{\mathfrak{b}}/\mathfrak{p}J_{\mathfrak{b}} \rightarrow \kappa(\mathfrak{p})[x_1, \dots, x_{n+m}]_{(\mathfrak{a}, x_{n+1}, \dots, x_{n+m})} \rightarrow S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \rightarrow 0$$

is exact. By construction x_i maps to $\psi(x_i)$ and x_{n+j} maps to zero under the last map. Thus it is easy to choose f_i as in (2) and (3) of the lemma. \square

Remark 87.2.3 (Projective resolutions). Let R be a ring. For any set S we let $F(S)$ denote the free R -module on S . Then any left R -module has the following two step resolution

$$F(M \times M) \oplus F(R \times M) \rightarrow F(M) \rightarrow M \rightarrow 0.$$

The first map is given by the rule

$$[m_1, m_2] \oplus [r, m] \mapsto [m_1 + m_2] - [m_1] - [m_2] + [rm] - r[m].$$

Lemma 87.2.4. Let $A \rightarrow B$ be a finite type, flat ring map with A an integral domain. Then B is a finitely presented A -algebra.

Proof. Special case of More on Flatness, Proposition 37.12.9. \square

Lemma 87.2.5. *Let R be a domain with fraction field K . Let $S = R[x_1, \dots, x_n]$ be a polynomial ring over R . Let M be a finite S -module. Assume that M is flat over R . If for every subring $R \subset R' \subset K$, $R \neq R'$ the module $M \otimes_R R'$ is finitely presented over $S \otimes_R R'$, then M is finitely presented over S .*

Proof. This lemma is true because M is finitely presented even without the assumption that $M \otimes_R R'$ is finitely presented for every R' as in the statement of the lemma. This follows from More on Flatness, Proposition 37.12.9. Originally this lemma had an erroneous proof (thanks to Ofer Gabber for finding the gap) and was used in an alternative proof of the proposition cited. To reinstate this lemma, we need a correct argument in case R is a local normal domain using only results from the chapters on commutative algebra; please email stacks.project@gmail.com if you have an argument. \square

87.3. Lemmas related to ZMT

The lemmas in this section were originally used in the proof of the (algebraic version of) Zariski's Main Theorem, Algebra, Theorem 10.119.13.

Lemma 87.3.1. *Let $\varphi : R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \dots + \varphi(a_n)t^n = 0$. Set $u_n = \varphi(a_n)$, $u_{n-1} = u_n t + \varphi(a_{n-1})$, and so on till $u_1 = u_2 t + \varphi(a_1)$. Then all of u_n, u_{n-1}, \dots, u_1 and $u_n t, u_{n-1} t, \dots, u_1 t$ are integral over R , and the ideals $(\varphi(a_0), \dots, \varphi(a_n))$ and (u_n, \dots, u_1) of S are equal.*

Proof. We prove this by induction on n . As $u_n = \varphi(a_n)$ we conclude from Algebra, Lemma 10.119.1 that $u_n t$ is integral over R . Of course $u_n = \varphi(a_n)$ is integral over R . Then $u_{n-1} = u_n t + \varphi(a_{n-1})$ is integral over R (see Algebra, Lemma 10.35.7) and we have

$$\varphi(a_0) + \varphi(a_1)t + \dots + \varphi(a_{n-1})t^{n-1} + u_{n-1}t^{n-1} = 0.$$

Hence by the induction hypothesis applied to the map $S' \rightarrow S$ where S' is the integral closure of R in S and the displayed equation we see that u_{n-1}, \dots, u_1 and $u_{n-1}t, \dots, u_1t$ are all in S' too. The statement on the ideals is immediate from the shape of the elements and the fact that $u_1t + \varphi(a_0) = 0$. \square

Lemma 87.3.2. *Let $\varphi : R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \dots + \varphi(a_n)t^n = 0$. Let $J \subset S$ be an ideal such that for at least one i we have $\varphi(a_i) \notin J$. Then there exists a $u \in S$, $u \notin J$ such that both u and ut are integral over R .*

Proof. This is immediate from Lemma 87.3.1 since one of the elements u_i will not be in J . \square

The following two lemmas are a way of describing closed subschemes of \mathbf{P}_R^1 cut out by one (nondegenerate) equation.

Lemma 87.3.3. *Let R be a ring. Let $F(X, Y) \in R[X, Y]$ be homogeneous of degree d . Assume that for every prime \mathfrak{p} of R at least one coefficient of F is not in \mathfrak{p} . Let $S = R[X, Y]/(F)$ as a graded ring. Then for all $n \geq d$ the R -module S_n is finite locally free of rank d .*

Proof. The R -module S_n has a presentation

$$R[X, Y]_{n-d} \rightarrow R[X, Y]_n \rightarrow S_n \rightarrow 0.$$

Thus by Algebra, Lemma 10.76.3 it is enough to show that multiplication by F induces an injective map $\kappa(\mathfrak{p})[X, Y] \rightarrow \kappa(\mathfrak{p})[X, Y]$ for all primes \mathfrak{p} . This is clear from the assumption that F does not map to the zero polynomial mod \mathfrak{p} . The assertion on ranks is clear from this as well. \square

Lemma 87.3.4. *Let k be a field. Let $F, G \in k[X, Y]$ be homogeneous of degrees d, e . Assume F, G relatively prime. Then multiplication by G is injective on $S = k[X, Y]/(F)$.*

Proof. This is one way to define “relatively prime”. If you have another definition, then you can show it is equivalent to this one. \square

Lemma 87.3.5. *Let R be a ring. Let $F(X, Y) \in R[X, Y]$ be homogeneous of degree d . Let $S = R[X, Y]/(F)$ as a graded ring. Let $\mathfrak{p} \subset R$ be a prime such that some coefficient of F is not in \mathfrak{p} . There exists an $f \in R$ $f \notin \mathfrak{p}$, an integer e , and a $G \in R[X, Y]_e$ such that multiplication by G induces isomorphisms $(S_n)_f \rightarrow (S_{n+e})_f$ for all $n \geq d$.*

Proof. During the course of the proof we may replace R by R_f for $f \in R$, $f \notin \mathfrak{p}$ (finitely often). As a first step we do such a replacement such that some coefficient of F is invertible in R . In particular the modules S_n are now locally free of rank d for $n \geq d$ by Lemma 87.3.3. Pick any $G \in R[X, Y]_e$ such that the image of G in $\kappa(\mathfrak{p})[X, Y]$ is relatively prime to the image of $F(X, Y)$ (this is possible for some e). Apply Algebra, Lemma 10.76.3 to the map induced by multiplication by G from $S_d \rightarrow S_{d+e}$. By our choice of G and Lemma 87.3.4 we see $S_d \otimes \kappa(\mathfrak{p}) \rightarrow S_{d+e} \otimes \kappa(\mathfrak{p})$ is bijective. Thus, after replacing R by R_f for a suitable f we may assume that $G : S_d \rightarrow S_{d+e}$ is bijective. This in turn implies that the image of G in $\kappa(\mathfrak{p}')[X, Y]$ is relatively prime to the image of F for all primes \mathfrak{p}' of R . And then by Algebra, Lemma 10.76.3 again we see that all the maps $G : S_d \rightarrow S_{d+e}$, $n \geq d$ are isomorphisms. \square

Remark 87.3.6. Let R be a ring. Suppose that we have $F \in R[X, Y]_d$ and $G \in R[X, Y]_e$ such that, setting $S = R[X, Y]/(F)$ we have (1) S_n is finite locally free of rank d for all $n \geq d$, and (2) multiplication by G defines isomorphisms $S_n \rightarrow S_{n+e}$ for all $n \geq d$. In this case we may define a finite, locally free R -algebra A as follows:

- (1) as an R -module $A = S_{ed}$, and
- (2) multiplication $A \times A \rightarrow A$ is given by the rule that $H_1 H_2 = H_3$ if and only if $G^d H_3 = H_1 H_2$ in S_{2ed} .

This makes sense because multiplication by G^d induces a bijective map $S_{de} \rightarrow S_{2de}$. It is easy to see that this defines a ring structure. Note the confusing fact that the element G^d defines the unit element of the ring A .

Lemma 87.3.7. *Let R be a ring, let $f \in R$. Suppose we have S, S' and the solid arrows forming the following commutative diagram of rings*

Assume that $R_f \rightarrow S'$ is finite. Then we can find a finite ring map $R \rightarrow S''$ and dotted arrows as in the diagram such that $S' = (S'')_f$.

Proof. Namely, suppose that S' is generated by x_i over R_f , $i = 1, \dots, w$. Let $P_i(t) \in R_f[t]$ be a monic polynomial such that $P_i(x_i) = 0$. Say P_i has degree $d_i > 0$. Write $P_i(t) = t^{d_i} + \sum_{j < d_i} (a_{ij}/f^n)t^j$ for some uniform n . Also write the image of x_i in S_f as g_i/f^n for suitable $g_i \in S$. Then we know that the element $\xi_i = f^{nd_i}g_i^{d_i} + \sum_{j < d_i} f^{n(d_i-j)}a_{ij}g_i^j$ of S is killed by a power of f . Hence upon increasing n to n' , which replaces g_i by $f^{n'-n}g_i$ we may assume $\xi_i = 0$. Then S' is generated by the elements $f^n x_i$, each of which is a zero of the monic polynomial $Q_i(t) = t^{d_i} + \sum_{j < d_i} f^{n(d_i-j)}a_{ij}t^j$ with coefficients in R . Also, by construction $Q_i(f^n g_i) = 0$ in S . Thus we get a finite R -algebra $S'' = R[z_1, \dots, z_w]/(Q_1(z_1), \dots, Q_w(z_w))$ which fits into a commutative diagram as above. The map $\alpha : S'' \rightarrow S$ maps z_i to $f^n g_i$ and the map $\beta : S'' \rightarrow S'$ maps z_i to $f^n x_i$. It may not yet be the case that β induces an isomorphism $(S'')_f \cong S'$. For the moment we only know that this map is surjective. The problem is that there could be elements $h/f^n \in (S'')_f$ which map to zero in S' but are not zero. In this case $\beta(h)$ is an element of S such that $f^N \beta(h) = 0$ for some N . Thus $f^N h$ is an element of the ideal $J = \{h \in S'' \mid \alpha(h) = 0 \text{ and } \beta(h) = 0\}$ of S'' . OK, and it is easy to see that S''/J does the job. \square

87.4. Formally smooth ring maps

Lemma 87.4.1. *Let R be a ring. Let S be a R -algebra. If S is of finite presentation and formally smooth over R then S is smooth over R .*

Proof. See Algebra, Proposition 10.133.13. \square

87.5. Simplicial methods

Lemma 87.5.1. *Assumptions and notation as in Simplicial, Lemma 14.31.1. There exists a section $g : U \rightarrow V$ to the morphism f and the composition $g \circ f$ is homotopy equivalent to the identity on V . In particular, the morphism f is a homotopy equivalence.*

Proof. Immediate from Simplicial, Lemmas 14.31.1 and 14.29.8. \square

87.6. Obsolete lemmas on schemes

Lemmas that seem superfluous.

Lemma 87.6.1. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $X \subset \mathbf{P}_R^n$ be a closed subscheme. Assume that $R = \Gamma(X, \mathcal{O}_X)$. Then the special fibre X_k is geometrically connected.*

Proof. This is a special case of More on Morphisms, Theorem 36.36.4. \square

Lemma 87.6.2. *Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ . Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) *For any short exact sequence of coherent sheaves if two out of three of them have property \mathcal{P} then so does the third.*
- (2) *If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.*
- (3) *For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $(Z \rightarrow X)_*\mathcal{I}$.*
- (4) *There exists some coherent sheaf \mathcal{G} on X such that*
 - (a) *$\text{Supp}(\mathcal{G}) = Z_0$,*
 - (b) *\mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ , and*
 - (c) *property \mathcal{P} holds for \mathcal{G} .*

Then property \mathcal{P} holds for every coherent sheaf \mathcal{F} on X whose support is contained in Z_0 .

Proof. The proof is a variant on the proof of Cohomology of Schemes, Lemma 29.12.5. In exactly the same manner as in that proof we see that any coherent sheaf whose support is strictly contained in Z_0 has property \mathcal{P} .

Consider a coherent sheaf \mathcal{G} as in (3). By Cohomology of Schemes, Lemma 29.12.2 there exists a sheaf of ideals \mathcal{I} on Z_0 and a short exact sequence

$$0 \rightarrow ((Z_0 \rightarrow X)_*\mathcal{I})^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0$$

where the support of \mathcal{Q} is strictly contained in Z_0 . In particular $r > 0$ and \mathcal{I} is nonzero because the support of \mathcal{G} is equal to Z . Since \mathcal{Q} has property \mathcal{P} we conclude that also $((Z_0 \rightarrow X)_*\mathcal{I})^{\oplus r}$ has property \mathcal{P} . By (2) we deduce property \mathcal{P} for $(Z_0 \rightarrow X)_*\mathcal{I}$. Slotting this into the proof of Cohomology of Schemes, Lemma 29.12.5 at the appropriate point gives the lemma. Some details omitted. \square

Lemma 87.6.3. *Let X be a Noetherian scheme. Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) *For any short exact sequence of coherent sheaves if two out of three of them have property \mathcal{P} then so does the third.*
- (2) *If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.*
- (3) *For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf \mathcal{G} such that*
 - (a) *$\text{Supp}(\mathcal{G}) = Z$,*
 - (b) *\mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ , and*
 - (c) *property \mathcal{P} holds for \mathcal{G} .*

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. This follows from Lemma 87.6.2 in exactly the same way that Cohomology of Schemes, Lemma 29.12.6 follows from Cohomology of Schemes, Lemma 29.12.5. \square

87.7. Functor of quotients

Lemma 87.7.1. *Let $S = \text{Spec}(R)$ be an affine scheme. Let X be an algebraic space over S . Let $q_i : \mathcal{F} \rightarrow \mathcal{Q}_i$, $i = 1, 2$ be surjective maps of quasi-coherent \mathcal{O}_X -modules.*

Assume \mathcal{Q}_1 flat over S . Let $T \rightarrow S$ be a quasi-compact morphism of schemes such that there exists a factorization

$$\begin{array}{ccc} & \mathcal{F}_T & \\ q_{1,T} \swarrow & & \searrow q_{2,T} \\ \mathcal{Q}_{1,T} & \cdots & \mathcal{Q}_{2,T} \end{array}$$

Then exists a closed subscheme $Z \subset S$ such that (a) $T \rightarrow S$ factors through Z and (b) $q_{1,Z}$ factors through $q_{2,Z}$. If $\text{Ker}(q_2)$ is a finite type \mathcal{O}_X -module and X quasi-compact, then we can take $Z \rightarrow S$ of finite presentation.

Proof. Apply Quot, Lemma 76.7.5 to the map $\text{Ker}(q_2) \rightarrow \mathcal{Q}_1$. \square

87.8. Spaces and fpqc coverings

The material here was made obsolete by Gabber's argument showing that algebraic spaces satisfy the sheaf condition with respect to fpqc coverings. Please visit Properties of Spaces, Section 48.14.

Lemma 87.8.1. *Let S be a scheme. Let X be an algebraic space over S . Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a fpqc covering of schemes over S . Then the map*

$$\text{Mor}_S(T, X) \longrightarrow \prod_{i \in I} \text{Mor}_S(T_i, X)$$

is injective.

Proof. Immediate consequence of Properties of Spaces, Proposition 48.14.1. \square

Lemma 87.8.2. *Let S be a scheme. Let X be an algebraic space over S . Let $X = \bigcup_{j \in J} X_j$ be a Zariski covering, see Spaces, Definition 47.12.5. If each X_j satisfies the sheaf property for the fpqc topology then X satisfies the sheaf property for the fpqc topology.*

Proof. This is true because all algebraic spaces satisfy the sheaf property for the fpqc topology, see Properties of Spaces, Proposition 48.14.1. \square

Lemma 87.8.3. *Let S be a scheme. Let X be an algebraic space over S . If X is Zariski locally quasi-separated over S , then X satisfies the sheaf condition for the fpqc topology.*

Proof. Immediate consequence of the general Properties of Spaces, Proposition 48.14.1. \square

Remark 87.8.4. This remark used to discuss to what extend the original proof of Lemma 87.8.3 (of December 18, 2009) generalizes.

87.9. Very reasonable algebraic spaces

Material that is somewhat obsolete.

Lemma 87.9.1. *Let S be a scheme. Let X be a reasonable algebraic space over S . Then $|X|$ is Kolmogorov (see Topology, Definition 5.7.4).*

Proof. Follows from the definitions and Decent Spaces, Lemma 50.10.5. \square

In the rest of this section we make some remarks about very reasonable algebraic spaces. If there exists a scheme U and a surjective, étale, quasi-compact morphism $U \rightarrow X$, then X is very reasonable, see Decent Spaces, Lemma 50.4.7.

Lemma 87.9.2. *A scheme is very reasonable.*

Proof. This is true because the identity map is a quasi-compact, surjective étale morphism. \square

Lemma 87.9.3. *Let S be a scheme. Let X be an algebraic space over S . If there exists a Zariski open covering $X = \bigcup X_i$ such that each X_i is very reasonable, then X is very reasonable.*

Proof. This is case (ϵ) of Decent Spaces, Lemma 50.5.2. \square

Lemma 87.9.4. *An algebraic space which is Zariski locally quasi-separated is very reasonable. In particular any quasi-separated algebraic space is very reasonable.*

Proof. This is one of the implications of Decent Spaces, Lemma 50.5.1. \square

Lemma 87.9.5. *Let S be a scheme. Let X, Y be algebraic spaces over S . Let $Y \rightarrow X$ be a representable morphism. If X is very reasonable, so is Y .*

Proof. This is case (ϵ) of Decent Spaces, Lemma 50.5.3. \square

Remark 87.9.6. Very reasonable algebraic spaces form a strictly larger collection than Zariski locally quasi-separated algebraic spaces. Consider an algebraic space of the form $X = [U/G]$ (see Spaces, Definition 47.14.4) where G is a finite group acting without fixed points on a non-quasi-separated scheme U . Namely, in this case $U \times_X U = U \times G$ and clearly both projections to U are quasi-compact, hence X is very reasonable. On the other hand, the diagonal $U \times_X U \rightarrow U \times U$ is not quasi-compact, hence this algebraic space is not quasi-separated. Now, take U the infinite affine space over a field k of characteristic $\neq 2$ with zero doubled, see Schemes, Example 25.21.4. Let $0_1, 0_2$ be the two zeros of U . Let $G = \{+1, -1\}$, and let -1 act by -1 on all coordinates, and by switching 0_1 and 0_2 . Then $[U/G]$ is very reasonable but not Zariski locally quasi-separated (details omitted).

Warning: The following lemma should be used with caution, as the schemes U_i in it are not necessarily separated or even quasi-separated.

Lemma 87.9.7. *Let S be a scheme. Let X be a very reasonable algebraic space over S . There exists a set of schemes U_i and morphisms $U_i \rightarrow X$ such that*

- (1) *each U_i is a quasi-compact scheme,*
- (2) *each $U_i \rightarrow X$ is étale,*
- (3) *both projections $U_i \times_X U_i \rightarrow U_i$ are quasi-compact, and*
- (4) *the morphism $\coprod U_i \rightarrow X$ is surjective (and étale).*

Proof. Decent Spaces, Definition 50.6.1 says that there exist $U_i \rightarrow X$ such that (2), (3) and (4) hold. Fix i , and set $R_i = U_i \times_X U_i$, and denote $s, t : R_i \rightarrow U_i$ the projections. For any affine open $W \subset U_i$ the open $W' = t(s^{-1}(W)) \subset U_i$ is a quasi-compact R_i -invariant open (see Groupoids, Lemma 38.17.2). Hence W' is a quasi-compact scheme, $W' \rightarrow X$ is étale, and $W' \times_X W' = s^{-1}(W') = t^{-1}(W')$ so both projections $W' \times_X W' \rightarrow W'$ are quasi-compact. This means the family of $W' \rightarrow X$, where $W \subset U_i$ runs through the members of affine open coverings of the U_i gives what we want. \square

87.10. Variants of cotangent complexes for schemes

This section gives an alternative construction of the cotangent complex of a morphism of schemes. This section is currently in the obsolete chapter as we can get by with the easier version discussed in Cotangent, Section 70.24 for applications.

Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{C}_{X/Y}$ be the category whose objects are commutative diagrams

$$(87.10.0.1) \quad \begin{array}{ccccc} X & \longleftarrow & U & \longrightarrow & A \\ \downarrow & & \downarrow & \searrow^{i} & \\ Y & \longleftarrow & V & & \end{array}$$

of schemes where

- (1) U is an open subscheme of X ,
- (2) V is an open subscheme of Y , and
- (3) there exists an isomorphism $A = V \times \text{Spec}(P)$ over V where P is a polynomial algebra over \mathbf{Z} (on some set of variables).

In other words, A is an (infinite dimensional) affine space over V . Morphisms are given by commutative diagrams.

Notation. An object of $\mathcal{C}_{X/Y}$, i.e., a diagram (87.10.0.1), is often denoted $U \rightarrow A$ where it is understood that (a) U is an open subscheme of X , (b) $U \rightarrow A$ is a morphism over Y , (c) the image of the structure morphism $A \rightarrow Y$ is an open $V \subset Y$, and (d) $A \rightarrow V$ is an affine space. We'll write $U \rightarrow A/V$ to indicate $V \subset Y$ is the image of $A \rightarrow Y$. Recall that X_{Zar} denotes the small Zariski site X . There are forgetful functors

$$\mathcal{C}_{X/Y} \rightarrow X_{Zar}, (U \rightarrow A) \mapsto U \quad \text{and} \quad \mathcal{C}_{X/Y} \mapsto Y_{Zar}, (U \rightarrow A/V) \mapsto V.$$

Lemma 87.10.1. *Let $X \rightarrow Y$ be a morphism of schemes.*

- (1) *The category $\mathcal{C}_{X/Y}$ is fibred over X_{Zar} .*
- (2) *The category $\mathcal{C}_{X/Y}$ is fibred over Y_{Zar} .*
- (3) *The category $\mathcal{C}_{X/Y}$ is fibred over the category of pairs (U, V) where $U \subset X$, $V \subset Y$ are open and $f(U) \subset V$.*

Proof. Ad (1). Given an object $U \rightarrow A$ of $\mathcal{C}_{X/Y}$ and a morphism $U' \rightarrow U$ of X_{Zar} consider the object $i' : U' \rightarrow A$ of $\mathcal{C}_{X/Y}$ where i' is the composition of i and $U' \rightarrow U$. The morphism $(U' \rightarrow A) \rightarrow (U \rightarrow A)$ of $\mathcal{C}_{X/Y}$ is strongly cartesian over X_{Zar} .

Ad (2). Given an object $U \rightarrow A/V$ and $V' \rightarrow V$ we can set $U' = U \cap f^{-1}(V')$ and $A' = V' \times_V A$ to obtain a strongly cartesian morphism $(U' \rightarrow A') \rightarrow (U \rightarrow A)$ over $V' \rightarrow V$.

Ad (3). Denote $(X/Y)_{Zar}$ the category in (3). Given $U \rightarrow A/V$ and a morphism $(U', V') \rightarrow (U, V)$ in $(X/Y)_{Zar}$ we can consider $A' = V' \times_V A$. Then the morphism $(U' \rightarrow A'/V') \rightarrow (U \rightarrow A/V)$ is strongly cartesian in $\mathcal{C}_{X/Y}$ over $(X/Y)_{Zar}$. \square

We obtain a topology τ_X on $\mathcal{C}_{X/Y}$ by using the topology inherited from X_{Zar} (see Stacks, Section 8.10). If not otherwise stated this is the topology on $\mathcal{C}_{X/Y}$ we will consider. To be precise, a family of morphisms $\{(U_i \rightarrow A_i) \rightarrow (U \rightarrow A)\}$ is a covering of $\mathcal{C}_{X/Y}$ if and only if

- (1) $U = \bigcup U_i$, and
- (2) $A_i = A$ for all i .

We obtain the same collection of sheaves if we allow $A_i \cong A$ in (2). The functor u defines a morphism of topoi $\pi : Sh(\mathcal{C}_{X/Y}) \rightarrow Sh(X_{Zar})$.

The site $\mathcal{C}_{X/Y}$ comes with several sheaves of rings.

- (1) The sheaf \mathcal{O} given by the rule $(U \rightarrow A) \mapsto \mathcal{O}(A)$.
- (2) The sheaf $\underline{\mathcal{O}}_X = \pi^{-1}\mathcal{O}_X$ given by the rule $(U \rightarrow A) \mapsto \mathcal{O}(U)$.
- (3) The sheaf $\underline{\mathcal{O}}_Y$ given by the rule $(U \rightarrow A/V) \mapsto \mathcal{O}(V)$.

We obtain morphisms of ringed topoi

$$(87.10.1.1) \quad \begin{array}{ccc} (Sh(\mathcal{C}_{X/Y}), \underline{\mathcal{O}}_X) & \xrightarrow{i} & (Sh(\mathcal{C}_{X/Y}), \mathcal{O}) \\ \pi \downarrow & & \\ (Sh(X_{Zar}), \mathcal{O}_X) & & \end{array}$$

The morphism i is the identity on underlying topoi and $i^\# : \mathcal{O} \rightarrow \underline{\mathcal{O}}_X$ is the obvious map. The map π is a special case of Cohomology on Sites, Situation 21.28.1. An important role will be played in the following by the derived functors $Li^* : D(\mathcal{O}) \rightarrow D(\underline{\mathcal{O}}_X)$ left adjoint to $Ri_* = i_* : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O})$ and $L\pi_! : D(\underline{\mathcal{O}}_X) \rightarrow D(\mathcal{O}_X)$ left adjoint to $\pi^* = \pi^{-1} : D(\mathcal{O}_X) \rightarrow D(\underline{\mathcal{O}}_X)$.

Remark 87.10.2. We obtain a second topology τ_Y on $\mathcal{C}_{X/Y}$ by taking the topology inherited from Y_{Zar} . There is a third topology $\tau_{X \rightarrow Y}$ where a family of morphisms $\{(U_i \rightarrow A_i) \rightarrow (U \rightarrow A)\}$ is a covering if and only if $U = \bigcup U_i$, $V = \bigcup V_i$ and $A_i \cong V_i \times_V A$. This is the topology inherited from the topology on the site $(X/Y)_{Zar}$ whose underlying category is the category of pairs (U, V) as in Lemma 87.10.1 part (3). The coverings of $(X/Y)_{Zar}$ are families $\{(U_i, V_i) \rightarrow (U, V)\}$ such that $U = \bigcup U_i$ and $V = \bigcup V_i$. There are morphisms of topoi

$$Sh(\mathcal{C}_{X/Y}) = Sh(\mathcal{C}_{X/Y}, \tau_X) \longleftarrow Sh(\mathcal{C}_{X/Y}, \tau_{X \rightarrow Y}) \longrightarrow Sh(\mathcal{C}_{X/Y}, \tau_Y)$$

(recall that τ_X is our “default” topology). The pullback functors for these arrows are sheafification and pushforward is the identity on underlying presheaves. The diagram of topoi

$$\begin{array}{ccccc} Sh(X_{Zar}) & \xleftarrow{\pi} & Sh(\mathcal{C}_{X/Y}) & \xleftarrow{\quad} & Sh(\mathcal{C}_{X/Y}, \tau_{X \rightarrow Y}) \\ \downarrow f & & & & \downarrow \\ Sh(Y_{Zar}) & \xleftarrow{\quad} & & \xleftarrow{\quad} & Sh(\mathcal{C}_{X/Y}, \tau_Y) \end{array}$$

is **not** commutative. Namely, the pullback of a nonzero abelian sheaf on Y is a nonzero abelian sheaf on $(\mathcal{C}_{X/Y}, \tau_{X \rightarrow Y})$, but we can certainly find examples where such a sheaf pulls back to zero on X . Note that any presheaf \mathcal{F} on Y_{Zar} gives a sheaf $\underline{\mathcal{F}}$ on $\mathcal{C}_{Y/X}$ by the rule which assigns to $(U \rightarrow A/V)$ the set $\mathcal{F}(V)$. Even if \mathcal{F} happens to be a sheaf it isn’t true in general that $\underline{\mathcal{F}} = \pi^{-1}f^{-1}\mathcal{F}$. This is related to the noncommutativity of the diagram above, as we can describe $\underline{\mathcal{F}}$ as the pushforward of the pullback of \mathcal{F} to $Sh(\mathcal{C}_{X/Y}, \tau_{X \rightarrow Y})$ via the lower horizontal and right vertical arrows. An example is the sheaf $\underline{\mathcal{O}}_Y$. But what is true is that there is a map $\underline{\mathcal{F}} \rightarrow \pi^{-1}f^{-1}\mathcal{F}$ which is transformed (as we shall see later) into an isomorphism after applying $\pi_!$.

87.11. Deformations and obstructions of flat modules

In this section we sketch a construction of a deformation theory for the stack of coherent sheaves for any algebraic space X over a ring Λ . This material is obsolete due to the improved discussion in Quot, Section 76.6.

Our setup will be the following. We assume given

- (1) a ring Λ ,
- (2) an algebraic space X over Λ ,
- (3) a Λ -algebra A , set $X_A = X \times_{\text{Spec}(\Lambda)} \text{Spec}(A)$, and
- (4) a finitely presented \mathcal{O}_{X_A} -module \mathcal{F} flat over A .

In this situation we will consider all possible surjections

$$0 \rightarrow I \rightarrow A' \rightarrow A \rightarrow 0$$

where A' is a Λ -algebra whose kernel I is an ideal of square zero in A' . Given A' we obtain a first order thickening $X_A \rightarrow X_{A'}$ of algebraic spaces over $\text{Spec}(\Lambda)$. For each of these we consider the problem of lifting \mathcal{F} to a finitely presented module \mathcal{F}' on $X_{A'}$ flat over A' . We would like to replicate the results of Deformation Theory, Lemma 69.11.1 in this setting.

To be more precise let $\text{Lift}(\mathcal{F}, A')$ denote the category of pairs (\mathcal{F}', α) where \mathcal{F}' is a finitely presented module on $X_{A'}$ flat over A' and $\alpha : \mathcal{F}'|_{X_A} \rightarrow \mathcal{F}$ is an isomorphism. Morphisms $(\mathcal{F}'_1, \alpha_1) \rightarrow (\mathcal{F}'_2, \alpha_2)$ are isomorphisms $\mathcal{F}'_1 \rightarrow \mathcal{F}'_2$ which are compatible with α_1 and α_2 . The set of isomorphism classes of $\text{Lift}(\mathcal{F}, A')$ is denoted $\text{Lift}(\mathcal{F}, A')$.

Let \mathcal{G} be a sheaf of $\mathcal{O}_X \otimes_{\Lambda} A$ -modules on $X_{\text{étale}}$ flat over A . We introduce the category $\text{Lift}(\mathcal{G}, A')$ of pairs (\mathcal{G}', β) where \mathcal{G}' is a sheaf of $\mathcal{O}_X \otimes_{\Lambda} A'$ -modules flat over A' and β is an isomorphism $\mathcal{G}' \otimes_{A'} A \rightarrow \mathcal{G}$.

Lemma 87.11.1. *Notation and assumptions as above. Let $p : X_A \rightarrow X$ denote the projection. Given A' denote $p' : X_{A'} \rightarrow X$ the projection. The functor p'_* induces an equivalence of categories between*

- (1) the category $\text{Lift}(\mathcal{F}, A')$, and
- (2) the category $\text{Lift}(p_*\mathcal{F}, A')$.

Proof. FIXME. □

Let \mathcal{H} be a sheaf of $\mathcal{O} \otimes_{\Lambda} A$ -modules on $\mathcal{C}_{X/\Lambda}$ flat over A . We introduce the category $\text{Lift}_{\mathcal{O}}(\mathcal{H}, A')$ whose objects are pairs (\mathcal{H}', γ) where \mathcal{H}' is a sheaf of $\mathcal{O} \otimes_{\Lambda} A'$ -modules flat over A' and $\gamma : \mathcal{H}' \otimes_{A'} A \rightarrow \mathcal{H}$ is an isomorphism of $\mathcal{O} \otimes_{\Lambda} A$ -modules.

Let \mathcal{G} be a sheaf of $\mathcal{O}_X \otimes_{\Lambda} A$ -modules on $X_{\text{étale}}$ flat over A . Consider the morphisms i and π of Cotangent, Equation (70.26.1.1). Denote $\underline{\mathcal{G}} = \pi^{-1}(\mathcal{G})$. It is simply given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{G}(U)$ hence it is a sheaf of $\underline{\mathcal{O}}_X \otimes_{\Lambda} A$ -modules. Denote $i_*\underline{\mathcal{G}}$ the same sheaf but viewed as a sheaf of $\mathcal{O} \otimes_{\Lambda} A$ -modules.

Lemma 87.11.2. *Notation and assumptions as above. The functor $\pi_!$ induces an equivalence of categories between*

- (1) the category $\text{Lift}_{\mathcal{O}}(i_*\underline{\mathcal{G}}, A')$, and
- (2) the category $\text{Lift}(\mathcal{G}, A')$.

Proof. FIXME. □

Lemma 87.11.3. *Notation and assumptions as in Lemma 87.11.2. Consider the object*

$$L = L(\Lambda, X, A, \mathcal{G}) = L\pi_!(Li^*(i_*(\underline{\mathcal{G}})))$$

of $D(\mathcal{O}_X \otimes_{\Lambda} A)$. Given a surjection $A' \rightarrow A$ of Λ -algebras with square zero kernel I we have

- (1) *The category $Lift(\mathcal{G}, A')$ is nonempty if and only if a certain class $\xi \in Ext_{\mathcal{O}_X \otimes_{\Lambda} A}^2(L, \mathcal{G} \otimes_A I)$ is zero.*
- (2) *If $Lift(\mathcal{G}, A')$ is nonempty, then $Lift(\mathcal{G}, A')$ is principal homogeneous under $Ext_{\mathcal{O}_X \otimes_{\Lambda} A}^1(L, \mathcal{G} \otimes_A I)$.*
- (3) *Given a lift \mathcal{G}' , the set of automorphisms of \mathcal{G}' which pull back to $id_{\mathcal{G}}$ is canonically isomorphic to $Ext_{\mathcal{O}_X \otimes_{\Lambda} A}^0(L, \mathcal{G} \otimes_A I)$.*

Proof. FIXME. □

Finally, we put everything together as follows.

Proposition 87.11.4. *With $\Lambda, X, A, \mathcal{F}$ as above. There exists a canonical object $L = L(\Lambda, X, A, \mathcal{F})$ of $D(X_A)$ such that given a surjection $A' \rightarrow A$ of Λ -algebras with square zero kernel I we have*

- (1) *The category $Lift(\mathcal{F}, A')$ is nonempty if and only if a certain class $\xi \in Ext_{X_A}^2(L, \mathcal{F} \otimes_A I)$ is zero.*
- (2) *If $Lift(\mathcal{F}, A')$ is nonempty, then $Lift(\mathcal{F}, A')$ is principal homogeneous under $Ext_{X_A}^1(L, \mathcal{F} \otimes_A I)$.*
- (3) *Given a lift \mathcal{F}' , the set of automorphisms of \mathcal{F}' which pull back to $id_{\mathcal{F}}$ is canonically isomorphic to $Ext_{X_A}^0(L, \mathcal{F} \otimes_A I)$.*

Proof. FIXME. □

Lemma 87.11.5. *In the situation of Proposition 87.11.4, if $X \rightarrow \text{Spec}(\Lambda)$ is locally of finite type and Λ is Noetherian, then L is pseudo-coherent.*

Proof. FIXME. □

87.12. Modifications

Here are some obsolete results on the category of Restricted Power Series, Equation (66.13.0.1). Please visit Restricted Power Series, Section 66.13 for the current material.

Lemma 87.12.1. *Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. The category of Restricted Power Series, Equation (66.13.0.1) for A is equivalent to the category Restricted Power Series, Equation (66.13.0.1) for the henselization A^h of A .*

Proof. This is a special case of Restricted Power Series, Lemma 66.13.2. □

87.13. Duplicate references

This section is a place where we collect duplicates.

Lemma 87.13.1. *Let S be a scheme. Let X be an algebraic space over S . The map $\{\text{Spec}(k) \rightarrow X \text{ monomorphism}\} \rightarrow |X|$ is injective.*

Proof. This is a duplicate of Properties of Spaces, Lemma 48.4.11. □

Theorem 87.13.2. *Let $S = \text{Spec}(K)$ with K a field. Let \bar{s} be a geometric point of S . Let $G = \text{Gal}_{\kappa(\bar{s})}$ denote the absolute Galois group. Then there is an equivalence of categories $\text{Sh}(S_{\text{étale}}) \rightarrow G\text{-Sets}$, $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$.*

Proof. This is a duplicate of Étale Cohomology, Theorem 44.57.3. □

Remark 87.13.3. You got here because of a duplicate tag. Please see Formal Deformation Theory, Section 68.11 for the actual content.

CHAPTER 88

GNU Free Documentation License

Version 1.2, November 2002

Copyright ©2000, 2001, 2002 Free Software Foundation, Inc.

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

88.1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "**Document**", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "**you**". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "**Modified Version**" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "**Secondary Section**" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if

the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "**Invariant Sections**" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "**Cover Texts**" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "**Transparent**" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "**Opaque**".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "**Title Page**" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "**Entitled XYZ**" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "**Acknowledgements**", "**Dedications**", "**Endorsements**", or "**History**".) To "**Preserve the Title**" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards

disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

88.2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

88.3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

88.4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version

to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- H. Include an unaltered copy of this License.
 - I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
 - J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
- K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
- L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
- M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
- N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
- O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

88.5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

88.6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the

extracted document, and follow this License in all other respects regarding verbatim copying of that document.

88.7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

88.8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

88.9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

88.10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later

version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

88.11. ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright ©YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the “with...Texts.” line with this:

with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

89.1. Alphabetized definitions

- $(2, 1)$ -category in 4.28.1
 $(2, 1)$ -periodic complex in 41.3.1
 (A, B) -bimodule in 10.11.6
 (R_k) in 10.146.1
 (R_k) in 27.12.1
 (S_k) in 10.146.1
 (S_k) in 27.12.1
 (S_k) in 29.11.1
 (S_k) in 29.11.1
 (U', R', s', t', c') is cartesian over (U, R, s, t, c) in 38.19.1
1-morphisms in 4.27.1
2-category of algebraic stacks over S in 71.12.3
2-category of categories fibred in groupoids over \mathcal{C} in 4.33.6
2-category of categories fibred in setoids over \mathcal{C} in 4.37.3
2-category of categories fibred in sets over \mathcal{C} in 4.36.3
2-category of categories over \mathcal{C} in 4.30.1
2-category of fibred categories over \mathcal{C} in 4.31.9
2-category of stacks in groupoids over \mathcal{C} in 8.5.5
2-category of stacks in setoids over \mathcal{C} in 8.6.5
2-category of stacks over \mathcal{C} in 8.4.5
2-category in 4.27.1
2-morphisms in 4.27.1
2-periodic complex in 41.3.1
 α -small with respect to I in 19.2.4
 δ is compatible with γ in 45.4.1
 δ -dimension of Z in 41.7.5
 δ -functor from \mathcal{A} to \mathcal{D} in 13.3.6
 δ -functor in 12.11.1
 $\delta(\tau)$ in 83.33.2
 $\delta_j^n : [n-1] \rightarrow [n]$ in 14.2.1
 ℓ -adic cohomology in 44.96.8
 ϵ -invariant in 41.27.3
 $\text{Hom}(U, V)$ in 14.14.1
 $\text{Hom}(U, V)$ in 14.16.1
 κ -generated in 27.21.1
 \mathbf{Z}_ℓ -sheaf in 44.96.1
 \mathcal{A}^0 in 22.18.3
 \mathcal{C}_Λ in 68.3.1
 \mathcal{G} -torsor in 20.5.1
 \mathcal{G} -torsor in 21.5.1
 \mathcal{I} is cofinal in \mathcal{J} in 4.17.1
 \mathcal{I} is initial in \mathcal{J} in 4.17.3
 \mathcal{K}_X in 30.15.1
 \mathcal{O}^* in 18.31.1
 \mathcal{O}_1 -derivation in 17.23.1
 \mathcal{O}_1 -derivation in 18.32.1
 \mathcal{O}_X -module in 73.7.1
 \mathcal{S} is endowed with the topology inherited from \mathcal{C} in 8.10.2
 \mathcal{S}_F in 4.34.2
 \mathcal{S}_F in 4.35.2
 \mathcal{X} is relatively representable over \mathcal{Y} in 4.39.5
 ϕ lies over f in 4.30.2
 $\text{Sh}(\mathcal{C})$ in 7.7.5
 $\sigma_j^n : [n+1] \rightarrow [n]$ in 14.2.1
 τ G -torsor in 38.9.3
 τ G -torsor in 60.9.3
 τ local on the base in 34.18.1
 τ local on the base in 56.9.1
 τ local on the source in 34.22.1
 τ local on the source in 56.12.1
 τ local on the target in 34.18.1
 τ local on the target in 56.9.1

- τ torsor in 38.9.3
- τ torsor in 60.9.3
- τ -covering in 44.20.1
- $Adeq((Sch/S)_\tau, \mathcal{O})$ in 42.5.7
- $Adeq(\mathcal{O})$ in 42.5.7
- $Adeq(S)$ in 42.5.7
- Mod_G in 44.58.1
- Ext -group in 12.6.2
- $Fil^f(A)$ in 83.23.4
- \underline{U} in 7.13.3
- φ -derivation in 17.23.1
- $\widehat{\varphi}$ -derivation in 18.32.1
- \widehat{C}_Λ in 68.4.1
- A -biderivation in 70.12.1
- C in 34.4.9
- C_r in 44.63.2
- $C_{S/R}$ in 10.142.2
- $d(M)$ in 10.58.8
- $D_c(X, \Lambda)$ in 44.90.1
- $D_{ctf}(X, \Lambda)$ in 44.90.7
- f has relative dimension d at x in 49.31.1
- F is relatively representable over G in 4.8.2
- f -ample in 28.38.1
- F -crystal on X/S (relative to σ) in 45.26.2
- f -map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ in 48.15.8
- f -map $\xi : \mathcal{G} \rightarrow \mathcal{F}$ in 6.21.7
- f -relatively ample in 28.38.1
- f -relatively very ample in 28.39.1
- f -very ample in 28.39.1
- $f^{-1}S$ in 8.12.9
- f_* in 34.4.19
- f_*S in 8.12.4
- G -equivariant quasi-coherent \mathcal{O}_X -module in 38.10.1
- G -equivariant quasi-coherent \mathcal{O}_X -module in 60.10.1
- G -equivariant in 38.8.1
- G -equivariant in 60.8.1
- G -invariant in 63.3.1
- G -module in 44.58.1
- G -set in 44.56.1
- G -torsor in the τ topology in 38.9.3
- G -torsor in the τ topology in 60.9.3
- G -torsor in 38.9.3
- G -trace of f on P in 44.93.2
- G -Sets in 44.56.1
- $g_! \mathcal{F} = (g_{p!} \mathcal{F})^\#$ in 18.16.1
- $g_{p!} \mathcal{F}$ in 18.16.1
- $H^{i+k}(A^\bullet) \rightarrow H^i(A[k]^\bullet)$ in 12.14.8
- H_1 -Koszul-regular in 15.21.1
- H_1 -regular ideal in 15.22.1
- H_1 -regular immersion in 30.13.1
- H_1 -regular immersion in 58.33.2
- H_1 -regular in 30.12.2
- $H_{i+k}(A_\bullet) \rightarrow H_i(A[k]_\bullet)$ in 12.14.2
- I -adically complete in 10.93.5
- I -adically complete in 10.93.5
- I -depth in 10.67.4
- I -power torsion module in 15.62.1
- i th extension group in 13.27.1
- i th right derived functor $R^i F$ of F in 13.17.2
- k -cycle associated to \mathcal{F} in 41.10.2
- k -cycle associated to Z in 41.9.2
- k -cycle in 41.8.1
- k -shifted chain complex $A[k]_\bullet$ in 12.14.1
- k -shifted cochain complex $A[k]^\bullet$ in 12.14.7
- k -shifted module in 22.4.3
- k th fitting ideal in 15.5.3
- L -function of \mathcal{F} in 44.97.1
- L -function of \mathcal{F} in 44.97.3
- $M \mapsto M^\vee$ in 15.42.1
- M - H_1 -regular in 15.21.1
- M -Koszul-regular in 15.21.1
- m -pseudo-coherent relative to R in 15.59.4
- m -pseudo-coherent relative to R in 15.59.4
- m -pseudo-coherent relative to S in 36.39.2
- m -pseudo-coherent relative to S in 36.39.2
- m -pseudo-coherent in 15.50.1
- m -pseudo-coherent in 15.50.1
- m -pseudo-coherent in 20.36.1
- m -pseudo-coherent in 20.36.1
- m -pseudo-coherent in 21.34.1
- m -pseudo-coherent in 21.34.1
- M -quasi-regular in 10.68.1
- M -regular sequence in I in 10.67.1
- M -regular in 10.67.1
- m -regular in 32.19.6
- n -simplex of U in 14.11.1

- n*-truncated simplicial object of \mathcal{C} in 14.12.1
R-bilinear in 10.11.1
R-derivation in 10.127.1
R-equivalent in 63.5.4
R-invariant in 38.17.1
R-invariant in 38.17.1
R-invariant in 38.17.1
R-invariant in 60.17.1
R-invariant in 60.17.1
R-invariant in 60.17.1
R-invariant in 63.3.1
R-linear category \mathcal{A} in 22.17.1
R-linear in 22.17.2
R-linear in 68.10.1
R-module of finite presentation in 10.5.1
R-orbit in 63.5.1
R-orbit in 63.5.4
 $R_{(f)}$ in 83.20.3
 S is a finite type R -algebra in 10.6.1
 S -birational in 28.10.10
 S -derivation $D : \mathcal{O}_{X/S} \rightarrow \mathcal{F}$ in 45.12.1
 S -derivation in 17.23.10
 S -pure in 37.15.1
 S -pure in 37.15.1
 S -rational map from X to Y in 28.10.1
 U -admissible blowup in 30.20.1
 U -admissible blowup in 53.8.1
 X is regular at x in 48.23.2
 x lies over U in 4.30.2
 $X_{\text{spaces}, \text{étale}}$ in 48.15.2
 Y is cartesian over X in 64.8.1
 Y -derivation in 18.32.10
2-fibre product of f and g in 4.29.2
2-morphism from f to g in 7.35.1
2-morphism from f to g in 18.8.1
étale at \mathfrak{q} in 10.138.1
étale at $x \in X$ in 28.37.1
étale at $x \in X$ in 40.11.4
étale at x in 49.36.1
étale covering of T in 33.4.1
étale covering of X in 55.7.1
étale covering in 44.4.1
étale covering in 44.27.1
étale equivalence relation in 47.9.2
étale homomorphism of local rings in 40.11.1
étale local on source-and-target in 34.28.3
étale local on the source-and-target in 34.29.1
étale local ring of S at \bar{s} in 44.33.2
étale local ring of X at \bar{x} in 48.19.2
étale local in 34.17.1
étale neighborhood in 44.29.1
étale neighborhood in 48.16.2
étale neighbourhood of (S, s) in 36.27.1
étale sheaf in 73.4.3
étale topos in 44.21.1
étale topos in 48.15.6
étale in 10.138.1
étale in 28.37.1
étale in 34.16.2
étale in 40.11.4
étale in 44.26.1
étale in 48.13.2
abelian presheaf over X in 6.4.4
abelian presheaf in 44.9.1
abelian sheaf on X in 6.8.1
abelian sheaves in 44.11.4
abelian variety in 44.66.1
abelian in 12.5.1
absolute frobenius in 44.80.3
absolute Galois group in 44.57.1
absolute ramification index in 15.68.17
absolutely flat in 15.67.1
absolutely flat in 15.67.1
absolutely flat in 36.44.1
abuts to in 12.20.6
action of G on the algebraic space X/B in 60.8.1
action of G on the scheme X/S in 38.8.1
acts freely in 47.14.4
acyclic for LF in 13.16.3
acyclic for RF in 13.16.3
acyclic in 12.12.4
acyclic in 12.12.10
additive in 12.3.1
additive in 12.3.8
adequate in 42.3.2
adequate in 42.5.1
adic constructible in 46.26.1
adic constructible in 46.27.4
adic lisse in 46.26.1
adic lisse in 46.27.4

- adic morphism* in 65.17.1
- adic** in 65.5.7

geometrically regular in 10.154.2
geometrically unibranch at x in 48.21.2
geometrically unibranch in 48.21.2
gerbe over in 8.11.4
gerbe over in 78.19.1
gerbe in 8.11.1
gerbe in 78.19.1
germ of X at x in 34.16.1
global complete intersection over k in 10.130.1
global dimension in 10.105.6
global finite presentation in 18.17.1
global Lefschetz number in 44.92.1
global presentation in 18.17.1
global sections in 7.44.1
going down in 10.40.1
going up in 10.40.1
going-down theorem in 83.17.1
going-up theorem in 83.17.1
good quotient in 63.9.1
good stratification in 5.27.2
graded A -algebra in 83.19.3
graded category \mathcal{A} over R in 22.18.1
graded direct sum in 22.18.4
graded functor in 22.18.2
graded ideals in 83.19.3
graded module M over a graded A -algebra B in 83.19.3
graded module in 83.19.2
graded submodules in 83.19.3
Grassmannian over \mathbf{Z} in 26.22.2
Grassmannian over R in 26.22.2
Grassmannian over S in 26.22.2
Grothendieck abelian category in 19.10.1
group algebraic space over B in 60.5.1
group cohomology groups in 44.58.2
group of infinitesimal automorphisms of x' over x in 68.18.1
group of infinitesimal automorphisms of x_0 in 68.18.2
group scheme over S in 38.4.1
groupoid in algebraic spaces over B in 60.11.1
groupoid in functors on \mathcal{C} in 68.19.1
groupoid over S in 38.11.1
groupoid scheme over S in 38.11.1
groupoid in 4.2.5
Gysin homomorphism in 41.28.1
 H -projective in 28.43.1
 H -quasi-projective in 28.41.1
has coproducts of pairs of objects in 4.5.2
has enough points in 7.37.1
has fibre products in 4.6.3
has products of pairs of objects in 4.4.2
has property (β) in 50.15.1
has property (β) in 50.15.1
has property \mathcal{P} at x in 48.7.5
has property \mathcal{P} at x in 77.7.5
has property \mathcal{P} in 48.7.2
has property \mathcal{P} in 49.22.2
has property \mathcal{P} in 77.7.2
has property \mathcal{P} in 78.12.2
has property \mathcal{Q} at x in 49.22.6
Hausdorff in 83.5.6
height in 10.59.2
henselian pair in 15.7.1
henselian in 10.145.1
henselian in 44.32.2
henselization of $\mathcal{O}_{S,s}$ in 44.33.2
henselization of S at s in 44.33.2
henselization in 10.145.18
Herbrand quotient in 41.3.2
higher direct images in 44.35.4
Hilbert function in 83.19.2
Hilbert polynomial in 10.58.6
Hilbert polynomial in 32.19.16
Hilbert polynomial in 83.19.2
homogeneous spectrum $\text{Proj}(R)$ in 83.20.2
homogeneous spectrum of \mathcal{A} over S in 26.16.7
homogeneous spectrum of \mathcal{A} over X in 53.3.3
homogeneous spectrum in 10.55.1

- homogeneous spectrum* in 26.8.3

modification of X in 54.6.1
module of differentials in 10.127.2
module of differentials in 17.23.3
module of differentials in 18.32.3
module of Kähler differentials in 10.127.2
module of principal parts of order k in 10.128.4
module of principal parts of order k in 18.33.4
module-valued functor in 42.3.1
monomorphism in 4.13.1
monomorphism in 25.23.1
monomorphism in 49.10.1
monomorphism in 65.19.1
monomorphism in 77.8.1
morphism $(A, F) \rightarrow (B, F)$ of filtered objects in 12.16.1
morphism $(N, \varphi) \rightarrow (N', \varphi')$ of descent data in 34.3.1
morphism $(U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoids in functors on \mathcal{C} in 68.19.1
morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data in 34.2.1
morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data in 56.3.1
morphism $\psi : (G, m) \rightarrow (G', m')$ of group algebraic spaces over B in 60.5.1
morphism $\psi : (G, m) \rightarrow (G', m')$ of group schemes over S in 38.4.1
morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data in 34.30.3
morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data in 56.19.3
morphism $\psi : (X_i, \varphi_{ij}) \rightarrow (X'_i, \varphi'_{ij})$ of descent data in 8.3.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules on \mathcal{B} in 6.30.11
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules in 6.6.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules in 18.9.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on \mathcal{B} in 6.30.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on X in 6.3.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with value in \mathcal{C} in 6.5.1
morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with values in \mathcal{C} on \mathcal{B} in 6.30.8
morphism $a : \xi \rightarrow \eta$ of formal objects in 68.7.1
morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoid schemes over S in 38.11.1
morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoids in algebraic spaces over B in 60.11.1
morphism $f : (V/X, \varphi) \rightarrow (V'/X, \varphi')$ of descent data relative to $X \rightarrow S$ in 34.30.1
morphism $f : (V/Y, \varphi) \rightarrow (V'/Y, \varphi')$ of descent data relative to $Y \rightarrow X$ in 56.19.1
morphism $f : F \rightarrow F'$ of algebraic spaces over S in 47.6.3
morphism $f : p \rightarrow p'$ in 7.36.2
morphism $f : X \rightarrow Y$ of schemes over S in 25.18.1
morphism from \mathcal{U} to \mathcal{V} in 7.8.1

- morphism of δ -functors from F to G in* 12.11.2
- morphism of \mathcal{G} -torsors in* 20.5.1

- weakly associated points of X* in 30.5.1

- weakly associated* in 10.65.1
- weakly associated* in 30.5.1
- weakly contractible* in 7.39.2
- weakly pre-admissible* in 65.4.7
- weakly unramified* in 15.68.1
- weakly unramified* in 15.71.1
- Weil divisor $[D]$ associated to an effective Cartier divisor $D \subset X$* in 83.34.1
- Weil divisor associated to \mathcal{L}* in 41.24.1
- Weil divisor associated to s* in 41.24.1
- Weil divisor associated to a Cartier divisor* in 83.34.1
- Weil divisor associated to a rational function $f \in K(X)^*$* in 83.34.1
- Weil divisor* in 83.34.1
- which associates a presheaf to a semi-representable object* in 24.2.2
- Yoneda extension* in 13.27.4
- Zariski covering of T* in 33.3.1
- Zariski covering of X* in 55.8.1
- Zariski covering* in 47.12.5
- Zariski locally quasi-separated over S* in 47.13.2
- Zariski locally quasi-separated* in 48.3.1
- Zariski locally quasi-separated* in 48.3.1
- Zariski sheaf* in 73.4.3
- Zariski topos* in 44.21.1
- Zariski, étale, smooth, syntomic, or fppf covering* in 45.8.4
- Zariski* in 10.16.3
- zero object* in 12.3.3
- zero scheme* in 30.9.18
- zero scheme* in 53.2.17
- zeroth K -group of \mathcal{A}* in 12.10.1
- zeroth Čech cohomology group* in 44.13.1
- Čech cohomology groups* in 20.10.1
- Čech cohomology groups* in 44.18.1
- Čech complex* in 20.10.1
- Čech complex* in 44.18.1

89.2. Definitions listed per chapter

- Introduction**
 - In 4.5.1: *coproduct, amalgamated sum*
- Conventions**
 - In 4.5.2: *has coproducts of pairs of objects*
- Set Theory**
 - In 4.6.1: *fibre product*
 - In 4.6.2: *cartesian*
- Categories**
 - In 4.6.3: *has fibre products*
 - In 4.6.4: *representable*
 - In 4.8.2: *representable, F is relatively representable over G*
 - In 4.9.1: *pushout*
 - In 4.9.2: *cocartesian*
 - In 4.10.1: *equalizer*
 - In 4.11.1: *coequalizer*
 - In 4.12.1: *initial, final*
 - In 4.13.1: *monomorphism, epimorphism*
 - In 4.14.1: *limit*
 - In 4.14.2: *colimit*
 - In 4.14.5: *product*
 - In 4.14.6: *coproduct*
 - In 4.16.1: *connected*
 - In 4.17.1: *\mathcal{I} is cofinal in \mathcal{J} , cofinal*
 - In 4.17.3: *\mathcal{I} is initial in \mathcal{J} , initial*
 - In 4.19.1: *directed, filtered, directed, filtered*
- In 4.2.1: *category*
- In 4.2.4: *isomorphism*
- In 4.2.5: *groupoid*
- In 4.2.8: *functor*
- In 4.2.9: *faithful, fully faithful, essentially surjective*
- In 4.2.10: *subcategory, full subcategory, strictly full*
- In 4.2.15: *natural transformation, morphism of functors*
- In 4.2.17: *equivalence of categories, quasi-inverse*
- In 4.2.20: *product category*
- In 4.3.1: *opposite category*
- In 4.3.2: *contravariant*
- In 4.3.3: *presheaf of sets on \mathcal{C} , presheaf*
- In 4.3.6: *representable*
- In 4.4.1: *product*
- In 4.4.2: *has products of pairs of objects*

- In 4.20.1: *codirected, cofiltered, codirected, cofiltered*
- In 4.21.1: *system over I in \mathcal{C} , inductive system over I in \mathcal{C} , inverse system over I in \mathcal{C} , projective system over I in \mathcal{C} , transition maps*
- In 4.21.2: *directed system, directed inverse system, directed*
- In 4.22.1: *is essentially constant, value, essentially constant, value*
- In 4.22.2: *essentially constant system, essentially constant inverse system*
- In 4.23.1: *left exact, right exact, exact*
- In 4.24.1: *left adjoint, right adjoint*
- In 4.25.1: *left multiplicative system, right multiplicative system, multiplicative system*
- In 4.25.17: *saturated*
- In 4.26.1: *horizontal*
- In 4.27.1: *2-category, 1-morphisms, 2-morphisms, vertical, composition, horizontal*
- In 4.27.2: *sub 2-category*
- In 4.27.4: *equivalent*
- In 4.27.5: *functor, weak functor, pseudo functor*
- In 4.28.1: *$(2, 1)$ -category*
- In 4.29.1: *final object*
- In 4.29.2: *2-fibre product of f and g*
- In 4.30.1: *2-category of categories over \mathcal{C}*
- In 4.30.2: *fibre category, lift, x lies over U , lift, ϕ lies over f*
- In 4.31.1: *strongly cartesian morphism, strongly \mathcal{C} -cartesian morphism*
- In 4.31.5: *fibred category over \mathcal{C}*
- In 4.31.6: *choice of pullbacks, pullback functor*
- In 4.31.9: *2-category of fibred categories over \mathcal{C}*
- In 4.32.2: *relative inertia of \mathcal{S} over \mathcal{S}' , inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of \mathcal{S}*
- In 4.33.1: *fibred in groupoids*
- In 4.33.6: *2-category of categories fibred in groupoids over \mathcal{C}*
- In 4.34.2: *split fibred category, \mathcal{S}_F*
- In 4.35.2: *split category fibred in groupoids, \mathcal{S}_F*
- In 4.36.1: *discrete*
- In 4.36.2: *category fibred in sets, category fibred in discrete categories*
- In 4.36.3: *2-category of categories fibred in sets over \mathcal{C}*
- In 4.37.1: *setoid*
- In 4.37.2: *category fibred in setoids*
- In 4.37.3: *2-category of categories fibred in setoids over \mathcal{C}*
- In 4.38.1: *representable*
- In 4.39.5: *representable, \mathcal{X} is relatively representable over \mathcal{Y}*
- ### Topology
- In 5.4.1: *base for the topology on X , basis for the topology on X*
- In 5.4.3: *subbase for the topology on X , subbasis for the topology on X*
- In 5.5.3: *strict map of topological spaces, submersive*
- In 5.6.1: *connected, connected component*
- In 5.6.7: *totally disconnected*
- In 5.6.9: *locally connected*
- In 5.7.1: *irreducible, irreducible component*
- In 5.7.4: *generic point, Kolmogorov, sober*
- In 5.8.1: *Noetherian, locally Noetherian*
- In 5.9.1: *chain of irreducible closed subsets, length, dimension, Krull dimension, Krull dimension of X at x*
- In 5.9.4: *equidimensional*
- In 5.10.1: *codimension*
- In 5.10.4: *catenary*
- In 5.11.1: *quasi-compact, quasi-compact, retrocompact*
- In 5.12.1: *locally quasi-compact*
- In 5.14.1: *constructible, locally constructible*
- In 5.16.2: *closed, proper, quasi-proper, universally closed*
- In 5.17.1: *Jacobson*
- In 5.18.1: *specialization, generalization, stable under specialization, stable under generalization*
- In 5.18.3: *specializations lift along f , specializing, generalizations lift along f , generalizing*
- In 5.19.1: *immediate specialization, dimension function*

In 5.20.1: *interior, nowhere dense*

In 5.21.1: *profinite*

In 5.22.1: *spectral, spectral*

In 5.25.1: *extremally disconnected*

In 5.26.2: *isolated point*

In 5.27.1: *partition, parts, refines*

In 5.27.2: *good stratification*

In 5.27.3: *stratification, strata*

Sheaves on Spaces

In 6.3.1: *presheaf \mathcal{F} of sets on X , morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on X*

In 6.3.2: *constant presheaf with value A*

In 6.4.4: *presheaf of abelian groups on X , abelian presheaf over X , morphism of abelian presheaves over X*

In 6.5.1: *presheaf \mathcal{F} on X with values in \mathcal{C} , morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with value in \mathcal{C}*

In 6.5.2: *underlying presheaf of sets of \mathcal{F}*

In 6.6.1: *presheaf of \mathcal{O} -modules, morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules*

In 6.7.1: *sheaf \mathcal{F} of sets on X , morphism of sheaves of sets*

In 6.7.4: *constant sheaf with value A*

In 6.8.1: *abelian sheaf on X , sheaf of abelian groups on X*

In 6.9.1: *sheaf*

In 6.10.1: *sheaf of \mathcal{O} -modules, morphism of sheaves of \mathcal{O} -modules*

In 6.11.2: *separated*

In 6.15.1: *type of algebraic structure*

In 6.16.2: *subpresheaf, subsheaf, injective, surjective, injective, surjective*

In 6.21.7: *f -map $\xi : \mathcal{G} \rightarrow \mathcal{F}$*

In 6.21.9: *composition of φ and ψ*

In 6.25.1: *ringed space, morphism of ringed spaces*

In 6.25.3: *composition of morphisms of ringed spaces*

In 6.26.1: *pushforward, pullback*

In 6.27.1: *skyscraper sheaf at x with value A , skyscraper sheaf, skyscraper sheaf, skyscraper sheaf, skyscraper sheaf*

In 6.30.1: *presheaf \mathcal{F} of sets on \mathcal{B} , morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on \mathcal{B}*

In 6.30.2: *sheaf \mathcal{F} of sets on \mathcal{B} , morphism of sheaves of sets on \mathcal{B}*

In 6.30.8: *presheaf \mathcal{F} with values in \mathcal{C} on \mathcal{B} , morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with values in \mathcal{C} on \mathcal{B} , sheaf \mathcal{F} with values in \mathcal{C} on \mathcal{B}*

In 6.30.11: *presheaf of \mathcal{O} -modules \mathcal{F} on \mathcal{B} , morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules on \mathcal{B} , sheaf \mathcal{F} of \mathcal{O} -modules on \mathcal{B}*

In 6.31.2: *restriction of \mathcal{G} to U , restriction of \mathcal{G} to U , open subspace of (X, \mathcal{O}) associated to U , restriction of \mathcal{G} to U*

In 6.31.3: *extension of \mathcal{F} by the empty set $j_{p!}\mathcal{F}$, extension of \mathcal{F} by the empty set $j_!\mathcal{F}$*

In 6.31.5: *extension $j_{p!}\mathcal{F}$ of \mathcal{F} by 0, extension $j_!\mathcal{F}$ of \mathcal{F} by 0, extension $j_{p!}\mathcal{F}$ of \mathcal{F} by e , extension $j_!\mathcal{F}$ of \mathcal{F} by e , extension by 0, extension by 0*

Sites and Sheaves

In 7.2.1: *presheaf of sets, Morphisms of presheaves*

In 7.2.2: *presheaf, morphism*

In 7.3.1: *injective, surjective*

In 7.3.3: *subpresheaf*

In 7.3.5: *image of φ*

In 7.6.1: *family of morphisms with fixed target*

In 7.6.2: *site, coverings of \mathcal{C}*

In 7.7.1: *sheaf*

In 7.7.5: *$Sh(\mathcal{C})$*

In 7.7.6: *sheaf*

In 7.8.1: *morphism of families of maps with fixed target of \mathcal{C} from \mathcal{U} to \mathcal{V} , morphism from \mathcal{U} to \mathcal{V} , refinement*

In 7.8.2: *combinatorially equivalent, tautologically equivalent*

In 7.10.9: *separated*

In 7.10.11: *sheaf associated to \mathcal{F}*

In 7.11.1: *quasi-compact*

In 7.12.1: *injective, surjective*

In 7.13.1: *effective epimorphism, universal effective epimorphism*

In 7.13.2: *weaker than the canonical topology, subcanonical*

In 7.13.3: *representable sheaves, \underline{U}*

In 7.14.1: *continuous*

- In 7.15.1: *morphism of sites*
 In 7.15.4: *composition*
 In 7.16.1: *topos, morphism of topoi, composition $f \circ g$*
 In 7.19.1: *cocontinuous*
 In 7.24.1: *localization of the site \mathcal{C} at the object U , localization morphism, direct image functor, restriction of \mathcal{F} to \mathcal{C}/U , extension of \mathcal{G} by the empty set*
 In 7.28.2: *special cocontinuous functor u from \mathcal{C} to \mathcal{D}*
 In 7.29.4: *localization of the topos $\text{Sh}(\mathcal{C})$ at \mathcal{F} , localization morphism*
 In 7.31.1: *point of the topos $\text{Sh}(\mathcal{C})$*
 In 7.31.2: *point p of the site \mathcal{C}*
 In 7.31.6: *skyscraper sheaf*
 In 7.35.1: *2-morphism from f to g*
 In 7.36.2: *morphism $f : p \rightarrow p'$*
 In 7.37.1: *conservative, has enough points*
 In 7.39.2: *weakly contractible, enough weakly contractible objects, enough P objects*
 In 7.41.1: *sheaf theoretically empty*
 In 7.41.3: *almost cocontinuous*
 In 7.42.1: *embedding*
 In 7.42.2: *subtopos*
 In 7.42.4: *open subtopos*
 In 7.42.6: *closed subtopos*
 In 7.42.7: *open immersion, closed immersion*
 In 7.43.1: *pushforward*
 In 7.44.1: *global sections*
 In 7.45.1: *sieve S on U*
 In 7.45.3: *sieve on U generated by the morphisms f_i*
 In 7.45.4: *pullback of S by f*
 In 7.45.6: *topology on \mathcal{C}*
 In 7.45.8: *finer*
 In 7.45.10: *sheaf*
 In 7.45.12: *canonical topology*
 In 7.46.2: *topology associated to \mathcal{C}*
 In 7.47.2: *separated*
 In 7.47.4: *sheaf associated to \mathcal{F}*
 In 7.50.1: *point p*
- Stacks**
- In 8.2.2: *presheaf of morphisms from x to y , presheaf of isomorphisms from x to y*
 In 8.3.1: *descent datum (X_i, φ_{ij}) in \mathcal{S} relative to the family $\{f_i : U_i \rightarrow U\}$, cocycle condition, morphism $\psi : (X_i, \varphi_{ij}) \rightarrow (X'_i, \varphi'_{ij})$ of descent data*
 In 8.3.4: *pullback functor*
 In 8.3.5: *trivial descent datum, canonical descent datum, effective*
 In 8.4.1: *stack*
 In 8.4.5: *2-category of stacks over \mathcal{C}*
 In 8.5.1: *stack in groupoids*
 In 8.5.5: *2-category of stacks in groupoids over \mathcal{C}*
 In 8.6.1: *stack in setoids, stack in sets, stack in discrete categories*
 In 8.6.5: *2-category of stacks in setoids over \mathcal{C}*
 In 8.10.2: *structure of site on \mathcal{S} inherited from \mathcal{C} , \mathcal{S} is endowed with the topology inherited from \mathcal{C}*
 In 8.11.1: *gerbe*
 In 8.11.4: *gerbe over*
 In 8.12.4: *$f_*\mathcal{S}$, pushforward of \mathcal{S} along f*
 In 8.12.9: *$f^{-1}\mathcal{S}$, pullback of \mathcal{S} along f*
- Fields**
- In 9.2.1: *field, subfield*
 In 9.2.2: *domain, integral domain*
 In 9.5.1: *characteristic, prime subfield of F*
 In 9.6.2: *field extension*
 In 9.6.3: *tower*
 In 9.6.6: *generates*
 In 9.7.1: *degree, finite*
 In 9.7.7: *number field*
 In 9.8.1: *algebraic, algebraic extension*
 In 9.9.1: *minimal polynomial*
 In 9.10.1: *algebraically closed*
 In 9.10.3: *algebraically closed, algebraic closure*
 In 9.11.1: *relatively prime*
 In 9.12.2: *separable, separable, separable*
 In 9.12.6: *separable degree*
 In 9.13.1: *purely inseparable, purely inseparable*
 In 9.13.7: *separable degree, inseparable degree, degree of inseparability*

- In 9.14.1: *normal*
- In 9.14.5: *automorphisms of E over F , automorphisms of E/F*
- In 9.15.2: *splitting field of P over F*
- In 9.19.1: *Galois*
- In 9.19.3: *Galois group*
- In 9.23.1: *algebraically independent, purely transcendental extension, transcendence basis*
- In 9.23.4: *transcendence degree*
- In 9.23.9: *algebraic closure of k in K , algebraically closed in K*
- In 9.24.1: *compositum of K and L in Ω*
- In 9.24.2: *linearly disjoint over k in Ω*
- In 9.25.1: *algebraic, separable, purely inseparable, normal, Galois*
- Commutative Algebra**
- In 10.5.1: *finite R -module, finitely generated R -module, finitely presented R -module, R -module of finite presentation*
- In 10.6.1: *finite type, S is a finite type R -algebra, finite presentation*
- In 10.7.1: *finite*
- In 10.8.1: *partially ordered set, directed set*
- In 10.8.2: *system (M_i, μ_{ij}) of R -modules over I , directed system*
- In 10.8.7: *homomorphism of systems*
- In 10.8.12: *relation*
- In 10.9.1: *multiplicative subset of R*
- In 10.9.2: *localization of A with respect to S*
- In 10.9.6: *localization*
- In 10.11.1: *R -bilinear*
- In 10.11.6: *(A, B) -bimodule*
- In 10.13.1: *base change, base change*
- In 10.16.1: *spectrum*
- In 10.16.3: *Zariski, standard opens*
- In 10.17.1: *local ring, local homomorphism of local rings, local ring map $\varphi : R \rightarrow S$*
- In 10.27.2: *Oka family*
- In 10.31.1: *locally nilpotent, nilpotent*
- In 10.34.1: *Jacobson ring*
- In 10.35.1: *integral over R , integral*
- In 10.35.8: *integral closure, integrally closed*
- In 10.36.1: *normal*
- In 10.36.3: *almost integral over R , completely normal*
- In 10.36.10: *normal*
- In 10.37.1: *integral over I*
- In 10.38.1: *flat, faithfully flat, flat, faithfully flat*
- In 10.39.1: *support of M*
- In 10.39.3: *annihilator of m , annihilator of M*
- In 10.40.1: *going up, going down*
- In 10.41.1: *separably generated over k , separable over k*
- In 10.42.1: *geometrically reduced over k*
- In 10.44.1: *perfect*
- In 10.44.5: *perfect closure*
- In 10.45.6: *geometrically irreducible over k*
- In 10.46.3: *geometrically connected over k*
- In 10.47.1: *geometrically integral over k*
- In 10.48.1: *dominates, valuation ring, centered*
- In 10.48.13: *value group, valuation, discrete valuation ring*
- In 10.50.1: *length*
- In 10.50.9: *simple*
- In 10.51.1: *Artinian*
- In 10.52.1: *essentially of finite type, essentially of finite presentation*
- In 10.55.1: *homogeneous spectrum*
- In 10.56.1: *blowup algebra, Rees algebra, affine blowup algebra*
- In 10.57.3: *numerical polynomial*
- In 10.58.1: *an ideal of definition of R*
- In 10.58.6: *Hilbert polynomial*
- In 10.58.8: *$d(M)$*
- In 10.59.1: *Krull dimension*
- In 10.59.2: *height*
- In 10.59.9: *system of parameters of R , regular local ring, regular system of parameters*
- In 10.62.1: *associated*
- In 10.63.1: *symbolic power*
- In 10.64.2: *relative assassin of N over S/R*
- In 10.65.1: *weakly associated*
- In 10.66.1: *embedded associated primes, embedded primes of R*

- In 10.67.1: *M*-regular, *M*-regular sequence in *I*, regular sequence
- In 10.67.4: *I*-depth, depth
- In 10.68.1: *M*-quasi-regular, quasi-regular sequence
- In 10.69.2: resolution, resolution of *M* by free *R*-modules, resolution of *M* by finite free *R*-modules
- In 10.74.1: projective
- In 10.75.1: locally free, finite locally free
- In 10.79.1: universally injective, universally exact
- In 10.81.1: direct sum dévissage, Kaplansky dévissage
- In 10.83.1: Mittag-Leffler inverse system
- In 10.85.1: Mittag-Leffler directed system of modules
- In 10.85.2: dominates
- In 10.85.6: Mittag-Leffler
- In 10.87.1: coherent module, coherent ring
- In 10.93.5: *I*-adically complete, *I*-adically complete
- In 10.98.4: rank
- In 10.99.1: Cohen-Macaulay
- In 10.99.6: maximal Cohen-Macaulay
- In 10.99.10: Cohen-Macaulay
- In 10.100.1: Cohen-Macaulay
- In 10.100.6: Cohen-Macaulay
- In 10.101.1: catenary
- In 10.101.5: universally catenary
- In 10.104.1: pure
- In 10.105.2: finite projective dimension, projective dimension
- In 10.105.6: finite global dimension, global dimension
- In 10.106.7: regular
- In 10.108.5: local ring of the fibre at \mathfrak{q}
- In 10.115.7: uniformizer
- In 10.116.1: associates, irreducible, prime
- In 10.116.4: unique factorization domain, UFD
- In 10.116.9: principal ideal domain, PID
- In 10.116.11: Dedekind domain
- In 10.117.2: order of vanishing along *R*
- In 10.117.3: lattice in *V*
- In 10.117.5: distance between *M* and *M'*
- In 10.118.3: quasi-finite at \mathfrak{q} , quasi-finite
- In 10.119.8: strongly transcendental over *R*
- In 10.121.1: relative dimension of *S/R* at \mathfrak{q} , relative dimension of
- In 10.127.1: derivation, *R*-derivation, Leibniz rule
- In 10.127.2: module of Kähler differentials, module of differentials
- In 10.128.1: differential operator $D : M \rightarrow N$ of order *k*
- In 10.128.4: module of principal parts of order *k*
- In 10.129.1: naive cotangent complex
- In 10.130.1: global complete intersection over *k*, local complete intersection over *k*
- In 10.130.5: complete intersection (over *k*)
- In 10.131.1: syntomic, flat local complete intersection over *R*
- In 10.131.5: relative global complete intersection
- In 10.132.1: smooth
- In 10.132.6: standard smooth algebra over *R*
- In 10.132.11: smooth at \mathfrak{q}
- In 10.133.1: formally smooth over *R*
- In 10.136.1: small extension
- In 10.138.1: étale, étale at \mathfrak{q}
- In 10.138.14: standard étale
- In 10.141.1: formally unramified over *R*
- In 10.142.2: universal first order thickening, conormal module, $C_{S/R}$
- In 10.143.1: formally étale over *R*
- In 10.144.1: unramified, *G*-unramified, unramified at \mathfrak{q} , *G*-unramified at \mathfrak{q}
- In 10.145.1: henselian, strictly henselian
- In 10.145.18: henselization, strict henselization of *R* with respect to $\kappa \subset \kappa^{sep}$, strict henselization
- In 10.146.1: (R_k) , regular in codimension $\leq k$, (S_k)
- In 10.149.1: complete local ring
- In 10.149.4: coefficient ring
- In 10.149.5: Cohen ring
- In 10.150.1: *N*-1, *N*-2, Japanese
- In 10.150.15: universally Japanese, Nagata ring

In 10.150.23: *analytically unramified, analytically unramified*

In 10.153.2: *geometrically normal*

In 10.154.2: *geometrically regular*

Brauer groups

In 11.2.1: *finite*

In 11.2.2: *skew field*

In 11.2.3: *simple, simple*

In 11.2.4: *central*

In 11.2.5: *opposite algebra*

In 11.5.2: *Brauer group*

In 11.8.1: *splits, splitting field*

Homological Algebra

In 12.3.1: *preadditive, additive*

In 12.3.3: *zero object*

In 12.3.5: *direct sum*

In 12.3.8: *additive*

In 12.3.9: *kernel, cokernel, coimage of f , image of f*

In 12.4.1: *Karoubian*

In 12.5.1: *abelian*

In 12.5.3: *injective, surjective, subobject, quotient*

In 12.5.7: *complex, exact at y , exact, short exact sequence*

In 12.5.9: *split*

In 12.6.1: *extension E of B by A*

In 12.6.2: *Ext-group*

In 12.9.1: *Serre subcategory, weak Serre subcategory*

In 12.9.5: *kernel of the functor F*

In 12.10.1: *zeroth K -group of \mathcal{A}*

In 12.11.1: *cohomological δ -functor, δ -functor*

In 12.11.2: *morphism of δ -functors from F to G*

In 12.11.3: *universal δ -functor*

In 12.12.2: *homotopy equivalence, homotopy equivalent*

In 12.12.4: *quasi-isomorphism, acyclic*

In 12.12.8: *homotopy equivalence, homotopy equivalent*

In 12.12.10: *quasi-isomorphism, acyclic*

In 12.14.1: *k -shifted chain complex $A[k]_{\bullet}$*

In 12.14.2: *$H_{i+k}(A_{\bullet}) \rightarrow H_i(A[k]_{\bullet})$*

In 12.14.7: *k -shifted cochain complex $A[k]^{\bullet}$*

In 12.14.8: *$H^{i+k}(A^{\bullet}) \rightarrow H^i(A[k]^{\bullet})$*

In 12.15.1: *category of graded objects of \mathcal{A}*

In 12.15.4: *shift*

In 12.16.1: *decreasing filtration, filtered object of \mathcal{A} , morphism $(A, F) \rightarrow (B, F)$ of filtered objects, induced filtration, quotient filtration, finite, separated, exhaustive*

In 12.16.3: *strict*

In 12.17.1: *spectral sequence in \mathcal{A} , morphism of spectral sequences*

In 12.17.2: *limit, collapses at E_r , degenerates at E_r*

In 12.18.1: *exact couple, morphism of exact couples*

In 12.18.3: *spectral sequence associated to the exact couple*

In 12.19.1: *differential object, morphism of differential objects*

In 12.19.3: *homology*

In 12.19.5: *spectral sequence associated to (A, d, α)*

In 12.20.1: *filtered differential object*

In 12.20.4: *induced filtration*

In 12.20.6: *converges, abuts to, converges to*

In 12.21.1: *filtered complex K^{\bullet} of \mathcal{A}*

In 12.21.5: *induced filtration*

In 12.21.7: *converges*

In 12.22.1: *double complex*

In 12.22.3: *associated simple complex sA^{\bullet} , associated total complex*

In 12.22.5: *converges, converges*

In 12.23.1: *injective*

In 12.23.4: *enough injectives*

In 12.23.5: *functorial injective embeddings*

In 12.24.1: *projective*

In 12.24.4: *enough projectives*

In 12.24.5: *functorial projective surjections*

In 12.27.2: *Mittag-Leffler condition, ML*

Derived Categories

In 13.3.1: *triangle, morphism of triangles*

In 13.3.2: *triangulated category, distinguished triangles, pre-triangulated category*

- In 13.3.3: *exact functor, triangulated functor*
- In 13.3.4: *pre-triangulated subcategory, triangulated subcategory*
- In 13.3.5: *homological, cohomological*
- In 13.3.6: *δ -functor from \mathcal{A} to \mathcal{D} , image of the short exact sequence under the given δ -functor*
- In 13.5.1: *compatible with the triangulated structure*
- In 13.6.1: *saturated*
- In 13.6.5: *kernel of F , kernel of H*
- In 13.6.7: *quotient category \mathcal{D}/\mathcal{B} , quotient functor*
- In 13.8.1: *category of (cochain) complexes, bounded below, bounded above, bounded*
- In 13.9.1: *cone*
- In 13.9.4: *termwise split injection $\alpha : A^\bullet \rightarrow B^\bullet$, termwise split surjection $\beta : B^\bullet \rightarrow C^\bullet$*
- In 13.9.9: *termwise split sequence of complexes of \mathcal{A} , triangle associated to the termwise split sequence of complexes*
- In 13.10.1: *distinguished triangle of $K(\mathcal{A})$*
- In 13.11.3: *derived category of \mathcal{A} , bounded derived category*
- In 13.14.1: *category of finite filtered objects of \mathcal{A}*
- In 13.14.2: *filtered quasi-isomorphism, filtered acyclic*
- In 13.14.5: *filtered derived category of \mathcal{A}*
- In 13.14.7: *bounded filtered derived category*
- In 13.15.2: *right derived functor RF is defined at, value of RF at X , left derived functor LF is defined at, value of LF at X*
- In 13.15.9: *right deriveable, everywhere defined, left deriveable, everywhere defined*
- In 13.15.10: *computes, computes*
- In 13.16.3: *right derived functors of F , left derived functors of F , right acyclic for F , acyclic for RF , left acyclic for F , acyclic for LF*
- In 13.17.2: *i th right derived functor $R^i F$ of F*
- In 13.18.1: *injective resolution of A , injective resolution of K^\bullet*
- In 13.19.1: *projective resolution of A , projective resolution of K^\bullet*
- In 13.21.1: *Cartan-Eilenberg resolution*
- In 13.23.2: *resolution functor*
- In 13.26.1: *filtered injective*
- In 13.27.1: *i th extension group*
- In 13.27.4: *Yoneda extension, equivalent*
- In 13.29.1: *K -injective*
- In 13.31.1: *derived colimit, homotopy colimit*
- In 13.32.1: *derived limit, homotopy limit*
- In 13.33.1: *classical generator, strong generator, weak generator, generator*
- In 13.34.1: *compact object*
- In 13.34.5: *compactly generated*
- Simplicial Methods**
- In 14.2.1: $\delta_j^n : [n-1] \rightarrow [n]$, $\sigma_j^n : [n+1] \rightarrow [n]$
- In 14.3.1: *simplicial object U of \mathcal{C} , simplicial set, simplicial abelian group, morphism of simplicial objects $U \rightarrow U'$, category of simplicial objects of \mathcal{C}*
- In 14.5.1: *cosimplicial object U of \mathcal{C} , cosimplicial set, cosimplicial abelian group, morphism of cosimplicial objects $U \rightarrow U'$, category of cosimplicial objects of \mathcal{C}*
- In 14.6.1: *product of U and V*
- In 14.7.1: *fibre product of V and W over U*
- In 14.8.1: *pushout of V and W over U*
- In 14.9.1: *product of U and V*
- In 14.10.1: *fibre product of V and W over U*
- In 14.11.1: *n -simplex of U , face of x , degeneracy of x , degenerate*
- In 14.12.1: *n -truncated simplicial object of \mathcal{C} , morphism of n -truncated simplicial objects*
- In 14.13.1: *product $U \times V$ of U and V , product $U \times V$ exists*
- In 14.14.1: $\text{Hom}(U, V)$
- In 14.16.1: $\text{Hom}(U, V)$
- In 14.17.1: *split*

- In 14.19.1: augmentation $\epsilon : U \rightarrow X$ of U towards an object X of \mathcal{C}
- In 14.21.3: Eilenberg-MacLane object $K(A, k)$
- In 14.25.1: homotopy connecting a to b , homotopic
- In 14.25.6: homotopy equivalence, homotopy equivalent
- In 14.27.1: homotopic, homotopy connecting a and b
- In 14.29.1: trivial Kan fibration
- In 14.30.1: Kan fibration, Kan complex
- In 15.50.1: m -pseudo-coherent, pseudo-coherent, m -pseudo-coherent, pseudo-coherent
- In 15.51.1: tor-amplitude in $[a, b]$, finite tor dimension, tor dimension $\leq d$, finite tor dimension
- In 15.52.1: finite projective dimension, projective-amplitude in $[a, b]$
- In 15.53.1: finite injective dimension, injective-amplitude in $[a, b]$
- In 15.56.1: perfect, perfect
- In 15.58.2: finitely presented relative to R

More on Algebra

- In 15.5.3: k th fitting ideal
- In 15.7.1: henselian pair
- In 15.8.1: auto-associated
- In 15.15.1: torsion, torsion free
- In 15.16.1: content ideal of x
- In 15.18.1: strict transform of M along $R \rightarrow R'$
- In 15.20.1: Koszul complex
- In 15.20.2: Koszul complex on f_1, \dots, f_r
- In 15.21.1: M -Koszul-regular, M - H_1 -regular, Koszul-regular, H_1 -Koszul-regular
- In 15.22.1: regular ideal, Koszul-regular ideal, H_1 -regular ideal, quasi-regular ideal
- In 15.23.2: local complete intersection
- In 15.26.1: topological ring, topological module, homomorphism of topological modules, homomorphism of topological rings, linearly topologized, linearly topologized, ideal of definition, pre-admissible, admissible, pre-adic, adic
- In 15.27.1: formally smooth over R
- In 15.27.3: formally smooth for the \mathfrak{n} -adic topology
- In 15.30.1: regular
- In 15.35.1: p -independent over k , p -basis of K over k
- In 15.36.1: J -0, J -1, J -2
- In 15.39.1: G -ring
- In 15.40.1: quasi-excellent, excellent
- In 15.42.1: $M \mapsto M^\vee$, free module
- In 15.45.3: K -flat
- In 15.45.13: derived tensor product
- In 15.47.1: Tor independent over R
- In 15.59.4: m -pseudo-coherent relative to R , pseudo-coherent relative to R , m -pseudo-coherent relative to R , pseudo-coherent relative to R
- In 15.60.1: pseudo-coherent ring map, perfect ring map
- In 15.62.1: I -power torsion module, an f -power torsion module
- In 15.64.4: derived complete with respect to I , derived complete with respect to I
- In 15.67.1: absolutely flat, weakly étale, absolutely flat
- In 15.67.3: weak dimension $\leq d$
- In 15.68.1: extension of discrete valuation rings, ramification index, weakly unramified, residual degree, residue degree
- In 15.68.6: unramified, totally ramified, tamely ramified
- In 15.68.9: decomposition group, inertia group
- In 15.68.17: mixed characteristic, absolute ramification index
- In 15.69.2: weak solution for $A \subset B$, solution for $A \subset B$, separable solution
- In 15.71.1: extension of valuation rings, weakly unramified, residual degree, residue degree
- In 15.72.5: Bézout domain, elementary divisor domain

Smoothing Ring Maps

- In 16.3.1: singular ideal of A over R
- In 16.3.3: elementary standard in A over R , strictly standard in A over R

Sheaves of Modules

- In 17.4.1: *generated by global sections, generate*
 In 17.4.5: *subsheaf generated by the s_i*
 In 17.5.1: *support of \mathcal{F} , support of s*
 In 17.8.1: *locally generated by sections*
 In 17.9.1: *finite type*
 In 17.10.1: *quasi-coherent sheaf of \mathcal{O}_X -modules*
 In 17.10.6: *sheaf associated to the module M and the ring map α , sheaf associated to the module M*
 In 17.11.1: *finite presentation*
 In 17.12.1: *coherent \mathcal{O}_X -module*
 In 17.13.1: *closed immersion of ringed spaces*
 In 17.14.1: *locally free, finite locally free, finite locally free of rank r*
 In 17.16.1: *flat*
 In 17.16.3: *flat at x*
 In 17.17.1: *flat at x , flat*
 In 17.17.3: *flat over Y at a point $x \in X$, flat over Y*
 In 17.20.1: *Koszul complex*
 In 17.20.2: *Koszul complex on f_1, \dots, f_r*
 In 17.21.1: *invertible \mathcal{O}_X -module, trivial*
 In 17.21.3: *tensor power of \mathcal{L}*
 In 17.21.4: *associated graded ring*
 In 17.21.6: *Picard group*
 In 17.23.1: *\mathcal{O}_1 -derivation, φ -derivation, Leibniz rule*
 In 17.23.3: *module of differentials, universal φ -derivation*
 In 17.23.10: *S -derivation, sheaf of differentials $\Omega_{X/S}$ of X over S*
 In 17.24.1: *naive cotangent complex*
 In 17.24.4: *naive cotangent complex*

Modules on Sites

- In 18.4.1: *free abelian presheaf*
 In 18.5.1: *free abelian sheaf*
 In 18.6.1: *ringed site, structure sheaf, morphism of ringed sites, composition of morphisms of ringed sites*
 In 18.7.1: *ringed topos, structure sheaf, morphism of ringed topoi, composition of morphisms of ringed topoi*
 In 18.8.1: *2-morphism from f to g*
 In 18.9.1: *presheaf of \mathcal{O} -modules, morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules*
 In 18.10.1: *sheaf of \mathcal{O} -modules, morphism of sheaves of \mathcal{O} -modules*
 In 18.13.1: *pushforward, pullback*
 In 18.16.1: *$g_{p!}\mathcal{F}$, $g_!\mathcal{F} = (g_{p!}\mathcal{F})^\#$*
 In 18.17.1: *free \mathcal{O} -module, finite free, generated by global sections, generated by r global sections, generated by finitely many global sections, global presentation, global finite presentation*
 In 18.19.1: *localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object U , localization morphism, direct image functor, restriction of \mathcal{F} to \mathcal{C}/U , extension by zero*
 In 18.21.2: *localization of the ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ at \mathcal{F} , localization morphism*
 In 18.23.1: *locally free, finite locally free, locally generated by sections, locally generated by r sections, of finite type, quasi-coherent, of finite presentation, coherent*
 In 18.28.1: *flat, flat, flat, flat*
 In 18.30.1: *flat, flat*
 In 18.30.3: *flat over $(Sh(\mathcal{D}), \mathcal{O}')$*
 In 18.31.1: *rank r , invertible \mathcal{O} -module, \mathcal{O}^**
 In 18.31.4: *Picard group*
 In 18.32.1: *\mathcal{O}_1 -derivation, φ -derivation, Leibniz rule*
 In 18.32.3: *module of differentials, universal φ -derivation*
 In 18.32.10: *Y -derivation, sheaf of differentials $\Omega_{X/Y}$ of X over Y , universal Y -derivation*
 In 18.33.1: *differential operator $D : \mathcal{F} \rightarrow \mathcal{G}$ of order k*
 In 18.33.4: *module of principal parts of order k*
 In 18.34.1: *naive cotangent complex*
 In 18.34.4: *naive cotangent complex*
 In 18.39.4: *locally ringed site*
 In 18.39.6: *locally ringed*
 In 18.39.8: *morphism of locally ringed topoi, morphism of locally ringed sites*
 In 18.42.1: *constant sheaf, locally constant, finite locally constant*

Injectives

- In 19.2.4: α -small with respect to I
- In 19.10.1: generator, Grothendieck abelian category
- In 19.11.1: size

Cohomology of Sheaves

- In 20.5.1: torsor, \mathcal{G} -torsor, morphism of \mathcal{G} -torsors, trivial \mathcal{G} -torsor
- In 20.10.1: Čech complex, Čech cohomology groups
- In 20.13.1: flasque, flabby
- In 20.24.1: alternating Čech complex
- In 20.24.2: ordered Čech complex
- In 20.25.2: locally finite
- In 20.27.2: K -flat
- In 20.27.13: derived tensor product
- In 20.27.14: Tor
- In 20.35.1: strictly perfect
- In 20.36.1: m -pseudo-coherent, pseudo-coherent, m -pseudo-coherent, pseudo-coherent
- In 20.37.1: tor-amplitude in $[a, b]$, finite tor dimension, locally has finite tor dimension
- In 20.38.1: perfect, perfect

Cohomology on Sites

- In 21.5.1: pseudo torsor, pseudo \mathcal{G} -torsor, morphism of pseudo \mathcal{G} -torsors, torsor, \mathcal{G} -torsor, morphism of \mathcal{G} -torsors, trivial \mathcal{G} -torsor
- In 21.9.1: Čech complex, Čech cohomology groups
- In 21.13.4: limp
- In 21.17.2: K -flat
- In 21.17.11: derived tensor product
- In 21.17.12: Tor
- In 21.23.2: qc covering
- In 21.31.1: simplicial \mathcal{A}_\bullet -module, simplicial sheaf of \mathcal{A}_\bullet -modules
- In 21.33.1: strictly perfect
- In 21.34.1: m -pseudo-coherent, pseudo-coherent, m -pseudo-coherent, pseudo-coherent
- In 21.35.1: tor-amplitude in $[a, b]$, finite tor dimension, locally has finite tor dimension
- In 21.36.1: perfect, perfect

Differential Graded Algebra

- In 22.3.1: differential graded algebra over R
 - In 22.3.2: homomorphism of differential graded algebras
 - In 22.3.3: opposite differential graded algebra
 - In 22.3.4: commutative, strictly commutative
 - In 22.3.5: tensor product differential graded algebra
 - In 22.4.1: differential graded module, homomorphism of differential graded modules
 - In 22.4.3: k -shifted module
 - In 22.5.1: homotopy between f and g , homotopic
 - In 22.5.3: homotopy category
 - In 22.6.1: cone
 - In 22.7.1: admissible monomorphism, admissible epimorphism, admissible short exact sequence
 - In 22.8.2: triangle associated to $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$, distinguished triangle
 - In 22.15.2: derived category of (A, d)
 - In 22.17.1: R -linear category \mathcal{A}
 - In 22.17.2: functor of R -linear categories, R -linear
 - In 22.18.1: graded category \mathcal{A} over R
 - In 22.18.2: functor of graded categories over R , graded functor
 - In 22.18.3: \mathcal{A}^0
 - In 22.18.4: graded direct sum
 - In 22.19.1: differential graded category \mathcal{A} over R
 - In 22.19.2: functor of differential graded categories over R
 - In 22.19.3: category of complexes of \mathcal{A} , homotopy category of \mathcal{A}
 - In 22.19.4: differential graded direct sum
- Divided Power Algebra**
- In 23.2.1: divided power structure
 - In 23.3.1: divided power ring, homomorphism of divided power rings
 - In 23.4.1: extends
 - In 23.6.1: divided power structure

In 23.6.4: *compatible with the differential graded structure*

In 23.8.5: *complete intersection, local complete intersection*

Hypercoverings

In 24.2.1: *semi-representable objects, semi-representable objects over X*

In 24.2.2: *which associates a presheaf to a semi-representable object*

In 24.2.4: *covering, covering*

In 24.2.6: *hypercovering of X*

In 24.3.1: *homology of K*

In 24.5.1: *hypercovering of \mathcal{G} , hypercovering*

Schemes

In 25.2.1: *locally ringed space (X, \mathcal{O}_X) , local ring of X at x , residue field of X at x , morphism of locally ringed spaces*

In 25.3.1: *open immersion*

In 25.3.3: *open subspace of X associated to U*

In 25.4.1: *closed immersion*

In 25.4.4: *closed subspace of X associated to the sheaf of ideals \mathcal{I}*

In 25.5.2: *standard open covering, standard open covering*

In 25.5.3: *structure sheaf $\mathcal{O}_{\text{Spec}(R)}$ of the spectrum of R , spectrum*

In 25.5.5: *affine scheme, morphism of affine schemes*

In 25.9.1: *scheme, morphism of schemes*

In 25.10.2: *open immersion, open subscheme, closed immersion, closed subscheme, immersion, locally closed immersion*

In 25.12.1: *reduced*

In 25.12.5: *scheme structure on Z , reduced induced scheme structure, reduction X_{red} of X*

In 25.15.1: *representable by a scheme, representable*

In 25.15.3: *satisfies the sheaf property for the Zariski topology, subfunctor $H \subset F$, representable by open immersions, covers F*

In 25.17.1: *fibre product*

In 25.17.7: *inverse image $f^{-1}(Z)$ of the closed subscheme Z*

In 25.18.1: *scheme over S , structure morphism, scheme over R , morphism $f : X \rightarrow Y$ of schemes over S , base change, base change, base change*

In 25.18.3: *preserved under arbitrary base change, preserved under base change, preserved under arbitrary base change, preserved under base change*

In 25.18.4: *scheme theoretic fibre X_s of f over s , fibre of f over s*

In 25.19.1: *quasi-compact*

In 25.20.1: *universally closed*

In 25.20.3: *satisfies the existence part of the valuative criterion, satisfies the uniqueness part of the valuative criterion*

In 25.21.3: *separated, quasi-separated, separated, quasi-separated*

In 25.23.1: *monomorphism*

Constructions of Schemes

In 26.4.5: *relative spectrum of \mathcal{A} over S , spectrum of \mathcal{A} over S*

In 26.5.1: *affine n -space over S , affine n -space over R*

In 26.6.1: *vector bundle associated to \mathcal{E}*

In 26.6.2: *vector bundle $\pi : V \rightarrow S$ over S , morphism of vector bundles over S*

In 26.7.1: *cone associated to \mathcal{A} , affine cone associated to \mathcal{A}*

In 26.7.2: *cone $\pi : C \rightarrow S$ over S , morphism of cones*

In 26.8.2: *standard open covering*

In 26.8.3: *structure sheaf $\mathcal{O}_{\text{Proj}(S)}$ of the homogeneous spectrum of S , homogeneous spectrum*

In 26.10.1: *twist of the structure sheaf of $\text{Proj}(S)$*

In 26.13.2: *projective n -space over \mathbf{Z} , projective n -space over S , projective n -space over R*

In 26.16.7: *relative homogeneous spectrum of \mathcal{A} over S , homogeneous spectrum of \mathcal{A} over S , relative Proj of \mathcal{A} over S*

In 26.21.1: *projective bundle associated to \mathcal{E} , twist of the structure sheaf*

In 26.22.2: *Grassmannian over \mathbf{Z} , Grassmannian over S , Grassmannian over R*

Properties of Schemes

In 27.3.1: *integral*

In 27.4.1: *local*

In 27.4.2: *locally P*

In 27.5.1: *locally Noetherian, Noetherian*

In 27.6.1: *Jacobson*

In 27.7.1: *normal*

In 27.8.1: *Cohen-Macaulay*

In 27.9.1: *regular, nonsingular*

In 27.10.1: *dimension, dimension of X at x*

In 27.11.1: *catenary*

In 27.12.1: *regular in codimension k , (R_k) , (S_k)*

In 27.13.1: *Japanese, universally Japanese, Nagata*

In 27.14.1: *regular locus, singular locus*

In 27.15.1: *quasi-affine*

In 27.19.1: *locally projective*

In 27.21.1: *κ -generated*

In 27.22.3: *subsheaf of sections annihilated by \mathcal{I}*

In 27.22.6: *subsheaf of sections supported on T*

In 27.24.1: *ample*

Morphisms of Schemes

In 28.5.5: *scheme theoretic support of \mathcal{F}*

In 28.6.2: *scheme theoretic image*

In 28.7.1: *scheme theoretic closure of U in X , scheme theoretically dense in X*

In 28.8.1: *dominant*

In 28.9.1: *birational*

In 28.10.1: *equivalent, rational map from X to Y , S -rational map from X to Y*

In 28.10.2: *rational function on X*

In 28.10.3: *ring of rational functions on X*

In 28.10.5: *function field, field of rational functions*

In 28.10.7: *defined in a point $x \in X$, domain of definition*

In 28.10.9: *dominant*

In 28.10.10: *birational, S -birational*

In 28.11.1: *surjective*

In 28.12.1: *universally injective, radicial*

In 28.13.1: *affine*

In 28.14.1: *quasi-affine*

In 28.15.1: *local, stable under base change, stable under composition*

In 28.15.2: *locally of type P*

In 28.16.1: *finite type at $x \in X$, locally of finite type, finite type*

In 28.17.3: *finite type point*

In 28.18.1: *universally catenary*

In 28.20.1: *J -2*

In 28.21.1: *quasi-finite at a point $x \in X$, locally quasi-finite, quasi-finite*

In 28.22.1: *finite presentation at $x \in X$, locally of finite presentation, finite presentation*

In 28.24.1: *open, universally open*

In 28.25.1: *submersive, universally submersive*

In 28.26.1: *flat at a point $x \in X$, flat over S at a point $x \in X$, flat, flat over S*

In 28.27.3: *canonical scheme structure on T*

In 28.30.1: *relative dimension $\leq d$ at x , relative dimension $\leq d$, relative dimension d*

In 28.32.1: *syntomic at $x \in X$, syntomic, local complete intersection over k , standard syntomic*

In 28.32.15: *syntomic of relative dimension d*

In 28.33.1: *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X , conormal sheaf of i*

In 28.34.1: *sheaf of differentials $\Omega_{X/S}$ of X over S , universal S -derivation*

In 28.35.1: *smooth at $x \in X$, smooth, standard smooth*

In 28.35.13: *smooth of relative dimension d*

In 28.36.1: *unramified at $x \in X$, G -unramified at $x \in X$, unramified, G -unramified*

In 28.37.1: *étale at $x \in X$, étale, standard étale*

In 28.38.1: *relatively ample, f -relatively ample, ample on X/S , f -ample*

In 28.39.1: *relatively very ample, f -relatively very ample, very ample on X/S , f -very ample*

- In 28.41.1: *quasi-projective, H -quasi-projective, locally quasi-projective*
 In 28.42.1: *proper*
 In 28.43.1: *projective, H -projective, locally projective*
 In 28.44.1: *integral, finite*
 In 28.45.1: *universal homeomorphism*
 In 28.46.1: *finite locally free, rank, degree*
 In 28.47.5: *degree of X over Y*
 In 28.47.8: *modification of X*
 In 28.47.9: *alteration of X*
 In 28.48.2: *integral closure of \mathcal{O}_X in \mathcal{A}*
 In 28.48.3: *normalization of X in Y*
 In 28.48.12: *normalization*
 In 28.50.1: *bounds the degrees of the fibres of f , fibres of f are universally bounded*

Cohomology of Schemes

- In 29.11.1: *depth k at a point, depth k at a point, (S_k) , (S_k)*
 In 29.11.2: *Cohen-Macaulay*

Divisors

- In 30.2.1: *associated, associated points of X*
 In 30.4.1: *embedded associated point, embedded point, embedded component*
 In 30.5.1: *weakly associated, weakly associated points of X*
 In 30.7.1: *relative assassin of \mathcal{F} in X over S*
 In 30.8.1: *relative weak assassin of \mathcal{F} in X over S*
 In 30.9.1: *locally principal closed subscheme, effective Cartier divisor*
 In 30.9.6: *sum of the effective Cartier divisors D_1 and D_2*
 In 30.9.11: *pullback of D by f is defined, pullback of the effective Cartier divisor*
 In 30.9.14: *invertible sheaf $\mathcal{O}_S(D)$ associated to D*
 In 30.9.16: *regular section*
 In 30.9.18: *zero scheme*
 In 30.10.2: *relative effective Cartier divisor*
 In 30.11.1: *conormal algebra $\mathcal{C}_{Z/X,*}$ of Z in X , conormal algebra of f*

- In 30.11.5: *normal cone $C_Z X$, normal bundle*
 In 30.12.2: *regular, Koszul-regular, H_1 -regular, quasi-regular*
 In 30.13.1: *regular immersion, Koszul-regular immersion, H_1 -regular immersion, quasi-regular immersion*
 In 30.14.2: *relative quasi-regular immersion, relative H_1 -regular immersion*
 In 30.15.1: *sheaf of meromorphic functions on X , \mathcal{K}_X , meromorphic function*
 In 30.15.3: *pullbacks of meromorphic functions are defined for f*
 In 30.15.5: *meromorphic section of \mathcal{F}*
 In 30.15.11: *regular*
 In 30.15.15: *ideal sheaf of denominators of s*
 In 30.18.1: *blowing up of X along Z , blowing up of X in the ideal sheaf \mathcal{I} , exceptional divisor, center*
 In 30.19.1: *strict transform, strict transform*
 In 30.20.1: *U -admissible blowup*

Limits of Schemes

Varieties

- In 32.3.1: *variety*
 In 32.4.1: *geometrically reduced at x , geometrically reduced*
 In 32.5.1: *geometrically connected*
 In 32.6.1: *geometrically irreducible*
 In 32.7.1: *geometrically pointwise integral at x , geometrically pointwise integral, geometrically integral*
 In 32.8.1: *geometrically normal at x , geometrically normal*
 In 32.10.1: *geometrically regular at x , geometrically regular over k*
 In 32.13.1: *algebraic k -scheme, locally algebraic k -scheme*
 In 32.16.1: *affine variety, projective variety, quasi-projective variety, proper variety*
 In 32.19.6: *m -regular*
 In 32.19.16: *Hilbert polynomial*
 In 32.23.1: *curve*

Topologies on Schemes

- In 33.3.1: *Zariski covering of T*
 In 33.3.4: *standard Zariski covering*
 In 33.3.5: *big Zariski site*
 In 33.3.7: *big Zariski site of S , small Zariski site of S , big affine Zariski site of S*
 In 33.3.14: *restriction to the small Zariski site*
 In 33.4.1: *étale covering of T*
 In 33.4.5: *standard étale covering*
 In 33.4.6: *big étale site*
 In 33.4.8: *big étale site of S , small étale site of S , big affine étale site of S*
 In 33.4.14: *restriction to the small étale site*
 In 33.5.1: *smooth covering of T*
 In 33.5.5: *standard smooth covering*
 In 33.5.6: *big smooth site*
 In 33.5.8: *big smooth site of S , big affine smooth site of S*
 In 33.6.1: *syntomic covering of T*
 In 33.6.5: *standard syntomic covering*
 In 33.6.6: *big syntomic site*
 In 33.6.8: *big syntomic site of S , big affine syntomic site of S*
 In 33.7.1: *fppf covering of T*
 In 33.7.5: *standard fppf covering*
 In 33.7.6: *big fppf site*
 In 33.7.8: *big fppf site of S , big affine fppf site of S*
 In 33.8.1: *fpqc covering of T*
 In 33.8.9: *standard fpqc covering*
 In 33.8.12: *satisfies the sheaf property for the given family, satisfies the sheaf property for the fpqc topology*
- Descent**
- In 34.2.1: *descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves, cocycle condition, morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data*
 In 34.2.3: *trivial descent datum, canonical descent datum, effective*
 In 34.3.1: *descent datum (N, φ) for modules with respect to $R \rightarrow A$, cocycle condition, morphism $(N, \varphi) \rightarrow (N', \varphi')$ of descent data*
 In 34.3.4: *effective*
 In 34.4.2: *split equalizer*
 In 34.4.5: *universally injective*
 In 34.4.9: *C*
 In 34.4.15: *base extension along f , descent morphism for modules, effective descent morphism for modules*
 In 34.4.19: *f_**
 In 34.7.2: *structure sheaf of the big site $(Sch/S)_\tau$, sheaf of \mathcal{O} -modules associated to \mathcal{F} , sheaf of \mathcal{O} -modules associated to \mathcal{F}*
 In 34.8.1: *parasitic, parasitic for the τ -topology*
 In 34.11.1: *local in the τ -topology*
 In 34.16.1: *germ of X at x , morphism of germs, composition of morphisms of germs*
 In 34.16.2: *étale, smooth*
 In 34.17.1: *étale local, smooth local*
 In 34.18.1: *τ local on the base, τ local on the target, local on the base for the τ -topology*
 In 34.22.1: *τ local on the source, local on the source for the τ -topology*
 In 34.28.3: *étale local on source-and-target*
 In 34.29.1: *étale local on the source-and-target*
 In 34.30.1: *descent datum for $V/X/S$, cocycle condition, descent datum relative to $X \rightarrow S$, morphism $f : (V/X, \varphi) \rightarrow (V'/X, \varphi')$ of descent data relative to $X \rightarrow S$*
 In 34.30.3: *descent datum (V_i, φ_{ij}) relative to the family $\{X_i \rightarrow S\}$, morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data*
 In 34.30.7: *pullback functor*
 In 34.30.9: *pullback functor*
 In 34.30.10: *trivial descent datum, canonical descent datum, effective*
 In 34.30.11: *canonical descent datum, effective*
 In 34.32.1: *morphisms of type \mathcal{P} satisfy descent for τ -coverings*
- Derived Categories of Schemes**
- In 35.6.4: *supported on T*
 In 35.12.1: *approximation holds for the triple*
 In 35.12.2: *approximation by perfect complexes holds*

In 35.16.2: *Tor independent over S*

More on Morphisms

In 36.2.1: *thickening, first order thickening, morphism of thickenings, thickenings over S , morphisms of thickenings over S*

In 36.3.1: *first order infinitesimal neighbourhood*

In 36.4.1: *formally unramified*

In 36.5.2: *universal first order thickening, conormal sheaf of Z over X*

In 36.6.1: *formally étale*

In 36.9.1: *formally smooth*

In 36.15.1: *normal at x , normal morphism*

In 36.16.1: *regular at x , regular morphism*

In 36.17.1: *Cohen-Macaulay at x , Cohen-Macaulay morphism*

In 36.27.1: *étale neighbourhood of (S, s) , morphism of étale neighbourhoods, elementary étale neighbourhood*

In 36.38.1: *finitely presented relative to S , of finite presentation relative to S*

In 36.39.2: *m -pseudo-coherent relative to S , pseudo-coherent relative to S , m -pseudo-coherent relative to S , pseudo-coherent relative to S*

In 36.40.2: *pseudo-coherent*

In 36.41.2: *perfect*

In 36.42.2: *Koszul at x , Koszul morphism, local complete intersection morphism*

In 36.44.1: *weakly étale, absolutely flat*

In 36.46.1: *ind-quasi-affine, ind-quasi-affine*

More on Flatness

In 37.4.1: *one step dévissage of $\mathcal{F}/X/S$ over s*

In 37.4.2: *one step dévissage of $\mathcal{F}/X/S$ at x*

In 37.4.6: *standard shrinking*

In 37.5.1: *complete dévissage of $\mathcal{F}/X/S$ over s*

In 37.5.2: *complete dévissage of $\mathcal{F}/X/S$ at x*

In 37.5.5: *standard shrinking*

In 37.6.1: *elementary étale localization of the ring map $R \rightarrow S$ at \mathfrak{q}*

In 37.6.2: *complete dévissage of $N/S/R$ over \mathfrak{r}*

In 37.6.4: *complete dévissage of $N/S/R$ at \mathfrak{q}*

In 37.14.2: *impurity of \mathcal{F} above s*

In 37.15.1: *pure along X_s , universally pure along X_s , pure along X_s , universally S -pure, universally pure relative to S , S -pure, pure relative to S , S -pure, pure relative to S*

In 37.20.1: *universal flattening of \mathcal{F} exists, universal flattening of X exists*

In 37.20.2: *flattening stratification, flattening stratification*

Groupoid Schemes

In 38.3.1: *pre-relation, relation, pre-equivalence relation, equivalence relation on U over S*

In 38.3.3: *restriction, pullback*

In 38.4.1: *group scheme over S , morphism $\psi : (G, m) \rightarrow (G', m')$ of group schemes over S*

In 38.4.3: *closed subgroup scheme, open subgroup scheme*

In 38.4.4: *smooth group scheme, flat group scheme, separated group scheme*

In 38.8.1: *action of G on the scheme X/S , equivariant, G -equivariant*

In 38.8.2: *free*

In 38.9.1: *pseudo G -torsor, formally principally homogeneous under G , trivial*

In 38.9.3: *principal homogeneous space, G -torsor, G -torsor in the τ topology, τ G -torsor, τ torsor, quasi-isotrivial, locally trivial*

In 38.10.1: *G -equivariant quasi-coherent \mathcal{O}_X -module, equivariant quasi-coherent \mathcal{O}_X -module*

In 38.11.1: *groupoid scheme over S , groupoid over S , morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoid schemes over S*

In 38.12.1: *quasi-coherent module on (U, R, s, t, c)*

- In 38.15.2: *stabilizer of the groupoid scheme (U, R, s, t, c)*
 In 38.16.2: *restriction of (U, R, s, t, c) to U'*
 In 38.17.1: *set-theoretically R -invariant, R -invariant, R -invariant, R -invariant*
 In 38.18.1: *quotient sheaf U/R*
 In 38.18.2: *representable quotient, representable quotient*
 In 38.19.1: *cartesian, (U', R', s', t', c') is cartesian over (U, R, s, t, c) , morphism of groupoid schemes cartesian over (U, R, s, t, c)*

More on Groupoid Schemes

Étale Morphisms of Schemes

- In 40.3.1: *unramified homomorphism of local rings*
 In 40.3.5: *unramified at x , unramified*
 In 40.9.1: *flat, faithfully flat, flat (resp. faithfully flat)*
 In 40.9.3: *flat over Y at $x \in X$, flat at $x \in X$, flat, faithfully flat*
 In 40.11.1: *étale homomorphism of local rings*
 In 40.11.4: *étale at $x \in X$, étale*

Chow Homology and Chern Classes

- In 41.2.1: *admissible, symbol, admissible relation, determinant of the finite length R -module M*
 In 41.3.1: *2-periodic complex, cohomology modules, exact, $(2, 1)$ -periodic complex, cohomology modules*
 In 41.3.2: *multiplicity, Herbrand quotient*
 In 41.3.4: *determinant of (M, φ, ψ)*
 In 41.4.3: *symbol associated to M, a, b*
 In 41.4.5: *tame symbol*
 In 41.7.5: *δ -dimension of Z*
 In 41.8.1: *locally finite, cycle on X , k -cycle*
 In 41.9.2: *multiplicity of Z' in Z , k -cycle associated to Z*
 In 41.10.2: *multiplicity of Z' in \mathcal{F} , k -cycle associated to \mathcal{F}*
 In 41.12.1: *pushforward*
 In 41.14.1: *flat pullback of α by f*

- In 41.16.1: *order of vanishing of f along Z*
 In 41.17.1: *principal divisor associated to f*
 In 41.19.1: *rationally equivalent to zero, rationally equivalent, Chow group of k -cycles on X , Chow group of k -cycles module rational equivalence on X*
 In 41.23.1: *order of vanishing of s along Z*
 In 41.24.1: *Weil divisor associated to s , Weil divisor associated to \mathcal{L}*
 In 41.25.1: *intersection with the first chern class of \mathcal{L}*
 In 41.27.3: *ϵ -invariant*
 In 41.27.5: *sum of the effective Cartier divisors*
 In 41.28.1: *Gysin homomorphism*
 In 41.34.1: *chern classes of \mathcal{E} on X , total chern class of \mathcal{E} on X*
 In 41.35.1: *intersection with the j th chern class of \mathcal{E}*
 In 41.36.1: *polynomial relation among the chern classes*

Adequate Modules

- In 42.3.1: *module-valued functor, morphism of module-valued functors*
 In 42.3.2: *adequate, linearly adequate*
 In 42.5.1: *adequate*
 In 42.5.7: *$\text{Adeq}(\mathcal{O})$, $\text{Adeq}((\text{Sch}/S)_\tau, \mathcal{O})$, $\text{Adeq}(S)$*
 In 42.8.1: *pure projective, pure injective*
 In 42.8.5: *pure projective resolution, pure injective resolution*
 In 42.8.8: *pure extension module*

Dualizing Complexes

- In 43.2.1: *essential, essential extension of, essential*
 In 43.4.1: *projective cover, projective envelope*
 In 43.5.1: *injective hull*
 In 43.5.5: *indecomposable*
 In 43.12.1: *dualizing complex*
 In 43.16.2: *dualizing complex*

Étale Cohomology

- In 44.4.1: *étale covering*

- In 44.9.1: *presheaf of sets, abelian presheaf*
- In 44.10.1: *family of morphisms with fixed target*
- In 44.10.2: *site, coverings*
- In 44.11.1: *separated presheaf, sheaf*
- In 44.11.4: *category of sheaves of sets, abelian sheaves*
- In 44.13.1: *zeroth Čech cohomology group*
- In 44.15.1: *fpqc covering*
- In 44.15.5: *satisfies the sheaf property for the fpqc topology*
- In 44.16.1: *descent datum, effective*
- In 44.16.5: *descent datum*
- In 44.16.6: *effective*
- In 44.17.2: *ringed site, quasi-coherent*
- In 44.18.1: *Čech complex, Čech cohomology groups*
- In 44.18.4: *free abelian presheaf on \mathcal{G}*
- In 44.20.1: *τ -covering*
- In 44.20.2: *standard τ -covering*
- In 44.20.4: *big τ -site of S , small τ -site of S*
- In 44.21.1: *étale topos, small étale topos, Zariski topos, small Zariski topos, big τ -topos*
- In 44.23.1: *constant sheaf*
- In 44.23.3: *structure sheaf*
- In 44.26.1: *étale*
- In 44.26.3: *standard étale*
- In 44.27.1: *étale covering*
- In 44.27.3: *big étale site over S , small étale site over S , big, small Zariski sites*
- In 44.29.1: *geometric point, lies over, étale neighborhood, morphism of étale neighborhoods*
- In 44.29.6: *stalk*
- In 44.31.3: *support of \mathcal{F} , support of σ*
- In 44.32.2: *henselian*
- In 44.32.6: *strictly henselian*
- In 44.33.2: *étale local ring of S at \bar{s} , strict henselization of $\mathcal{O}_{S,s}$, henselization of $\mathcal{O}_{S,s}$, strict henselization of S at \bar{s} , henselization of S at s*
- In 44.35.1: *direct image, pushforward*
- In 44.35.3: *direct image, pushforward*
- In 44.35.4: *higher direct images*
- In 44.36.1: *inverse image, pullback*
- In 44.56.1: *G -set, discrete G -set, morphism of G -sets, G -Sets*
- In 44.57.1: *absolute Galois group, algebraic*
- In 44.58.1: *G -module, discrete G -module, morphism of G -modules, Mod_G*
- In 44.58.2: *continuous group cohomology groups, group cohomology groups, Galois cohomology groups, Galois cohomology groups of K with coefficients in M*
- In 44.61.3: *similar, equivalent*
- In 44.61.4: *Brauer group*
- In 44.63.2: *C_r , nontrivial solution*
- In 44.63.6: *variety, curve*
- In 44.66.1: *abelian variety*
- In 44.67.1: *extension by zero, extension by zero*
- In 44.68.1: *constant sheaf with value E , constant sheaf, locally constant, finite locally constant, constant sheaf with value A , constant sheaf, locally constant, finite locally constant, constant sheaf with value M , constant sheaf, locally constant*
- In 44.69.1: *constructible, constructible, constructible*
- In 44.75.1: *trace*
- In 44.80.3: *absolute Frobenius*
- In 44.80.5: *geometric Frobenius*
- In 44.80.9: *arithmetic Frobenius*
- In 44.80.11: *geometric Frobenius*
- In 44.81.1: *trace*
- In 44.83.4: *total right derived functor of F , total right derived functor of G*
- In 44.84.1: *filtered injective, projective, filtered quasi-isomorphism*
- In 44.85.1: *filtered derived functor*
- In 44.87.1: *perfect*
- In 44.89.1: *finite Tor-dimension*
- In 44.90.1: *$D_c(X, \Lambda)$*
- In 44.90.7: *$D_{ctf}(X, \Lambda)$*
- In 44.92.1: *global Lefschetz number*
- In 44.92.2: *local Lefschetz number*
- In 44.93.2: *G -trace of f on P*
- In 44.96.1: *\mathbf{Z}_ℓ -sheaf, lisse, morphism*
- In 44.96.6: *torsion, stalk*
- In 44.96.8: *ℓ -adic cohomology*
- In 44.97.1: *L -function of \mathcal{F}*
- In 44.97.3: *L -function of \mathcal{F}*

- In 44.105.1: *open*
- In 44.109.1: *unramified cusp form on $GL_2(\mathbf{A})$ with values in Λ*
- Crystalline Cohomology**
- In 45.2.2: *divided power envelope of J in B relative to (A, I, γ)*
- In 45.4.1: *δ is compatible with γ*
- In 45.5.2: *divided power thickening, homomorphism of divided power thickenings*
- In 45.6.1: *divided power A -derivation*
- In 45.7.1: *divided power structure γ*
- In 45.7.2: *divided power scheme, morphism of divided power schemes*
- In 45.7.3: *divided power thickening*
- In 45.8.1: *divided power thickening of X relative to (S, \mathcal{I}, γ) , morphism of divided power thickenings of X relative to (S, \mathcal{I}, γ)*
- In 45.8.4: *Zariski, étale, smooth, syntomic, or fppf covering, big crystalline site*
- In 45.9.1: *crystalline site*
- In 45.11.1: *locally quasi-coherent, quasi-coherent, crystal in $\mathcal{O}_{X/S}$ -modules*
- In 45.11.3: *crystal in quasi-coherent modules, crystal in finite locally free modules*
- In 45.12.1: *S -derivation $D : \mathcal{O}_{X/S} \rightarrow \mathcal{F}$*
- In 45.26.2: *F -crystal on X/S (relative to σ), nondegenerate*
- Pro-étale Cohomology**
- In 46.2.3: *w -local, w -local*
- In 46.3.1: *local isomorphism, identifies local rings*
- In 46.4.1: *ind-Zariski*
- In 46.7.1: *ind-étale*
- In 46.10.1: *w -contractible*
- In 46.11.1: *pro-étale covering of T*
- In 46.11.6: *standard pro-étale covering*
- In 46.11.8: *big pro-étale site*
- In 46.11.12: *big pro-étale site of S , small pro-étale site of S , big affine pro-étale site of S*
- In 46.11.18: *restriction to the small pro-étale site*
- In 46.14.4: *derived complete with respect to \mathcal{I}*
- In 46.24.1: *extension by zero, extension by zero*
- In 46.25.1: *constructible*
- In 46.26.1: *constructible Λ -sheaf, lisse, adic lisse, adic constructible*
- In 46.27.1: *constructible*
- In 46.27.4: *adic lisse, adic constructible*
- Algebraic Spaces**
- In 47.5.1: *property \mathcal{P}*
- In 47.6.1: *algebraic space over S*
- In 47.6.3: *morphism $f : F \rightarrow F'$ of algebraic spaces over S*
- In 47.9.2: *étale equivalence relation*
- In 47.9.3: *presentation*
- In 47.12.1: *open immersion, open subspace, closed immersion, closed subspace, immersion, locally closed subspace*
- In 47.12.5: *Zariski covering*
- In 47.12.6: *small Zariski site F_{Zar}*
- In 47.13.2: *separated over S , locally separated over S , quasi-separated over S , Zariski locally quasi-separated over S*
- In 47.14.4: *acts freely, quotient of U by G*
- In 47.16.2: *base change of F' to S , viewed as an algebraic space over S'*
- Properties of Algebraic Spaces**
- In 48.3.1: *separated, locally separated, quasi-separated, Zariski locally quasi-separated, separated, locally separated, quasi-separated, Zariski locally quasi-separated*
- In 48.4.1: *point*
- In 48.4.7: *topological space*
- In 48.5.1: *quasi-compact*
- In 48.7.2: *has property \mathcal{P}*
- In 48.7.5: *has property \mathcal{P} at x*
- In 48.8.1: *dimension of X at x*
- In 48.8.2: *dimension*
- In 48.9.5: *algebraic space structure on Z , reduced induced algebraic space structure, reduction X_{red} of X*
- In 48.13.2: *étale*
- In 48.15.1: *small étale site $X_{étale}$*
- In 48.15.2: *$X_{spaces, étale}$*

- In 48.15.6: *étale topos, small étale topos*
 In 48.15.8: *f-map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$*
 In 48.16.1: *geometric point, geometric point lying over x*
 In 48.16.2: *étale neighborhood, morphism of étale neighborhoods*
 In 48.16.6: *stalk*
 In 48.17.3: *support of \mathcal{F} , support of σ*
 In 48.18.2: *structure sheaf*
 In 48.19.2: *étale local ring of X at \bar{x} , strict henselization of X at \bar{x}*
 In 48.20.2: *dimension of the local ring of X at x*
 In 48.21.2: *geometrically unibranch at x , geometrically unibranch*
 In 48.22.1: *Noetherian*
 In 48.23.2: *X is regular at x*
 In 48.27.1: *quasi-coherent*
 In 48.29.2: *locally projective*

Morphisms of Algebraic Spaces

- In 49.4.2: *separated, locally separated, quasi-separated*
 In 49.5.2: *surjective*
 In 49.6.2: *open, universally open*
 In 49.7.1: *submersive, universally submersive*
 In 49.8.2: *quasi-compact*
 In 49.9.2: *closed, universally closed*
 In 49.10.1: *monomorphism*
 In 49.13.2: *inverse image $f^{-1}(Z)$ of the closed subspace Z*
 In 49.15.4: *scheme theoretic support of \mathcal{F}*
 In 49.16.2: *scheme theoretic image*
 In 49.17.3: *scheme theoretic closure of U in X , scheme theoretically dense in X*
 In 49.18.1: *dominant*
 In 49.19.3: *universally injective*
 In 49.20.2: *affine*
 In 49.20.8: *relative spectrum of \mathcal{A} over X , spectrum of \mathcal{A} over X*
 In 49.21.2: *quasi-affine*
 In 49.22.2: *has property \mathcal{P}*
 In 49.22.6: *has property \mathcal{Q} at x*
 In 49.23.1: *locally of finite type, finite type at x , of finite type*
 In 49.25.2: *finite type point*
 In 49.26.1: *locally quasi-finite, quasi-finite at x , quasi-finite*

- In 49.27.1: *locally of finite presentation, finite presentation at x , of finite presentation*
 In 49.28.1: *flat, flat at x*
 In 49.29.2: *flat at x over Y , flat over Y*
 In 49.31.1: *dimension of the local ring of the fibre of f at x , transcendence degree of $x/f(x)$, f has relative dimension d at x*
 In 49.31.2: *relative dimension $\leq d$, relative dimension d*
 In 49.33.1: *syntomic, syntomic at x*
 In 49.34.1: *smooth, smooth at x*
 In 49.35.1: *unramified, unramified at x , G -unramified, G -unramified at x*
 In 49.36.1: *étale at x*
 In 49.37.1: *proper*
 In 49.38.1: *satisfies the uniqueness part of the valuative criterion, satisfies the existence part of the valuative criterion, satisfies the valuative criterion*

- In 49.41.2: *integral, finite*
 In 49.42.2: *finite locally free, rank, degree*
 In 49.43.2: *integral closure of \mathcal{O}_X in \mathcal{A}*
 In 49.43.3: *normalization of X in Y*
 In 49.47.2: *universal homeomorphism*

Decent Algebraic Spaces

- In 50.3.1: *fibres of f are universally bounded*
 In 50.6.1: *decent, reasonable, very reasonable*
 In 50.11.6: *residual space of X at x*
 In 50.15.1: *has property (β) , has property (β) , decent, reasonable, very reasonable*
 In 50.18.1: *birational*

Cohomology of Algebraic Spaces

- In 51.5.2: *alternating Čech complex*
 In 51.11.1: *coherent*

Limits of Algebraic Spaces

- In 52.3.1: *locally of finite presentation, limit preserving, locally of finite presentation over S , locally of finite presentation, relatively limit preserving*
 In 52.14.3: *subsheaf of sections annihilated by \mathcal{I}*

In 52.14.6: *subsheaf of sections supported on T*

Divisors on Algebraic Spaces

In 53.2.1: *locally principal closed subspace, effective Cartier divisor*

In 53.2.6: *sum of the effective Cartier divisors D_1 and D_2*

In 53.2.10: *pullback of D by f is defined, pullback of the effective Cartier divisor*

In 53.2.13: *invertible sheaf $\mathcal{O}_X(D)$ associated to D*

In 53.2.15: *regular section*

In 53.2.17: *zero scheme*

In 53.3.3: *relative homogeneous spectrum of \mathcal{A} over X , homogeneous spectrum of \mathcal{A} over X , relative Proj of \mathcal{A} over X*

In 53.6.1: *blowing up of X along Z , blowing up of X in the ideal sheaf \mathcal{I} , exceptional divisor, center*

In 53.7.1: *strict transform, strict transform*

In 53.8.1: *U -admissible blowup*

Algebraic Spaces over Fields

In 54.5.1: *integral*

In 54.5.3: *degree of X over Y*

In 54.6.1: *modification of X*

In 54.6.3: *alteration of X*

In 54.8.1: *geometrically connected*

Topologies on Algebraic Spaces

In 55.3.1: *fppc covering of X*

In 55.4.1: *fppf covering of X*

In 55.5.1: *syntomic covering of X*

In 55.6.1: *smooth covering of X*

In 55.7.1: *étale covering of X*

In 55.8.1: *Zariski covering of X*

Descent and Algebraic Spaces

In 56.3.1: *descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves, cocycle condition, morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data*

In 56.3.3: *trivial descent datum, canonical descent datum, effective*

In 56.9.1: *τ local on the base, τ local on the target, local on the base for the τ -topology*

In 56.12.1: *τ local on the source, local on the source for the τ -topology*

In 56.18.1: *smooth local on source-and-target*

In 56.19.1: *descent datum for $V/Y/X$, cocycle condition, descent datum relative to $Y \rightarrow X$, morphism $f : (V/Y, \varphi) \rightarrow (V'/Y, \varphi')$ of descent data relative to $Y \rightarrow X$*

In 56.19.3: *descent datum (V_i, φ_{ij}) relative to the family $\{X_i \rightarrow X\}$, morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data*

In 56.19.7: *pullback functor*

In 56.19.9: *pullback functor*

In 56.19.10: *trivial descent datum, canonical descent datum, effective*

In 56.19.11: *canonical descent datum, effective*

Derived Categories of Spaces

In 57.3.2: *supported on T*

In 57.5.1: *derived category of \mathcal{O}_X -modules with quasi-coherent cohomology sheaves*

In 57.8.1: *elementary distinguished square*

In 57.13.1: *approximation holds for the triple*

In 57.13.2: *approximation by perfect complexes holds*

In 57.17.2: *Tor independent over B*

More on Morphisms of Spaces

In 58.3.1: *radicial*

In 58.4.1: *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X , conormal sheaf of i*

In 58.5.1: *conormal algebra $\mathcal{C}_{Z/X,*}$ of Z in X , conormal algebra of i*

In 58.5.5: *normal cone $C_Z X$, normal bundle*

In 58.6.2: *sheaf of differentials $\Omega_{X/Y}$ of X over Y , universal Y -derivation*

In 58.8.1: *thickening, first order thickening, morphism of thickenings, thickenings over B , morphisms of thickenings over B*

In 58.9.1: *first order infinitesimal neighbourhood*

- In 58.10.1: *formally smooth, formally étale, formally unramified*
- In 58.11.1: *formally unramified*
- In 58.12.5: *universal first order thickening, conormal sheaf of Z over X*
- In 58.13.1: *formally étale*
- In 58.16.1: *formally smooth*
- In 58.19.2: *the restriction of \mathcal{F} to its fibre over z is flat at x over the fibre of Y over z , the fibre of X over z is flat at x over the fibre of Y over z , the fibre of X over z is flat over the fibre of Y over z*
- In 58.33.2: *Koszul-regular immersion, H_1 -regular immersion, quasi-regular immersion*
- In 58.34.1: *pseudo-coherent, pseudo-coherent at x*
- In 58.35.1: *perfect, perfect at x*
- In 58.36.1: *Koszul morphism, local complete intersection morphism, Koszul at x*
- In 60.12.1: *quasi-coherent module on (U, R, s, t, c)*
- In 60.15.2: *stabilizer of the groupoid in algebraic spaces (U, R, s, t, c)*
- In 60.16.2: *restriction of (U, R, s, t, c) to U'*
- In 60.17.1: *R -invariant, R -invariant, R -invariant*
- In 60.18.1: *quotient sheaf U/R*
- In 60.18.3: *quotient representable by an algebraic space, representable quotient, representable quotient, quotient representable by an algebraic space*
- In 60.19.1: *quotient stack, quotient stack*

More on Groupoids in Spaces

- In 61.12.1: *split over u , splitting of R over u , quasi-split over u , quasi-splitting of R over u*

Pushouts of Algebraic Spaces

Groupoids in Algebraic Spaces

- In 60.4.1: *pre-relation, relation, pre-equivalence relation, equivalence relation on U over B*
- In 60.4.3: *restriction, pullback*
- In 60.5.1: *group algebraic space over B , morphism $\psi : (G, m) \rightarrow (G', m')$ of group algebraic spaces over B*
- In 60.8.1: *action of G on the algebraic space X/B , equivariant, G -equivariant*
- In 60.8.2: *free*
- In 60.9.1: *pseudo G -torsor, formally principally homogeneous under G , trivial*
- In 60.9.3: *principal homogeneous space, principal homogeneous G -space over B , G -torsor in the τ topology, τ G -torsor, τ torsor, quasi-isotrivial, locally trivial*
- In 60.10.1: *G -equivariant quasi-coherent \mathcal{O}_X -module, equivariant quasi-coherent \mathcal{O}_X -module*
- In 60.11.1: *groupoid in algebraic spaces over B , morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoids in algebraic spaces over B*

Bootstrap

- In 62.3.1: *representable by algebraic spaces*
- In 62.4.1: *property \mathcal{P}*

Quotients of Groupoids

- In 63.3.1: *R -invariant, G -invariant*
- In 63.3.4: *pullback, flat pullback*
- In 63.4.1: *categorical quotient, categorical quotient in \mathcal{C} , categorical quotient in the category of schemes, categorical quotient in schemes*
- In 63.4.4: *universal categorical quotient, uniform categorical quotient*
- In 63.5.1: *orbit, R -orbit*
- In 63.5.4: *weakly R -equivalent, R -equivalent, weak orbit, weak R -orbit, orbit, R -orbit*
- In 63.5.8: *set-theoretically R -invariant, separates orbits, separates R -orbits*
- In 63.5.13: *set-theoretic pre-equivalence relation, set-theoretic equivalence relation*
- In 63.5.18: *orbit space for R*
- In 63.6.1: *coarse quotient, coarse quotient in schemes*
- In 63.7.1: *uniformly, universally*

In 63.8.1: *sheaf of R -invariant functions on X , the functions on X are the R -invariant functions on U*

In 63.9.1: *good quotient*

In 63.10.1: *geometric quotient*

Simplicial Spaces

In 64.8.1: *cartesian, Y is cartesian over X*

In 64.8.3: *simplicial scheme associated to f*

In 64.9.1: *quasi-coherent sheaf, cartesian*

Formal Algebraic Spaces

In 65.4.6: *tensor product, completed tensor product*

In 65.4.7: *topologically nilpotent, weak ideal of definition, weakly pre-admissible, weakly admissible*

In 65.4.9: *taut*

In 65.5.1: *affine formal algebraic space, morphism of affine formal algebraic spaces*

In 65.5.7: *McQuillan, classical, adic, adic*, Noetherian*

In 65.5.9: *formal spectrum*

In 65.6.2: *countably indexed*

In 65.7.1: *formal algebraic space, morphism of formal algebraic spaces*

In 65.9.3: *completion of X along T*

In 65.11.3: *quasi-separated, separated*

In 65.12.2: *quasi-compact*

In 65.12.4: *quasi-compact*

In 65.15.5: *locally countably indexed, locally adic*, locally Noetherian*

In 65.17.1: *adic morphism*

In 65.18.1: *locally of finite type, finite type*

In 65.19.1: *monomorphism*

In 65.20.1: *closed immersion*

In 65.21.1: *separated, quasi-separated*

In 65.22.1: *proper*

Restricted Power Series

In 66.3.1: *topologically of finite type over*

In 66.7.2: *rig-étale*

In 66.11.1: *rig-surjective*

Resolution of Surfaces

Formal Deformation Theory

In 68.3.1: \mathcal{C}_Λ , *classical case*

In 68.3.2: *small extension*

In 68.3.6: *relative cotangent space*

In 68.3.9: *essential surjection*

In 68.4.1: $\hat{\mathcal{C}}_\Lambda$

In 68.5.1: *category cofibered in groupoids over \mathcal{C}*

In 68.6.1: *prorepresentable*

In 68.6.2: *predeformation category, morphism of predeformation categories*

In 68.7.1: *category $\hat{\mathcal{F}}$ of formal objects of \mathcal{F} , formal object $\xi = (R, \xi_n, f_n)$ of \mathcal{F} , morphism $a : \xi \rightarrow \eta$ of formal objects*

In 68.7.3: *completion of \mathcal{F}*

In 68.8.1: *smooth*

In 68.8.13: *versal*

In 68.9.1: *conditions (S1) and (S2)*

In 68.10.1: *R -linear*

In 68.10.9: *tangent space TF of F*

In 68.11.1: *tangent space $T\mathcal{F}$ of \mathcal{F}*

In 68.11.3: *differential $d\varphi : T\mathcal{F} \rightarrow TG$ of φ*

In 68.13.4: *minimal, miniversal*

In 68.15.1: *condition (RS)*

In 68.15.8: *deformation category*

In 68.16.1: *lift of x along f , morphism of lifts*

In 68.18.1: *group of infinitesimal automorphisms of x' over x*

In 68.18.2: *group of infinitesimal automorphisms of x_0*

In 68.18.5: *automorphism functor of x*

In 68.19.1: *category of groupoids in functors on \mathcal{C} , groupoid in functors on \mathcal{C} , morphism $(U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoids in functors on \mathcal{C}*

In 68.19.4: *representable*

In 68.19.7: *restriction $(U, R, s, t, c)|_{\mathcal{C}'}$ of (U, R, s, t, c) to \mathcal{C}'*

In 68.19.9: *quotient category cofibered in groupoids $[U/R] \rightarrow \mathcal{C}$, quotient morphism $U \rightarrow [U/R]$*

In 68.20.1: *prorepresentable*

In 68.20.2: *completion $(U, R, s, t, c)^\wedge$ of (U, R, s, t, c)*

In 68.21.1: *smooth*

In 68.23.1: *presentation of \mathcal{F} by (U, R, s, t, c)* associated syntomic site, associated fppf site

In 68.25.1: *normalized, minimal*

Deformation Theory

In 69.3.2: *strict morphism of thickenings*

In 69.8.2: *strict morphism of thickenings*

The Cotangent Complex

In 70.3.1: *standard resolution of B over A*

In 70.3.2: *cotangent complex*

In 70.12.1: *A -biderivation*

In 70.16.1: *Atiyah class*

In 70.17.1: *standard resolution of \mathcal{B} over \mathcal{A}*

In 70.17.2: *cotangent complex*

In 70.18.1: *Atiyah class*

In 70.19.1: *cotangent complex*

In 70.21.1: *cotangent complex*

In 70.23.1: *cotangent complex $L_{X/Y}$ of X over Y*

In 70.25.1: *cotangent complex $L_{X/Y}$ of X over Y*

Algebraic Stacks

In 71.8.1: *representable by an algebraic space over S*

In 71.9.1: *representable by algebraic spaces*

In 71.10.1: *property \mathcal{P}*

In 71.12.1: *algebraic stack over S*

In 71.12.2: *Deligne-Mumford stack*

In 71.12.3: *2-category of algebraic stacks over S*

In 71.16.4: *smooth groupoid*

In 71.16.5: *presentation*

In 71.19.2: *viewed as an algebraic stack over S'*

In 71.19.3: *change of base of \mathcal{X}'*

Examples of Stacks

In 72.17.2: *degree d finite Hilbert stack of \mathcal{X} over \mathcal{Y}*

Sheaves on Algebraic Stacks

In 73.3.1: *presheaf on \mathcal{X} , morphism of presheaves on \mathcal{X}*

In 73.4.1: *associated Zariski site, associated étale site, associated smooth site,*

In 73.4.3: *Zariski sheaf, sheaf for the Zariski topology, étale sheaf, sheaf for the étale topology, smooth sheaf, sheaf for the smooth topology, syntomic sheaf, sheaf for the syntomic topology, fppf sheaf, sheaf, sheaf for the fppf topology*

In 73.4.5: *associated morphism of fppf topoi*

In 73.6.1: *structure sheaf of \mathcal{X}*

In 73.7.1: *presheaf of modules on \mathcal{X} , $\mathcal{O}_{\mathcal{X}}$ -module, sheaf of $\mathcal{O}_{\mathcal{X}}$ -modules*

In 73.9.2: *pullback $x^{-1}\mathcal{F}$ of \mathcal{F} , restriction of \mathcal{F} to $U_{\text{étale}}$*

In 73.11.1: *quasi-coherent module on \mathcal{X} , quasi-coherent $\mathcal{O}_{\mathcal{X}}$ -module*

In 73.11.4: *locally quasi-coherent*

Criteria for Representability

In 74.8.1: *algebraic*

Artin's axioms

In 75.5.1: *condition (RS)*

In 75.9.1: *formal object, morphism of formal objects, lies over*

In 75.9.3: *effective*

In 75.11.1: *versal*

In 75.13.1: *limit preserving*

In 75.14.1: *openness of versality, openness of versality*

In 75.18.2: *condition (RS*)*

In 75.19.1: *obstruction theory, obstruction modules, obstruction*

In 75.20.5: *naive obstruction theory*

Quot and Hilbert Spaces

Properties of Algebraic Stacks

In 77.4.2: *point*

In 77.4.8: *topological space*

In 77.5.1: *surjective*

In 77.6.1: *quasi-compact*

In 77.7.2: *has property \mathcal{P}*

In 77.7.5: *has property \mathcal{P} at x*

In 77.8.1: *monomorphism*

In 77.9.1: *open immersion, closed immersion, immersion*

In 77.9.8: *open substack, closed substack, locally closed substack*

- In 77.10.4: *algebraic stack structure on Z , reduced induced algebraic stack structure, reduction \mathcal{X}_{red} of \mathcal{X}*
- In 77.11.8: *residual gerbe of \mathcal{X} at x exists, residual gerbe of \mathcal{X} at x*
- In 77.12.2: *dimension of \mathcal{X} at x*
- In 77.12.3: *dimension*

- In 83.2.3: *colimit*
- In 83.2.8: *finite presentation*
- In 83.5.4: *quasi-compact*
- In 83.5.6: *Hausdorff*
- In 83.5.9: *irreducible, irreducible*
- In 83.5.12: *generic point*
- In 83.5.16: *Noetherian, Artinian*
- In 83.5.18: *irreducible component*
- In 83.5.22: *closed, specialization, generalization*
- In 83.5.26: *connected, connected component*
- In 83.8.1: *length*
- In 83.12.1: *catenary*
- In 83.15.1: *finite locally free, invertible module*
- In 83.15.3: *class group of A , Picard group of A*
- In 83.17.1: *going-up theorem, going-down theorem*
- In 83.19.1: *numerical polynomial*
- In 83.19.2: *graded module, locally finite, Euler-Poincaré function, Hilbert function, Hilbert polynomial*
- In 83.19.3: *graded A -algebra, graded module M over a graded A -algebra B , homomorphisms of graded modules/rings, graded submodules, graded ideals, exact sequences of graded modules*
- In 83.20.1: *homogeneous*
- In 83.20.2: *homogeneous spectrum $\text{Proj}(R)$*
- In 83.20.3: *$R_{(f)}$*
- In 83.21.1: *Cohen-Macaulay*
- In 83.23.3: *filtered injective*
- In 83.23.4: *$\text{Fil}^f(\mathcal{A})$*
- In 83.23.6: *filtered quasi-isomorphism*
- In 83.23.7: *filtered acyclic*
- In 83.26.12: *integral*
- In 83.28.1: *dual numbers*
- In 83.28.3: *tangent space of X over S , tangent vector*
- In 83.29.1: *quasi-coherent*
- In 83.29.2: *specialization*
- In 83.29.5: *locally Noetherian, Noetherian*

- In 83.29.6: *coherent Weil divisor associated to a Cartier divisor*
 In 83.32.1: *invertible \mathcal{O}_X -module*
 In 83.32.4: *invertible module M , trivial*
 In 83.32.7: *Picard group of X*
 In 83.33.2: $\delta(\tau)$
 In 83.34.1: *Weil divisor, prime divisor, Weil divisor associated to a rational function $f \in K(X)^*$, effective Cartier divisor, Weil divisor $[D]$ associated to an effective Cartier divisor $D \subset X$, sheaf of total quotient rings \mathcal{K}_S , Cartier divisor,*

Topics in Geometry

- (63) Quotients of Groupoids
- (64) Simplicial Spaces
- (65) Formal Algebraic Spaces
- (66) Restricted Power Series
- (67) Resolution of Surfaces

Deformation Theory

- (68) Formal Deformation Theory
- (69) Deformation Theory
- (70) The Cotangent Complex

Algebraic Stacks

- (71) Algebraic Stacks
- (72) Examples of Stacks
- (73) Sheaves on Algebraic Stacks
- (74) Criteria for Representability
- (75) Artin's Axioms

- (76) Quot and Hilbert Spaces

- (77) Properties of Algebraic Stacks
- (78) Morphisms of Algebraic Stacks
- (79) Cohomology of Algebraic Stacks
- (80) Derived Categories of Stacks
- (81) Introducing Algebraic Stacks

Miscellany

- (82) Examples
- (83) Exercises
- (84) Guide to Literature
- (85) Desirables
- (86) Coding Style
- (87) Obsolete
- (88) GNU Free Documentation License
